static java.util.Date	<a href="#">getParamDate</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter by index, Return as Date.
static double	<a href="#">getParamDouble</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter by index, Return as double.
static double	<a href="#">getParamDouble</a> ( <a href="#">AMFDataList</a> params, int index, double defaultVal) Get parameter by index, Return as double.
static int	<a href="#">getParamInt</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter by index, Return as int.
static int	<a href="#">getParamInt</a> ( <a href="#">AMFDataList</a> params, int index, int defaultVal) Get parameter by index, Return as int.
static long	<a href="#">getParamLong</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter by index, Return as long.
static long	<a href="#">getParamLong</a> ( <a href="#">AMFDataList</a> params, int index, long defaultVal) Get parameter by index, Return as long.
static <a href="#">AMFDataMixedArray</a>	<a href="#">getParamMixedArray</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter by index, Return as AMFDataMixedArray.
static <a href="#">AMFDataObj</a>	<a href="#">getParamObj</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter by index, Return as Object.
static String	<a href="#">getParamString</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter by index, Return as String.
static String	<a href="#">getParamString</a> ( <a href="#">AMFDataList</a> params, int index, String defaultVal) Get parameter by index, Return as String.
static int	<a href="#">getParamType</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter type.

static <a href="#">IMediaStream</a>	<a href="#">getStream</a> ( <a href="#">IClient</a> client, com.wowza.wms.request.RequestFunction function) For methods called from the client side object NetStream (publish, play, deleteStream) get the IMediaStream object associated with the call.
static <a href="#">IVHost</a>	<a href="#">getVHost</a> ( <a href="#">IClient</a> client) Get vHost of a client.
void	<a href="#">invokePrevious</a> ( <a href="#">IClient</a> client, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params) Wowza Pro will determine command priority based on the order of the modules in the module list.
static void	<a href="#">invokePrevious</a> (Object instance, <a href="#">IClient</a> client, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params) Wowza Pro will determine command priority based on the order of the modules in the module list.
static boolean	<a href="#">isSendResult</a> ( <a href="#">AMFDataList</a> params) Is this method call expecting sendResult to be called.
static void	<a href="#">sendClientOnStatusError</a> ( <a href="#">IClient</a> client, String code, String description) Send an error message to the client-side client.onStatus handler
static boolean	<a href="#">sendResult</a> ( <a href="#">IClient</a> client, <a href="#">AMFDataList</a> params, <a href="#">AMFData</a> data) Send a result to client method call as a AMFData object.
static boolean	<a href="#">sendResult</a> ( <a href="#">IClient</a> client, <a href="#">AMFDataList</a> params, boolean value) Send a result to client method call as a single boolean value.
static boolean	<a href="#">sendResult</a> ( <a href="#">IClient</a> client, <a href="#">AMFDataList</a> params, double value) Send a result to client method call as a single double value.
static boolean	<a href="#">sendResult</a> ( <a href="#">IClient</a> client, <a href="#">AMFDataList</a> params, int value) Send a result to client method call as a single int value.
static boolean	<a href="#">sendResult</a> ( <a href="#">IClient</a> client, <a href="#">AMFDataList</a> params, String value) Send a result to client method call as a single String value.
static void	<a href="#">sendStreamOnStatusError</a> ( <a href="#">IMediaStream</a> stream, String code, String description) Send an error to the client-side NetStream.onStatus handler

Constant value: **14**

## Constructors

### ModuleBase

```
public ModuleBase( )
```

## Methods

### getParamCount

```
protected static int getParamCount(AMFDataList params)
```

Get the total number of parameters passed to method.

**Parameters:**

params - parameters

**Returns:**

total number of parameters

### getCallbackParamCount

```
protected static int getCallbackParamCount(AMFDataList params)
```

Get the total number of parameters passed to callback.

**Parameters:**

params - parameters

**Returns:**

total number of parameters

### getParamType

```
protected static int getParamType(AMFDataList params,  
int index)
```

Get parameter type.

**Parameters:**

params - parameters

index - parameter index

**Returns:**

parameter type (AMFData.DATA\_TYPE\_\*)

### getParam

```
protected static AMFData getParam(AMFDataList params,  
int index)
```

Get parameter by index. Return as AMFData object.

(continued from last page)

**Parameters:**

params - parameters  
index - parameter index

**Returns:**

parameter value as AMFData object, null if out of bounds

---

## getParamMixedArray

```
protected static AMFDataMixedArray getParamMixedArray(AMFDataList params,  
int index)
```

Get parameter by index, Return as AMFDataMixedArray.

**Parameters:**

params - parameters  
index - parameter index

**Returns:**

parameter value as AMFDataMixedArray object, null if out of bounds

---

## getParamObj

```
protected static AMFDataObj getParamObj(AMFDataList params,  
int index)
```

Get parameter by index, Return as Object.

**Parameters:**

params - parameters  
index - parameter index

**Returns:**

parameter value as Object object, null if out of bounds

---

## getParamString

```
protected static String getParamString(AMFDataList params,  
int index)
```

Get parameter by index, Return as String.

**Parameters:**

params - parameters  
index - parameter index

**Returns:**

parameter value as String object, null if out of bounds

---

## getParamString

```
protected static String getParamString(AMFDataList params,  
int index,  
String defaultVal)
```

Get parameter by index, Return as String.

**Parameters:**

params - parameters

---

(continued from last page)

index - parameter index  
defaultVal - default value

**Returns:**

parameter value as String object, defaultVal if out of bounds

---

## getParamDate

```
protected static java.util.Date getParamDate(AMFDataList params,  
int index)
```

Get parameter by index, Return as Date.

**Parameters:**

params - parameters  
index - parameter index

**Returns:**

parameter value as Date object, null if out of bounds

---

## getParamInt

```
protected static int getParamInt(AMFDataList params,  
int index)
```

Get parameter by index, Return as int.

**Parameters:**

params - parameters  
index - parameter index

**Returns:**

parameter value as int, 0 if out of bounds

---

## getParamInt

```
protected static int getParamInt(AMFDataList params,  
int index,  
int defaultVal)
```

Get parameter by index, Return as int.

**Parameters:**

params - parameters  
index - parameter index  
defaultVal - default value

**Returns:**

parameter value as int, defaultVal if out of bounds

---

## getParamDouble

```
protected static double getParamDouble(AMFDataList params,  
int index)
```

Get parameter by index, Return as double.

**Parameters:**

params - parameters

---

(continued from last page)

index - parameter index

**Returns:**

parameter value as double, 0 if out of bounds

---

## getParamDouble

```
protected static double getParamDouble(AMFDataList params,  
    int index,  
    double defaultVal)
```

Get parameter by index, Return as double.

**Parameters:**

params - parameters  
index - parameter index  
defaultVal - default value

**Returns:**

parameter value as double, 0 if out of bounds

---

## getParamLong

```
protected static long getParamLong(AMFDataList params,  
    int index)
```

Get parameter by index, Return as long.

**Parameters:**

params - parameters  
index - parameter index

**Returns:**

parameter value as long, 0 if out of bounds

---

## getParamLong

```
protected static long getParamLong(AMFDataList params,  
    int index,  
    long defaultVal)
```

Get parameter by index, Return as long.

**Parameters:**

params - parameters  
index - parameter index  
defaultVal - default value

**Returns:**

parameter value as long, defaultVal if out of bounds

---

## getParamBoolean

```
protected static boolean getParamBoolean(AMFDataList params,  
    int index)
```

Get parameter by index, Return as boolean.

**Parameters:**

params - parameters

---

(continued from last page)

index - parameter index

**Returns:**

parameter value as boolean, false if out of bounds

---

## getParamBoolean

```
protected static boolean getParamBoolean(AMFDataList params,  
int index,  
boolean defaultVal)
```

Get parameter by index, Return as boolean.

**Parameters:**

params - parameters  
index - parameter index  
defaultVal - default value

**Returns:**

parameter value as boolean, defaultVal if out of bounds

---

## getAppInstance

```
protected static IApplicationInstance getAppInstance(IClient client)
```

Get applicationInstance of a client.

**Parameters:**

client - client

**Returns:**

applicationInstance

---

## getApplication

```
protected static IApplication getApplication(IClient client)
```

Get application of a client.

**Parameters:**

client - client

**Returns:**

application

---

## isSendResult

```
protected static boolean isSendResult(AMFDataList params)
```

Is this method call expecting sendResult to be called. If on the client side the call to `NetConnection.call("handlerName", resultObj, param1...);` had a value for resultObj (non-null), then the method is expecting some type of result or return data. Calling a variant of sendResult will provide this callback.

**Parameters:**

params - parameters

**Returns:**

true if client side call is expecting call to sendResult

---

## getVHost

protected static [IVHost](#) **getVHost**([IClient](#) client)

Get vHost of a client.

**Parameters:**

client - client

**Returns:**

vHost

---

## sendResult

protected static boolean **sendResult**([IClient](#) client,  
[AMFDataList](#) params,  
String value)

Send a result to client method call as a single String value.

**Parameters:**

client - client

params - parameters

value - return value

**Returns:**

true if client side call is expecting call to sendResult

---

## sendResult

protected static boolean **sendResult**([IClient](#) client,  
[AMFDataList](#) params,  
boolean value)

Send a result to client method call as a single boolean value.

**Parameters:**

client - client

params - parameters

value - return value

**Returns:**

true if client side call is expecting call to sendResult

---

## sendResult

protected static boolean **sendResult**([IClient](#) client,  
[AMFDataList](#) params,  
int value)

Send a result to client method call as a single int value.

**Parameters:**

client - client

params - parameters

value - return value

**Returns:**

true if client side call is expecting call to sendResult

---

## sendResult

```
protected static boolean sendResult(IClient client,  
    AMFDataList params,  
    double value)
```

Send a result to client method call as a single double value.

**Parameters:**

client - client  
params - parameters  
value - return value

**Returns:**

true if client side call is expecting call to sendResult

---

## sendResult

```
protected static boolean sendResult(IClient client,  
    AMFDataList params,  
    AMFData data)
```

Send a result to client method call as a AMFData object. This can be a single AMFData value like new AMFDataItem((double)1.234) or a complex type like AMFDataMixedArray, AMFDataArray or AMFDataObj.

**Parameters:**

client - client  
params - parameters  
data - return value

**Returns:**

true if client side call is expecting call to sendResult

---

## getLogger

```
protected static WMSLogger getLogger()
```

Get the logging interface.

**See Also:**

[WMSLogger](#)

---

## getStream

```
protected static IMediaStream getStream(IClient client,  
    com.wowza.wms.request.RequestFunction function)
```

For methods called from the client side object NetStream (publish, play, deleteStream) get the IMediaStream object associated with the call.

**Parameters:**

client - client  
function - functions

**Returns:**

media stream

---

(continued from last page)

## invokePrevious

```
protected static void invokePrevious(Object instance,
    IClient client,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Wowza Pro will determine command priority based on the order of the modules in the module list. Wowza Pro by default will only invoke the last module that defines a given command. This method enables you to call the method by the same name in the previous module that defines that command. For example if you have three modules defined in the module list; ModuleCore, ModuleSecureURLParams and ModuleMyModule and all three modules implement the "play" command. When "play" is invoked it will invoke the "play" command in ModuleMyModule. If in ModuleMyModule you would like to call the "play" command in ModuleSecureURLParams, you can call: invokePrevious(this, client, function, params); and it will invoke the "play" command defined in ModuleSecureURLParams.

### Parameters:

instance - instance of the current module  
 client - client object passed into command  
 function - function passed into command  
 params - parameters passed into command

## invokePrevious

```
protected void invokePrevious(IClient client,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Wowza Pro will determine command priority based on the order of the modules in the module list. Wowza Pro by default will only invoke the last module that defines a given command. This method enables you to call the method by the same name in the previous module that defines that command. For example if you have three modules defined in the module list; ModuleCore, ModuleSecureURLParams and ModuleMyModule and all three modules implement the "play" command. When "play" is invoked it will invoke the "play" command in ModuleMyModule. If in ModuleMyModule you would like to call the "play" command in ModuleSecureURLParams, you can call: this.invokePrevious(client, function, params); and it will invoke the "play" command defined in ModuleSecureURLParams.

### Parameters:

client - client object passed into command  
 function - function passed into command  
 params - parameters passed into command

## sendClientOnStatusError

```
protected static void sendClientOnStatusError(IClient client,
    String code,
    String description)
```

Send an error message to the client-side client.onStatus handler

### Parameters:

client - destination client  
 code - code  
 description - description

## sendStreamOnStatusError

```
protected static void sendStreamOnStatusError(IMediaStream stream,
    String code,
    String description)
```

Send an error to the client-side NetStream.onStatus handler

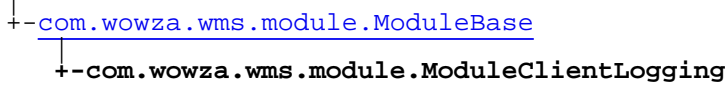

### Parameters:

(continued from last page)

stream - destination stream  
code - code  
description - description

## com.wowza.wms.module Class ModuleClientLogging

**Methods inherited from class `java.lang.Object`**

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Constructors

### ModuleClientLogging

```
public ModuleClientLogging()
```

## Methods

### logDebug

```
public static void logDebug(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Send a debug message to the logging system `NetConnection.call("logDebug", null, message);`

**Parameters:**

`client` - client  
`function` - function  
`params` - params (message)

### logInfo

```
public static void logInfo(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Send a info message to the logging system `NetConnection.call("logInfo", null, message);`

**Parameters:**

`client` - client  
`function` - function  
`params` - params (message)

### logWarn

```
public static void logWarn(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Send a warning message to the logging system `NetConnection.call("logWarn", null, message);`

**Parameters:**

`client` - client  
`function` - function  
`params` - params (message)

(continued from last page)

## logError

```
public static void logError(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Send a error message to the logging system `NetConnection.call("logError", null, message);`

### Parameters:

client - client

function - function

params - params (message)

## com.wowza.wms.module Class ModuleCore

```
java.lang.Object
|
+-com.wowza.wms.module.ModuleBase
|
+-com.wowza.wms.module.ModuleCore
```

```
public class ModuleCore
extends ModuleBase
```

ModuleCore includes all the basic commands support by the NetStream and NetConnection client side objects. Any of these methods can be overwritten in a custom module. Below is an example of custom module that overrides the play method to modify the name of the file to be played:

```
package com.wowza.wms.plugin.overrideexample;

import com.wowza.wms.amf.*;
import com.wowza.wms.client.*;
import com.wowza.wms.module.*;
import com.wowza.wms.request.*;

public class ModuleOverrideExample extends ModuleBase
{
    public void play(IClient client, RequestFunction function, AMFDataList params)
    {
        if (params.get(PARAM1).getType() == AMFData.DATA_TYPE_STRING)
        {
            String playName = params.getString(PARAM1);
            params.set(PARAM1, new AMFDataItem(playName+"_newname"));
        }
        this.invokePrevious(client, function, params);
    }
}
```

### Fields inherited from class [com.wowza.wms.module.ModuleBase](#)

[CALLBACK\\_PARAM1](#), [CALLBACK\\_PARAM10](#), [CALLBACK\\_PARAM2](#), [CALLBACK\\_PARAM3](#), [CALLBACK\\_PARAM4](#), [CALLBACK\\_PARAM5](#), [CALLBACK\\_PARAM6](#), [CALLBACK\\_PARAM7](#), [CALLBACK\\_PARAM8](#), [CALLBACK\\_PARAM9](#), [PARAM1](#), [PARAM10](#), [PARAM2](#), [PARAM3](#), [PARAM4](#), [PARAM5](#), [PARAM6](#), [PARAM7](#), [PARAM8](#), [PARAM9](#), [PARAMMETHODNAME](#), [PLAYTRANSITION\\_APPEND](#), [PLAYTRANSITION\\_APPEND\\_IMMEDIATE](#), [PLAYTRANSITION\\_RESET](#), [PLAYTRANSITION\\_RESET\\_IMMEDIATE](#), [PLAYTRANSITION\\_STOP](#), [PLAYTRANSITION\\_SWAP](#), [PLAYTRANSITION\\_SWITCH](#), [PLAYTRANSITION\\_UNKNOWN](#), [PLAYTRANSITIONSTR\\_APPEND](#), [PLAYTRANSITIONSTR\\_RESET](#), [PLAYTRANSITIONSTR\\_STOP](#), [PLAYTRANSITIONSTR\\_SWAP](#), [PLAYTRANSITIONSTR\\_SWITCH](#), [PLAYTRANSITIONSTR\\_UNKNOWN](#)

## Constructor Summary

public	<a href="#">ModuleCore()</a>
--------	------------------------------

## Method Summary

static void	<a href="#">closeStream(IClient client, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params)</a> Server side implementation of NetStream.close();
static void	<a href="#">createStream(IClient client, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params)</a> Create new server side NetStream object (internal to Flash workings).

## Constructors

### ModuleCore

```
public ModuleCore()
```

## Methods

(continued from last page)

## createStream

```
public static void createStream(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Create new server side NetStream object (internal to Flash workings).

### Parameters:

client - client  
function - function  
params - parameters (no params)

---

## initStream

```
public static void initStream(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Create new server side NetStream object (internal to Flash workings).

### Parameters:

client - client  
function - function  
params - parameters (streamIndex, boolean)

---

## releaseStream

```
public static void releaseStream(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## getLastStreamId

```
public static void getLastStreamId(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Get the id for the last created stream `NetConnection.call("getLastStreamId", resultObj);`

### Parameters:

client - client  
function - client  
params - params (no params)

---

## deleteStream

```
public static void deleteStream(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Delete server side stream object (internal to Flash workings).

### Parameters:

client - client  
function - function  
params - params

---

## publish

```
public static void publish(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Server side implementation of NetStream.publish(name : String [, howToPublish : String]);

### Parameters:

client - client

function - function

params - params (name [if name = "false" or "null" stop publishing], howToPublish ["record", "live", "append"])

---

## setBandwidthLimit

```
public static void setBandwidthLimit(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## play2

```
public static void play2(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Server side implementation of NetStream.play(playOptions : NetStreamPlayOptions);

### Parameters:

client

function

params

---

## play

```
public static void play(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Server side implementation of NetStream.play(name : Object [,start : Number[, len : Number[, reset : Object]]]);

### Parameters:

client - client

function - function

params - params (name, start, len, reset)

---

## closeStream

```
public static void closeStream(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Server side implementation of NetStream.close();

### Parameters:

client - client

function - function

params - params (no params)

---

---

## seek

```
public static void seek(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Server side implementation of NetStream.seek(offset : Number);

### Parameters:

client - client  
function - function  
params - params (offset)

---

## pause

```
public static void pause(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Server side implementation of NetStream.pause([ flag : Boolean]);

### Parameters:

client - client  
function - function  
params - params (flag)

---

## setBufferTime

```
public static void setBufferTime(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Server side implementation of NetStream.setBufferTime(bufferTime : Number);

### Parameters:

client - client  
function - function  
params - params (bufferTime)

---

## getClientID

```
public static void getClientID(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Get the clientId for a client connection NetConnection.call("getClientID", resultObj);

### Parameters:

client - client  
function - function  
params - params (no params)

---

## getVersion

```
public static void getVersion(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Get the Wowza Pro server version and build number NetConnection.call("getVersion", resultObj);

---

(continued from last page)

**Parameters:**

client - client  
function - function  
params - params (no params)

---

## setLiveStreamPacketizer

```
public static void setLiveStreamPacketizer(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Set the live stream packetizer for a stream

**Parameters:**

client - client  
function - function  
params - params (liveStreamPacketizer)

---

## initLiveStreamRepeating

```
public static void initLiveStreamRepeating(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Initialize a stream for live stream repeating

**Parameters:**

client - client  
function - function  
params - params (liveStreamPacketizer, liveStreamRepeater)

---

## getLiveStreamPacketizer

```
public static void getLiveStreamPacketizer(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Get the live stream packetizer list for a client connection `NetConnection.call("getLiveStreamPacketizer", resultObj);`

**Parameters:**

client - client  
function - function  
params - params (no params)

---

## setStreamType

```
public static void setStreamType(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Set the default stream type for a client connection `NetConnection.call("setStreamType", null, streamType);`

**Parameters:**

client - client  
function - function  
params - params (streamType)

---

(continued from last page)

## getStreamType

```
public static void getStreamType(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Get the default stream type for a client connection `NetConnection.call("getStreamType", resultObj);`

### Parameters:

client - client  
function - function  
params - params (no params)

---

## receiveAudio

```
public static void receiveAudio(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Server side implementation of `NetStream.receiveAudio(receive : Boolean);`

### Parameters:

client - client  
function - function  
params - params (receive)

---

## receiveVideo

```
public static void receiveVideo(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Server side implementation of `NetStream.receiveVideo(receive : Boolean | FPS : Number);` FPS does not work the same as FMS. Wowza Pro accepts the following values:

- true: Send all video frames
- false: Send no video
- -1: Send all video frames
- -2: Send half the frames (remove B frames) (Note: only works with Sorenson Spark video with B-frames)
- -3: Send only key frames

### Parameters:

client - client  
function - function  
params - params (receive | FPS)

---

## getStreamBitrate

```
public void getStreamBitrate(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Get stream bitrate in bits-per-second for a video on demand stream (will not work for live). To call, `NetConnection.call("getStreamBitrate", resultObj, streamName);`

### Parameters:

client - client  
function - function  
params - params (streamName:String)

## getStreamLength

```
public static void getStreamLength(IClient client,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Get stream length in seconds NetConnection.call("getStreamLength", resultObj, streamName); If you pass in an array of streamNames it will return an array of durations.

### Parameters:

client - client  
function - function  
params - params (streamName:String or streamNames:Array)

---

## getRepeaterOriginUrl

```
public static void getRepeaterOriginUrl(IClient client,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Get the Repeater Origin URL for this client

### Parameters:

client - client  
function - function  
params - params

---

## setRepeaterOriginUrl

```
public static void setRepeaterOriginUrl(IClient client,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Set the Repeater Origin URL for this client

### Parameters:

client - client  
function - function  
params - params (repeaterOriginUrl)

---

## FCPublish

```
public static void FCPublish(IClient client,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

FCPublish method called by FME 2.5

### Parameters:

client - client  
function - function  
params - params

---

## FCUnPublish

```
public static void FCUnPublish(IClient client,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

(continued from last page)

FCUnpublish method called by FME 2.5

**Parameters:**

client - client  
function - function  
params - params

---

## FCUnpublish

```
public static void FCUnpublish(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## pauseRaw

```
public static void pauseRaw(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

pauseRaw method introduced in Flash player 10

**Parameters:**

client - client  
function - function  
params - params

---

## getReferrer

```
public static void getReferrer(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

getReferrer returns the referrer from the onConnect metadata

**Parameters:**

client - client  
function - function  
params - params

---

## getPageUrl

```
public static void getPageUrl(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

getPageUrl returns the pageUrl from the onConnect metadata

**Parameters:**

client - client  
function - function  
params - params

---

## FCSubscribe

```
public static void FCSubscribe(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

(continued from last page)

FCSubscribe subscribes to a live stream (if origin edge will start the stream from the origin to the edge)

**Parameters:**

client - client  
function - function  
params - params (streamName:String, [mediaCasterType:String])

---

## FCUnsubscribe

```
public static void FCUnsubscribe(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

FCUnSubscribe to a live stream

**Parameters:**

client - client  
function - function  
params - params (streamName:String)

---

## FCUnSubscribe

```
public static void FCUnSubscribe(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## startTransmit

```
public static void startTransmit(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## stopTransmit

```
public static void stopTransmit(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## getMediaList

```
public static void getMediaList(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

## com.wowza.wms.module Class ServerListenerStreamDemoPublisher

java.lang.Object

└─com.wowza.wms.module.ServerListenerStreamDemoPublisher

All Implemented Interfaces:

[IApplicationInstanceNotify](#), [IApplicationNotify](#), [IVHostNotify](#), [IServerNotify2](#)

public class **ServerListenerStreamDemoPublisher**

extends Object

implements [IServerNotify2](#), [IVHostNotify](#), [IApplicationNotify](#), [IApplicationInstanceNotify](#)

### Nested Class Summary

class	<a href="#">ServerListenerStreamDemoPublisher.DemoPublisher</a> ServerListenerStreamDemoPublisher.DemoPublisher
class	<a href="#">ServerListenerStreamDemoPublisher.DemoPublisherConfig</a> ServerListenerStreamDemoPublisher.DemoPublisherConfig
class	<a href="#">ServerListenerStreamDemoPublisher.ServerPublisherMap</a> ServerListenerStreamDemoPublisher.ServerPublisherMap
class	<a href="#">ServerListenerStreamDemoPublisher.VHostPublishersMap</a> ServerListenerStreamDemoPublisher.VHostPublishersMap

### Field Summary

public static final	<a href="#">EVENTTYPE_APPLICATION_START</a> Value: <b>3</b>
public static final	<a href="#">EVENTTYPE_STREAM_START</a> Value: <b>2</b>

## Fields

### EVENTTYPE\_STREAM\_STOP

```
public static final int EVENTTYPE_STREAM_STOP
```

Constant value: **1**

### EVENTTYPE\_STREAM\_START

```
public static final int EVENTTYPE_STREAM_START
```

Constant value: **2**

### EVENTTYPE\_APPLICATION\_START

```
public static final int EVENTTYPE_APPLICATION_START
```

Constant value: **3**

## Constructors

### ServerListenerStreamDemoPublisher

```
public ServerListenerStreamDemoPublisher()
```

## Methods

### onServerCreate

```
public void onServerCreate(IServer server)
```

### onServerConfigLoaded

```
public void onServerConfigLoaded(IServer server)
```

(continued from last page)

---

### onServerInit

```
public void onServerInit(IServer server)
```

---

### onServerShutdownStart

```
public void onServerShutdownStart(IServer server)
```

---

### onServerShutdownComplete

```
public void onServerShutdownComplete(IServer server)
```

---

### onVHostCreate

```
public void onVHostCreate(IVHost vhost)
```

---

### getServerPublisherMap

```
public ServerListenerStreamDemoPublisher.ServerPublisherMap getServerPublisherMap()
```

---

### onVHostInit

```
public void onVHostInit(IVHost vhost)
```

---

### onVHostShutdownStart

```
public void onVHostShutdownStart(IVHost vhost)
```

---

### onVHostShutdownComplete

```
public void onVHostShutdownComplete(IVHost vhost)
```

---

### onVHostClientConnect

```
public void onVHostClientConnect(IVHost vhost,  
    IClient inClient,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

## onApplicationInstanceCreate

```
public void onApplicationInstanceCreate(IApplicationInstance applicationInstance)
```

---

## onApplicationInstanceDestroy

```
public void onApplicationInstanceDestroy(IApplicationInstance applicationInstance)
```

---

## onApplicationCreate

```
public void onApplicationCreate(IApplication application)
```

---

## onApplicationDestroy

```
public void onApplicationDestroy(IApplication application)
```

---

## getAppInstance

```
public IApplicationInstance getAppInstance(IVHost vhost,  
    ServerListenerStreamDemoPublisher.DemoPublisherConfig config)
```

---

## getAppInstance

extends

---

### Method Summary

void	<a href="#">onCallback</a> ( <a href="#">INetConnection</a> netconnection, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params)
------	---

---

### Methods

#### onCallback

```
public void onCallback(INetConnection netconnection,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## com.wowza.wms.netconnection Interface INetConnectionCallResult

---

public interface **INetConnectionCallResult**  
extends

---

### Method Summary

void	<a href="#">onResult</a> ( <a href="#">INetConnection</a> netconnection, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params)
------	---

---

### Methods

#### **onResult**

```
public void onResult(INetConnection netconnection,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

## com.wowza.wms.netconnection Interface INetConnectionIdle

public interface **INetConnectionIdle**  
extends

### Method Summary

void	<a href="#">onIdle</a> ( <a href="#">INetConnection</a> netconnection, org.apache.mina.common.Session session)
void	<a href="#">onSessionClosed</a> ( <a href="#">INetConnection</a> netconnection, org.apache.mina.common.Session session)
void	<a href="#">onSessionOpened</a> ( <a href="#">INetConnection</a> netconnection, org.apache.mina.common.Session session)

### Methods

#### onIdle

```
public void onIdle(INetConnection netconnection,  
    org.apache.mina.common.Session session)
```

#### onSessionOpened

```
public void onSessionOpened(INetConnection netconnection,  
    org.apache.mina.common.Session session)
```

#### onSessionClosed

```
public void onSessionClosed(INetConnection netconnection,  
    org.apache.mina.common.Session session)
```

## com.wowza.wms.netconnection Interface INetConnectionPingResult

public interface **INetConnectionPingResult**  
extends

INetConnectionPingResult: callback interface used by INetConnection ping.

### Method Summary

void	<a href="#">onResult</a> ( <a href="#">INetConnection</a> netConnection, long pingTime, int pingId, boolean result) Triggered on server to server result from call to INetConnection.ping.
------	---

### Methods

#### onResult

```
public void onResult(INetConnection netConnection,  
    long pingTime,  
    int pingId,  
    boolean result)
```

Triggered on server to server result from call to INetConnection.ping. This method will be called on a success or failure (ping timeout) of a ping.

#### Parameters:

netConnection - net connection  
pingTime - time in server time (milliseconds) when the ping was initiated  
pingId - internal server id for the ping request  
result - true is ping was successful false if failure (timeout)

## com.wowza.wms.netconnection Interface INetConnectionPublisher

All Known Implementing Classes:

[PushPublishRTMPNetConnectionPublisher](#)

public interface **INetConnectionPublisher**  
extends

### Method Summary

int	<a href="#">play</a> ( <a href="#">INetConnection</a> netConnection, java.io.OutputStream out, long[] playSizes)

## Fields

### PUSHPUBLISH\_TYPE\_UNKNOWN

```
public static final int PUSHPUBLISH_TYPE_UNKNOWN
```

(continued from last page)

Constant value: **0**

---

**PUSHPUBLISH\_TYPE\_RTMP**

```
public static final int PUSHPUBLISH_TYPE_RTMP
```

Constant value: **1**

---

**PUSHPUBLISH\_TYPE\_RTP**

```
public static final int PUSHPUBLISH_TYPE_RTP
```

Constant value: **2**

---

**PUSHPUBLISH\_TYPE\_CUPERTINO**

```
public static final int PUSHPUBLISH_TYPE_CUPERTINO
```

Constant value: **3**

---

**PUSHPUBLISH\_TYPE\_SANJOSE**

```
public static final int PUSHPUBLISH_TYPE_SANJOSE
```

Constant value: **4**

---

**PUSHPUBLISH\_TYPE\_MPEGDASH**

```
public static final int PUSHPUBLISH_TYPE_MPEGDASH
```

Constant value: **5**

---

**PUSHPUBLISH\_TYPE\_SRT**

```
public static final int PUSHPUBLISH_TYPE_SRT
```

Constant value: **6**

---

**PUSHPUBLISH\_TYPE\_RTP\_BUFFERED**

```
public static final int PUSHPUBLISH_TYPE_RTP_BUFFERED
```

Constant value: **7**

---

**CONNECTED\_STATE\_NOT\_CONNECTED**

```
public static final int CONNECTED_STATE_NOT_CONNECTED
```

Constant value: **0**

(continued from last page)

## CONNECTED\_STATE\_WAITING

```
public static final int CONNECTED_STATE_WAITING
```

Constant value: **1**

## CONNECTED\_STATE\_CONNECTING

```
public static final int CONNECTED_STATE_CONNECTING
```

Constant value: **2**

## CONNECTED\_STATE\_CONNECTED

```
public static final int CONNECTED_STATE_CONNECTED
```

Constant value: **3**

## Methods

### connect

```
public void connect()
```

### disconnect

```
public void disconnect(boolean hard)
```

### resetConnection

```
public void resetConnection()
```

### getProperties

```
public WMSProperties getProperties()
```

### getEntryName

```
public String getEntryName()
```

### setEntryName

```
public void setEntryName(String entryName)
```

---

**getSrcStreamName**

```
public String getSrcStreamName()
```

---

**setSrcStreamName**

```
public void setSrcStreamName(String srcStreamName)
```

---

**getProfile**

```
public String getProfile()
```

---

**setProfile**

```
public void setProfile(String profile)
```

---

**getDestinationName**

```
public String getDestinationName()
```

---

**setDestinationName**

```
public void setDestinationName(String destinationName)
```

---

**getDstStreamName**

```
public String getDstStreamName()
```

---

**setDstStreamName**

```
public void setDstStreamName(String dstStreamNameIn)
```

---

**setStreamName**

```
public void setStreamName(String streamName)
```

---

**getHostname**

```
public String getHostname()
```

---

(continued from last page)

---

**setHost**

```
public void setHost(String hostname)
```

---

---

**setHostname**

```
public void setHostname(String hostname)
```

---

---

**setDebugLog**

```
public void setDebugLog(boolean debugLog)
```

---

---

**getPort**

```
public int getPort()
```

---

---

**setPort**

```
public void setPort(int port)
```

---

---

**setPort**

```
public void setPort(String port)
```

---

---

**getReconnectWaitTime**

```
public int getReconnectWaitTime()
```

---

---

**setReconnectWaitTime**

```
public void setReconnectWaitTime(int reconnectWaitTime)
```

---

(continued from last page)

---

## init

```
public void init(IApplicationInstance appInstance2,  
                String streamName,  
                IMediaStream stream,  
                java.util.Map profileData,  
                java.util.Map maps,  
                com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,  
                boolean debug)
```

---

## getPushPublishType

```
public int getPushPublishType()
```

---

## createPushPublishSession

```
public IPushPublishSession createPushPublishSession()
```

---

## getSrcStream

```
public IMediaStream getSrcStream()
```

---

## setSrcStream

```
public void setSrcStream(IMediaStream srcStream)
```

---

## getMap

```
public java.util.Map getMap()
```

---

## getContextStr

```
public String getContextStr()
```

---

## getConnectedState

```
public int getConnectedState()
```

---

## getMessagesAttemptedCount

```
public long getMessagesAttemptedCount()
```

---

---

**getMessagesRetriedCount**

```
public long getMessagesRetriedCount()
```

---

---

**getMessagesFailedCount**

```
public long getMessagesFailedCount()
```

---

---

**getDestinationID**

```
public int getDestinationID()
```

---

---

**updateUsageTracker**

```
public void updateUsageTracker()
```

---

---

**isParent**

```
public boolean isParent()
```

---

---

**isTargetedStream**

```
public boolean isTargetedStream(String streamName)
```

---

---

**handleParentStreamDisconnect**

```
public boolean handleParentStreamDisconnect(IPushPublishSession pushPublishSession,  
boolean isReset)
```

---

## com.wowza.wms.pushpublish.model Interface IPushPublishCrossSession

All Known Implementing Classes:

[PushPublishHTTPPlaylistMap](#)

public interface **IPushPublishCrossSession**  
extends

### Method Summary

boolean	<a href="#">isSessionValid()</a>
---------	----------------------------------

### Methods

#### isSessionValid

public boolean **isSessionValid()**

## com.wowza.wms.pushpublish.model Interface IPushPublishHTTPGroupMember

All Known Implementing Classes:

[PushPublishHTTPSanJoseAkamaiHandler](#), [PushPublishHTTPCupertino](#)

public interface **IPushPublishHTTPGroupMember**  
extends

### Method Summary

Boolean	<a href="#">adaptiveGroupPlaylistNeedsUpdating</a> (long lastUpdateTime, java.util.List groupingsByRedundantPairs, java.util.List groupingsByAbrGroups)
<a href="#">ManifestModel</a>	<a href="#">createGroupPlaylist</a> (String id, java.util.List groupingsByRedundantPairs, java.util.List groupingsByAbrGroups, <a href="#">IApplicationInstance</a> appInstance, String context, <a href="#">WMSProperties</a> properties) Creates a group playlist.
String	<a href="#">getAdaptiveGroupName</a> ( )
String	<a href="#">getGroupPlaylistRenditionDescription</a> (boolean forABRPlaylist) Generates a description or playlist-element String which can be used to differentiate this rendition from other renditions in a group.
<a href="#">WMSProperties</a>	<a href="#">getPlaylistProperties</a> ( )
Boolean	<a href="#">isGroupReady</a> (java.util.List groupingsByRedundantPairs, java.util.List groupingsByAbrGroups)
boolean	<a href="#">isInAdaptiveGroup</a> ( )
boolean	<a href="#">isInRedundancyPair</a> ( )
boolean	<a href="#">isLogDebugManifest</a> ( )
boolean	<a href="#">isSendToBackupServer</a> ( )
void	<a href="#">sendGroupPlaylist</a> (String groupName, <a href="#">ManifestModel</a> manifest) Sends a group playlist to the destination.

### Methods

(continued from last page)

## createGroupPlaylist

```
public ManifestModel createGroupPlaylist(String id,  
    java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups,  
    IApplicationInstance appInstance,  
    String context,  
    WMSProperties properties)
```

Creates a group playlist.

### Parameters:

id - the id  
groupingsByRedundantPairs - the renditions grouped by redundant pairs  
groupingsByAbrGroups - the renditions grouped by redundant ABR group  
properties - the properties

### Returns:

the manifest model

---

## sendGroupPlaylist

```
public void sendGroupPlaylist(String groupName,  
    ManifestModel manifest)
```

Sends a group playlist to the destination.

### Parameters:

groupName - the group name  
manifest - the playlist/manifest to send

---

## getGroupPlaylistRenditionDescription

```
public String getGroupPlaylistRenditionDescription(boolean forABRPlaylist)
```

Generates a description or playlist-element String which can be used to differentiate this rendition from other renditions in a group. The group playlist could either for a single stream being pushed redundantly to a primary & backup destination, or for an ABR group of streams being pushed to a single destination or being pushed redundantly to multiple destinations.

### Parameters:

forABRPlaylist - flag to indicate whether the description is for an adaptive bitrate group playlist.

---

## isInAdaptiveGroup

```
public boolean isInAdaptiveGroup()
```

---

## adaptiveGroupPlaylistNeedsUpdating

```
public Boolean adaptiveGroupPlaylistNeedsUpdating(long lastUpdateTime,  
    java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups)
```

(continued from last page)

## isGroupReady

```
public Boolean isGroupReady(java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups)
```

---

## getAdaptiveGroupName

```
public String getAdaptiveGroupName()
```

---

## getPlaylistProperties

```
public WMSProperties getPlaylistProperties()
```

---

## isInRedundancyPair

```
public boolean isInRedundancyPair()
```

---

## isSendToBackupServer

```
public boolean isSendToBackupServer()
```

---

## isLogDebugManifest

```
public boolean isLogDebugManifest()
```

## com.wowza.wms.pushpublish.model Interface IPushPublishHTTPOutputBuilder

All Known Implementing Classes:

[PushPublishHTTPSanJoseAkamaiHandler](#), [PushPublishHTTPCupertino](#)

public interface **IPushPublishHTTPOutputBuilder**  
extends

### Field Summary

public static final	<a href="#">PUSHER_ERROR_LIVEPACKETIZER_NOT_CONFIGURED</a> Value: <b>1</b>
public static final	<a href="#">PUSHER_ERROR_RENDITIONS_MISCONFIGURED</a> Value: <b>2</b>

------	--

## Fields

### **PUSHER\_ERROR\_LIVEPACKETIZER\_NOT\_CONFIGURED**

```
public static final int PUSHER_ERROR_LIVEPACKETIZER_NOT_CONFIGURED
```

Constant value: **1**

### **PUSHER\_ERROR\_RENDITIONS\_MISCONFIGURED**

```
public static final int PUSHER_ERROR_RENDITIONS_MISCONFIGURED
```

Constant value: **2**

## Methods

### **getAppInstance**

```
public IApplicationInstance getAppInstance()
```

### **isDebugLog**

```
public boolean isDebugLog()
```

### **getSrcStreamName**

```
public String getSrcStreamName()
```

### **getDstStreamName**

```
public String getDstStreamName()
```

### **getLiveStreamPacketizerName**

```
public String getLiveStreamPacketizerName()
```

### **getPacketizerLock**

```
public Object getPacketizerLock(ILiveStreamPacketizer liveStreamPacketizer)
```

**getLastChunkId**

```
public int getLastChunkId(ILiveStreamPacketizer liveStreamPacketizer)
```

---

**getChunkDurationTarget**

```
public int getChunkDurationTarget(ILiveStreamPacketizer liveStreamPacketizer)
```

---

**resetNewPacketizer**

```
public void resetNewPacketizer(ILiveStreamPacketizer liveStreamPacketizer)
```

---

**createOutputItem**

```
public PushPublishHTTPOutputItem createOutputItem(ILiveStreamPacketizer  
liveStreamPacketizer,  
int lastChunkIndex)
```

---

**outputOpen**

```
public boolean outputOpen()
```

---

**outputClose**

```
public boolean outputClose()
```

---

**outputSend**

```
public void outputSend(PushPublishHTTPOutputItem outputItem)
```

---

**error**

```
public void error(int errorCode)
```

---

## com.wowza.wms.pushpublish.model Interface IPushPublishProfileUtil

All Known Implementing Classes:

[PushPublishHTTPSanJoseAkamaiHandler](#), [PushPublishHTTPCupertinoUtil](#)

public interface **IPushPublishProfileUtil**  
extends

The Interface IPushPublishProfileUtil

### Field Summary

public static final	<a href="#">PROPERTY_LOG_DEBUG_MANIFEST</a> Value: <b>logDebugManifest</b>
---------------------	---

### Method Summary

<a href="#">ManifestModel</a>	<a href="#">createGroupPlaylist</a> (String id, java.util.List groupingsByRedundantPairs, java.util.List groupingsByAbrGroups, <a href="#">IApplicationInstance</a> appInstance, String context, <a href="#">WMSProperties</a> properties) This method is deprecated.
boolean	<a href="#">isParent</a> ( java.util.Map entry) Is this a parent profile?
boolean	<a href="#">isTargetedStream</a> (java.util.Map entry, String streamName) Is this a stream targeted by this entry?
void	<a href="#">onDeleteEntry</a> ( java.util.Map entry) Allows processing of a map file entry prior to being deleted.
void	<a href="#">onReadEntry</a> ( java.util.Map entry) Allows modification of a map file entry after prior to being returned through a Push Publishing api.
void	<a href="#">onWriteEntry</a> ( java.util.Map oldEntry, java.util.Map newEntry) Allows modification of a map file entry prior to being written to the map file.
void	<a href="#">setApplicationInstance</a> ( <a href="#">IApplicationInstance</a> appInstance) Set the application instance associated with this Util class
void	<a href="#">setApplicationName</a> (String appName) Set the application name associated with this Util class
void	<a href="#">setVHost</a> ( <a href="#">IVHost</a> vhost ) Set the VHost associated with this Util class
boolean	<a href="#">validateEntry</a> ( java.util.Map entry) Allows validation of a map file entry.

### Fields

(continued from last page)

## PROPERTY\_LOG\_DEBUG\_MANIFEST

```
public static final java.lang.String PROPERTY_LOG_DEBUG_MANIFEST
```

Constant value: **logDebugManifest**

## Methods

### setVHost

```
public void setVHost(IVHost vhost)
```

Set the VHost associated with this Util class

**Parameters:**

vhost

### setApplicationName

```
public void setApplicationName(String appName)
```

Set the application name associated with this Util class

**Parameters:**

appName

### setApplicationInstance

```
public void setApplicationInstance(IApplicationInstance appInstance)
```

Set the application instance associated with this Util class

**Parameters:**

appInstance

### onWriteEntry

```
public void onWriteEntry(java.util.Map oldEntry,  
    java.util.Map newEntry)
```

Allows modification of a map file entry prior to being written to the map file.

**Parameters:**

oldEntry - the old version of the entry (null for new entries)

newEntry - the new version of the entry to be written

### onReadEntry

```
public void onReadEntry(java.util.Map entry)
```

Allows modification of a map file entry after prior to being returned through a Push Publishing api.

**Parameters:**

entry - the map file entry as read from disk

(continued from last page)

## onDeleteEntry

```
public void onDeleteEntry(java.util.Map entry)
```

Allows processing of a map file entry prior to being deleted.

**Parameters:**

entry - the map file entry as read from disk

---

## validateEntry

```
public boolean validateEntry(java.util.Map entry)
```

Allows validation of a map file entry.

**Parameters:**

entry - the map file entry as read from disk

**Returns:**

true if entry is valid

---

## isParent

```
public boolean isParent(java.util.Map entry)
```

Is this a parent profile?

**Parameters:**

entry - the map file entry as read from disk

**Returns:**

true if entry is a parent profile, false if child profile or standalone

---

## isTargetedStream

```
public boolean isTargetedStream(java.util.Map entry,  
                                String streamName)
```

Is this a stream targeted by this entry?

**Parameters:**

entry - the map file entry as read from disk  
streamName - the name of the stream

**Returns:**

true if this is a stream targeted by this entry

---

## createGroupPlaylist

```
public ManifestModel createGroupPlaylist(String id,  
    java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups,  
    IApplicationInstance appInstance,  
    String context,  
    WMSProperties properties)
```

This method is deprecated. Please use `createGroupPlaylist(String, List<, List<, IApplicationInstance, String, WMSProperties)` Allows creation of a group playlist. (This is a placeholder for future features)

**Parameters:**

(continued from last page)

`id` - the id

`groupingsByRedundantPairs` - the renditions grouped by redundant pairs

`groupingsByAbrGroups` - the renditions grouped by redundant ABR group

`properties` - the properties

**Returns:**

the manifest model

## com.wowza.wms.pushpublish.model Interface IPushPublishSession

All Known Implementing Classes:  
[PushPublishSessionBase](#)

public interface **IPushPublishSession**  
extends

The Interface IPushPublishSession.

### Field Summary

public static final	<a href="#">PUSHPUBLISHSESSION_TYPE_RTMP</a> Value: <b>1</b>

## getContextStr

```
public String getContextStr()
```

---

## getDestinationID

```
public int getDestinationID()
```

## com.wowza.wms.pushpublish.model Interface IPushPublishSessionNotify

All Known Implementing Classes:

[PushPublishSessionNotifyBase](#)

public interface **IPushPublishSessionNotify**  
extends

### Method Summary

void	<a href="#">onPushPublishSessionCreate</a> (String streamName, <a href="#">IMediaStream</a> stream, <a href="#">IPushPublishSession</a> pushPublishSession) Invoked when push publish session is created
void	<a href="#">onPushPublishSessionDestroy</a> (String streamName, <a href="#">IMediaStream</a> stream, <a href="#">IPushPublishSession</a> pushPublishSession) Invoked when push publish session is destroyed

### Methods

#### onPushPublishSessionCreate

```
public void onPushPublishSessionCreate(String streamName,  
    IMediaStream stream,  
    IPushPublishSession pushPublishSession)
```

Invoked when push publish session is created

**Parameters:**

streamName - stream name  
stream - stream  
pushPublishSession - push publish session

#### onPushPublishSessionDestroy

```
public void onPushPublishSessionDestroy(String streamName,  
    IMediaStream stream,  
    IPushPublishSession pushPublishSession)
```

Invoked when push publish session is destroyed

**Parameters:**

streamName - stream name  
stream - stream  
pushPublishSession - push publish session

## com.wowza.wms.pushpublish.model Class PushPublishBase

java.lang.Object

└-com.wowza.wms.pushpublish.model.PushPublishBase

All Implemented Interfaces:

[IPushPublish](#)

Direct Known Subclasses:

[PushPublishShoutcast](#), [PushPublishRTP](#), [PushPublishRTMP](#), [PushPublishHTTPBase](#)

public abstract class **PushPublishBase**

extends Object

implements [IPushPublish](#)

The Class PushPublishBase.

### Field Summary

protected	<a href="#">appInstance</a> The app instance within-which the module is running.
protected	<a href="#">className</a>

## Constructor Summary

public	<a href="#"><u>PushPublishBase</u></a> ( ) Instantiates a new push publisher base.
--------	---

## Method Summary

void	<a href="#"><u>add</u></a> ( <a href="#"><u>IOPerformanceCounter</u></a> totalValue)
void	<a href="#"><u>addIOPerformance2</u></a> ( <a href="#"><u>IOPerformanceCounter</u></a> totalIOPerformanceResult)
<a href="#"><u>IPushPublishSession</u></a>	<a href="#"><u>createPushPublishSession</u></a> ( )
<a href="#"><u>IApplicationInstance</u></a>	<a href="#"><u>getAppInstance</u></a> ( ) Get appInstance interface.
double	<a href="#"><u>getBandwidth</u></a> ( )
abstract String	<a href="#"><u>getContextStr</u></a> ( )
int	<a href="#"><u>getDestinationID</u></a> ( ) Get destination ID.
String	<a href="#"><u>getDestinationName</u></a> ( ) Get destination name.
int	<a href="#"><u>getDestinationServer</u></a> ( ) Get destination server.
String	<a href="#"><u>getDstStreamName</u></a> ( ) Get destination stream name.
String	<a href="#"><u>getEntryName</u></a> ( ) Get map file entry name.
String	<a href="#"><u>getHostname</u></a> ( ) Get destination server host name.
String	<a href="#"><u>getImplementation</u></a> ( ) Gets the implementation.
java.net.InetAddress	<a href="#"><u>getInetAddr</u></a> ( )
java.util.Map	<a href="#"><u>getMap</u></a> ( )
long	<a href="#"><u>getMessagesOutBytes</u></a> ( )
long	<a href="#"><u>getMessagesOutCount</u></a> ( )
String	<a href="#"><u>getPassword</u></a> ( ) Get password.
int	<a href="#"><u>getPort</u></a> ( ) Get destination server port.

String	<a href="#"><u>getProfile()</u></a> Get entry profile.
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get properties.
int	<a href="#"><u>getPushPublishType()</u></a>
static String	<a href="#"><u>getPushPublishVersionStr()</u></a> <b>Deprecated.</b> Gets the push publish version str.
int	<a href="#"><u>getReconnectWaitTime()</u></a> Get the reconnect wait time (milliseconds).
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getSrcStream()</u></a> Get source IMediaStream.
String	<a href="#"><u>getSrcStreamName()</u></a> Get source stream name.
String	<a href="#"><u>getUserName()</u></a> Gets the user name.
static String	<a href="#"><u>getWowzaStreamingEngineVersionStr()</u></a> Gets the server version str.
boolean	<a href="#"><u>handleParentStreamDisconnect()</u></a> ( <a href="#"><u>IPushPublishSession</u></a> pushPublishSession, boolean isReset)
void	<a href="#"><u>incrementMessagesOut()</u></a> (long bytes)
void	<a href="#"><u>init()</u></a> ( <a href="#"><u>IApplicationInstance</u></a> appInstance, String streamName, <a href="#"><u>IMediaStream</u></a> stream, java.util.Map profileData, java.util.Map maps, com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher, boolean streamDebug) Init the instance.
boolean	<a href="#"><u>isAdaptiveStreaming()</u></a> Checks if is adaptive streaming.
boolean	<a href="#"><u>isDebugLog()</u></a>
boolean	<a href="#"><u>isExternalRedundancy()</u></a> Is there an redundant stream being pushed by an external WSE instance? return true or false
boolean	<a href="#"><u>isParent()</u></a>
boolean	<a href="#"><u>isTargetedStream()</u></a> (String streamName)
void	<a href="#"><u>load()</u></a> (java.util.HashMap dataMap) Loads map and profile parameters
void	<a href="#"><u>logDebug()</u></a> (String methodName, String log)
void	<a href="#"><u>logError()</u></a> (String methodName, String log)

void	<a href="#"><u>logError</u></a> (String methodName, String log, Throwable e)
void	<a href="#"><u>logError</u></a> (String methodName, Throwable e)
void	<a href="#"><u>logInfo</u></a> (String methodName, String log)
void	<a href="#"><u>logWarn</u></a> (String methodName, String log)
void	<a href="#"><u>setAdaptiveStreaming</u></a> (boolean isAdaptiveStreaming) Sets the adaptive streaming.
void	<a href="#"><u>setAdaptiveStreaming</u></a> (String adaptiveStreamingStr)
void	<a href="#"><u>setAppInstance</u></a> ( <a href="#"><u>IApplicationInstance</u></a> appInstance) Set appInstance interface.
void	<a href="#"><u>setDebugLog</u></a> (boolean debugLog) Set debug logging.
void	<a href="#"><u>setDestinationName</u></a> (String destinationName) Set destination name.
void	<a href="#"><u>setDestinationServer</u></a> (int destinationServer) Set destination server.
void	<a href="#"><u>setDestinationServer</u></a> (String destinationServer) Set destination server.
void	<a href="#"><u>setDstStreamName</u></a> (String dstStreamName) Set destination stream name.
void	<a href="#"><u>setEntryName</u></a> (String entryName) Set map file entry name.
void	<a href="#"><u>setExternalRedundancy</u></a> (boolean isExternalRedundancy) Set whether there is an external redundant stream.
void	<a href="#"><u>setExternalRedundancy</u></a> (String externalRedundancy)
void	<a href="#"><u>setHost</u></a> (String hostname) Set destination server host name.
void	<a href="#"><u>setHostname</u></a> (String hostname)
void	<a href="#"><u>setImplementation</u></a> (String implementation) Sets the implementation.
void	<a href="#"><u>setInetAddr</u></a> (java.net.InetAddress inetAddr)
void	<a href="#"><u>setPassword</u></a> (String password) Set password.
void	<a href="#"><u>setPort</u></a> (int port) Set destination server port.

void	<a href="#"><u>setPort</u></a> (String port) Set destination server port.
void	<a href="#"><u>setProfile</u></a> (String profile) Set map file entry profile.
void	<a href="#"><u>setReconnectWaitTime</u></a> (int reconnectWaitTime) Set the reconnect wait time (milliseconds).
void	<a href="#"><u>setSrcStream</u></a> ( <a href="#"><u>IMediaStream</u></a> srcStream) Sets the source IMediaStream.
void	<a href="#"><u>setSrcStreamName</u></a> (String srcStreamName) Set source stream name.
void	<a href="#"><u>setStreamName</u></a> (String streamName) Sets the stream name.
void	<a href="#"><u>setUserName</u></a> (String userName) Set user name.
void	<a href="#"><u>updateUsageTracker</u></a> ()

## Fields

### logger

protected com.wowza.wms.logging.WMSLogger **logger**

### className

protected java.lang.String **className**

(continued from last page)

---

## pushPublishType

protected int **pushPublishType**

The type of stream to be published.

---

## pushPublishStreamDebug

protected boolean **pushPublishStreamDebug**

Enables stream debug.

---

## reconnectWaitTime

protected int **reconnectWaitTime**

The time between reconnect attempts (only applies to some profiles).

---

## sendingPerformance

protected com.wowza.util.IOPerformanceCounter **sendingPerformance**

---

## totalIOPerformanceLast

protected com.wowza.util.IOPerformanceCounter **totalIOPerformanceLast**

---

## totalIOPerformance2Last

protected com.wowza.util.IOPerformanceCounter **totalIOPerformance2Last**

---

## properties

protected com.wowza.wms.application.WMSProperties **properties**

The properties.

---

## profile

protected java.lang.String **profile**

The map file entry profile.

---

## entryName

protected java.lang.String **entryName**

The map file entry name.

---

## isAdaptiveStreaming

protected boolean **isAdaptiveStreaming**

---

---

(continued from last page)

The is adaptive streaming.

---

## **userName**

protected java.lang.String **userName**

The user name.

---

## **password**

protected java.lang.String **password**

The password.

---

## **appInstance**

protected com.wowza.wms.application.IApplicationInstance **appInstance**

The app instance within-which the module is running.

---

## **srcStreamName**

protected java.lang.String **srcStreamName**

The src stream name.

---

## **srcStream**

protected com.wowza.wms.stream.IMediaStream **srcStream**

---

## **dstStreamName**

protected java.lang.String **dstStreamName**

The destination stream name.

---

## **hostname**

protected java.lang.String **hostname**

The destination host.

---

## **inetAddr**

protected java.net.InetAddress **inetAddr**

The destination inet address.

---

## **port**

protected int **port**

The destination port.

---

(continued from last page)

---

## mImplementation

```
protected java.lang.String mImplementation
```

The profile implementation.

---

## DESTINATION\_PRI

```
public static final int DESTINATION_PRI
```

Constant value: **0**

---

## DESTINATION\_BAK

```
public static final int DESTINATION_BAK
```

Constant value: **1**

---

## DESTINATION\_RED

```
public static final int DESTINATION_RED
```

Constant value: **2**

---

## destinationServer

```
protected int destinationServer
```

Destination server for Stream Target destinations; can be primary, backup, or redundant.

---

## isExternalRedundancy

```
protected boolean isExternalRedundancy
```

Stream Target has a redundant stream being pushed by another WSE instance

---

## destinationName

```
protected java.lang.String destinationName
```

Name of the target destination; e.g. "wowzastreamingcloud", "akamai", "rtmp" (generic).

---

## pushPublishSession

```
protected com.wowza.wms.pushpublish.model.IPushPublishSession pushPublishSession
```

---

## myMap

```
protected java.util.Map myMap
```

---

## Constructors

---

(continued from last page)

## PushPublishBase

```
public PushPublishBase()
```

Instantiates a new push publisher base.

## Methods

### init

```
public void init(IApplicationInstance appInstance,  
                String streamName,  
                IMediaStream stream,  
                java.util.Map profileData,  
                java.util.Map maps,  
                com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,  
                boolean streamDebug)
```

Initiates the instance.

#### Parameters:

appInstance - the app instance  
streamName - the source stream name  
maps - the map entry params  
profileData - the profile params  
streamDebug - stream debug flag

## updateUsageTracker

```
public void updateUsageTracker()
```

## getImplementation

```
public String getImplementation()
```

Gets the implementation.

#### Returns:

the implementation

## setImplementation

```
public void setImplementation(String implementation)
```

Sets the implementation.

#### Parameters:

implementation - the new implementation

## getProperties

```
public WMSProperties getProperties()
```

Get properties.

#### Returns:

(continued from last page)

---

properties

---

## getProfile

```
public String getProfile()
```

Get entry profile.

**Returns:**

map entry profile

---

## setProfile

```
public void setProfile(String profile)
```

Set map file entry profile.

**Parameters:**

profile - map entry profile

---

## getEntryName

```
public String getEntryName()
```

Get map file entry name.

**Returns:**

map file entry name

---

## setEntryName

```
public void setEntryName(String entryName)
```

Set map file entry name.

**Parameters:**

entryName - map file entry name

---

## isAdaptiveStreaming

```
public boolean isAdaptiveStreaming()
```

Checks if is adaptive streaming.

**Returns:**

true, if is adaptive streaming

---

## setAdaptiveStreaming

```
public void setAdaptiveStreaming(boolean isAdaptiveStreaming)
```

Sets the adaptive streaming.

**Parameters:**

isAdaptiveStreaming - the new adaptive streaming

---

(continued from last page)

---

## setAdaptiveStreaming

```
public void setAdaptiveStreaming(String adaptiveStreamingStr)
```

---

## getUserName

```
public String getUserName()
```

Gets the user name.

**Returns:**

the user name

---

## setUserName

```
public void setUserName(String userName)
```

Set user name.

**Parameters:**

userName - user name

---

## getPassword

```
public String getPassword()
```

Get password.

**Returns:**

password

---

## setPassword

```
public void setPassword(String password)
```

Set password.

**Parameters:**

password - password

---

## getAppInstance

```
public IApplicationInstance getAppInstance()
```

Get appInstance interface.

**Returns:**

appInstance interface

---

## setAppInstance

```
public void setAppInstance(IApplicationInstance appInstance)
```

Set appInstance interface.

**Parameters:**

(continued from last page)

appInstance - appInstance interface

---

## getSrcStreamName

```
public String getSrcStreamName()
```

Get source stream name.

**Returns:**

source stream name

---

## setSrcStreamName

```
public void setSrcStreamName(String srcStreamName)
```

Set source stream name.

**Parameters:**

srcStreamName - source stream name

---

## getDstStreamName

```
public String getDstStreamName()
```

Get destination stream name.

**Returns:**

destination stream name

---

## setDstStreamName

```
public void setDstStreamName(String dstStreamName)
```

Set destination stream name.

**Parameters:**

dstStreamName - destination stream name

---

## setStreamName

```
public void setStreamName(String streamName)
```

Sets the stream name.

**Parameters:**

streamName - the new stream name

---

## getHostname

```
public String getHostname()
```

Get destination server host name.

**Returns:**

destination server host name

---

(continued from last page)

---

## setHost

```
public void setHost(String hostname)
```

Set destination server host name.

### Parameters:

hostname - destination server host name

---

## setHostname

```
public void setHostname(String hostname)
```

---

## getPort

```
public int getPort()
```

Get destination server port.

### Returns:

destination server port

---

## setPort

```
public void setPort(int port)
```

Set destination server port.

### Parameters:

port - destination server port

---

## setPort

```
public void setPort(String port)
```

Set destination server port.

### Parameters:

port - destination server port

---

## setDestinationServer

```
public void setDestinationServer(String destinationServer)
```

Set destination server.

### Parameters:

destinationServer - destination server

---

## getDestinationServer

```
public int getDestinationServer()
```

Get destination server. return destination server

---

(continued from last page)

---

## setDestinationServer

```
public void setDestinationServer(int destinationServer)
```

Set destination server.

### Parameters:

destinationServer - destination server

---

## isExternalRedundancy

```
public boolean isExternalRedundancy()
```

Is there an redundant stream being pushed by an external WSE instance? return true or false

---

## setExternalRedundancy

```
public void setExternalRedundancy(boolean isExternalRedundancy)
```

Set whether there is an external redundant stream.

### Parameters:

isExternalRedundancy

---

## setExternalRedundancy

```
public void setExternalRedundancy(String externalRedundancy)
```

---

## getDestinationName

```
public String getDestinationName()
```

Get destination name.

### Returns:

destination name

---

## setDestinationName

```
public void setDestinationName(String destinationName)
```

Set destination name.

### Parameters:

destinationName - destination name

---

## isParent

```
public boolean isParent()
```

---

## isTargetedStream

```
public boolean isTargetedStream(String streamName)
```

---

(continued from last page)

---

## handleParentStreamDisconnect

```
public boolean handleParentStreamDisconnect(IPushPublishSession pushPublishSession,  
boolean isReset)
```

---

## getPushPublishVersionStr

```
public static String getPushPublishVersionStr()
```

**Deprecated.** *Gets the push publish version str.*

**Returns:**

the push publish version str

---

## getWowzaStreamingEngineVersionStr

```
public static String getWowzaStreamingEngineVersionStr()
```

Gets the server version str.

**Returns:**

the server version str

---

## load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

**Parameters:**

dataMap - the data map

---

## getReconnectWaitTime

```
public int getReconnectWaitTime()
```

Get the reconnect wait time (milliseconds). Shortest time between connection attempts.

**Returns:**

reconnect wait time (milliseconds)

---

## setReconnectWaitTime

```
public void setReconnectWaitTime(int reconnectWaitTime)
```

Set the reconnect wait time (milliseconds). Shortest time between connection attempts.

**Parameters:**

reconnectWaitTime - reconnect wait time (milliseconds)

(continued from last page)

---

## getBandwidth

```
public double getBandwidth()
```

---

## getInetAddr

```
public java.net.InetAddress getInetAddr()
```

**Returns:**

the inetAddr

---

## setInetAddr

```
public void setInetAddr(java.net.InetAddress inetAddr)
```

**Parameters:**

inetAddr - the inetAddr to set

---

## getPushPublishType

```
public int getPushPublishType()
```

---

## createPushPublishSession

```
public IPushPublishSession createPushPublishSession()
```

---

## getSrcStream

```
public IMediaStream getSrcStream()
```

Get source IMediaStream.

**Returns:**

source IMediaStream

---

## setSrcStream

```
public void setSrcStream(IMediaStream srcStream)
```

Sets the source IMediaStream.

**Parameters:**

srcStream - the source IMediaStream

---

## getMap

```
public java.util.Map getMap()
```

---

(continued from last page)

---

## incrementMessagesOut

```
public void incrementMessagesOut(long bytes)
```

---

## getMessagesOutBytes

```
public long getMessagesOutBytes()
```

---

## getMessagesOutCount

```
public long getMessagesOutCount()
```

---

## add

```
public void add(IOPerformanceCounter totalValue)
```

---

## addIOPerformance2

```
public void addIOPerformance2(IOPerformanceCounter totalIOPerformanceResult)
```

---

## getDestinationID

```
public int getDestinationID()
```

Get destination ID. A return value of 0 means the destination ID cannot be determined.

**Returns:**

destination ID

---

## getContextStr

```
public abstract String getContextStr()
```

---

## isDebugLog

```
public boolean isDebugLog()
```

---

## setDebugLog

```
public void setDebugLog(boolean debugLog)
```

Set debug logging.

---

(continued from last page)

**Parameters:**

debugLog - debug logging

---

**logDebug**

```
public void logDebug(String methodName,  
    String log)
```

---

**logInfo**

```
public void logInfo(String methodName,  
    String log)
```

---

**logWarn**

```
public void logWarn(String methodName,  
    String log)
```

---

**logError**

```
public void logError(String methodName,  
    String log)
```

---

**logError**

```
public void logError(String methodName,  
    String log,  
    Throwable e)
```

---

**logError**

```
public void logError(String methodName,  
    Throwable e)
```

## com.wowza.wms.pushpublish.model Class PushPublishCloudStorageProvider

## getUserAgent

```
public String getUserAgent()
```

---

## setUserAgent

```
public void setUserAgent(String userAgent)
```

---

## getDestinationPort

```
public int getDestinationPort()
```

---

## load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

## com.wowza.wms.pushpublish.model Class PushPublishHTTPBase

java.lang.Object

All Implemented Interfaces:

[IPushPublish](#)

Direct Known Subclasses:

[PushPublishHTTPCupertino](#), [PushPublishHTTPYouTubeBase](#), [PushPublishHTTPAkamaiBase](#)

public abstract class **PushPublishHTTPBase**

extends [PushPublishBase](#)

### Field Summary

protected	<a href="#">httpLogManifests</a> Enables logging of the manifest itself.
protected	<a href="#">httpManifestDebug</a> Enables manifest playlist debug logging.
protected static final	<a href="#">INDETERMINATE_PLAYLIST_COUNT</a> Value: <b>-1</b>
protected static final	<a href="#">MIN_PLAYLIST_COUNT</a> The minimum allowable playlist size. Value: <b>3</b>
protected	<a href="#">playlistAcrossSessions</a> Indicates whether instance-specific playlists should be maintained across source stream interruptions and app restarts.
protected	<a href="#">playlistCountFromMap</a> The playlist size from the map entry.
protected	<a href="#">playlistCountFromPacketizer</a> The playlist size used by the associated live stream packetizer.
protected	<a href="#">playlistCrossName</a> The instance-specific name for the playlist, allowing the playlist to be maintained across session restarts.
protected	<a href="#">playlistDurationFromMap</a> The playlist duration from the map entry.
protected	<a href="#">playlistMap</a> The playlist map.
protected	<a href="#">playlistName</a> The actual name of playlist file that is to be pushed to the destination (e.g.

protected	<a href="#">playlistTimeout</a> The timeout value used to delete orphaned playlists from the vhost.
protected	<a href="#">relativePlaylists</a> use only relative URL references in the playlist/manifest

---

## Fields

---

### MIN\_PLAYLIST\_COUNT

protected static final int **MIN\_PLAYLIST\_COUNT**

The minimum allowable playlist size.  
Constant value: **3**

---

### playlistCountFromPacketizer

protected int **playlistCountFromPacketizer**

The playlist size used by the associated live stream packetizer.

---

### playlistMap

protected com.wowza.wms.pushpublish.model.PushPublishHTTPPlaylistMap **playlistMap**

The playlist map.

---

### playlistCrossName

protected java.lang.String **playlistCrossName**

The instance-specific name for the playlist, allowing the playlist to be maintained across session restarts.

---

### playlistName

protected java.lang.String **playlistName**

The actual name of playlist file that is to be pushed to the destination (e.g. "playlist.m3u8").

---

### relativePlaylists

protected boolean **relativePlaylists**

use only relative URL references in the playlist/manifest

---

### httpManifestDebug

protected boolean **httpManifestDebug**

Enables manifest playlist debug logging.

---

### httpLogManifests

protected boolean **httpLogManifests**

Enables logging of the manifest itself.

---

### INDETERMINATE\_PLAYLIST\_COUNT

protected static final int **INDETERMINATE\_PLAYLIST\_COUNT**

---

(continued from last page)

Constant value: **-1**

## playlistCountFromMap

protected int **playlistCountFromMap**

The playlist size from the map entry.

## playlistDurationFromMap

protected long **playlistDurationFromMap**

The playlist duration from the map entry. This value is in seconds. http.playlistDuration

## playlistTimeout

protected int **playlistTimeout**

The timeout value used to delete orphaned playlists from the vhost.

## playlistAcrossSessions

protected boolean **playlistAcrossSessions**

Indicates whether instance-specific playlists should be maintained across source stream interruptions and app restarts.

## Constructors

### PushPublishHTTPBase

public **PushPublishHTTPBase**()

## Methods

### init

```
public void init(IApplicationInstance appInstance,
    String streamName,
    IMediaStream stream,
    java.util.Map profileData,
    java.util.Map maps,
    com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,
    boolean streamDebug)
```

Inits the instance.

#### Parameters:

appInstance - the app instance  
 streamName - the source stream name  
 maps - the map entry params  
 profileData - the profile params  
 streamDebug - stream debug flag

## setPlaylistCountFromMap

public void **setPlaylistCountFromMap**(int playlistCountFromMap)

(continued from last page)

Set the playlist count value from the map file.

**Parameters:**

playlistCountFromMap - the playlist count

---

## setPlaylistCountFromPacketizer

```
public void setPlaylistCountFromPacketizer(int playlistCountFromPacketizer)
```

Set the playlist count value from the live stream packetizer.

**Parameters:**

playlistCountFromPacketizer - the playlist count

---

## getPlaylistCount

```
public int getPlaylistCount()
```

Get the playlist count. The value from the map file is returned if defined, else the packetizer value is returned return the playlist count

---

## getPlaylistTimeout

```
public int getPlaylistTimeout()
```

Get the playlist timeout value. return the playlist timeout value

---

## setPlaylistTimeout

```
public void setPlaylistTimeout(int playlistTimeout)
```

Set the playlist timeout value.

**Parameters:**

playlistTimeout - the playlist timeout

---

## isPlaylistAcrossSessions

```
public boolean isPlaylistAcrossSessions()
```

Is the playlist maintained across recurring pushpublish sessions. return true if the playlist is maintained across recurring pushpublish sessions

---

## setPlaylistAcrossSessions

```
public void setPlaylistAcrossSessions(boolean playlistAcrossSessions)
```

Set whether the playlist is maintained across recurring pushpublish sessions.

**Parameters:**

playlistAcrossSessions - is the playlist maintained across recurring pushpublish sessions

---

## getPlaylistMap

```
public PushPublishHTTPPlaylistMap getPlaylistMap()
```

Get the playlist map. return the playlist map

---

(continued from last page)

---

## isRelativePlaylists

```
public boolean isRelativePlaylists()
```

---

## setRelativePlaylists

```
public void setRelativePlaylists(boolean relativePlaylists)
```

---

## getAdaptiveGroupName

```
public String getAdaptiveGroupName()
```

---

## setAdaptiveGroupName

```
public void setAdaptiveGroupName(String adaptiveGroup)
```

---

## isInAdaptiveGroup

```
public boolean isInAdaptiveGroup()
```

Is the entry in an adaptive group. return true if the entry is in an adaptive group

---

## load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

**Parameters:**

dataMap - the data map

---

## isLogDebugManifest

```
public boolean isLogDebugManifest()
```

Get the current setting of the HTTP Manifest debug logging This is controlled by the pushPublishHTTPPlayListDebug boolean property in the application.xml and by the http.manifestDebug setting in the pushpublish map file

**Returns:**

true if HTTP Manifest debug logging is enabled

---

## logDebugManifest

```
public void logDebugManifest(String methodName,  
                             String log)
```

Log the provided log str if the HTTP Manifest logging is enabled

**Parameters:**

methodName - name of the class method using the log  
log - string to log if enabled

---

All Known Implementing Classes:

[PushPublishHTTPCupertino](#)

public interface **IPushPublishHTTPCupertino**  
extends

#### Method Summary

int	<a href="#">deleteMediaSegment</a> ( <a href="#">MediaSegmentModel</a> mediaSegment) Deletes the media (chunk) at the destination URI.
String	<a href="#">getDestinationLogData</a> () JSON formatted string containing information unique to the instance.
boolean	<a href="#">isSendToBackupServer</a> () Is this implementation sending to a backup server
boolean	<a href="#">outputClose</a> () Close the destination (if needed).
boolean	<a href="#">outputOpen</a> () Open the destination (if needed) in preparation of having one or more items (playlists/media segments) pushed to it
int	<a href="#">sendGroupMasterPlaylist</a> (String groupName, <a href="#">PlaylistModel</a> playlist) Sends a group master playlist to the destination.
int	<a href="#">sendMasterPlaylist</a> ( <a href="#">PlaylistModel</a> playlist) Sends the master playlist to the destination.
int	<a href="#">sendMediaPlaylist</a> ( <a href="#">PlaylistModel</a> playlist) Sends the media playlist to the destination.
int	<a href="#">sendMediaSegment</a> ( <a href="#">MediaSegmentModel</a> mediaSegment) Sends the media (chunk) to the destination; media provided as a fragment list.
void	<a href="#">setSendToBackupServer</a> (boolean backup) Setup to send to a backup destination
boolean	<a href="#">updateGroupMasterPlaylistPlaybackURI</a> (String groupName, <a href="#">PlaylistModel</a> masterPlaylist) Get the group master playlist URI for the given group master playlist file that a player would use to consume the content from the CDN Example: "http://myHost.com/myPath/myGroup/playlist.m3u8"
boolean	<a href="#">updateMasterPlaylistPlaybackURI</a> ( <a href="#">PlaylistModel</a> playlist) update the master playlist URI for the provided playlist model that a player would use to consume the content from the CDN Example: "http://myHost.com/myPath/myStream/playlist.m3u8" where "playlist.m3u8" is the value given for masterPlaylistFilename

boolean	<a href="#">updateMediaPlaylistPlaybackURI</a> ( <a href="#">PlaylistModel</a> playlist) update/set the media playlist (chunklist) URI for the provided media playlist file that a player would use to consume the content from the CDN Example: "http://myHost.com/myPath/myStream/chunklist.m3u8" where "chunklist.m3u8" is the value given for mediaPlaylistFilename
boolean	<a href="#">updateMediaSegmentPlaybackURI</a> ( <a href="#">MediaSegmentModel</a> mediaSegment) set the media URI for the given media (chunk) file that a player would use to consume the content from the CDN Example: "http://myHost.com/myPath/myStream/media_1.ts" where "media_1.ts" is the value given for mediaFilename

## Methods

### updateMasterPlaylistPlaybackURI

```
public boolean updateMasterPlaylistPlaybackURI(PlaylistModel playlist)
```

update the master playlist URI for the provided playlist model that a player would use to consume the content from the CDN Example: "http://myHost.com/myPath/myStream/playlist.m3u8" where "playlist.m3u8" is the value given for masterPlaylistFilename

**Parameters:**

playlist - the master playlist model to update the URI in

**Returns:**

true if the URI was updated

### sendMasterPlaylist

```
public int sendMasterPlaylist(PlaylistModel playlist)
```

Sends the master playlist to the destination.

**Parameters:**

playlist - the master playlist model

**Returns:**

number of bytes sent to output (less than zero implies the implementation does not support, 0 is a failure, > 0 is success)

### updateMediaPlaylistPlaybackURI

```
public boolean updateMediaPlaylistPlaybackURI(PlaylistModel playlist)
```

update/set the media playlist (chunklist) URI for the provided media playlist file that a player would use to consume the content from the CDN Example: "http://myHost.com/myPath/myStream/chunklist.m3u8" where "chunklist.m3u8" is the value given for mediaPlaylistFilename

**Parameters:**

playlist - to update the uri in

**Returns:**

true if the playlist uri was updated

### sendMediaPlaylist

```
public int sendMediaPlaylist(PlaylistModel playlist)
```

(continued from last page)

Sends the media playlist to the destination.

**Parameters:**

`playlist` - the media playlist model

**Returns:**

number of bytes sent to output (less than zero implies the implementation does not support, 0 is a failure, > 0 is success)

## updateMediaSegmentPlaybackURI

```
public boolean updateMediaSegmentPlaybackURI(MediaSegmentModel mediaSegment)
```

set the media URI for the given media (chunk) file that a player would use to consume the content from the CDN Example: "http://myHost.com/myPath/myStream/media\_1.ts" where "media\_1.ts" is the value given for `mediaFilename`

**Parameters:**

`mediaSegment` - to update the uri of

**Returns:**

true if the uri was updated

## sendMediaSegment

```
public int sendMediaSegment(MediaSegmentModel mediaSegment)
```

Sends the media (chunk) to the destination; media provided as a fragment list.

**Parameters:**

`mediaSegment` - the media file in fragment list form

**Returns:**

number of bytes sent to output (less than zero implies the implementation does not support, 0 is a failure, > 0 is success)

## deleteMediaSegment

```
public int deleteMediaSegment(MediaSegmentModel mediaSegment)
```

Deletes the media (chunk) at the destination URI. Default implementation assumes the URI uses the HTTP schema and deletes the media using the WSE HTTPByteWriter. Implementations not using the HTTP schema or not wanting to use the default HTTPByteWriter should override the default method.

**Parameters:**

`mediaSegment` - the media destination URI

**Returns:**

number of bytes sent if successful (less than zero implies the implementation does not support, 0 is a failure, > 0 is success)

## updateGroupMasterPlaylistPlaybackURI

```
public boolean updateGroupMasterPlaylistPlaybackURI(String groupName,
PlaylistModel masterPlaylist)
```

Get the group master playlist URI for the given group master playlist file that a player would use to consume the content from the CDN Example: "http://myHost.com/myPath/myGroup/playlist.m3u8"

**Parameters:**

`groupName` - group name

`masterPlaylist` - master group playlist

(continued from last page)

**Returns:**

true if the uri was updated

---

## sendGroupMasterPlaylist

```
public int sendGroupMasterPlaylist(String groupName,  
    PlaylistModel playlist)
```

Sends a group master playlist to the destination.

**Parameters:**

groupName - the group name

playlist - the group master playlist model

**Returns:**

number of bytes sent to output

---

## setSendToBackupServer

```
public void setSendToBackupServer(boolean backup)
```

Setup to send to a backup destination

---

## isSendToBackupServer

```
public boolean isSendToBackupServer()
```

Is this implementation sending to a backup server

**Returns:**

true if sending to a backup server

---

## outputOpen

```
public boolean outputOpen()
```

Open the destination (if needed) in preparation of having one or more items (playlists/media segments) pushed to it

**Returns:**

true if the destination was opened

---

## outputClose

```
public boolean outputClose()
```

Close the destination (if needed). All items (playlist/media segments) have been pushed to bring the destination up to date with the current state

**Returns:**

true if the destination was closed

---

## getDestinationLogData

```
public String getDestinationLogData()
```

JSON formatted string containing information unique to the instance. This information is added to the log entry when starting and stopping the push publish session.

**Returns:**

(continued from last page)

string in JSON format (including outer braces)

## com.wowza.wms.pushpublish.protocol.cupertino Class MediaSegmentModelTracker

```
protected boolean addEndListOnDisconnect
```

---

## keepMediaSegmentDataAfterSending

```
protected boolean keepMediaSegmentDataAfterSending
```

---

## Constructors

### PushPublishHTTPCupertino

```
public PushPublishHTTPCupertino()
```

---

## Methods

### init

```
public void init(IApplicationInstance appInstance,  
                String streamName,  
                IMediaStream stream,  
                java.util.Map profileData,  
                java.util.Map maps,  
                com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,  
                boolean streamDebug)
```

Inits the instance.

---

### getPlaylistCount

```
public int getPlaylistCount()
```

Get the playlist count. The value from the map file is returned if defined, else the packetizer value is returned return the playlist count

(continued from last page)

---

## load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

---

## createOutputItem

```
public final PushPublishHTTPOutputItem createOutputItem(ILiveStreamPacketizer  
liveStreamPacketizer,  
int lastChunkIndex)
```

---

## outputSend

```
public final void outputSend(PushPublishHTTPOutputItem outputItem)
```

---

## getContextStr

```
public String getContextStr()
```

---

## resetNewPacketizer

```
public void resetNewPacketizer(ILiveStreamPacketizer liveStreamPacketizer)
```

---

## error

```
public void error(int errorCode)
```

---

## isInRedundancyPair

```
public boolean isInRedundancyPair()
```

---

## createGroupPlaylist

```
public ManifestModel createGroupPlaylist(String id,  
java.util.List groupingsByRedundantPairs,  
java.util.List groupingsByAbrGroups,  
IApplicationInstance appInstance,  
String context,  
WMSProperties properties)
```

---

## sendGroupPlaylist

```
public void sendGroupPlaylist(String groupName,  
ManifestModel manifest)
```

---

(continued from last page)

---

## getGroupPlaylistRenditionDescription

```
public String getGroupPlaylistRenditionDescription(boolean forABRPlaylist)
```

---

## isGroupReady

```
public Boolean isGroupReady(java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups)
```

---

## adaptiveGroupPlaylistNeedsUpdating

```
public Boolean adaptiveGroupPlaylistNeedsUpdating(long lastUpdateTime,  
    java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups)
```

---

## getPlaylistProperties

```
public WMSPProperties getPlaylistProperties()
```

---

## getRenditionsStr

```
public String getRenditionsStr()
```

---

## setRenditionsStr

```
public void setRenditionsStr(String renditionsStr)
```

---

## getLiveStreamPacketizerName

```
public String getLiveStreamPacketizerName()
```

---

## getPacketizerLock

```
public Object getPacketizerLock(ILiveStreamPacketizer liveStreamPacketizer)
```

---

## getLastChunkId

```
public int getLastChunkId(ILiveStreamPacketizer liveStreamPacketizer)
```

---

---

### **getChunkDurationTarget**

```
public int getChunkDurationTarget(ILiveStreamPacketizer liveStreamPacketizer)
```

---

### **connect**

```
public void connect()
```

---

### **disconnect**

```
public void disconnect()
```

---

### **disconnect**

```
public void disconnect(boolean hard)
```

---

### **getMessagesAttemptedCount**

```
public long getMessagesAttemptedCount()
```

---

### **getMessagesRetriedCount**

```
public long getMessagesRetriedCount()
```

---

### **getMessagesFailedCount**

```
public long getMessagesFailedCount()
```

---

### **resetConnection**

```
public void resetConnection()
```

---

### **getConnectedState**

```
public int getConnectedState()
```

---

### **getRandomSessionStr**

```
public String getRandomSessionStr()
```

---

(continued from last page)

Gets a random session string that lives for the life time of the currently published stream. If the stream times out or drops for one reason or another, this will return a new session string.

**Returns:**

String containing a unique string to the incoming stream

---

## getDestinationLogData

```
public abstract String getDestinationLogData()
```

Get a JSON formatted string of data that represents the destination to include with the connect/disconnect logging

**Returns:**

JSON formatted string representation

---

## printPlaylist

```
public String printPlaylist(PlaylistModel playlist)
```

Will print the provided playlist to a String. Intended as a debug tool

**Parameters:**

playlist - to print to a String

**Returns:**

String containing the text based representation of the playlist (not UTF-8 encoded)

---

## createTag

```
protected TagModel createTag(Class clazz)
```

Create a TagModel of the provided TagModel

**Parameters:**

clazz - Class of the TagModel to create

**Returns:**

a new instance of the TagModel requested

---

## addTagToPlaylist

```
protected void addTagToPlaylist(PlaylistModel playlist,  
                                TagModel tag)
```

Adds the provided TagModel to the end of the list of TagModels for the provided Playlist Model

**Parameters:**

playlist - to add the TagModel to  
tag - to add to the playlist

---

## addTagToPlaylist

```
protected void addTagToPlaylist(PlaylistModel playlist,  
                                int idx,  
                                TagModel tag)
```

Adds the provided TagModel to the list of TagModels at the idx for the provided Playlist Model

**Parameters:**

(continued from last page)

playlist - to add the TagModel to  
idx - index where to insert the TagModel at  
tag - Model to insert into the list of TagModels

---

## createMasterPlaylist

```
protected PlaylistModel createMasterPlaylist()
```

Creates a master playlist and propagates the context string from this implemenation to the returned playlist model

**Returns:**

a new master playlist

---

## createMediaPlaylist

```
protected PlaylistModel createMediaPlaylist(int renditionIdx)
```

Creates a empty media playlist and propagates the context from this implemenation to the returned playlist

**Returns:**

a new media playlist

---

## createMediaSegmentModel

```
protected MediaSegmentModel createMediaSegmentModel()
```

Creates an empty media segment model and propagates the context from the implementation to the returnd media segment model

**Returns:**

media segment model

---

## writeTagToString

```
protected String writeTagToString(TagModel tag)
```

Writes the tag contents out to a string in UTF-8 encoding to a String

**Parameters:**

tag - to be encoded

**Returns:**

String containing the tag contents for use in a playlist

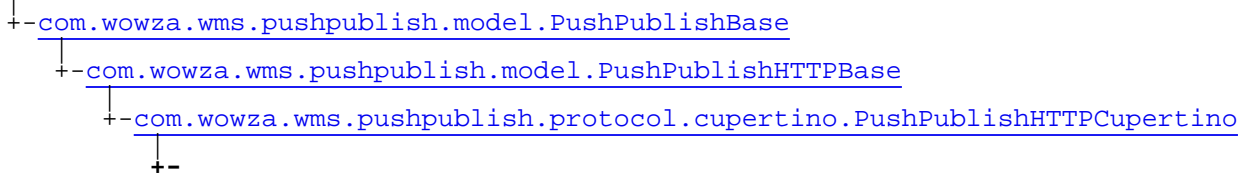

---

## getMediaPlaylistPlaybackURL

```
public String getMediaPlaylistPlaybackURL(int rendition)
```

## com.wowza.wms.pushpublish.protocol.cupertino Class PushPublishHTTPCupertinoAkamaiHandler

## Fields

### resolvedHostname

protected java.lang.String **resolvedHostname**

## Constructors

### PushPublishHTTPCupertinoAkamaiHandler

public **PushPublishHTTPCupertinoAkamaiHandler**()

## Methods

(continued from last page)

## init

```
public void init(IApplicationInstance appInstance,  
                String streamName,  
                IMediaStream stream,  
                java.util.Map profileData,  
                java.util.Map maps,  
                com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,  
                boolean streamDebug)
```

Initiates the instance.

---

## load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

---

## outputOpen

```
public boolean outputOpen()
```

---

## outputClose

```
public boolean outputClose()
```

---

## connect

```
public void connect()
```

---

## resetConnection

```
public void resetConnection()
```

---

## getChunkDurationTarget

```
public int getChunkDurationTarget(ILiveStreamPacketizer liveStreamPacketizer)
```

---

## isSendToBackupServer

```
public boolean isSendToBackupServer()
```

---

## setSendToBackupServer

```
public void setSendToBackupServer(boolean backup)
```

(continued from last page)

---

## getPlaylistProperties

```
public WMSProperties getPlaylistProperties()
```

---

## updateGroupMasterPlaylistPlaybackURI

```
public boolean updateGroupMasterPlaylistPlaybackURI(String groupName,  
    PlaylistModel masterPlaylist)
```

---

## updateMasterPlaylistPlaybackURI

```
public boolean updateMasterPlaylistPlaybackURI(PlaylistModel playlist)
```

---

## updateMediaPlaylistPlaybackURI

```
public boolean updateMediaPlaylistPlaybackURI(PlaylistModel playlist)
```

---

## updateMediaSegmentPlaybackURI

```
public boolean updateMediaSegmentPlaybackURI(MediaSegmentModel mediaSegment)
```

---

## sendGroupMasterPlaylist

```
public int sendGroupMasterPlaylist(String groupName,  
    PlaylistModel playlist)
```

---

## sendMasterPlaylist

```
public int sendMasterPlaylist(PlaylistModel playlist)
```

---

## sendMediaPlaylist

```
public int sendMediaPlaylist(PlaylistModel playlist)
```

---

## sendMediaSegment

```
public int sendMediaSegment(MediaSegmentModel mediaSegment)
```

## deleteMediaSegment

```
public int deleteMediaSegment(MediaSegmentModel mediaSegment)
```

---

## getDestiationLogData

```
public String getDestiationLogData()
```

Get a JSON formatted string of data that represents the destination to include with the connect/disconnect logging

---

## createByteWriter

```
public HTTPByteWriter createByteWriter(java.net.URI uri,  
int port)
```

---

## destroyByteWriter

```
public boolean destroyByteWriter()
```

## Constructors

### PushPublishHTTPCupertinoGoogleHandler

```
public PushPublishHTTPCupertinoGoogleHandler()
```

## Methods

### init

```
public void init(IApplicationInstance appInstance,  
                String streamName,  
                IMediaStream stream,  
                java.util.Map profileData,  
                java.util.Map maps,  
                com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,  
                boolean streamDebug)
```

Initiates the instance.

### load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

### outputOpen

```
public boolean outputOpen()
```

### outputClose

```
public boolean outputClose()
```

### connect

```
public void connect()
```

### resetConnection

```
public void resetConnection()
```

### getChunkDurationTarget

```
public int getChunkDurationTarget(ILiveStreamPacketizer liveStreamPacketizer)
```

---

### isSendToBackupServer

```
public boolean isSendToBackupServer()
```

---

### setSendToBackupServer

```
public void setSendToBackupServer(boolean backup)
```

---

### updateGroupMasterPlaylistPlaybackURI

```
public boolean updateGroupMasterPlaylistPlaybackURI(String groupName,  
    PlaylistModel masterPlaylist)
```

---

### updateMasterPlaylistPlaybackURI

```
public boolean updateMasterPlaylistPlaybackURI(PlaylistModel playlist)
```

---

### updateMediaPlaylistPlaybackURI

```
public boolean updateMediaPlaylistPlaybackURI(PlaylistModel playlist)
```

---

### updateMediaSegmentPlaybackURI

```
public boolean updateMediaSegmentPlaybackURI(MediaSegmentModel mediaSegment)
```

---

### sendGroupMasterPlaylist

```
public int sendGroupMasterPlaylist(String groupName,  
    PlaylistModel masterPlaylist)
```

---

### sendMasterPlaylist

```
public int sendMasterPlaylist(PlaylistModel playlist)
```

---

### sendMediaPlaylist

```
public int sendMediaPlaylist(PlaylistModel playlist)
```

---

(continued from last page)

---

## sendMediaSegment

```
public int sendMediaSegment(MediaSegmentModel mediaSegment)
```

---

## deleteMediaSegment

```
public int deleteMediaSegment(MediaSegmentModel mediaSegment)
```

---

## getDestiationLogData

```
public String getDestiationLogData()
```

Get a JSON formatted string of data that represents the destination to include with the connect/disconnect logging

---

## getDestinationDomain

```
public String getDestinationDomain()
```

---

## getDestinationPath

```
public String getDestinationPath()
```

---

## getContextStr

```
public String getContextStr()
```

---

## getIngressURL

```
public String getIngressURL()
```

---

## getPlaybackURL

```
public String getPlaybackURL()
```

---

## getPlaybackDomain

```
public String getPlaybackDomain()
```

---

## getPlaybackPath

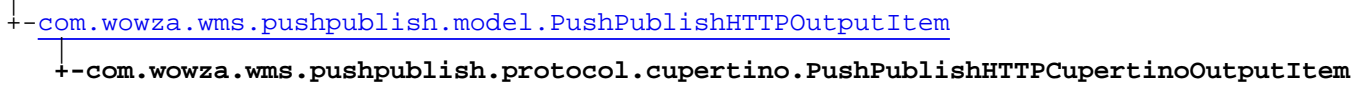

```
public String getPlaybackPath()
```

---

```

Constant value: **PushPublishHTTPCupertinoTracker**

### HTTPADAPTER\_NAME

```
public static final java.lang.String HTTPADAPTER_NAME
```

Constant value: **cupertinostreaming**

## Constructors

(continued from last page)

## PushPublishHTTPCupertinoUtil

```
public PushPublishHTTPCupertinoUtil()
```

## Methods

### onWriteEntry

```
public void onWriteEntry(java.util.Map oldEntry,  
    java.util.Map newEntry)
```

### onReadEntry

```
public void onReadEntry(java.util.Map entry)
```

### onDeleteEntry

```
public void onDeleteEntry(java.util.Map entry)
```

### validateEntry

```
public boolean validateEntry(java.util.Map entry)
```

### isParent

```
public boolean isParent(java.util.Map entry)
```

### isTargetedStream

```
public boolean isTargetedStream(java.util.Map entry,  
    String streamName)
```

### createGroupPlaylist

```
public ManifestModel createGroupPlaylist(String id,  
    java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups,  
    IApplicationInstance appInstance,  
    String context,  
    WMSProperties properties)
```

(continued from last page)

## createTag

```
public TagModel createTag(Class clazz,  
                           String context)
```

Create a TagModel of the provided TagModel

### Parameters:

clazz - Class of the TagModel to create

### Returns:

a new instance of the TagModel requested

---

## addTagToPlaylist

```
public void addTagToPlaylist(PlaylistModel playlist,  
                             TagModel tag)
```

Adds the provided TagModel to the end of the list of TagModels for the provided Playlist Model

### Parameters:

playlist - to add the TagModel to

tag - to add to the playlist

---

## addTagToPlaylist

```
public void addTagToPlaylist(PlaylistModel playlist,  
                             int idx,  
                             TagModel tag)
```

Adds the provided TagModel to the list of TagModels at the idx for the provided Playlist Model

### Parameters:

playlist - to add the TagModel to

idx - index where to insert the TagModel at

tag - Model to insert into the list of TagModels

---

## createMasterPlaylist

```
public PlaylistModel createMasterPlaylist(String context,  
                                           boolean logDebugManifest)
```

Creates a master playlist and propagates the context string from this implementation to the returned playlist model

### Returns:

a new master playlist

---

## createMediaPlaylist

```
public PlaylistModel createMediaPlaylist(int renditionIdx,  
                                          PushPublishHTTPCupertino hlsEntry,  
                                          String context,  
                                          boolean logDebugManifest)
```

Creates a empty media playlist and propagates the context from this implementation to the returned playlist

### Returns:

a new media playlist

(continued from last page)

## createMediaSegmentModel

```
public MediaSegmentModel createMediaSegmentModel(boolean debugLog)
```

Creates an empty media segment model and propagates the context from the implementation to the returned media segment model

### Returns:

media segment model

---

## setMediaPlaylistRenditionIndex

```
public void setMediaPlaylistRenditionIndex(PlaylistModel mediaPlaylist,  
int index)
```

---

## getMediaPlaylistRenditionIndex

```
public int getMediaPlaylistRenditionIndex(PlaylistModel mediaPlaylist)
```

---

## getMediaPlaylistForRendtion

```
public PlaylistModel getMediaPlaylistForRendtion(PlaylistModel masterPlaylist,  
int renditionIndex)
```

---

## setMediaSegmentIndex

```
public void setMediaSegmentIndex(MediaSegmentModel mediaSegment,  
long index)
```

---

## getMediaSegmentIndex

```
public long getMediaSegmentIndex(MediaSegmentModel mediaSegment)
```

---

## setMediaSegmentDelete

```
public void setMediaSegmentDelete(MediaSegmentModel mediaSegment,  
boolean delete)
```

---

## isMediaSegmentDelete

```
public boolean isMediaSegmentDelete(MediaSegmentModel mediaSegment)
```

---

(continued from last page)

---

## setMediaSegmentSent

```
public void setMediaSegmentSent(MediaSegmentModel mediaSegment,  
    boolean sent)
```

---

## isMediaSegmentSent

```
public boolean isMediaSegmentSent(MediaSegmentModel mediaSegment)
```

---

## setMediaSegementSize

```
public void setMediaSegementSize(MediaSegmentModel mediaSegment)
```

---

## getMediaSegementSize

```
public long getMediaSegementSize(MediaSegmentModel mediaSegment)
```

---

## setMediaSegementProgramDateTime

```
public void setMediaSegementProgramDateTime(MediaSegmentModel mediaSegment,  
    String progDateTime)
```

---

## getMediaSegementProgramDateTime

```
public String getMediaSegementProgramDateTime(MediaSegmentModel mediaSegment)
```

---

## setVHost

```
public void setVHost(IVHost vhost)
```

---

## setApplicationName

```
public void setApplicationName(String appName)
```

---

## setApplicationInstance

```
public void setApplicationInstance(IApplicationInstance appInstance)
```

---

## Methods

### onConnectStart

```
public void onConnectStart(PushPublishRTMPNetConnectionSession pushPublisherSession)
```

### onConnectSuccess

```
public void onConnectSuccess(PushPublishRTMPNetConnectionSession pushPublisherSession)
```

### onConnectFailure

```
public void onConnectFailure(PushPublishRTMPNetConnectionSession pushPublisherSession)
```

(continued from last page)

---

## onHandshakeResult

```
public void onHandshakeResult(PushPublishRTMPNetConnectionSession
    pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

---

## onAkamaiSetChallenge

```
public void onAkamaiSetChallenge(PushPublishRTMPNetConnectionSession
    pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

---

## onAkamaiSetOriginConnectionInfo

```
public void onAkamaiSetOriginConnectionInfo(PushPublishRTMPNetConnectionSession
    pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

---

## onAkamaiClientLogin

```
public void onAkamaiClientLogin(PushPublishRTMPNetConnectionSession
    pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

---

## onFCPublish

```
public void onFCPublish(PushPublishRTMPNetConnectionSession pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

---

## onFCAnnounce

```
public void onFCAnnounce(PushPublishRTMPNetConnectionSession pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

---

## onReleaseStream

```
public void onReleaseStream(PushPublishRTMPNetConnectionSession pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

---

(continued from last page)

---

## onConnect

```
public void onConnect(PushPublishRTMPNetConnectionSession pushPublisherSession,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## onStreamCreate

```
public void onStreamCreate(PushPublishRTMPNetConnectionSession pushPublisherSession,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## onStreamOnPlayStatus

```
public void onStreamOnPlayStatus(PushPublishRTMPNetConnectionSession  
pushPublisherSession,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## onStreamOnStatus

```
public void onStreamOnStatus(PushPublishRTMPNetConnectionSession pushPublisherSession,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

---

## onPublishHandlerPlay

```
public void onPublishHandlerPlay(PushPublishRTMPNetConnectionSession  
pushPublisherSession,  
    java.io.OutputStream out,  
    long[] playSizes)
```

---

## onSessionIdle

```
public void onSessionIdle(PushPublishRTMPNetConnectionSession pushPublisherSession)
```

---

## onSessionOpened

```
public void onSessionOpened(PushPublishRTMPNetConnectionSession pushPublisherSession)
```

---

## onSessionClosed

```
public void onSessionClosed(PushPublishRTMPNetConnectionSession pushPublisherSession)
```

---

---

## onValidateSession

```
public void onValidateSession(PushPublishRTMPNetConnectionSession
pushPublisherSession)
```

---

## onValidateSessionResult

```
public void onValidateSessionResult(PushPublishRTMPNetConnectionSession
pushPublisherSession,
    boolean result)
```

---

## onPushPublisherSessionCreate

```
public void onPushPublisherSessionCreate(PushPublishRTMPNetConnectionSession
pushPublisherSession)
```

---

## onPushPublisherSessionDestroy

```
public void onPushPublisherSessionDestroy(PushPublishRTMPNetConnectionSession
pushPublisherSession)
```

## com.wowza.wms.pushpublish.protocol.rtmp Class PushPublishRTMP

java.lang.Object

All Implemented Interfaces:

[IPushPublish](#)

Direct Known Subclasses:

[PushPublishRTMPProfileHandler](#)

---

```
public class PushPublishRTMP
extends PushPublishBase
```

PushPublish

### Sample Code to push to Wowza Server or Adobe Media Server (no authentication)

This method should work with **Level 3** as well as long as the publishing application on not authenticated.

```
try
{
    PushPublishRTMP publisher = new PushPublishRTMP();

    // Source stream
    publisher.setAppInstance(appInstance);
    publisher.setSrcStreamName("myStream");

    // Destination stream
    publisher.setHostname("localhost");
    publisher.setPort(1935);
    publisher.setDstApplicationName("live");
    publisher.setDstStreamName("myStream");

    // Uncomment if pushing to Adobe Media Server
    //publisher.setSendOriginalTimecodes(true);
    //publisher.setOriginalTimecodeThreshold(0x100000);

    // SecureToken shared secret
    //publisher.setSecureTokenSharedSecret("#ed%h0#w@1");

    publisher.setSendFCPublish(true);
    publisher.setSendReleaseStream(true);
    publisher.setDebugLog(true);

    publisher.connect();
}
catch(Exception e)
{
    WMSLoggerFactory.getLogger(null).info(CLASSNAME+"RTMP: ", e);
}
```

## Sample Code to push to Wowza Server or Adobe Media Server (RTMP username/password authentication)

This method should work with **Level 3** as well if the publishing application is protected using RTMP authentication.

```
try
{
    PushPublishRTMP publisher = new PushPublishRTMP();

    // Source stream
    publisher.setAppInstance(appInstance);
    publisher.setSrcStreamName("myStream");

    // Destination stream
    publisher.setHostname("localhost");
    publisher.setPort(1935);
    publisher.setDstApplicationName("live");
    publisher.setDstStreamName("myStream");
    publisher.setConnectionFlashVersion(PushPublishRTMP.CURRENTFMLEVERSION);

    // Uncomment if pushing to Adobe Media Server
    //publisher.setSendOriginalTimecodes(true);
    //publisher.setOriginalTimecodeThreshold(0x100000);

    // SecureToken shared secret
    //publisher.setSecureTokenSharedSecret("#ed%h0#w@1");

    publisher.setSendFCPublish(true);
    publisher.setSendReleaseStream(true);
    publisher.setDebugLog(true);

    PushPublishRTMPAuthProviderAdobe adobeRTMPAuthProvider = new
PushPublishRTMPAuthProviderAdobe();

    adobeRTMPAuthProvider.init(publisher);
    adobeRTMPAuthProvider.setUserName("username");
    adobeRTMPAuthProvider.setPassword("password");
    publisher.setRTMPAuthProvider(adobeRTMPAuthProvider);

    publisher.connect();
}
catch(Exception e)
{
    WMSLoggerFactory.getLogger(null).info(CLASSNAME+"RTMP: ", e);
}
```

## Sample Code to push to Akamai

```

try
{
    PushPublishRTMP publisher = new PushPublishRTMP();

    // Source stream
    publisher.setAppInstance(appInstance);
    publisher.setSrcStreamName("myStream");

    // Destination stream
    String streamId = "12345";
    String akamaiUsername = "56789";
    String akamaiPassword = "changeme";
    boolean isPrimary = true;
    String hostname = (isPrimary?"p":"b")+".ep"+streamId+".i.akamaientrypoint.net";
    String dstApplicationName = "EntryPoint";
    String dstStreamName = "myStream"+"@"+streamId;

    publisher.setHostname(hostname);
    publisher.setPort(1935);
    publisher.setDstApplicationName(dstApplicationName);
    publisher.setDstStreamName(dstStreamName);
    publisher.setDebugLog(true);

    publisher.setConnectionFlashVersion(PushPublishRTMP.getPushPublishVersionStr());

    if (PushPublishRTMP.isFlashVersionFMLE(publisher.getConnectionFlashVersion()))
    {
        PushPublishRTMPAuthProviderAdobe adobeRTMPAuthProvider = new
PushPublishRTMPAuthProviderAdobe();

        adobeRTMPAuthProvider.init(publisher);
        adobeRTMPAuthProvider.setUserName(akamaiUsername);
        adobeRTMPAuthProvider.setPassword(akamaiPassword);

        publisher.setRTMPAuthProvider(adobeRTMPAuthProvider);
    }
    else
    {
        publisher.setAkamaiUserName(akamaiUsername);
        publisher.setAkamaiPassword(akamaiPassword);
    }

    publisher.setSendFCPublish(true);
    publisher.setSendReleaseStream(true);
    publisher.setSendStreamCloseCommands(true);

    publisher.setSendOriginalTimecodes(true);
    publisher.setOriginalTimecodeThreshold(0x100000);

    publisher.connect();
}

```

```
catch(Exception e)
{
    WMSLoggerFactory.getLogger(null).info(CLASSNAME+"RTMP: ", e);
}
```

## Sample Code to push to **Limelight**

```
try
{
    PushPublishRTMP publisher = new PushPublishRTMP();

    // Source stream
    publisher.setAppInstance(appInstance);
    publisher.setSrcStreamName("myStream");

    // Destination stream
    publisher.setHostname("fmmpush.lax.llnw.net");
    publisher.setPort(1935);
    publisher.setDstApplicationName("live");
    publisher.setDstStreamName("myStream");

    publisher.setSendFCPublish(true);
    publisher.setSendReleaseStream(true);
    publisher.setDebugLog(true);

    publisher.setSendOriginalTimecodes(true);
    publisher.setOriginalTimecodeThreshold(0x100000);

    PushPublishRTMPAuthProviderLimelight limelightRTMPAuthProvider = new
PushPublishRTMPAuthProviderLimelight();

    limelightRTMPAuthProvider.init(publisher);
    limelightRTMPAuthProvider.setUserName("username");
    limelightRTMPAuthProvider.setPassword("password");
    publisher.setRTMPAuthProvider(limelightRTMPAuthProvider);

    publisher.connect();
}
catch(Exception e)
{
    WMSLoggerFactory.getLogger(null).info(CLASSNAME+"RTMP: ", e);
}
```

Sample Code to push to **BitGravity** (streaming needs to be setup per instructions in **BG Live 3rd Party Encoder Configuration** guide.)

```
try
{
    PushPublishRTMP publisher = new PushPublishRTMP();

    // Source stream
    publisher.setAppInstance(client.getAppInstance());
    publisher.setSrcStreamName("myStream");

    // Destination stream
    publisher.setHostname("rtpdev1.iad1.bitgravity.com");
    publisher.setPort(1935);
    publisher.setDstApplicationName("rtmp");
    publisher.setDstAppInstanceName("push");

    publisher.setDstStreamName("test@test.com/71d73d4cfd1e2f2fed77238021a2cbbe/test/live/feed01")
;

    publisher.setSendFCPublish(true);
    publisher.setSendReleaseStream(true);
    publisher.setDebugLog(true);

    publisher.connect();
}
catch(Exception e)
{
    WMSLoggerFactory.getLogger(null).info(CLASSNAME+"RTMP: ", e);
}
```

## Constructor Summary

public	<a href="#">PushPublishRTMP()</a>
--------	-----------------------------------

## Method Summary

void	<a href="#">addConnectMetaData</a> (String key, <a href="#">AMFData</a> value) Added metadata values to the connect metadata object
void	<a href="#">addListener</a> ( <a href="#">IPushPublishRTMPNotify</a> listener) Add IPushPublishRTMPNotify listener
void	<a href="#">addOnMetadataItemToRemove</a> (String name)
void	<a href="#">addSession</a> ( <a href="#">PushPublishRTMPNetConnectionSession</a> sessionHolder) Add session

void	<a href="#"><u>bumpReconnectWaitTime()</u></a> Bump the reconnect wait time
void	<a href="#"><u>callConnect(PushPublishRTMPNetConnectionSession pushPublisherSession, String addQueryStr)</u></a> Internal connect
void	<a href="#"><u>connect()</u></a> Connect to server
<a href="#"><u>AMFDataList</u></a>	<a href="#"><u>convertDataEvenToAMFData(AMFPacket packet)</u></a>
<a href="#"><u>AMFPacket</u></a>	<a href="#"><u>convertOnMetadataToSetDataFrame(AMFPacket packet)</u></a>
<a href="#"><u>PushPublishRTMPNetConnectionPublisher</u></a>	<a href="#"><u>createNetConnectionPublisher(PushPublishRTMPNetConnectionSession pushPublisherSession)</u></a>
<a href="#"><u>IPushPublishSession</u></a>	<a href="#"><u>createPushPublishSession()</u></a>
void	<a href="#"><u>disconnect()</u></a> Disconnect from server
void	<a href="#"><u>disconnect(boolean hard)</u></a>
<a href="#"><u>AMFPacket</u></a>	<a href="#"><u>filterOnMetadataEvent(AMFPacket packet, long flags, java.util.List itemsToRemove, java.util.Map itemsToAdd)</u></a>
String	<a href="#"><u>getAkamaiOriginIp()</u></a> Get Akamai Origin IP
int	<a href="#"><u>getAkamaiOriginPort()</u></a> Get Akamai Origin Port
String	<a href="#"><u>getAkamaiPassword()</u></a> Get Akamai password
String	<a href="#"><u>getAkamaiSessionKey(String sessionId)</u></a> Get Akamai session key
String	<a href="#"><u>getAkamaiUserName()</u></a> Get Akamai user name
<a href="#"><u>IApplicationInstance</u></a>	<a href="#"><u>getAppInstance()</u></a> Get appInstance interface
String	<a href="#"><u>getBindAddress()</u></a>
long	<a href="#"><u>getConnectAttemptCount()</u></a>
int	<a href="#"><u>getConnectedState()</u></a>
String	<a href="#"><u>getConnectionFlashVerion()</u></a> Get Flash version used in connection metadata
String	<a href="#"><u>getConnectionFlashVersion()</u></a> Get Flash version used in connection metadata

String	<a href="#"><u>getConnectionPageURL()</u></a> Get Page URL used in connection metadata
String	<a href="#"><u>getConnectionQueryStr()</u></a> Get the connection query string
String	<a href="#"><u>getConnectionSwfURL()</u></a> Get SWF URL used in connection metadata
int	<a href="#"><u>getConnectionTimeout()</u></a> Get the connection timeout (milliseconds)
long	<a href="#"><u>getConnectLastAttempt()</u></a> Get timestamp of last connection attempt
long	<a href="#"><u>getConnectLastSuccess()</u></a> Get timestamp of last successful connection
String	<a href="#"><u>getContextStr()</u></a> Get the connection details
String	<a href="#"><u>getDstAppInstanceName()</u></a> Get destination appInstance name
String	<a href="#"><u>getDstApplicationName()</u></a> Get destination application name
String	<a href="#"><u>getDstStreamName()</u></a> Get destination stream name
String	<a href="#"><u>getHowToPublish()</u></a> Get the howToPublish string (valid values are "live", "record" and "append")
long	<a href="#"><u>getLastAudioTC()</u></a> Get the absolute timecode of the last sent audio packet (milliseconds)
long	<a href="#"><u>getLastDataTC()</u></a> Get the absolute timecode of the last sent data packet (milliseconds)
<a href="#"><u>PushPublishRTMPNetConnectionSession</u></a>	<a href="#"><u>getLastSession()</u></a> Get the last session interface
long	<a href="#"><u>getLastVideoKeyFrameTC()</u></a> Get the absolute timecode of the last sent video keyframe packet (milliseconds)
long	<a href="#"><u>getLastVideoTC()</u></a> Get the absolute timecode of the last sent video packet (milliseconds)
java.util.List	<a href="#"><u>getLocalListeners()</u></a> Get a list of IPushPublishRTMPNotify listeners
Object	<a href="#"><u>getLock()</u></a> Get the synchronization lock
long	<a href="#"><u>getMessagesAttemptedCount()</u></a>
long	<a href="#"><u>getMessagesFailedCount()</u></a>

long	<a href="#"><u>getMessagesRetriedCount</u></a> ( )
<a href="#"><u>INetConnection</u></a>	<a href="#"><u>getNetConnection</u></a> ( ) Get the underlying INetConnection interface for this session
long	<a href="#"><u>getOnMetadataFilter</u></a> ( )
long	<a href="#"><u>getOriginalTimecodeOffset</u></a> ( )
long	<a href="#"><u>getOriginalTimecodeThreshold</u></a> ( ) Get the original timecode threshold.
long	<a href="#"><u>getPacketsSentAudio</u></a> ( )
long	<a href="#"><u>getPacketsSentData</u></a> ( )
long	<a href="#"><u>getPacketsSentVideo</u></a> ( )
long	<a href="#"><u>getPacketsSentVideoKeyFrame</u></a> ( )
int	<a href="#"><u>getPort</u></a> ( ) Get destination server port
String	<a href="#"><u>getQueryString</u></a> ( ) Get the queryString
int	<a href="#"><u>getReconnectDelay</u></a> (long currTime) Get the reconnect delay
java.net.SocketAddresses	<a href="#"><u>getRemoteIpAddress</u></a> ( )
<a href="#"><u>IPushPublishRTMPAuthProvider</u></a>	<a href="#"><u>getRTMPAuthProvider</u></a> ( ) Get RTMP authentication provider
String	<a href="#"><u>getSecureTokenSharedSecret</u></a> ( ) Get SecureToken shared secret
<a href="#"><u>PushPublishRTMPNetConnectionSession</u></a>	<a href="#"><u>getSessionHolderByNetConnection</u></a> ( <a href="#"><u>INetConnection</u></a> netConnection) Get the session holder by INetConnection interface
<a href="#"><u>PushPublishRTMPNetConnectionSession</u></a>	<a href="#"><u>getSessionHolderBySession</u></a> (org.apache.mina.common.IoSession session) Get session holder by IoSession
String	<a href="#"><u>getSessionListDebug</u></a> ( ) Get the list of active IoSession ids for this publishing session
long	<a href="#"><u>getSrcStreamBufferSize</u></a> ( ) The amount of audio/video in milliseconds that must be available in the source streams buffer before push publishing will begin.
String	<a href="#"><u>getSrcStreamName</u></a> ( ) Get source stream name
int	<a href="#"><u>getStreamCloseWaitTime</u></a> ( ) Get stream close timeout (milliseconds)

int	<a href="#"><u>getSyncPacketType()</u></a>
long	<a href="#"><u>getSyncTimecode()</u></a>
int	<a href="#"><u>getTimecodesOutOfOrderThreshold()</u></a>
long	<a href="#"><u>getTotalPacketsSent()</u></a> Get total number of packets sent during push publishing session
long	<a href="#"><u>getValidationFrequency()</u></a> Get connection validation frequency (millisecond).
long	<a href="#"><u>getWaitOnMetadataTimeout()</u></a> Timeout (milliseconds) that the wait on onMetadata system will wait looking for video and audio data to be populated.
org.apache.mina.common. IoSession	<a href="#"><u>internalConnect(PushPublishRTMPNetConnectionSession pushPublisherSession)</u></a> Internal connect method
boolean	<a href="#"><u>isCurrentSession(org.apache.mina.common.IoSession session)</u></a> Test to see if passed in session is current session
boolean	<a href="#"><u>isDebugLog()</u></a> Is debug logging turned on
boolean	<a href="#"><u>isDebugPackets()</u></a> Set to true to log every packet being sent
static boolean	<a href="#"><u>isFlashVerionFMLE(String flashVersion)</u></a> Returns true if the Flash player version string is a Flash Media Live Encoder version (start with FMLE/ or FME/)
static boolean	<a href="#"><u>isFlashVersionFMLE(String flashVersion)</u></a> Returns true if the Flash player version string is a Flash Media Live Encoder version (start with FMLE/ or FME/)
boolean	<a href="#"><u>isOnMetadataReady(IMediaStream stream, AMFPacket packet)</u></a>
boolean	<a href="#"><u>isOnMetadataToSetDataFrame()</u></a> If true all onMetadata events are converted to @setDataFrame calls
boolean	<a href="#"><u>isRemoveDefaultAppInstance()</u></a> If true and destination application instance is _definst_ then the application instance name will not be sent to the remove server as part of the connection information.
boolean	<a href="#"><u>isResetOnTimecodeOutOfOrder()</u></a> Set to true if you wish push to reset if timecodes jump out of order.
boolean	<a href="#"><u>isSendFCAnnounce()</u></a> If true call FCAnnounce(streamName) after connecting to server
boolean	<a href="#"><u>isSendFCPublish()</u></a> If true call FCPublish(streamName) after connecting to server
boolean	<a href="#"><u>isSendOnMetadata()</u></a> True if sending onMetadata event at start of stream

boolean	<a href="#"><u>isSendOriginalTimecodes()</u></a> true if sending the original timecodes of source stream.
boolean	<a href="#"><u>isSendReleaseStream()</u></a> If true call releaseStream(streamName) after connecting to server
boolean	<a href="#"><u>isSendStreamCloseCommands()</u></a> If true will send FCUnpublish, closeStream, deleteStream on disconnect
boolean	<a href="#"><u>isSSL()</u></a>
boolean	<a href="#"><u>isWaitOnMetadataAudio()</u></a> If true and waitOnMetadataAvailable, publishing will not start until onMetadata packet is populated with audio data.
boolean	<a href="#"><u>isWaitOnMetadataAudioDatarate()</u></a>
boolean	<a href="#"><u>isWaitOnMetadataAvailable()</u></a> Set to true to turn on system that will monitor onMetadata packet and wait for it to be populated before it starts sending the stream.
boolean	<a href="#"><u>isWaitOnMetadataVideo()</u></a> If true and waitOnMetadataAvailable, publishing will not start until onMetadata packet is populated with video data.
boolean	<a href="#"><u>isWaitOnMetadataVideoDatarate()</u></a>
void	<a href="#"><u>notifyAkamaiClientLogin(PushPublishRTMPNetConnectionSession pushPublisherSession, com.wowza.wms.request.RequestFunction function, AMFDataList params)</u></a> Notify Akamai ClientLogin

## Constructors

### PushPublishRTMP

public **PushPublishRTMP**()

## Methods

### createNetConnectionPublisher

protected [PushPublishRTMPNetConnectionPublisher](#)  
**createNetConnectionPublisher**([PushPublishRTMPNetConnectionSession](#) pushPublisherSession)

---

### getNetConnection

public [INetConnection](#) **getNetConnection**()

Get the underlying INetConnection interface for this session

**Returns:**

INetConnection interface for this session

---

## getLock

```
public Object getLock()
```

Get the synchronization lock

**Returns:**

synchronization lock

---

## getConnectionTimeout

```
public int getConnectionTimeout()
```

Get the connection timeout (milliseconds)

**Returns:**

connection timeout (milliseconds)

---

## setConnectionTimeout

```
public void setConnectionTimeout(int connectionTimeout)
```

Set the connection timeout (milliseconds)

**Parameters:**

connectionTimeout - connection timeout (milliseconds)

---

## getHowToPublish

```
public String getHowToPublish()
```

Get the howToPublish string (valid values are "live", "record" and "append")

**Returns:**

howToPublish string

---

## setHowToPublish

```
public void setHowToPublish(String howToPublish)
```

Set the howToPublish string (valid values are "live", "record" and "append")

**Parameters:**

howToPublish - howToPublish string

---

## isSendFCPublish

```
public boolean isSendFCPublish()
```

If true call FCPublish(streamName) after connecting to server

**Returns:**

true if calling FCPublish(streamName) after connecting to server

---

## setSendFCPublish

```
public void setSendFCPublish(boolean sendFCPublish)
```

---

---

(continued from last page)

If true call FCPublish(streamName) after connecting to server

**Parameters:**

sendFCPublish - true if calling FCPublish(streamName) after connecting to server

---

## isSendReleaseStream

```
public boolean isSendReleaseStream( )
```

If true call releaseStream(streamName) after connecting to server

**Returns:**

true if calling releaseStream(streamName) after connecting to server

---

## setSendReleaseStream

```
public void setSendReleaseStream(boolean sendReleaseStream)
```

If true call releaseStream(streamName) after connecting to server

**Parameters:**

sendReleaseStream - true if calling releaseStream(streamName) after connecting to server

---

## getSessionListDebug

```
public String getSessionListDebug( )
```

Get the list of active IoSession ids for this publishing session

**Returns:**

list of active IoSession ids for this publishing session

---

## isCurrentSession

```
public boolean isCurrentSession(org.apache.mina.common.IoSession session)
```

Test to see if passed in session is current session

**Parameters:**

session - IoSession interface

**Returns:**

true if current session

---

## getLastSession

```
public PushPublishRTMPNetConnectionSession getLastSession( )
```

Get the last session interface

**Returns:**

last session interface

---

## addSession

```
public void addSession(PushPublishRTMPNetConnectionSession sessionHolder)
```

Add session

---

(continued from last page)

**Parameters:**

sessionHolder - session holder

---

**removeSession**

```
public void removeSession(PushPublishRTMPNetConnectionSession sessionHolder)
```

Remove session

**Parameters:**

sessionHolder - session holder

---

**getSessionHolderBySession**

```
public PushPublishRTMPNetConnectionSession  
getSessionHolderBySession(org.apache.mina.common.IoSession session)
```

Get session holder by IoSession

**Parameters:**

session - IoSession

**Returns:**

session holder

---

**getSessionHolderByNetConnection**

```
public PushPublishRTMPNetConnectionSession  
getSessionHolderByNetConnection(INetConnection netConnection)
```

Get the session holder by INetConnection interface

**Parameters:**

netConnection - INetConnection interface

**Returns:**

session holder

---

**sessionOpened**

```
public void sessionOpened(org.apache.mina.common.IoSession session)
```

Internal callback

**Parameters:**

session - IoSession

---

**sessionClosed**

```
public void sessionClosed(org.apache.mina.common.IoSession session)
```

Internal callback

**Parameters:**

session - IoSession

(continued from last page)

## tryToConnect

```
protected void tryToConnect(PushPublishRTMP.STATE connectionState)
```

Try to connect to server

---

## resetConnection

```
public void resetConnection()
```

Reset server connection

---

## resetConnection

```
public void resetConnection(boolean noDelay)
```

Reset server connection

**Parameters:**

noDelay - if true reset immediately

---

## getContextStr

```
public String getContextStr()
```

Get the connection details

**Returns:**

connection details

---

## resolveHostName

```
protected String resolveHostName()
```

Resolve host name to connect to

**Returns:**

hostname

---

## internalConnect

```
protected org.apache.mina.common.IoSession  
internalConnect(PushPublishRTMPNetConnectionSession pushPublisherSession)
```

Internal connect method

**Parameters:**

pushPublisherSession - session holder

**Returns:**

Io session

---

## getRemoteIpAddress

```
public java.net.SocketAddress getRemoteIpAddress()
```

## getConnectionQueryStr

```
public String getConnectionQueryStr()
```

Get the connection query string

**Returns:**

connection query string

---

## setConnectionQueryStr

```
public void setConnectionQueryStr(String connectionQueryStr)
```

Set the connection query string

**Parameters:**

connectionQueryStr - connection query string

---

## getQueryString

```
public String getQueryString()
```

Get the queryString

**Parameters:**

queryString

---

## setQueryString

```
public void setQueryString(String queryString)
```

Set the queryString, as set in the map file

**Parameters:**

queryString

---

## connect

```
public void connect()
```

Connect to server

---

## callConnect

```
protected void callConnect(PushPublishRTMPNetConnectionSession pushPublisherSession,  
String addQueryStr)
```

Internal connect

**Parameters:**

pushPublisherSession - session holder

addQueryStr - additional query params

---

## getAkamaiSessionKey

```
public String getAkamaiSessionKey(String sessionId)
```

---

(continued from last page)

Get Akamai session key

**Parameters:**

sessionId - session Id

**Returns:**

Akamai session key

---

## getConnectionFlashVerion

```
public String getConnectionFlashVerion()
```

Get Flash version used in connection metadata

**Returns:**

Flash version used in connection metadata

---

## getConnectionFlashVersion

```
public String getConnectionFlashVersion()
```

Get Flash version used in connection metadata

**Returns:**

Flash version used in connection metadata

---

## setConnectionFlashVersion

```
public void setConnectionFlashVersion(String connectionFlashVersion)
```

Set Flash version used in connection metadata

**Parameters:**

connectionFlashVersion - Flash version used in connection metadata

---

## setConnectionFlashVerion

```
public void setConnectionFlashVerion(String connectionFlashVersion)
```

Set Flash version used in connection metadata

**Parameters:**

connectionFlashVersion - Flash version used in connection metadata

---

## getConnectionSwfURL

```
public String getConnectionSwfURL()
```

Get SWF URL used in connection metadata

**Returns:**

SWF URL used in connection metadata

---

## setConnectionSwfURL

```
public void setConnectionSwfURL(String connectionSwfURL)
```

Set SWF URL used in connection metadata

---

(continued from last page)

**Parameters:**

connectionSwfURL - SWF URL used in connection metadata

---

**getConnectionPageURL**

```
public String getConnectionPageURL()
```

Get Page URL used in connection metadata

**Returns:**

Page URL used in connection metadata

---

**setConnectionPageURL**

```
public void setConnectionPageURL(String connectionPageURL)
```

Set Page URL used in connection metadata

**Parameters:**

connectionPageURL - Page URL used in connection metadata

---

**getSecureTokenSharedSecret**

```
public String getSecureTokenSharedSecret()
```

Get SecureToken shared secret

**Returns:**

SecureToken shared secret

---

**setSecureTokenSharedSecret**

```
public void setSecureTokenSharedSecret(String secureTokenSharedSecret)
```

Set SecureToken shared secret

**Parameters:**

secureTokenSharedSecret - SecureToken shared secret

---

**getAkamaiUserName**

```
public String getAkamaiUserName()
```

Get Akamai user name

**Returns:**

Akamai user name

---

**setAkamaiUserName**

```
public void setAkamaiUserName(String akamaiUserName)
```

Set Akamai user name

**Parameters:**

akamaiUserName - Akamai user name

(continued from last page)

## getAkamaiPassword

```
public String getAkamaiPassword()
```

Get Akamai password

**Returns:**

Akamai password

---

## setAkamaiPassword

```
public void setAkamaiPassword(String akamaiPassword)
```

Set Akamai password

**Parameters:**

akamaiPassword - Akamai password

---

## getAkamaiOriginIp

```
public String getAkamaiOriginIp()
```

Get Akamai Origin IP

**Returns:**

Akamai Origin IP

---

## setAkamaiOriginIp

```
public void setAkamaiOriginIp(String akamaiOriginIp)
```

Set Akamai Origin IP

**Parameters:**

akamaiOriginIp - Akamai Origin IP

---

## getAkamaiOriginPort

```
public int getAkamaiOriginPort()
```

Get Akamai Origin Port

**Returns:**

Akamai Origin Port

---

## setAkamaiOriginPort

```
public void setAkamaiOriginPort(int akamaiOriginPort)
```

Set Akamai Origin Port

**Parameters:**

akamaiOriginPort - Akamai Origin Port

---

## isSendFCAnnounce

```
public boolean isSendFCAnnounce()
```

(continued from last page)

If true call FCAnnounce(streamName) after connecting to server

**Returns:**

true if calling FCAnnounce(streamName) after connecting to server

---

## setSendFCAnnounce

```
public void setSendFCAnnounce(boolean sendFCAnnounce)
```

If true call FCAnnounce(streamName) after connecting to server

**Parameters:**

sendFCAnnounce - true if calling FCAnnounce(streamName) after connecting to server

---

## getValidationFrequency

```
public long getValidationFrequency()
```

Get connection validation frequency (millisecond). Zero to turn off validation.

**Returns:**

connection validation frequency (millisecond)

---

## setValidationFrequency

```
public void setValidationFrequency(long validationFrequency)
```

Set connection validation frequency (millisecond). Zero to turn off validation.

**Parameters:**

validationFrequency - connection validation frequency (millisecond)

---

## addListener

```
public void addListener(IPushPublishRTMPNotify listener)
```

Add IPushPublishRTMPNotify listener

**Parameters:**

listener - IPushPublishRTMPNotify listener

---

## removeListener

```
public boolean removeListener(IPushPublishRTMPNotify listener)
```

remove IPushPublishRTMPNotify listener

**Parameters:**

listener - IPushPublishRTMPNotify listener

**Returns:**

true if removed

---

## getLocalListeners

```
protected java.util.List getLocalListeners()
```

Get a list of IPushPublishRTMPNotify listeners

---

(continued from last page)

**Returns:**

list of IPushPublishRTMPNotify listeners

---

**notifyConnectStart**

```
protected void notifyConnectStart(PushPublishRTMPNetConnectionSession
pushPublisherSession)
```

Notify connect start

**Parameters:**

pushPublisherSession - session holder

---

**notifyConnectSuccess**

```
protected void notifyConnectSuccess(PushPublishRTMPNetConnectionSession
pushPublisherSession)
```

Notify connect success

**Parameters:**

pushPublisherSession - session holder

---

**notifyConnectFailure**

```
protected void notifyConnectFailure(PushPublishRTMPNetConnectionSession
pushPublisherSession)
```

Notify connect failure

**Parameters:**

pushPublisherSession - session holder

---

**notifyHandshakeResult**

```
protected void notifyHandshakeResult(PushPublishRTMPNetConnectionSession
pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Notify handshake result

**Parameters:**

pushPublisherSession - session holder  
function - function  
params - params

---

**notifyAkamaiSetChallenge**

```
protected void notifyAkamaiSetChallenge(PushPublishRTMPNetConnectionSession
pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Notify Akamai SetChallenge

**Parameters:**

pushPublisherSession - session holder  
function - function  
params - params

## notifyAkamaiSetOriginConnectionInfo

```
protected void notifyAkamaiSetOriginConnectionInfo(PushPublishRTMPNetConnectionSession
pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Notify Akamai SetOriginConnectionInfo

### Parameters:

pushPublisherSession - session holder  
function - function  
params - params

---

## notifyAkamaiClientLogin

```
protected void notifyAkamaiClientLogin(PushPublishRTMPNetConnectionSession
pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Notify Akamai ClientLogin

### Parameters:

pushPublisherSession - session holder  
function - function  
params - params

---

## notifyFCPublish

```
protected void notifyFCPublish(PushPublishRTMPNetConnectionSession
pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Notify FCPublish

### Parameters:

pushPublisherSession - session holder  
function - function  
params - params

---

## notifyFCAnnounce

```
protected void notifyFCAnnounce(PushPublishRTMPNetConnectionSession
pushPublisherSession,
    com.wowza.wms.request.RequestFunction function,
    AMFDataList params)
```

Notify FCAnnounce

### Parameters:

pushPublisherSession - session holder  
function - function  
params - params

---

(continued from last page)

## notifyConnect

```
protected void notifyConnect(PushPublishRTMPNetConnectionSession pushPublisherSession,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Notify connect

### Parameters:

pushPublisherSession - session holder  
function - function  
params - params

---

## notifyStreamCreate

```
protected void notifyStreamCreate(PushPublishRTMPNetConnectionSession  
pushPublisherSession,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Notify stream create

### Parameters:

pushPublisherSession - session holder  
function - function  
params - params

---

## notifyStreamOnPlayStatus

```
protected void notifyStreamOnPlayStatus(PushPublishRTMPNetConnectionSession  
pushPublisherSession,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Notify OnPlayStatus

### Parameters:

pushPublisherSession - session holder  
function - function  
params - params

---

## notifyStreamOnStatus

```
protected void notifyStreamOnStatus(PushPublishRTMPNetConnectionSession  
pushPublisherSession,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Notify StreamOnStatus

### Parameters:

pushPublisherSession - session holder  
function - function  
params - params

---

(continued from last page)

## notifyPublishHandlerPlay

```
protected void notifyPublishHandlerPlay(PushPublishRTMPNetConnectionSession  
pushPublisherSession,  
    java.io.OutputStream out,  
    long[] playSizes)
```

Notify publish handler play

### Parameters:

pushPublisherSession - session holder  
out - output stream  
playSizes - play sizes

---

## notifySessionIdle

```
protected void notifySessionIdle(PushPublishRTMPNetConnectionSession  
pushPublisherSession)
```

Notify session idle event

### Parameters:

pushPublisherSession - session holder

---

## notifySessionOpened

```
protected void notifySessionOpened(PushPublishRTMPNetConnectionSession  
pushPublisherSession)
```

Notify session opened

### Parameters:

pushPublisherSession - session holder

---

## notifySessionClosed

```
protected void notifySessionClosed(PushPublishRTMPNetConnectionSession  
pushPublisherSession)
```

Notify session closed

### Parameters:

pushPublisherSession - session holder

---

## notifyValidateSession

```
protected void notifyValidateSession(PushPublishRTMPNetConnectionSession  
pushPublisherSession)
```

---

## notifyValidateSessionResult

```
protected void notifyValidateSessionResult(PushPublishRTMPNetConnectionSession  
pushPublisherSession,  
    boolean result)
```

(continued from last page)

---

## notifyPushPublisherSessionCreate

protected void **notifyPushPublisherSessionCreate**([PushPublishRTMPNetConnectionSession](#) pushPublisherSession)

Notify session create

### Parameters:

pushPublisherSession - session holder

---

## notifyPushPublisherSessionDestroy

protected void **notifyPushPublisherSessionDestroy**([PushPublishRTMPNetConnectionSession](#) pushPublisherSession)

Notify session destroy

### Parameters:

pushPublisherSession - session holder

---

## getConnectLastAttempt

public long **getConnectLastAttempt**()

Get timestamp of last connection attempt

### Returns:

timestamp of last connection attempt

---

## getConnectAttemptCount

public long **getConnectAttemptCount**()

---

## setConnectLastAttempt

public void **setConnectLastAttempt**(long connectLastAttempt)

Set timestamp of last connection attempt

### Parameters:

connectLastAttempt - timestamp of last connection attempt

---

## bumpReconnectWaitTime

protected void **bumpReconnectWaitTime**()

Bump the reconnect wait time

---

## getReconnectDelay

protected int **getReconnectDelay**(long currTime)

Get the reconnect delay

### Parameters:

currTime - current timestamp

---

(continued from last page)

**Returns:**

delay in milliseconds

---

**getConnectLastSuccess**

```
public long getConnectLastSuccess()
```

Get timestamp of last successful connection

**Returns:**

timestamp of last successful connection

---

**setConnectLastSuccess**

```
public void setConnectLastSuccess(long connectLastSuccess)
```

Set timestamp of last successful connection

**Parameters:**

connectLastSuccess - timestamp of last successful connection

---

**isSendOriginalTimecodes**

```
public boolean isSendOriginalTimecodes()
```

true if sending the original timecodes of source stream. false if starting at zero.

**Returns:**

true if sending the original timecodes of source stream

---

**setSendOriginalTimecodes**

```
public void setSendOriginalTimecodes(boolean sendOriginalTimecodes)
```

true if sending the original timecodes of source stream. false if starting at zero.

**Parameters:**

sendOriginalTimecodes - true if sending the original timecodes of source stream

---

**getOriginalTimecodeThreshold**

```
public long getOriginalTimecodeThreshold()
```

Get the original timecode threshold. This value will attempt to reduce the magnitude of absolute timecodes while keeping multiple-bitrate alignment. It is probably best to set this value quite high to a value such as 0x100000. The value is in milliseconds. The following formula is used to calculate a timecode offset  $\text{timecodeOffset} = \text{timecode} - (\text{timecode} \% \text{originalTimecodeThreshold})$ ;

**Returns:**

original timecode threshold

---

**setOriginalTimecodeThreshold**

```
public void setOriginalTimecodeThreshold(long originalTimecodeThreshold)
```

Set the original timecode threshold. This value will attempt to reduce the magnitude of absolute timecodes while keeping multiple-bitrate alignment. It is probably best to set this value quite high to a value such as 0x100000. The value is in milliseconds. The following formula is used to calculate a timecode offset  $\text{timecodeOffset} = \text{timecode} - (\text{timecode} \% \text{originalTimecodeThreshold})$ ;

(continued from last page)

**Parameters:**

originalTimecodeThreshold - original timecode threshold

---

**setOriginalTimecodeThreshold**

```
public void setOriginalTimecodeThreshold(String i)
```

---

**isDebugLog**

```
public boolean isDebugLog()
```

Is debug logging turned on

**Returns:**

true if debug logging is turned on

---

**setDebugLog**

```
public void setDebugLog(boolean debugLog)
```

Set debug logging

**Parameters:**

debugLog - debug logging

---

**setStreamDebugLog**

```
public void setStreamDebugLog(boolean debugLog)
```

---

**getAppInstance**

```
public IApplicationInstance getAppInstance()
```

Get appInstance interface

**Returns:**

appInstance interface

---

**setAppInstance**

```
public void setAppInstance(IApplicationInstance appInstance)
```

Set appInstance interface

**Parameters:**

appInstance - appInstance interface

---

**getSrcStreamName**

```
public String getSrcStreamName()
```

Get source stream name

---

(continued from last page)

**Returns:**

source stream name

---

**setSrcStreamName**

```
public void setSrcStreamName(String srcStreamName)
```

Set source stream name

**Parameters:**

srcStreamName - source stream name

---

**getDstStreamName**

```
public String getDstStreamName()
```

Get destination stream name

**Returns:**

destination stream name

---

**setDstStreamName**

```
public void setDstStreamName(String dstStreamName)
```

Set destination stream name

**Parameters:**

dstStreamName - destination stream name

---

**getPort**

```
public int getPort()
```

Get destination server port

**Returns:**

destination server port

---

**setPort**

```
public void setPort(int port)
```

Set destination server port

**Parameters:**

port - destination server port

---

**getDstApplicationName**

```
public String getDstApplicationName()
```

Get destination application name

**Returns:**

destination application name

---

(continued from last page)

## setDstApplicationName

```
public void setDstApplicationName(String dstApplicationName)
```

Set destination application name

**Parameters:**

dstApplicationName - destination application name

---

## getDstAppInstanceName

```
public String getDstAppInstanceName()
```

Get destination appInstance name

**Returns:**

destination appInstance name

---

## setDstAppInstanceName

```
public void setDstAppInstanceName(String dstAppInstanceName)
```

Set destination appInstance name

**Parameters:**

dstAppInstanceName - destination appInstance name

---

## getRTMPAuthProvider

```
public IPushPublishRTMPAuthProvider getRTMPAuthProvider()
```

Get RTMP authentication provider

**Returns:**

RTMP authentication provider

---

## setRTMPAuthProvider

```
public void setRTMPAuthProvider(IPushPublishRTMPAuthProvider rtmpAuthProvider)
```

Set RTMP authentication provider

**Parameters:**

rtmpAuthProvider - RTMP authentication provider

---

## isSendOnMetadata

```
public boolean isSendOnMetadata()
```

True if sending onMetadata event at start of stream

**Returns:**

True if sending onMetadata event at start of stream

---

## setSendOnMetadata

```
public void setSendOnMetadata(boolean sendOnMetadata)
```

(continued from last page)

True if sending onMetadata event at start of stream

**Parameters:**

sendOnMetadata - True if sending onMetadata event at start of stream

---

## isRemoveDefaultAppInstance

```
public boolean isRemoveDefaultAppInstance( )
```

If true and destination application instance is `_definst_` then the application instance name will not be sent to the remove server as part of the connection information.

**Returns:**

true if omitting `_definst_`

---

## setRemoveDefaultAppInstance

```
public void setRemoveDefaultAppInstance(boolean removeDefaultAppInstance)
```

If true and destination application instance is `_definst_` then the application instance name will not be sent to the remove server as part of the connection information.

**Parameters:**

removeDefaultAppInstance - true if omitting `_definst_`

---

## isOnMetadataToSetDataFrame

```
public boolean isOnMetadataToSetDataFrame( )
```

If true all onMetadata events are converted to `@setDataFrame` calls

**Returns:**

true all onMetadata events are converted to `@setDataFrame` calls

---

## setOnMetadataToSetDataFrame

```
public void setOnMetadataToSetDataFrame(boolean onMetadataToSetDataFrame)
```

If true all onMetadata events are converted to `@setDataFrame` calls

**Parameters:**

onMetadataToSetDataFrame - true all onMetadata events are converted to `@setDataFrame` calls

---

## isSendStreamCloseCommands

```
public boolean isSendStreamCloseCommands( )
```

If true will send `FCUnpublish`, `closeStream`, `deleteStream` on disconnect

**Returns:**

true will send close commands

---

## setSendStreamCloseCommands

```
public void setSendStreamCloseCommands(boolean sendStreamCloseCommands)
```

If true will send `FCUnpublish`, `closeStream`, `deleteStream` on disconnect

**Parameters:**

(continued from last page)

sendStreamCloseCommands - true will send close commands

---

## convertDataEventToAMFData

```
public AMFDataList convertDataEventToAMFData(AMFPacket packet)
```

---

## convertOnMetadataToSetDataFrame

```
public AMFPacket convertOnMetadataToSetDataFrame(AMFPacket packet)
```

---

## filterOnMetadataEvent

```
public AMFPacket filterOnMetadataEvent(AMFPacket packet,  
    long flags,  
    java.util.List itemsToRemove,  
    java.util.Map itemsToAdd)
```

---

## getStreamCloseWaitTime

```
public int getStreamCloseWaitTime()
```

Get stream close timeout (milliseconds)

### Returns:

stream close timeout (milliseconds)

---

## setStreamCloseWaitTime

```
public void setStreamCloseWaitTime(int streamCloseWaitTime)
```

Set stream close timeout (milliseconds)

### Parameters:

streamCloseWaitTime - stream close timeout (milliseconds)

---

## disconnect

```
public void disconnect()
```

Disconnect from server

---

## disconnect

```
public void disconnect(boolean hard)
```

---

## isFlashVerionFMLE

```
public static boolean isFlashVerionFMLE(String flashVersion)
```

Returns true if the Flash player version string is a Flash Media Live Encoder version (start with FMLE/ or FME/)

---

(continued from last page)

**Parameters:**

flashVersion - true if Flash Media Live Encoder version

**Returns:**

true if flash

---

## isFlashVersionFMLE

```
public static boolean isFlashVersionFMLE(String flashVersion)
```

Returns true if the Flash player version string is a Flash Media Live Encoder version (start with FMLE/ or FME/)

**Parameters:**

flashVersion - true if Flash Media Live Encoder version

**Returns:**

true if flash

---

## isDebugPackets

```
public boolean isDebugPackets()
```

Set to true to log every packet being sent

**Returns:**

true to log every packet being sent

---

## setDebugPackets

```
public void setDebugPackets(boolean debugPackets)
```

Set to true to log every packet being sent

**Parameters:**

debugPackets - true to log every packet being sent

---

## getTotalPacketsSent

```
public long getTotalPacketsSent()
```

Get total number of packets sent during push publishing session

**Returns:**

total number of packets sent during push publishing session

---

## isResetOnTimecodeOutOfOrder

```
public boolean isResetOnTimecodeOutOfOrder()
```

Set to true if you wish push to reset if timecodes jump out of order.

**Returns:**

true if you wish push to reset if timecodes jump out of order

---

## setResetOnTimecodeOutOfOrder

```
public void setResetOnTimecodeOutOfOrder(boolean resetOnTimecodeOutOfOrder)
```

(continued from last page)

Set to true if you wish push to reset if timecodes jump out of order.

**Parameters:**

resetOnTimecodeOutOfOrder - true if you wish push to reset if timecodes jump out of order

---

## getTimecodesOutOfOrderThreshold

```
public int getTimecodesOutOfOrderThreshold()
```

---

## setTimecodesOutOfOrderThreshold

```
public void setTimecodesOutOfOrderThreshold(int timecodesOutOfOrderThreshold)
```

---

## getLastVideoTC

```
public long getLastVideoTC()
```

Get the absolute timecode of the last sent video packet (milliseconds)

**Returns:**

absolute timecode of the last sent video packet (milliseconds)

---

## getLastVideoKeyFrameTC

```
public long getLastVideoKeyFrameTC()
```

Get the absolute timecode of the last sent video keyframe packet (milliseconds)

**Returns:**

absolute timecode of the last sent video keyframe packet (milliseconds)

---

## getLastAudioTC

```
public long getLastAudioTC()
```

Get the absolute timecode of the last sent audio packet (milliseconds)

**Returns:**

absolute timecode of the last sent audio packet (milliseconds)

---

## getLastDataTC

```
public long getLastDataTC()
```

Get the absolute timecode of the last sent data packet (milliseconds)

**Returns:**

absolute timecode of the last sent data packet (milliseconds)

---

## isOnMetadataReady

```
protected boolean isOnMetadataReady(IMediaStream stream,  
    AMFPacket packet)
```

---

## isWaitOnMetadataAvailable

```
public boolean isWaitOnMetadataAvailable()
```

Set to true to turn on system that will monitor onMetadata packet and wait for it to be populated before it starts sending the stream. Default is true. If stream is audio or video only, be sure to use setWaitOnMetadataVideo and setWaitOnMetadataAudio to properly turn off the channel you are not using or the system will always timeout.

**Returns:**

true to turn on system that will monitor onMetadata packet

---

## setWaitOnMetadataAvailable

```
public void setWaitOnMetadataAvailable(boolean waitOnMetadataAvailable)
```

Set to true to turn on system that will monitor onMetadata packet and wait for it to be populated before it starts sending the stream. Default is true. If stream is audio or video only, be sure to use setWaitOnMetadataVideo and setWaitOnMetadataAudio to properly turn off the channel you are not using or the system will always timeout.

**Parameters:**

waitOnMetadataAvailable - true to turn on system that will monitor onMetadata packet

---

## isWaitOnMetadataVideo

```
public boolean isWaitOnMetadataVideo()
```

If true and waitOnMetadataAvailable, publishing will not start until onMetadata packet is populated with video data.

**Returns:**

publishing will not start until onMetadata packet is populated with video data

---

## setWaitOnMetadataVideo

```
public void setWaitOnMetadataVideo(boolean waitOnMetadataVideo)
```

If true and waitOnMetadataAvailable, publishing will not start until onMetadata packet is populated with video data.

**Parameters:**

waitOnMetadataVideo - publishing will not start until onMetadata packet is populated with video data

---

## isWaitOnMetadataAudio

```
public boolean isWaitOnMetadataAudio()
```

If true and waitOnMetadataAvailable, publishing will not start until onMetadata packet is populated with audio data.

**Returns:**

publishing will not start until onMetadata packet is populated with audio data

---

## setWaitOnMetadataAudio

```
public void setWaitOnMetadataAudio(boolean waitOnMetadataAudio)
```

If true and waitOnMetadataAvailable, publishing will not start until onMetadata packet is populated with audio data.

**Parameters:**

waitOnMetadataAudio - publishing will not start until onMetadata packet is populated with audio data

---

---

## getWaitOnMetadataTimeout

```
public long getWaitOnMetadataTimeout()
```

Timeout (milliseconds) that the wait on onMetadata system will wait looking for video and audio data to be populated.

**Returns:**

timeout (milliseconds) that the wait on onMetadata system will wait looking for video and audio data to be populated

---

## setWaitOnMetadataTimeout

```
public void setWaitOnMetadataTimeout(long waitOnMetadataTimeout)
```

Timeout (milliseconds) that the wait on onMetadata system will wait looking for video and audio data to be populated.

**Parameters:**

waitOnMetadataTimeout - timeout (milliseconds) that the wait on onMetadata system will wait looking for video and audio data to be populated

---

## isWaitOnMetadataVideoDatarate

```
public boolean isWaitOnMetadataVideoDatarate()
```

---

## setWaitOnMetadataVideoDatarate

```
public void setWaitOnMetadataVideoDatarate(boolean waitOnMetadataVideoDatarate)
```

---

## isWaitOnMetadataAudioDatarate

```
public boolean isWaitOnMetadataAudioDatarate()
```

---

## setWaitOnMetadataAudioDatarate

```
public void setWaitOnMetadataAudioDatarate(boolean waitOnMetadataAudioDatarate)
```

---

## getSrcStreamBufferSize

```
public long getSrcStreamBufferSize()
```

The amount of audio/video in milliseconds that must be available in the source streams buffer before push publishing will being.

**Returns:**

amount of audio/video in milliseconds that must be available

---

## setSrcStreamBufferSize

```
public void setSrcStreamBufferSize(long srcStreamBufferSize)
```

---

(continued from last page)

The amount of audio/video in milliseconds that must be available in the source streams buffer before push publishing will being.

**Parameters:**

`srcStreamBufferSize` - amount of audio/video in milliseconds that must be available

---

## **addConnectMetaData**

```
public void addConnectMetaData(String key,  
    AMFData value)
```

Added metadata values to the connect metadata object

**Parameters:**

`key` - key

`value` - [AMFDataObj](#) value

---

## **createPushPublishSession**

```
public IPushPublishSession createPushPublishSession()
```

---

## **getPacketsSentAudio**

```
public long getPacketsSentAudio()
```

---

## **getPacketsSentVideo**

```
public long getPacketsSentVideo()
```

---

## **getPacketsSentVideoKeyFrame**

```
public long getPacketsSentVideoKeyFrame()
```

---

## **getPacketsSentData**

```
public long getPacketsSentData()
```

---

## **isSSL**

```
public boolean isSSL()
```

---

## **setSSL**

```
public void setSSL(boolean isSSL)
```

---

---

## getBindAddress

```
public String getBindAddress()
```

---

## setBindAddress

```
public void setBindAddress(String bindAddress)
```

---

## getConnectedState

```
public int getConnectedState()
```

---

## getMessagesAttemptedCount

```
public long getMessagesAttemptedCount()
```

---

## getMessagesRetriedCount

```
public long getMessagesRetriedCount()
```

---

## getMessagesFailedCount

```
public long getMessagesFailedCount()
```

---

## getSyncTimecode

```
public long getSyncTimecode()
```

---

## setSyncTimecode

```
public void setSyncTimecode(long syncTimecode)
```

---

## getSyncPacketType

```
public int getSyncPacketType()
```

---

## setSyncPacketType

```
public void setSyncPacketType(int syncPacketType)
```

---

(continued from last page)

---

## Fields

### CLASS

`public static final java.lang.Class CLASS`

### CLASSNAME

`public static final java.lang.String CLASSNAME`

Constant value: **PushPublishRTMPAkamaiHandler**

### SendToBackupServer

`protected boolean SendToBackupServer`

The is backup.

## Constructors

(continued from last page)

## PushPublishRTMPAkamaiHandler

```
public PushPublishRTMPAkamaiHandler()
```

## Methods

### init

```
public void init(IApplicationInstance appInstance2,  
                String streamName,  
                IMediaStream stream,  
                java.util.Map profileData,  
                java.util.Map maps,  
                com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,  
                boolean debug)
```

Initiates the instance.

### load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

### setUserName

```
public void setUsername(String userName)
```

Set user name.

### setPassword

```
public void setPassword(String password)
```

Set password.

### setAkamaiOriginIp

```
public void setAkamaiOriginIp(String akamaiOriginIp)
```

Set Akamai Origin IP.

#### Parameters:

akamaiOriginIp - Akamai Origin IP

### setAkamaiOriginPort

```
public void setAkamaiOriginPort(String akamaiOriginPort)
```

### setAkamaiStreamId

```
public void setAkamaiStreamId(String id)
```

Sets the akamai stream id.

(continued from last page)

**Parameters:**

id - the new akamai stream id

---

**setStreamId**

```
public void setStreamId(String id)
```

---

**setAkamaiUserName**

```
public void setAkamaiUserName(String string)
```

Set Akamai user name

---

**setAkamaiPassword**

```
public void setAkamaiPassword(String string)
```

Set Akamai password

---

**getStreamAngle**

```
public String getStreamAngle()
```

---

**setStreamAngle**

```
public void setStreamAngle(String streamAngleIn)
```

---

**getStreamBandWidth**

```
public String getStreamBandWidth()
```

---

**setStreamBandWidth**

```
public void setStreamBandWidth(String streamBandWidth)
```

---

**createAkamaiStreamName**

```
public String createAkamaiStreamName(String dstStreamName,  
    IMediaStream stream)
```

## Constructor Summary

public	<a href="#">PushPublishRTMPPProfileHandler()</a> Instantiates a new push publisher rtmp.
--------	---

## Method Summary

String	<a href="#">getDstAppInstanceName()</a> Get destination appInstance name.
String	<a href="#">getDstApplicationName()</a> Get destination application name.
String	<a href="#">getLocalBindAddress()</a> Get local bind address for the connection.
void	<a href="#">init(IApplicationInstance appInstance2, String streamName, IMediaStream stream, java.util.Map profileData, java.util.Map maps, com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher, boolean debug)</a>
boolean	<a href="#">isDebugLog()</a> Is debug logging turned on.
boolean	<a href="#">isDebugPackets()</a> Checks if is debug packets.
boolean	<a href="#">isUsePingPong()</a> Is RTMP ping pong support enabled.
void	<a href="#">load(java.util.HashMap dataMap)</a>
void	<a href="#">setApplication(String dstApplicationNameIN)</a> Set destination application name.
void	<a href="#">setConnectionFlashVersion(String connectionFlashVersion)</a> Set Flash version used in connection metadata.
void	<a href="#">setConnectionInfoPageURL(String connectionPageURL)</a> Set Page URL used in connection metadata.
void	<a href="#">setConnectionInfoQueryString(String connectionQueryStr)</a> Set the connection query string.

void	<a href="#"><u>setConnectionInfoSwfURL</u></a> (String connectionSwfURL) Set SWF URL used in connection metadata.
void	<a href="#"><u>setConnectionTimeout</u></a> (String connectionTimeout)
void	<a href="#"><u>setConnectLastAttempt</u></a> (String connectLastAttempt)
void	<a href="#"><u>setConnectLastSuccess</u></a> (String connectLastSuccess)
void	<a href="#"><u>setDebugPackets</u></a> (boolean debugPackets) Sets the debug packets.
void	<a href="#"><u>setDebugPackets</u></a> (String debugPacketsIn) Sets the debug packets.
void	<a href="#"><u>setDstAppInstanceName</u></a> (String dstAppInstanceName)
void	<a href="#"><u>setDstApplicationName</u></a> (String string) Sets the dst application name.
void	<a href="#"><u>setDstStreamName</u></a> (String dstStreamNameIn)
void	<a href="#"><u>setHowToPublish</u></a> (String howToPublish)
void	<a href="#"><u>setlocalBindAddress</u></a> (String bindAddress) Sets the local bind address for the connection.
void	<a href="#"><u>setOnMetadataToSetDataFrame</u></a> (String onMetadataToSetDataFrame)
void	<a href="#"><u>setOriginalTimecodeThreshold</u></a> (String originalTimecodeThreshold) Sets the original timecode threshold.
void	<a href="#"><u>setQueryString</u></a> (String queryString)
void	<a href="#"><u>setReconnectWaitTime</u></a> (String reconnectWaitTime)
void	<a href="#"><u>setRemoveDefaultAppInstance</u></a> (String removeDefaultAppInstance) Sets the removes the default app instance.
void	<a href="#"><u>setResetOnTimecodeOutOfOrder</u></a> (String resetOnTimecodeOutOfOrder) Set to true if you wish push to reset if timecodes jump out of order.
void	<a href="#"><u>setSecureTokenSharedSecret</u></a> (String secureTokenSharedSecret) Set SecureToken shared secret.
void	<a href="#"><u>setSendFCAnnounce</u></a> (String sendFCAnnounce)
void	<a href="#"><u>setSendFCPublish</u></a> (String sendFCPublish) Sets the send fc publish.
void	<a href="#"><u>setSendOnMetadata</u></a> (String sendOnMetadata)
void	<a href="#"><u>setSendOriginalTimecodes</u></a> (String sendOriginalTimecodes) Sets the send original timecodes.

void	<a href="#"><u>setSendReleaseStream</u></a> (String sendReleaseStream) Sets the send release stream.
void	<a href="#"><u>setSendStreamCloseCommands</u></a> (String sendStreamCloseCommands) Sets the send stream close commands.
void	<a href="#"><u>setSSL</u></a> (String sslStr)
void	<a href="#"><u>setStreamCloseWaitTime</u></a> (String streamCloseWaitTime)
void	<a href="#"><u>setTimecodesOutOfOrderThreshold</u></a> (String timecodesOutOfOrderThreshold)
void	<a href="#"><u>setUsePingPong</u></a> (boolean usePingPong) Sets the RTMP ping pong support parameter.
void	<a href="#"><u>setUsePingPong</u></a> (String usePingPong) Sets the RTMP ping pong support parameter.
void	<a href="#"><u>setValidationFrequency</u></a> (String validationFrequency)
void	<a href="#"><u>setWaitOnMetadataAudio</u></a> (String waitOnMetadataAudio)
void	<a href="#"><u>setWaitOnMetadataAudioDatarate</u></a> (String waitOnMetadataAudioDatarate)
void	<a href="#"><u>setWaitOnMetadataAvailable</u></a> (String waitOnMetadataAvailable)
void	<a href="#"><u>setWaitOnMetadataTimeout</u></a> (String waitOnMetadataTimeout) Timeout (milliseconds) that the wait on onMetadata system will wait looking for video and audio data to be populated.
void	<a href="#"><u>setWaitOnMetadataVideo</u></a> (String waitOnMetadataVideo)
void	<a href="#"><u>setWaitOnMetadataVideoDatarate</u></a> (String waitOnMetadataVideoDatarate)

## Fields

### CLASS

```
public static final java.lang.Class CLASS
```

### CLASSNAME

```
public static final java.lang.String CLASSNAME
```

Constant value: **PushPublishRTMPPProfileHandler**

### streamId

```
protected java.lang.String streamId
```

The stream id.

## Constructors

(continued from last page)

## PushPublishRTMPProfileHandler

```
public PushPublishRTMPProfileHandler()
```

Instantiates a new push publisher rtmp.

**Throws:**

LicensingException - the licensing exception

## Methods

### setConnectionTimeout

```
public void setConnectionTimeout(String connectionTimeout)
```

### setSendFCPublish

```
public void setSendFCPublish(String sendFCPublish)
```

Sets the send fc publish.

**Parameters:**

sendFCPublish - the new send fc publish

### setSendReleaseStream

```
public void setSendReleaseStream(String sendReleaseStream)
```

Sets the send release stream.

**Parameters:**

sendReleaseStream - the new send release stream

### setConnectionInfoQueryString

```
public void setConnectionInfoQueryString(String connectionQueryStr)
```

Set the connection query string.

**Parameters:**

connectionQueryStr - connection query string

### setConnectionFlashVersion

```
public void setConnectionFlashVersion(String connectionFlashVersion)
```

Set Flash version used in connection metadata.

**Parameters:**

connectionFlashVersion - Flash version used in connection metadata

### setConnectionInfoSwfURL

```
public void setConnectionInfoSwfURL(String connectionSwfURL)
```

---

(continued from last page)

Set SWF URL used in connection metadata.

**Parameters:**

connectionSwfURL - SWF URL used in connection metadata

---

## setConnectionInfoPageURL

```
public void setConnectionInfoPageURL(String connectionPageURL)
```

Set Page URL used in connection metadata.

**Parameters:**

connectionPageURL - Page URL used in connection metadata

---

## setSecureTokenSharedSecret

```
public void setSecureTokenSharedSecret(String secureTokenSharedSecret)
```

Set SecureToken shared secret.

**Parameters:**

secureTokenSharedSecret - SecureToken shared secret

---

## setSendFCAnnounce

```
public void setSendFCAnnounce(String sendFCAnnounce)
```

---

## setValidationFrequency

```
public void setValidationFrequency(String validationFrequency)
```

---

## setConnectLastAttempt

```
public void setConnectLastAttempt(String connectLastAttempt)
```

---

## setReconnectWaitTime

```
public void setReconnectWaitTime(String reconnectWaitTime)
```

---

## setConnectLastSuccess

```
public void setConnectLastSuccess(String connectLastSuccess)
```

---

## setSendOriginalTimecodes

```
public void setSendOriginalTimecodes(String sendOriginalTimecodes)
```

Sets the send original timecodes.

---

(continued from last page)

**Parameters:**

sendOriginalTimecodes - the new send original timecodes

---

**setSendOnMetadata**

```
public void setSendOnMetadata(String sendOnMetadata)
```

---

**setRemoveDefaultAppInstance**

```
public void setRemoveDefaultAppInstance(String removeDefaultAppInstance)
```

Sets the removes the default app instance.

**Parameters:**

removeDefaultAppInstance - the new removes the default app instance

---

**setHowToPublish**

```
public void setHowToPublish(String howToPublish)
```

Set the howToPublish string (valid values are "live", "record" and "append")

---

**setOnMetadataToSetDataFrame**

```
public void setOnMetadataToSetDataFrame(String onMetadataToSetDataFrame)
```

---

**setSendStreamCloseCommands**

```
public void setSendStreamCloseCommands(String sendStreamCloseCommands)
```

Sets the send stream close commands.

**Parameters:**

sendStreamCloseCommands - the new send stream close commands

---

**setStreamCloseWaitTime**

```
public void setStreamCloseWaitTime(String streamCloseWaitTime)
```

---

**setOriginalTimecodeThreshold**

```
public void setOriginalTimecodeThreshold(String originalTimecodeThreshold)
```

Sets the original timecode threshold.

**Parameters:**

originalTimecodeThreshold - the new original timecode threshold

---

**setQueryString**

```
public void setQueryString(String queryString)
```

---

(continued from last page)

Set the queryString, as set in the map file

---

### **setResetOnTimecodeOutOfOrder**

```
public void setResetOnTimecodeOutOfOrder(String resetOnTimecodeOutOfOrder)
```

Set to true if you wish push to reset if timecodes jump out of order.

**Parameters:**

resetOnTimecodeOutOfOrder - true if you wish push to reset if timecodes jump out of order

---

### **setTimecodesOutOfOrderThreshold**

```
public void setTimecodesOutOfOrderThreshold(String timecodesOutOfOrderThreshold)
```

---

### **setWaitOnMetadataTimeout**

```
public void setWaitOnMetadataTimeout(String waitOnMetadataTimeout)
```

Timeout (milliseconds) that the wait on onMetadata system will wait looking for video and audio data to be populated.

**Parameters:**

waitOnMetadataTimeout - the new timeout value (milliseconds-string)

---

### **setWaitOnMetadataAvailable**

```
public void setWaitOnMetadataAvailable(String waitOnMetadataAvailable)
```

---

### **setWaitOnMetadataVideo**

```
public void setWaitOnMetadataVideo(String waitOnMetadataVideo)
```

---

### **setWaitOnMetadataAudio**

```
public void setWaitOnMetadataAudio(String waitOnMetadataAudio)
```

---

### **setWaitOnMetadataVideoDatarate**

```
public void setWaitOnMetadataVideoDatarate(String waitOnMetadataVideoDatarate)
```

---

### **setWaitOnMetadataAudioDatarate**

```
public void setWaitOnMetadataAudioDatarate(String waitOnMetadataAudioDatarate)
```

---

(continued from last page)

---

## setSSL

```
public void setSSL(String sslStr)
```

---

## load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

---

## isDebugPackets

```
public boolean isDebugPackets()
```

Checks if is debug packets.

**Returns:**

true, if is debug packets

---

## setDebugPackets

```
public void setDebugPackets(boolean debugPackets)
```

Sets the debug packets.

**Parameters:**

debugPackets - the new debug packets

---

## setDebugPackets

```
public void setDebugPackets(String debugPacketsIn)
```

Sets the debug packets.

**Parameters:**

debugPacketsIn - the new debug packets

---

## isUsePingPong

```
public boolean isUsePingPong()
```

Is RTMP ping pong support enabled.

**Returns:**

true if ping pong support is enabled

---

## setUsePingPong

```
public void setUsePingPong(boolean usePingPong)
```

Sets the RTMP ping pong support parameter.

**Parameters:**

usePingPong - true to enable RTMP ping pong support

(continued from last page)

## setUsePingPong

```
public void setUsePingPong(String usePingPong)
```

Sets the RTMP ping pong support parameter.

**Parameters:**

usePingPong - "true" to enable RTMP ping pong support

---

## isDebugLog

```
public boolean isDebugLog()
```

Is debug logging turned on.

**Returns:**

true if debug logging is turned on

---

## getDstApplicationName

```
public String getDstApplicationName()
```

Get destination application name.

**Returns:**

destination application name

---

## setApplication

```
public void setApplication(String dstApplicationNameIN)
```

Set destination application name.

**Parameters:**

dstApplicationNameIN - destination application name

---

## setDstApplicationName

```
public void setDstApplicationName(String string)
```

Sets the dst application name.

**Parameters:**

string - the new dst application name

---

## getDstAppInstanceName

```
public String getDstAppInstanceName()
```

Get destination appInstance name.

**Returns:**

destination appInstance name

---

## setlocalBindAddress

```
public void setlocalBindAddress(String bindAddress)
```

---

(continued from last page)

Sets the local bind address for the connection.

**Parameters:**

bindAddress - the local bind address for the connection

---

## getLocalBindAddress

```
public String getLocalBindAddress()
```

Get local bind address for the connection.

**Returns:**

local bind address for the connection

---

## init

```
public void init(IApplicationInstance appInstance2,  
                String streamName,  
                IMediaStream stream,  
                java.util.Map profileData,  
                java.util.Map maps,  
                com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,  
                boolean debug)
```

Initiates the instance.

---

## setDstStreamName

```
public void setDstStreamName(String dstStreamNameIn)
```

Set destination stream name

---

## setDstAppInstanceName

```
public void setDstAppInstanceName(String dstAppInstanceName)
```

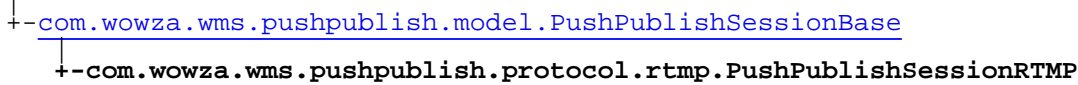

Set destination appInstance name

---

## com.wowza.wms.pushpublish.protocol.rtmp

### Class PushPublishSessionRTMP

java.lang.Object

All Implemented Interfaces:

[IPushPublishSession](#)

public class **PushPublishSessionRTMP**  
 extends [PushPublishSessionBase](#)

Fields inherited from class [com.wowza.wms.pushpublish.model.PushPublishSessionBase](#)

[profile](#), [pushPublishImpl](#), [stream](#), [type](#)

Fields inherited from interface [com.wowza.wms.pushpublish.model.IPushPublishSession](#)

[PUSHPUBLISHSESSION\\_TYPE\\_RTMP](#), [PUSHPUBLISHSESSION\\_TYPE\\_RTP](#),  
[PUSHPUBLISHSESSION\\_TYPE\\_UNKNOWN](#)

## Constructor Summary

public	<a href="#">PushPublishSessionRTMP()</a>
--------	--

Methods inherited from class [com.wowza.wms.pushpublish.model.PushPublishSessionBase](#)

[getContextStr](#), [getDestinationID](#), [getProfile](#), [getPushPublishImpl](#), [getStream](#), [getType](#),  
[setProfile](#), [setPushPublishImpl](#), [setStream](#)

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait,  
 wait

Methods inherited from interface [com.wowza.wms.pushpublish.model.IPushPublishSession](#)

[getContextStr](#), [getDestinationID](#), [getProfile](#), [getPushPublishImpl](#), [getStream](#), [getType](#),  
[setProfile](#), [setPushPublishImpl](#), [setStream](#)

## Constructors

### PushPublishSessionRTMP

public **PushPublishSessionRTMP**()

---

Package

**com.wowza.wms.pushpublish.protocol.rtp**

## com.wowza.wms.pushpublish.protocol.rtp Class PushPublishRTP

java.lang.Object

└- [com.wowza.wms.pushpublish.model.PushPublishBase](#)

└- [com.wowza.wms.pushpublish.protocol.rtp.PushPublishRTP](#)

All Implemented Interfaces:

[IPushPublish](#)

public class **PushPublishRTP**  
extends [PushPublishBase](#)

The Class PushPublishRTP.

### Field Summary

protected	<a href="#">audioHost</a> The audio host.
protected	<a href="#">audioPort</a> The audio port.
public static final	<a href="#">CLASS</a>
public static final	<a href="#">CLASSNAME</a> Value: <b>PushPublishRTP</b>
protected	<a href="#">isRTPWrapped</a> The is rtp wrapped.
protected	<a href="#">lock</a>
protected	<a href="#">mRtpDestination</a> The m rtp destination.
protected	<a href="#">removeSDPFiles</a> The remove sdp files
protected	<a href="#">rtpPushPublishSession</a> The rtp push publish session.
public static final	<a href="#">SDPFILEEXTENSION</a> The Constant SDPFILEEXTENSION. Value: <b>.sdp</b>
protected	<a href="#">singleStreamAV</a> The stream packetizer.
protected	<a href="#">videoHost</a> The video host.

protected	<a href="#">videoPort</a> The video port.
protected	<a href="#">writeSDPFiles</a> The write sdp files.

Fields inherited from class [com.wowza.wms.pushpublish.model.PushPublishBase](#)

## Fields

### CLASS

public static final java.lang.Class **CLASS**

### CLASSNAME

public static final java.lang.String **CLASSNAME**

Constant value: **PushPublishRTP**

### SDPFILEEXTENSION

public static final java.lang.String **SDPFILEEXTENSION**

The Constant SDPFILEEXTENSION.

Constant value: **.sdp**

### rtpPushPublishSession

protected com.wowza.wms.rtp.model.RTPPushPublishSession **rtpPushPublishSession**

The rtp push publish session.

### singleStreamAV

protected boolean **singleStreamAV**

The stream packetizer.

### audioPort

protected int **audioPort**

The audio port.

---

## videoPort

protected int **videoPort**

The video port.

---

## audioHost

protected java.lang.String **audioHost**

The audio host.

---

## videoHost

protected java.lang.String **videoHost**

The video host.

---

## isRTPWrapped

protected boolean **isRTPWrapped**

The is rtp wrapped.

---

## writeSDPFiles

protected boolean **writeSDPFiles**

The write sdp files.

---

## removeSDPFiles

protected boolean **removeSDPFiles**

The remove sdp files

---

## mRtpDestination

protected com.wowza.wms.rtp.model.RTPDestination **mRtpDestination**

The m rtp destination.

---

## lock

protected java.lang.Object **lock**

---

## Constructors

### PushPublishRTP

public **PushPublishRTP**()

---

## Methods

(continued from last page)

## init

```
public void init(IApplicationInstance appInstance,  
                String streamName,  
                IMediaStream stream,  
                java.util.Map profileData,  
                java.util.Map maps,  
                com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,  
                boolean debug)
```

Initiates the instance.

---

## connect

```
public void connect()
```

---

## disconnect

```
public void disconnect()
```

---

## disconnect

```
public void disconnect(boolean hard)
```

---

## resetConnection

```
public void resetConnection()
```

---

## resetConnection

```
public void resetConnection(int delay)
```

---

## getRTTPushPublishSession

```
public RTTPushPublishSession getRTTPushPublishSession()
```

Gets the rTP push publish session.

**Returns:**

the rTP push publish session

---

## setRTTPushPublishSession

```
public void setRTTPushPublishSession(RTTPushPublishSession rtpPushPublishSession)
```

Sets the rTP push publish session.

**Parameters:**

(continued from last page)

---

rtpPushPublishSession - the new rTP push publish session

---

## getAppInstance

```
public IApplicationInstance getAppInstance()
```

Get appInstance interface.

---

## setAppInstance

```
public void setAppInstance(IApplicationInstance appInstance)
```

Set appInstance interface.

---

## isSingleStreamAV

```
public boolean isSingleStreamAV()
```

Checks if is stream is packatized.

**Returns:**

true, if is stream packetizer

---

## setSingleStreamAV

```
public void setSingleStreamAV(boolean inSingleStreamAV)
```

Sets the stream packetizer.

**Parameters:**

inSingleStreamAV - whether stream is packatized

---

## setSingleStreamAV

```
public void setSingleStreamAV(String inSingleStreamAV)
```

---

## getHostname

```
public String getHostname()
```

Get destination server host name.

---

## setHostname

```
public void setHostname(String hostname)
```

---

## setPort

```
public void setPort(int port)
```

Set destination server port.

**Parameters:**

port - destination server port

---

---

## setPort

```
public void setPort(String portIn)
```

Set destination server port.

---

## getAudioPort

```
public int getAudioPort()
```

Gets the audio port.

**Returns:**

the audio port

---

## setAudioPort

```
public void setAudioPort(int audioPort)
```

Sets the audio port.

**Parameters:**

audioPort - the new audio port

---

## getAudioHost

```
public String getAudioHost()
```

Gets the audio host.

**Returns:**

the audio host

---

## setAudioHost

```
public void setAudioHost(String audioHost)
```

Sets the audio host.

**Parameters:**

audioHost - the new audio host

---

## getVideoHost

```
public String getVideoHost()
```

Gets the video host.

**Returns:**

the video host

---

## setVideoHost

```
public void setVideoHost(String videoHost)
```

Sets the video host.

---

(continued from last page)

**Parameters:**

videoHost - the new video host

---

**setAudioPort**

```
public void setAudioPort(String audioPort)
```

Sets the audio port.

**Parameters:**

audioPort - the new audio port

---

**getVideoPort**

```
public int getVideoPort()
```

Gets the video port.

**Returns:**

the video port

---

**setVideoPort**

```
public void setVideoPort(String videoPort)
```

Sets the video port.

**Parameters:**

videoPort - the new video port

---

**isRTPWrapped**

```
public boolean isRTPWrapped()
```

Checks if is rTP wrapped.

**Returns:**

true, if is rTP wrapped

---

**setRTPWrapped**

```
public void setRTPWrapped(String string)
```

Sets the rTP wrapped.

**Parameters:**

string - the new rTP wrapped

---

**getHostType**

```
public String getHostType()
```

Gets the host type.

**Returns:**

the host type

(continued from last page)

---

## setHostType

```
public void setHostType(String hostType)
```

Sets the host type.

**Parameters:**

hostType - the new host type

---

## setTimeToLive

```
public void setTimeToLive(String ttl)
```

Sets the time to live.

**Parameters:**

ttl - the new time to live

---

## getTimeToLive

```
public int getTimeToLive()
```

Gets the time to live.

**Returns:**

the time to live

---

## load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

---

## getRtpStreamWaitTimeout

```
public long getRtpStreamWaitTimeout()
```

---

## setRtpStreamWaitTimeout

```
public void setRtpStreamWaitTimeout(String rtpStreamWaitTimeout)
```

---

## setRtpStreamWaitTimeout

```
public void setRtpStreamWaitTimeout(long rtpStreamWaitTimeout)
```

---

## createPushPublishSession

```
public IPushPublishSession createPushPublishSession()
```

---

(continued from last page)

---

**getContextStr**

```
public String getContextStr()
```

---

---

**getmRtpDestination**

```
public RTPDestination getmRtpDestination()
```

---

---

**getConnectedState**

```
public int getConnectedState()
```

---

---

**setConnectionStatus**

```
public void setConnectionStatus(Boolean connected)
```

---

---

**getMessagesAttemptedCount**

```
public long getMessagesAttemptedCount()
```

---

---

**getMessagesRetriedCount**

```
public long getMessagesRetriedCount()
```

---

---

**getMessagesFailedCount**

```
public long getMessagesFailedCount()
```

---

---

**add**

```
public void add(IOPerformanceCounter totalValue)
```

---

---

**addIOPerformance2**

```
public void addIOPerformance2(IOPerformanceCounter totalIOPerformanceResult)
```

---

## com.wowza.wms.pushpublish.protocol.rtp Class PushPublishRTPRunner

```

java.lang.Object
  |
  +- java.lang.Thread
        |
        +- com.wowza.wms.pushpublish.protocol.rtp.PushPublishRTPRunner
  
```

All Implemented Interfaces:  
Runnable

```

public class PushPublishRTPRunner
extends Thread
  
```

The Class RTPStarter. Utility class to starts an RTP session for push publishing

### Field Summary

public static final	<a href="#">CLASS</a>
public static final	<a href="#">CLASSNAME</a> Value: <b>PushPublishRTPRunner</b>

#### Fields inherited from class java.lang.Thread

MAX\_PRIORITY, MIN\_PRIORITY, NORM\_PRIORITY

### Constructor Summary

public	<a href="#">PushPublishRTPRunner</a> ( <a href="#">PushPublishRTP</a> pushPublisherRTP, <a href="#">RTPDestination</a> rtpDestination) Instantiates a new rTP PushPublishRTPRunner.
--------	--

### Method Summary

void	<a href="#">disconnect</a> ()
void	<a href="#">run</a> ()

#### Methods inherited from class java.lang.Thread

activeCount, checkAccess, clone, countStackFrames, currentThread, destroy, dumpStack, enumerate, getAllStackTraces, getContextClassLoader, getDefaultUncaughtExceptionHandler, getId, getName, getPriority, getStackTrace, getState, getThreadGroup, getUncaughtExceptionHandler, holdsLock, interrupt, interrupted, isAlive, isDaemon, isInterrupted, join, join, join, resume, run, setContextClassLoader, setDaemon, setDefaultUncaughtExceptionHandler, setName, setPriority, setUncaughtExceptionHandler, sleep, sleep, start, stop, stop, suspend, toString, yield

#### Methods inherited from class java.lang.Object

```
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait
```

Methods inherited from interface `java.lang.Runnable`

```
run
```

## Fields

### CLASS

```
public static final java.lang.Class CLASS
```

### CLASSNAME

```
public static final java.lang.String CLASSNAME
```

Constant value: **PushPublishRTPRunner**

## Constructors

### PushPublishRTPRunner

```
public PushPublishRTPRunner(PushPublishRTP pushPublisherRTP,  
                             RTPDestination rtpDestination)
```

Instantiates a new rTP PushPublishRTPRunner.

#### Parameters:

`pushPublisherRTP` - the push publisher rtp  
`rtpDestination` - the rtp destination

## Methods

### disconnect

```
public void disconnect()
```

### run

```
public void run()
```

## com.wowza.wms.pushpublish.protocol.rtp Class PushPublishRTSPActionNotify

java.lang.Object

└-com.wowza.wms.pushpublish.protocol.rtp.PushPublishRTSPActionNotify

All Implemented Interfaces:

[IRTSPActionNotify](#)

```
public class PushPublishRTSPActionNotify
extends Object
implements IRTSPActionNotify
```

The Class PushPublishRTSPActionNotify.

### Constructor Summary

public	<a href="#">PushPublishRTSPActionNotify</a> (com.wowza.wms.pushpublish.module.ModulePushPublish modulePushPublish) Instantiates a new push publish rtsp action notify.
--------	---

### Method Summary

void	<a href="#">onAnnounce</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)
void	<a href="#">onDescribe</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)
void	<a href="#">onGetParameter</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)
void	<a href="#">onOptions</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)
void	<a href="#">onPause</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)

void	<a href="#">onRecord</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)
void	<a href="#">onRedirect</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)

void	<a href="#">onSetParameter</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)
void	<a href="#">onSetup</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)
void	<a href="#">onTeardown</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)

#### Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

#### Methods inherited from interface [com.wowza.wms.rtp.model.IRTSPActionNotify](#)

[onAnnounce](#), [onDescribe](#), [onGetParameter](#), [onOptions](#), [onPause](#), [onPlay](#), [onRecord](#), [onRedirect](#), [onSetParameter](#), [onSetup](#), [onTeardown](#)

## Constructors

### PushPublishRTSPActionNotify

```
public PushPublishRTSPActionNotify(com.wowza.wms.pushpublish.module.ModulePushPublish modulePushPublish)
```

Instantiates a new push publish rtsp action notify.

#### Parameters:

`modulePushPublish` - the module push publish

## Methods

### onDescribe

```
public void onDescribe(RTPSession rtspSession,
    com.wowza.wms.rtsp.RTSPRequestMessage req,
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

### onAnnounce

```
public void onAnnounce(RTPSession rtspSession,
    com.wowza.wms.rtsp.RTSPRequestMessage req,
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

### onGetParameter

```
public void onGetParameter(RTPSession rtspSession,
    com.wowza.wms.rtsp.RTSPRequestMessage req,
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

(continued from last page)

---

## onSetParameter

```
public void onSetParameter(RTPSession rtspSession,  
    com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

---

## onOptions

```
public void onOptions(RTPSession rtspSession,  
    com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

---

## onPause

```
public void onPause(RTPSession rtspSession,  
    com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

---

## onPlay

```
public void onPlay(RTPSession rtspSession,  
    com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

---

## onRecord

```
public void onRecord(RTPSession rtspSession,  
    com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

---

## onRedirect

```
public void onRedirect(RTPSession rtspSession,  
    com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

---

## onSetup

```
public void onSetup(RTPSession rtspSession,  
    com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

---

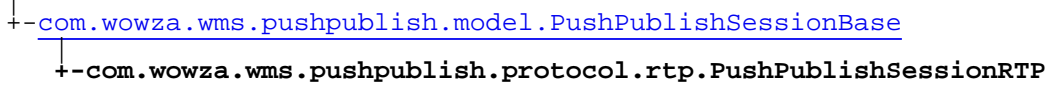

(continued from last page)

## onTeardown

```
public void onTeardown(RTPSession rtspSession,  
    com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

## com.wowza.wms.pushpublish.protocol.rtp Class PushPublishSessionRTP

## Fields

### CLASS

```
public static final java.lang.Class CLASS
```

### CLASSNAME

```
public static final java.lang.String CLASSNAME
```

Constant value: **PushPublishHTTPSanJoseAkamai**

### LIVESTREAMPACKETIZER\_NAME

```
public static final java.lang.String LIVESTREAMPACKETIZER_NAME
```

Constant value: **sanjosestreamingpacketizer**

---

## HTTPADAPTER\_NAME

```
public static final java.lang.String HTTPADAPTER_NAME
```

Constant value: **sanjosestreaming**

---

## BITRATEKBPSPLACHOLDER

```
public static final java.lang.String BITRATEKBPSPLACHOLDER
```

Constant value: **{bitrateKbps}**

---

## STREAMNAMEPLACHOLDER

```
public static final java.lang.String STREAMNAMEPLACHOLDER
```

Constant value: **{streamName}**

---

## SETLEVELPLAYLISTNAME

```
public static final java.lang.String SETLEVELPLAYLISTNAME
```

Constant value: **setlevelmanifest.f4m**

---

## REPRESENTATIONID

```
public static final java.lang.String REPRESENTATIONID
```

Constant value: **{bitrateKbps}kbps**

---

## STREAMLEVELPLAYLISTNAME

```
public static final java.lang.String STREAMLEVELPLAYLISTNAME
```

Constant value: **{bitrateKbps}kbps.f4m**

---

## BOOTSTRAPURL

```
public static final java.lang.String BOOTSTRAPURL
```

Constant value: **{bitrateKbps}kbps.bootstrap**

---

## BOOTSTRAPINFOLD

```
public static final java.lang.String BOOTSTRAPINFOLD
```

Constant value: **bootstrap{bitrateKbps}kbps**

---

(continued from last page)

## MEDIAURLFILENAME

```
public static final java.lang.String MEDIAURLFILENAME
```

Constant value: `{bitrateKbps}kbps`

## CHUNKLISTNAME

```
public static final java.lang.String CHUNKLISTNAME
```

Constant value: `playlist.abst`

## CHUNKIDPLACEHOLDER

```
public static final java.lang.String CHUNKIDPLACEHOLDER
```

Constant value: `{chunkId}`

## CHUNKMEDIANAME

```
public static final java.lang.String CHUNKMEDIANAME
```

Constant value: `{bitrateKbps}kbpsSeg1-Frag{chunkId}`

## TAB1

```
public static final java.lang.String TAB1
```

Constant value:

## TAB2

```
public static final java.lang.String TAB2
```

Constant value:

## AKAMAISANJOSECHUNKDURATION

```
public static final int AKAMAISANJOSECHUNKDURATION
```

Constant value: `6000`

## Constructors

### PushPublishHTTPSanJoseAkamaiHandler

```
public PushPublishHTTPSanJoseAkamaiHandler()
```

## Methods

(continued from last page)

## init

```
public void init(IApplicationInstance appInstance,  
                String streamName,  
                IMediaStream stream,  
                java.util.Map profileData,  
                java.util.Map maps,  
                com.wowza.wms.pushpublish.manager.IPushPublisher pushPublisher,  
                boolean streamDebug)
```

Inits the instance.

---

## getSetLevelMediaElements

```
public String getSetLevelMediaElements(boolean forABRPlaylist)
```

---

## getStreamLevelMediaElements

```
public String getStreamLevelMediaElements(LiveStreamPacketizerSanJose packetizer)
```

---

## getPlaylistF4M

```
public String getPlaylistF4M(LiveStreamPacketizerSanJose packetizer,  
                             boolean setLevel)
```

---

## createOutputItem

```
public PushPublishHTTPOutputItem createOutputItem(ILiveStreamPacketizer  
liveStreamPacketizer,  
int lastChunkIndex)
```

---

## outputSend

```
public void outputSend(PushPublishHTTPOutputItem outputItem)
```

---

## getContextStr

```
public String getContextStr()
```

---

## getPlaybackChunklistURL

```
public String getPlaybackChunklistURL(String filename,  
                                       boolean forABRPlaylist)
```

(continued from last page)

---

## resetNewPacketizer

```
public void resetNewPacketizer(ILiveStreamPacketizer liveStreamPacketizer)
```

---

## sendGroupPlaylist

```
public void sendGroupPlaylist(String groupName,  
    ManifestModel manifest)
```

---

## getGroupPlaylistRenditionDescription

```
public String getGroupPlaylistRenditionDescription(boolean forABRPlaylist)
```

---

## isGroupReady

```
public Boolean isGroupReady(java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups)
```

---

## adaptiveGroupPlaylistNeedsUpdating

```
public Boolean adaptiveGroupPlaylistNeedsUpdating(long lastUpdateTime,  
    java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups)
```

---

## getPlaylistProperties

```
public WMSProperties getPlaylistProperties()
```

---

## padInt

```
public String padInt(int value,  
    int len)
```

---

## connect

```
public void connect()
```

---

## disconnect

```
public void disconnect()
```

---

---

## disconnect

```
public void disconnect(boolean hard)
```

---

## isDeleteSentChunks

```
public boolean isDeleteSentChunks()
```

---

## setDeleteSentChunks

```
public void setDeleteSentChunks(boolean deleteSentChunks)
```

---

## setRepresentationId

```
public void setRepresentationId(String representationId)
```

---

## isDebugLog

```
public boolean isDebugLog()
```

---

## setDebugLog

```
public void setDebugLog(boolean debugLog)
```

Set debug logging.

---

## getLiveStreamPacketizerName

```
public String getLiveStreamPacketizerName()
```

---

## getPacketizerLock

```
public Object getPacketizerLock(ILiveStreamPacketizer liveStreamPacketizer)
```

---

## getLastChunkId

```
public int getLastChunkId(ILiveStreamPacketizer liveStreamPacketizer)
```

---

## getChunkDurationTarget

```
public int getChunkDurationTarget(ILiveStreamPacketizer liveStreamPacketizer)
```

---

(continued from last page)

---

## outputOpen

```
public boolean outputOpen()
```

---

---

## outputClose

```
public boolean outputClose()
```

---

---

## getConnectedState

```
public int getConnectedState()
```

---

---

## getMessagesAttemptedCount

```
public long getMessagesAttemptedCount()
```

---

---

## getMessagesRetriedCount

```
public long getMessagesRetriedCount()
```

---

---

## getMessagesFailedCount

```
public long getMessagesFailedCount()
```

---

---

## load

```
public void load(java.util.HashMap dataMap)
```

Loads map and profile parameters

---

---

## error

```
public void error(int errorCode)
```

---

---

## onWriteEntry

```
public void onWriteEntry(java.util.Map oldEntry,  
    java.util.Map newEntry)
```

---

(continued from last page)

---

## onReadEntry

```
public void onReadEntry(java.util.Map entry)
```

---

## onDeleteEntry

```
public void onDeleteEntry(java.util.Map entry)
```

---

## validateEntry

```
public boolean validateEntry(java.util.Map entry)
```

---

## isParent

```
public boolean isParent(java.util.Map entry)
```

---

## isTargetedStream

```
public boolean isTargetedStream(java.util.Map entry,  
    String streamName)
```

---

## createGroupPlaylist

```
public ManifestModel createGroupPlaylist(String id,  
    java.util.List groupingsByRedundantPairs,  
    java.util.List groupingsByAbrGroups,  
    IApplicationInstance appInstance,  
    String context,  
    WMSProperties properties)
```

---

## setVHost

```
public void setVHost(IVHost vhost)
```

---

## setApplicationName

```
public void setApplicationName(String appName)
```

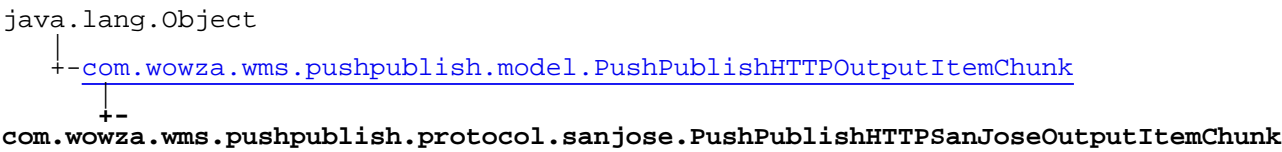

---

```

Bump the reconnect wait time

---

### getConnectionTimeout

```
public int getConnectionTimeout()
```

Get the connection timeout (milliseconds)

**Returns:**

connection timeout (milliseconds)

---

### setConnectionTimeout

```
public void setConnectionTimeout(int connectionTimeout)
```

Set the connection timeout (milliseconds)

**Parameters:**

connectionTimeout - connection timeout (milliseconds)

---

(continued from last page)

---

## resolveHostName

protected String **resolveHostName**()

---

## getLocalListeners

protected java.util.List **getLocalListeners**()

Get a list of IPushPublishShoutcastNotify listeners

**Returns:**

list of IPushPublishShoutcastNotify listeners

---

## addListener

public void **addListener**([IPushPublishShoutcastNotify](#) listener)

Add IPushPublishShoutcastNotify listener

**Parameters:**

listener - IPushPublishShoutcastNotify listener

---

## notifyConnect

protected void **notifyConnect**([IPushPublishShoutcastConnector](#) pushPublisherSession)

---

## notifyConnectStart

protected void **notifyConnectStart**([IPushPublishShoutcastConnector](#) pushPublisherSession)

## com.wowza.wms.response Class ResponseFunction

java.lang.Object

└─com.wowza.wms.response.ResponseFunction

public class **ResponseFunction**  
extends Object

ResponseFunction: class for sending status messages to the client.

### Field Summary

public	<a href="#">doBreak</a>
--------	-------------------------

### Constructor Summary

public	<a href="#">ResponseFunction</a> ( <a href="#">IClient</a> client) Create an empty ResponseFunction
public	<a href="#">ResponseFunction</a> ( <a href="#">INetConnection</a> netConnection) Create an empty ResponseFunction
public	<a href="#">ResponseFunction</a> ( <a href="#">INetConnection</a> netConnection, <a href="#">AMFObj</a> amfObj) Create an empty ResponseFunction
public	<a href="#">ResponseFunction</a> ( <a href="#">IClient</a> client, <a href="#">AMFObj</a> amfObj) Create an empty ResponseFunction
public	<a href="#">ResponseFunction</a> ( <a href="#">IMediaStream</a> stream, <a href="#">AMFObj</a> amfObj) Create an empty ResponseFunction

### Method Summary

void	<a href="#">addBody</a> ( <a href="#">AMFData</a> body) Add AMFData to the body of the message.
void	<a href="#">addBytes</a> (byte[] inbytes) Add raw AMFData bytes[] to message body
void	<a href="#">createBroadcastMessage</a> (java.nio.ByteBuffer messageBytes) Create broadcast message.
void	<a href="#">createConnectMessage</a> (String inName, double inResultNum) Create net connection connect message.
void	<a href="#">createDefaultMessage</a> (String inName, double inResultNum) Create a default message (onStatus type messages).
void	<a href="#">createEnhancedSeekMessage</a> (byte[] messageBuffer, int src, int tc)

void	<a href="#"><u>createPlayStatusMessage</u></a> (String inName) Create onPlayStatus message.
void	<a href="#"><u>createSeekMessage</u></a> (String inName) Create a seek result message.
void	<a href="#"><u>createSOMessage</u></a> (byte[] messageBuffer, int objectEncoding) Create shared object message.
long	<a href="#"><u>getTimecode</u></a> () Get function timecode (milliseconds).
int	<a href="#"><u>getType</u></a> () Get message type.
boolean	<a href="#"><u>isForceAMF0</u></a> ()
void	<a href="#"><u>setBody</u></a> (int index, <a href="#"><u>AMFData</u></a> body) Add AMFData to the body of the message.
void	<a href="#"><u>setForceAMF0</u></a> (boolean forceAMF0)
void	<a href="#"><u>setMessageBytes</u></a> (byte[] messageBytes)
void	<a href="#"><u>setRetAMFNumber</u></a> (int innum) Set the return channel id
void	<a href="#"><u>setSrc</u></a> (int src) Set the src (stream id) for the message.
void	<a href="#"><u>setTimecode</u></a> (long timecode) Set function timecode (milliseconds).
void	<a href="#"><u>setType</u></a> (int type) Set message type.
int	<a href="#"><u>write</u></a> (java.io.OutputStream out, boolean isAbsTimecode, int chunkSize) Write message directly to OutputStream
int	<a href="#"><u>write</u></a> (java.io.OutputStream out, int chunkSize) Write message directly to OutputStream.

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### doBreak

public boolean **doBreak**

(continued from last page)

## Constructors

### ResponseFunction

```
public ResponseFunction(IClient client)
```

Create an empty ResponseFunction

**Parameters:**

client - client

### ResponseFunction

```
public ResponseFunction(INetConnection netConnection)
```

Create an empty ResponseFunction

**Parameters:**

netConnection - net connection

### ResponseFunction

```
public ResponseFunction(INetConnection netConnection,  
                        AMFObj amfObj)
```

Create an empty ResponseFunction

**Parameters:**

netConnection - net connection

amfObj - amf object

### ResponseFunction

```
public ResponseFunction(IClient client,  
                        AMFObj amfObj)
```

Create an empty ResponseFunction

**Parameters:**

client - client object

amfObj - amf object

### ResponseFunction

```
public ResponseFunction(IMediaStream stream,  
                        AMFObj amfObj)
```

Create an empty ResponseFunction

**Parameters:**

stream - media stream object

amfObj - amf object

## Methods

### setSrc

```
public void setSrc(int src)
```

(continued from last page)

Set the src (stream id) for the message.

**Parameters:**

src - src (stream id)

---

## createDefaultMessage

```
public void createDefaultMessage(String inName,  
    double inResultNum)
```

Create a default message (onStatus type messages).

**Parameters:**

inName - handler name (example: onStatus)

inResultNum - result number of 0 if not result

---

## createConnectMessage

```
public void createConnectMessage(String inName,  
    double inResultNum)
```

Create net connection connect message.

**Parameters:**

inName - handler name (example: connection)

inResultNum - result number if 0 not a result

---

## createSeekMessage

```
public void createSeekMessage(String inName)
```

Create a seek result message.

**Parameters:**

inName - handler name (example: onStatus)

---

## createPlayStatusMessage

```
public void createPlayStatusMessage(String inName)
```

Create onPlayStatus message.

**Parameters:**

inName - handler name (example: onPlayStatus)

---

## setMessageBytes

```
public void setMessageBytes(byte[] messageBytes)
```

---

## createBroadcastMessage

```
public void createBroadcastMessage(java.nio.ByteBuffer messageBytes)
```

Create broadcast message. Used for ByteBuffer handler calls.

**Parameters:**

(continued from last page)

messageBytes - ByteBuffer with raw AMFData bytes to be sent to client

---

## createSOMessage

```
public void createSOMessage(byte[] messageBuffer,  
    int objectEncoding)
```

Create shared object message. Used for ByteBuffer handler calls.

**Parameters:**

messageBuffer

---

## createEnhancedSeekMessage

```
public void createEnhancedSeekMessage(byte[] messageBuffer,  
    int src,  
    int tc)
```

---

## addBody

```
public void addBody(AMFData body)
```

Add AMFData to the body of the message.

**Parameters:**

body - AMFData message

---

## setBody

```
public void setBody(int index,  
    AMFData body)
```

Add AMFData to the body of the message.

**Parameters:**

index - index in body list

body - AMFData message

---

## addBytes

```
public void addBytes(byte[] inbytes)
```

Add raw AMFData bytes[] to message body

**Parameters:**

inbytes - raw AMFData bytes[]

---

## setRetAMFNumber

```
public void setRetAMFNumber(int innum)
```

Set the return channel id

**Parameters:**

innum - return channel id

(continued from last page)

## getTimecode

```
public long getTimecode()
```

Get function timecode (milliseconds).

**Returns:**

function timecode (milliseconds)

---

## setTimecode

```
public void setTimecode(long timecode)
```

Set function timecode (milliseconds).

**Parameters:**

timecode - function timecode (milliseconds)

---

## setType

```
public void setType(int type)
```

Set message type. See IVHost.CONTENTTYPE\_\*

**Parameters:**

type - message type

---

## getType

```
public int getType()
```

Get message type. See IVHost.CONTENTTYPE\_\*

**Returns:**

message type

---

## write

```
public int write(java.io.OutputStream out,  
int chunkSize)
```

Write message directly to OutputStream.

**Parameters:**

out - OutputStream

**Returns:**

number of bytes written

---

## isForceAMF0

```
public boolean isForceAMF0()
```

---

## setForceAMF0

```
public void setForceAMF0(boolean forceAMF0)
```

(continued from last page)

---

**write**

```
public int write(java.io.OutputStream out,  
                boolean isAbsTimecode,  
                int chunkSize)
```

Write message directly to OutputStream

**Parameters:**

out - OutputStream  
isAbsTimecode - is timecode absolute

**Returns:**

number of bytes written

## com.wowza.wms.response Class ResponseFunctions

java.lang.Object

└─com.wowza.wms.response.ResponseFunctions

public class **ResponseFunctions**  
extends Object

ResponseFunctions: collection of ResponseFunction objects. This interface is used to asynchronously collect up a set of client responses that will be sent to the client at the next opportunity.

### Constructor Summary

public	<a href="#">ResponseFunctions()</a>
--------	-------------------------------------

### Method Summary

void	<a href="#">add(ResponseFunction wmsResponseFunction)</a> Add a function.
void	<a href="#">clear()</a>
boolean	<a href="#">isPending()</a> Are there any pending items in the list.
int	<a href="#">output(java.io.OutputStream out, int sendChunkSize)</a> Write all functions (in order added to list) to OutputStream.

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### ResponseFunctions

public **ResponseFunctions()**

## Methods

### add

public void **add**([ResponseFunction wmsResponseFunction](#))

Add a function.

(continued from last page)

**Parameters:**wmsResponseFunction - function

---

**clear**

```
public void clear()
```

**isPending**

```
public boolean isPending()
```

Are there any pending items in the list.

**Returns:**

true if items in list

---

**output**

```
public int output(java.io.OutputStream out,  
int sendChunkSize)
```

Write all functions (in order added to list) to OutputStream.

**Parameters:**

out - OutputStream

**Returns:**

total number of bytes written

---

## com.wowza.wms.response Class ResponseStream

java.lang.Object

└─com.wowza.wms.response.ResponseStream

public class **ResponseStream**  
extends Object

### Constructor Summary

public	<a href="#">ResponseStream</a> ( <a href="#">IMediaStream</a> stream)

## Constructors

### ResponseStreams

public **ResponseStreams**()

## Methods

### addStreamResponse

public void **addStreamResponse**([IMediaStream](#) stream)

(continued from last page)

**output**

```
public int output(java.io.OutputStream out,  
    IClient clientInt)
```

---

**isPending**

```
public boolean isPending()
```

---

**size**

```
public int size()
```

---

---

Package

**com.wowza.wms.rtp.model**

---

## com.wowza.wms.rtp.model Interface IRTPEncryptionProvider

---

public interface **IRTPEncryptionProvider**  
extends

---

### Method Summary

void	<a href="#">onTrack</a> ( <a href="#">RTPSession</a> rtpSession, RTPTrack rtpTrack)
------	---

---

### Methods

#### **onTrack**

```
public void onTrack(RTPSession rtpSession,  
                    RTPTrack rtpTrack)
```

---

## com.wowza.wms.rtp.model Interface IRTTPMessageHandler

---

public interface **IRTTPMessageHandler**  
extends

IRTTPMessageHandler: Internal use.

---

### Method Summary

void	<a href="#">handleMessage</a> (java.net.SocketAddress socketAddr, byte[] buffer, int offset, int len)
------	---

---

### Methods

#### handleMessage

```
public void handleMessage(java.net.SocketAddress socketAddr,  
    byte[] buffer,  
    int offset,  
    int len)
```

com.wowza.wms.rtp.model

# Interface IRTPMetadataProvider

public interface **IRTPMetadataProvider**  
extends

IRTPMetadataProvider: Internal use.

Method Summary	
byte[]	<a href="#">getMetadataPacket</a> ( <a href="#">RTPStream</a> stream)

## Methods

**getMetadataPacket**  
public byte[] **getMetadataPacket**([RTPStream](#) stream)

com.wowza.wms.rtp.model

# Interface IRTPSessionNotify

public interface **IRTPSessionNotify**  
extends

IRTPSessionNotify: listener interface for RTP sessions. See RTPSessions.addSessionListener(IRTPSessionNotify listener)

Method Summary	
void	<a href="#">onRTPSessionCreate</a> ( <a href="#">RTPSession</a> rtpSession) Invoked when RTP session is created
void	<a href="#">onRTPSessionDestroy</a> ( <a href="#">RTPSession</a> rtpSession) Invoked when RTP session is destroyed

## Methods

### onRTPSessionCreate

public void **onRTPSessionCreate**([RTPSession](#) rtpSession)

    Invoked when RTP session is created

**Parameters:**  
    rtpSession - RTP session

### onRTPSessionDestroy

public void **onRTPSessionDestroy**([RTPSession](#) rtpSession)

    Invoked when RTP session is destroyed

**Parameters:**  
    rtpSession - RTP session

## com.wowza.wms.rtp.model Interface IRTSPActionNotify

All Known Implementing Classes:

[PushPublishRTSPActionNotify](#)

public interface **IRTSPActionNotify**  
extends

IRTSPActionNotify: listener interface for RTSP actions. See RTPSession.addActionListener(IRTSPActionNotify actionListener)

### Method Summary

void	<a href="#">onAnnounce</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by ANNOUNCE command
void	<a href="#">onDescribe</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by DESCRIBE command
void	<a href="#">onGetParameter</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by GET_PARAMETER command
void	<a href="#">onOptions</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by OPTIONS command
void	<a href="#">onPause</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by PAUSE command
void	<a href="#">onPlay</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by PLAY command
void	<a href="#">onRecord</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by RECORD command
void	<a href="#">onRedirect</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by REDIRECT command
void	<a href="#">onSetParameter</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by SET_PARAMETER command
void	<a href="#">onSetup</a> ( <a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked by SETUP command

void

```
onTearardown(RTPSession rtspSession,  
com.wowza.wms.rtp.RTSPRequestMessage req,  
com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by TEARDOWN command

## Methods

### onDescribe

```
public void onDescribe(RTPSession rtspSession,  
com.wowza.wms.rtp.RTSPRequestMessage req,  
com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by DESCRIBE command

**Parameters:**

rtspSession - RTP session  
req - RTP request  
resp - RTP response

### onAnnounce

```
public void onAnnounce(RTPSession rtspSession,  
com.wowza.wms.rtp.RTSPRequestMessage req,  
com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by ANNOUNCE command

**Parameters:**

rtspSession - RTP session  
req - RTP request  
resp - RTP response

### onSetParameter

```
public void onSetParameter(RTPSession rtspSession,  
com.wowza.wms.rtp.RTSPRequestMessage req,  
com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by SET\_PARAMETER command

**Parameters:**

rtspSession - RTP session  
req - RTP request  
resp - RTP response

### onGetParameter

```
public void onGetParameter(RTPSession rtspSession,  
com.wowza.wms.rtp.RTSPRequestMessage req,  
com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by GET\_PARAMETER command

**Parameters:**

rtspSession - RTP session  
req - RTP request  
resp - RTP response

## onOptions

```
public void onOptions(RTPSession rtspSession,  
    com.wowza.wms.rtp.RTSPRequestMessage req,  
    com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by OPTIONS command

### Parameters:

rtspSession - RTP session  
req - RTP request  
resp - RTP response

---

## onPause

```
public void onPause(RTPSession rtspSession,  
    com.wowza.wms.rtp.RTSPRequestMessage req,  
    com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by PAUSE command

### Parameters:

rtspSession - RTP session  
req - RTP request  
resp - RTP response

---

## onPlay

```
public void onPlay(RTPSession rtspSession,  
    com.wowza.wms.rtp.RTSPRequestMessage req,  
    com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by PLAY command

### Parameters:

rtspSession - RTP session  
req - RTP request  
resp - RTP response

---

## onRecord

```
public void onRecord(RTPSession rtspSession,  
    com.wowza.wms.rtp.RTSPRequestMessage req,  
    com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by RECORD command

### Parameters:

rtspSession  
req  
resp

---

## onRedirect

```
public void onRedirect(RTPSession rtspSession,  
    com.wowza.wms.rtp.RTSPRequestMessage req,  
    com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by REDIRECT command

---

(continued from last page)

**Parameters:**

rtspSession - RTP session  
req - RTP request  
resp - RTP response

---

**onSetup**

```
public void onSetup(RTPSession rtspSession,  
    com.wowza.wms.rtp.RTSPRequestMessage req,  
    com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by SETUP command

**Parameters:**

rtspSession - RTP session  
req - RTP request  
resp - RTP response

---

**onTeardown**

```
public void onTeardown(RTPSession rtspSession,  
    com.wowza.wms.rtp.RTSPRequestMessage req,  
    com.wowza.wms.rtp.RTSPResponseMessages resp)
```

Invoked by TEARDOWN command

**Parameters:**

rtspSession - RTP session  
req - RTP request  
resp - RTP response

## com.wowza.wms.rtp.model

### Class RTPContext

java.lang.Object

└-com.wowza.wms.rtp.model.RTPContext

public class **RTPContext**  
extends Object

RTPContext: RTP context

#### Constructor Summary

public	<a href="#">RTPContext</a> ( <a href="#">IVHost</a> vhost) Constructor
--------	---

#### Method Summary

boolean	<a href="#">acquireSocketAddress</a> (java.net.SocketAddress socketAddress) Acquire UDP socket address
int	<a href="#">acquireUDPPortPair</a> () Acquire next available UDP port pair
int	<a href="#">acquireUDPPortPair</a> (int port) Acquire UDP port pair
void	<a href="#">cacheRTPStream</a> ( <a href="#">RTPStream</a> stream) Cache an RTP stream, Internal use.
void	<a href="#">doWatchdog</a> () Idle events for cleanup
boolean	<a href="#">existsRTSPTunnelingSession</a> (String sessionId) Return true if session id is valid RTSP/RTP tunneling session id
int[]	<a href="#">expandToPortPair</a> (int port) Expand a single port to a pair.
RTPPacketizerItem	<a href="#">getAudioPacketizerItem</a> ( <a href="#">IApplicationInstance</a> appInstance, int codecId) Get audio packetizer for a given codec id.
com.wowza.wms.rtp.dep acketizer.RTPDePacket izerList	<a href="#">getDePacketizerList</a> () Get a list of the available depacketizers
String	<a href="#">getDePacketizerName</a> (RTPTrack rtpTrack) Get a depacketizer by name
Object	<a href="#">getLock</a> () Get the UDP port manager lock
Object	<a href="#">getRTSPTunnelingLock</a> () Get the RTSP/RTP tunneling lock

com.wowza.wms.rtsp.RTSP TunnelingSession	<a href="#">getRTSP TunnelingSession</a> (String sessionId) Get RTSP/RTP tunneling session by session id
<a href="#">RTPSessions</a>	<a href="#">getSessions</a> () Get RTP sessions
RTPPacketizerItem	<a href="#">getStreamPacketizerItem</a> ( <a href="#">IApplicationInstance</a> appInstance, int codecId) Get stream packetizer for a given codec id.
UDPTransportManager	<a href="#">getUDPTransportManager</a> () Get the UDP transport manager
<a href="#">IVHost</a>	<a href="#">getVHost</a> () Get vhost
RTPPacketizerItem	<a href="#">getVideoPacketizerItem</a> ( <a href="#">IApplicationInstance</a> appInstance, int codecId) Get video packetizer for a given codec id.
void	<a href="#">init</a> () Initialize
boolean	<a href="#">isUDPPortDebugLog</a> ()
void	<a href="#">putAudioPacketizerItem</a> (int codecId, RTPPacketizerItem rtpPacketizerInfo) Set the audio packetizer for a given codec id
void	<a href="#">putRTSP TunnelingSession</a> (String sessionId, com.wowza.wms.rtsp.RTSP TunnelingSession rtspTunnelingSession) Remove RTSP/RTP tunneling session by session id
void	<a href="#">putStreamPacketizerItem</a> (int codecId, RTPPacketizerItem rtpPacketizerInfo) Set the stream packetizer for a given codec id
void	<a href="#">putVideoPacketizerItem</a> (int codecId, RTPPacketizerItem rtpPacketizerInfo) Set the video packetizer for a given codec id
boolean	<a href="#">releaseSocketAddress</a> (java.net.SocketAddress socketAddress) Release UDP socket address
void	<a href="#">releaseUDPPortPair</a> (int port) Release port pair
com.wowza.wms.rtsp.RTSP TunnelingSession	<a href="#">removeRTSP TunnelingSession</a> (String sessionId) Remove RTSP/RTP tunneling session by session id
void	<a href="#">shutdown</a> () Shutdown
void	<a href="#">shutdownRTPSession</a> ( <a href="#">RTPSession</a> rtpSession) Gracefully and forcefully shutdown and RTP session
void	<a href="#">shutdownRTPSession</a> (String sessionId) Gracefully and forcefully shutdown and RTP session
<a href="#">RTPStream</a>	<a href="#">uncacheRTPStream</a> (String streamId) UnCache an RTP stream, Internal use.

**Methods inherited from class** `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Constructors

### RTPContext

```
public RTPContext(IVHost vhost)
```

Constructor

**Parameters:**

vhost - vhost

## Methods

### doWatchdog

```
public void doWatchdog()
```

Idle events for cleanup

### init

```
public void init()
```

Initialize

### shutdown

```
public void shutdown()
```

Shutdown

### getAudioPacketizerItem

```
public RTPPacketizerItem getAudioPacketizerItem(IApplicationInstance appInstance,  
int codecId)
```

Get audio packetizer for a given codec id.

**Parameters:**

appInstance - application instance

codecId - codec id, see IVHost.CODEC\_AUDIO\_\*

**Returns:**

packetizer info

### putAudioPacketizerItem

```
public void putAudioPacketizerItem(int codecId,  
RTPPacketizerItem rtpPacketizerInfo)
```

Set the audio packetizer for a given codec id

(continued from last page)

**Parameters:**

codecId - codec id, see IVHost.CODEC\_AUDIO\_\*  
rtpPacketizerInfo - packetizer info

---

## getVideoPacketizerItem

```
public RTPPacketizerItem getVideoPacketizerItem(IApplicationInstance appInstance,  
int codecId)
```

Get video packetizer for a given codec id.

**Parameters:**

appInstance - application instance  
codecId - codec id, see IVHost.CODEC\_VIDEO\_\*

**Returns:**

packetizer info

---

## putVideoPacketizerItem

```
public void putVideoPacketizerItem(int codecId,  
RTPPacketizerItem rtpPacketizerInfo)
```

Set the video packetizer for a given codec id

**Parameters:**

codecId - codec id, see IVHost.CODEC\_VIDEO\_\*  
rtpPacketizerInfo - packetizer info

---

## getStreamPacketizerItem

```
public RTPPacketizerItem getStreamPacketizerItem(IApplicationInstance appInstance,  
int codecId)
```

Get stream packetizer for a given codec id.

**Parameters:**

appInstance - application instance  
codecId - codec id, see IVHost.CODEC\_STREAM\_\*

**Returns:**

packetizer info

---

## putStreamPacketizerItem

```
public void putStreamPacketizerItem(int codecId,  
RTPPacketizerItem rtpPacketizerInfo)
```

Set the stream packetizer for a given codec id

**Parameters:**

codecId - codec id, see IVHost.CODEC\_STREAM\_\*  
rtpPacketizerInfo - packetizer info

---

## getSessions

```
public RTPSessions getSessions()
```

(continued from last page)

Get RTP sessions

**Returns:**

RTP sessions

---

## getVHost

```
public IVHost getVHost()
```

Get vhost

**Returns:**

vhost

---

## getUDPTransportManager

```
public UDPTransportManager getUDPTransportManager()
```

Get the UDP transport manager

**Returns:**

UDP transport manager

---

## getLock

```
public Object getLock()
```

Get the UDP port manager lock

**Returns:**

UDP port manager lock

---

## acquireSocketAddress

```
public boolean acquireSocketAddress(java.net.SocketAddress socketAddress)
```

Acquire UDP socket address

**Parameters:**

socketAddress - UDP socket address

**Returns:**

true if available

---

## releaseSocketAddress

```
public boolean releaseSocketAddress(java.net.SocketAddress socketAddress)
```

Release UDP socket address

**Parameters:**

socketAddress - UDP socket address

**Returns:**

true if available

---

(continued from last page)

---

## acquireUDPPortPair

```
public int acquireUDPPortPair(int port)
```

Acquire UDP port pair

**Parameters:**

port - starting port

**Returns:**

port

---

## expandToPortPair

```
public int[] expandToPortPair(int port)
```

Expand a single port to a pair. Ports are allocated in pairs always starting with even port number.

**Parameters:**

port - port

**Returns:**

port

---

## acquireUDPPortPair

```
public int acquireUDPPortPair()
```

Acquire next available UDP port pair

**Returns:**

port

---

## releaseUDPPortPair

```
public void releaseUDPPortPair(int port)
```

Release port pair

**Parameters:**

port - first port of pair

---

## isUDPPortDebugLog

```
public boolean isUDPPortDebugLog()
```

---

## cacheRTPStream

```
public void cacheRTPStream(RTPStream stream)
```

Cache an RTP stream, Internal use.

**Parameters:**

stream - RTP stream

---

(continued from last page)

## uncacheRTPStream

```
public RTPStream uncacheRTPStream(String streamId)
```

UnCache an RTP stream, Internal use.

**Parameters:**

streamId - stream id

**Returns:**

RTP Stream

---

## getDePacketizerList

```
public com.wowza.wms.rtp.depaketizer.RTPDePacketizerList getDePacketizerList()
```

Get a list of the available depacketizers

**Returns:**

list of the available depacketizers

---

## getDePacketizerName

```
public String getDePacketizerName(RTPTrack rtpTrack)
```

Get a depacketizer by name

**Parameters:**

rtpTrack - track

**Returns:**

depacketizer

---

## getRTSPTunnelingLock

```
public Object getRTSPTunnelingLock()
```

Get the RTSP/RTP tunneling lock

**Returns:**

RTSP/RTP tunneling lock

---

## getRTSPTunnelingSession

```
public com.wowza.wms.rtsp.RTSPTunnelingSession getRTSPTunnelingSession(String sessionId)
```

Get RTSP/RTP tunneling session by session id

**Parameters:**

sessionId - session id

**Returns:**

RTSP/RTP tunneling session

(continued from last page)

## removeRTSPTunnelingSession

```
public com.wowza.wms.rtp.RTSPTunnelingSession removeRTSPTunnelingSession(String sessionId)
```

Remove RTSP/RTP tunneling session by session id

**Parameters:**

sessionId - session id

**Returns:**

RTSP/RTP tunneling session if removed

---

## existsRTSPTunnelingSession

```
public boolean existsRTSPTunnelingSession(String sessionId)
```

Return true if session id is valid RTSP/RTP tunneling session id

**Parameters:**

sessionId - session id

**Returns:**

true if session id is valid RTSP/RTP tunneling session id

---

## putRTSPTunnelingSession

```
public void putRTSPTunnelingSession(String sessionId,  
    com.wowza.wms.rtp.RTSPTunnelingSession rtspTunnelingSession)
```

Remove RTSP/RTP tunneling session by session id

**Parameters:**

sessionId - session id

rtspTunnelingSession - RTSP/RTP tunneling session

---

## shutdownRTPSession

```
public void shutdownRTPSession(String sessionId)
```

Gracefully and forcefully shutdown and RTP session

**Parameters:**

sessionId

---

## shutdownRTPSession

```
public void shutdownRTPSession(RTPSession rtpSession)
```

Gracefully and forcefully shutdown and RTP session

**Parameters:**

rtpSession - RTP session

## com.wowza.wms.rtp.model Class RTPDestination

java.lang.Object

└─com.wowza.wms.rtp.model.RTPDestination

public class **RTPDestination**  
extends Object

RTPDestination: Fully describes an RTP destination.

### Constructor Summary

public	<a href="#">RTPDestination()</a>
--------	----------------------------------

### Method Summary

String	<a href="#">getAudioHost()</a> Get audio host
int	<a href="#">getAudioPort()</a> Get audio port
String	<a href="#">getHost()</a> Get the host
String	<a href="#">getHostType()</a> Get host type (default IP4)
String	<a href="#">getName()</a> Get name
int	<a href="#">getStreamPort()</a> Get stream port
int	<a href="#">getTTL()</a> Get time to live
String	<a href="#">getVideoHost()</a> Get video host
int	<a href="#">getVideoPort()</a> Get video port
boolean	<a href="#">isMulticast()</a> Return true if multicast destination
boolean	<a href="#">isRTPWrapped()</a> Is stream wrapped in RTP (MPEG-TS in RTP)
boolean	<a href="#">isStream()</a> Return true if stream destination (and not native RTP destination)

void	<a href="#"><code>setAudioHost</code></a> (String audioHost) Set audio host
void	<a href="#"><code>setAudioPort</code></a> (int audioPort) Set audio port
void	<a href="#"><code>setHost</code></a> (String host) Set host
void	<a href="#"><code>setHostType</code></a> (String hostType) Set host type (default IP4)
void	<a href="#"><code>setName</code></a> (String name) Set name
void	<a href="#"><code>setRTPWrapped</code></a> (boolean isRTPWrapped) Is stream wrapped in RTP (MPEG-TS in RTP)
void	<a href="#"><code>setStreamPort</code></a> (int streamPort) Set stream port
void	<a href="#"><code>setTTL</code></a> (int ttl) Set time to live
void	<a href="#"><code>setVideoHost</code></a> (String videoHost) Set video host
void	<a href="#"><code>setVideoPort</code></a> (int videoPort) Set video port
String	<a href="#"><code>toString</code></a> ()

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### RTPDestination

```
public RTPDestination()
```

## Methods

### toString

```
public String toString()
```

(continued from last page)

## isMulticast

```
public boolean isMulticast()
```

Return true if multicast destination

**Returns:**

true if multicast destination

---

## isStream

```
public boolean isStream()
```

Return true if stream destination (and not native RTP destination)

**Returns:**

true if stream destination

---

## getHost

```
public String getHost()
```

Get the host

**Returns:**

host

---

## setHost

```
public void setHost(String host)
```

Set host

**Parameters:**

host - host

---

## getVideoPort

```
public int getVideoPort()
```

Get video port

**Returns:**

video port

---

## setVideoPort

```
public void setVideoPort(int videoPort)
```

Set video port

**Parameters:**

videoPort - video port

---

## getAudioPort

```
public int getAudioPort()
```

(continued from last page)

Get audio port

**Returns:**

audio port

---

## setAudioPort

```
public void setAudioPort(int audioPort)
```

Set audio port

**Parameters:**

audioPort - audio port

---

## getStreamPort

```
public int getStreamPort()
```

Get stream port

**Returns:**

stream port

---

## setStreamPort

```
public void setStreamPort(int streamPort)
```

Set stream port

**Parameters:**

streamPort - stream port

---

## getVideoHost

```
public String getVideoHost()
```

Get video host

**Returns:**

video host

---

## setVideoHost

```
public void setVideoHost(String videoHost)
```

Set video host

**Parameters:**

videoHost - video host

---

## getAudioHost

```
public String getAudioHost()
```

Get audio host

**Returns:**

audio host

## setAudioHost

```
public void setAudioHost(String audioHost)
```

Set audio host

**Parameters:**

audioHost - audio host

---

## getHostType

```
public String getHostType()
```

Get host type (default IP4)

**Returns:**

host type

---

## setHostType

```
public void setHostType(String hostType)
```

Set host type (default IP4)

**Parameters:**

hostType - host type

---

## getTTL

```
public int getTTL()
```

Get time to live

**Returns:**

time to live

---

## setTTL

```
public void setTTL(int ttl)
```

Set time to live

**Parameters:**

ttl - time to live

---

## isRTPWrapped

```
public boolean isRTPWrapped()
```

Is stream wrapped in RTP (MPEG-TS in RTP)

**Returns:**

true if stream wrapped in RTP

---

## setRTPWrapped

```
public void setRTPWrapped(boolean isRTPWrapped)
```

---

(continued from last page)

Is stream wrapped in RTP (MPEG-TS in RTP)

**Parameters:**

isRTPWrapped - true if stream wrapped in RTP

---

## getName

```
public String getName()
```

Get name

**Returns:**

name

---

## setName

```
public void setName(String name)
```

Set name

**Parameters:**

name - name

## com.wowza.wms.rtp.model

### Class RTPPort

java.lang.Object

└─com.wowza.wms.rtp.model.RTPPort

All Implemented Interfaces:

[IUDPMessageHandler](#)

public class **RTPPort**  
 extends Object  
 implements [IUDPMessageHandler](#)

### Constructor Summary

public	<a href="#">RTPPort</a> (String inIpAddress, int inPort, String outIpAddress, int outPort, boolean isMulticast) Constructor
--------	--

### Method Summary

void	<a href="#">bind</a> (int direction) Bind to port
int	<a href="#">getAddressCount</a> () Get address count
<a href="#">IRTPMessageHandler</a>	<a href="#">getHandler</a> () Get the message handler
String	<a href="#">getInIpAddress</a> () Get in IP address
int	<a href="#">getInPort</a> () Get in port
String	<a href="#">getOutIpAddress</a> () Get out IP address
int	<a href="#">getOutPort</a> () Get out port
RTPTrack	<a href="#">getTrack</a> () Get RTP track
int	<a href="#">getTTL</a> () Get time to live (milliseconds)
<a href="#">IUDPTransport</a>	<a href="#">getUDPTransport</a> () Get the UDP transport
void	<a href="#">handleMessage</a> (java.net.SocketAddress socketAddr, Object message)

boolean	<a href="#"><u>isBlockUDPOut</u></a> ( )
boolean	<a href="#"><u>isConnected</u></a> ( )
boolean	<a href="#"><u>isInMulticast</u></a> ( ) Is in stream multicast
boolean	<a href="#"><u>isMulticast</u></a> ( ) Is multicast
boolean	<a href="#"><u>isOutMulticast</u></a> ( ) Is out stream multicast
void	<a href="#"><u>sendMessage</u></a> (byte[] message, int offset, int len) Send a message out
void	<a href="#"><u>sendResponse</u></a> (byte[] message) Send a response
void	<a href="#"><u>sendResponse</u></a> (byte[] message, int offset, int len) Send response
void	<a href="#"><u>sendResponse</u></a> (byte[] message, int offset, int len, java.net.SocketAddress destination, long timecode) Send response to destination
void	<a href="#"><u>sessionClosed</u></a> ( <a href="#"><u>IUDPTransportSession</u></a> session)
void	<a href="#"><u>sessionOpened</u></a> ( <a href="#"><u>IUDPTransportSession</u></a> session)
void	<a href="#"><u>setAddressCount</u></a> (int addressCount) Set address count
void	<a href="#"><u>setBlockUDPOut</u></a> (boolean blockUDPOut)
void	<a href="#"><u>setHandler</u></a> ( <a href="#"><u>IRTPMessageHandler</u></a> handler) Set the message handler
void	<a href="#"><u>setTrack</u></a> (RTPTrack track) Set RTP track
void	<a href="#"><u>setTTL</u></a> (int ttl) Set time to live (milliseconds)
void	<a href="#"><u>shutdown</u></a> ( ) Shutdown port
void	<a href="#"><u>unbind</u></a> ( ) Unbind

#### Methods inherited from class java.lang.Object

## Constructors

### RTPPort

```
public RTPPort(String inIpAddress,
               int inPort,
               String outIpAddress,
               int outPort,
               boolean isMulticast)
```

Constructor

**Parameters:**

inIpAddress - in ip address  
inPort - in port  
outIpAddress - out ip address  
outPort - out port  
isMulticast - true if multicast

## Methods

### getTrack

```
public RTPTrack getTrack()
```

Get RTP track

**Returns:**

RTP track

---

### setTrack

```
public void setTrack(RTPTrack track)
```

Set RTP track

**Parameters:**

track - RTP track

---

### getUDPTransport

```
public IUDPTransport getUDPTransport()
```

Get the UDP transport

**Returns:**

UDP transport

---

### getInIpAddress

```
public String getInIpAddress()
```

Get in IP address

(continued from last page)

**Returns:**  
in IP address

---

## getOutIpAddress

```
public String getOutIpAddress()
```

Get out IP address

**Returns:**  
out IP address

---

## getInPort

```
public int getInPort()
```

Get in port

**Returns:**  
in port

---

## getOutPort

```
public int getOutPort()
```

Get out port

**Returns:**  
out port

---

## isConnected

```
public boolean isConnected()
```

---

## bind

```
public void bind(int direction)
```

Bind to port

**Parameters:**  
direction - in or out, see IUDPTransport.DIRECTION\_\*

---

## unbind

```
public void unbind()
```

Unbind

---

## shutdown

```
public void shutdown()
```

Shutdown port

(continued from last page)

## getHandler

```
public IRTPMessageHandler getHandler()
```

Get the message handler

**Returns:**

message handler

---

## setHandler

```
public void setHandler(IRTPMessageHandler handler)
```

Set the message handler

**Parameters:**

handler - message handler

---

## sendMessage

```
public void sendMessage(byte[] message,  
    int offset,  
    int len)
```

Send a message out

**Parameters:**

message - message

offset - offset

len - len

---

## sendResponse

```
public void sendResponse(byte[] message)
```

Send a response

**Parameters:**

message - message

---

## sendResponse

```
public void sendResponse(byte[] message,  
    int offset,  
    int len)
```

Send response

**Parameters:**

message - message

offset - offset

len - len

(continued from last page)

---

## sendResponse

```
public void sendResponse(byte[] message,  
    int offset,  
    int len,  
    java.net.SocketAddress destination,  
    long timecode)
```

Send response to destination

### Parameters:

message - message  
offset - offset  
len - len  
destination - destination address

---

## sessionOpened

```
public void sessionOpened(IUDPTransportSession session)
```

---

## sessionClosed

```
public void sessionClosed(IUDPTransportSession session)
```

---

## handleMessage

```
public void handleMessage(java.net.SocketAddress socketAddr,  
    Object message)
```

---

## isInMulticast

```
public boolean isInMulticast()
```

Is in stream multicast

### Returns:

true if multicast

---

## isOutMulticast

```
public boolean isOutMulticast()
```

Is out stream multicast

### Returns:

true if multicast

---

## isMulticast

```
public boolean isMulticast()
```

Is multicast

---

(continued from last page)

**Returns:**

true if multicast

---

**getTTL**

```
public int getTTL()
```

Get time to live (milliseconds)

**Returns:**

time to live (milliseconds)

---

**setTTL**

```
public void setTTL(int ttl)
```

Set time to live (milliseconds)

**Parameters:**

ttl - time to live (milliseconds)

---

**getAddressCount**

```
public int getAddressCount()
```

Get address count

**Returns:**

address count

---

**setAddressCount**

```
public void setAddressCount(int addressCount)
```

Set address count

**Parameters:**

addressCount - address count

---

**isBlockUDPOut**

```
public boolean isBlockUDPOut()
```

---

**setBlockUDPOut**

```
public void setBlockUDPOut(boolean blockUDPOut)
```

## com.wowza.wms.rtp.model Class RTPPushPublishSession

java.lang.Object

└─com.wowza.wms.rtp.model.RTPPushPublishSession

public class **RTPPushPublishSession**  
extends Object

RTPPushPublishSession: RTP push publishing session

### Constructor Summary

public	<a href="#">RTPPushPublishSession()</a>
--------	---

### Method Summary

<a href="#">RTPSession</a>	<a href="#">getRTPSession()</a> Get RTP session
String	<a href="#">getSDPData()</a> Get SDP data
void	<a href="#">setRTPSession(<a href="#">RTPSession</a> rtpSession)</a> Set RTP session
void	<a href="#">setSDPData(String sdpData)</a> Set SDP data

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### RTPPushPublishSession

public **RTPPushPublishSession()**

## Methods

### getSDPData

public String **getSDPData()**

Get SDP data

---

(continued from last page)

**Returns:**

SDP data

---

**setSDPData**

```
public void setSDPData(String sdpData)
```

Set SDP data

**Parameters:**

sdpData - SDP data

---

**getRTPSession**

```
public RTPSession getRTPSession()
```

Get RTP session

**Returns:**

RTP session

---

**setRTPSession**

```
public void setRTPSession(RTPSession rtpSession)
```

Set RTP session

**Parameters:**

rtpSession - RTP session

---

## com.wowza.wms.rtp.model Class RTPSession

## Constructor Summary

public	<a href="#">RTPSession</a> (String sessionId) Constructor
--------	--

## Method Summary

void	<a href="#">acceptSession</a> () Accept this session
void	<a href="#">addActionListener</a> ( <a href="#">IRTSPActionNotify</a> actionListener) Add action listener
void	<a href="#">addIOPerformance</a> ( <a href="#">IOPerformanceCounter</a> totalIOPerformanceResult) Internal use
void	<a href="#">addIOPerformance2</a> ( <a href="#">IOPerformanceCounter</a> totalIOPerformanceResult) Internal use
void	<a href="#">addRTSPStream</a> ( <a href="#">RTPStream</a> stream) Add RTP stream
boolean	<a href="#">allPortsConnected</a> ()

void	<a href="#"><u>clearLoggingValues()</u></a> Clear logging values, Internal use.
void	<a href="#"><u>doIdle()</u></a>
<a href="#"><u>IApplicationInstance</u></a>	<a href="#"><u>getAppInstance()</u></a> Get application instance
RTPPacketizerItem	<a href="#"><u>getAudioPacketizerItem(RTPContext rtpContext, IApplicationInstance appInstance, int codecId)</u></a> Get audio packetizer for a given codec id.
<a href="#"><u>IAuthenticateRTSP</u></a>	<a href="#"><u>getAuthenticatePlayHandler()</u></a> Get the authentication play handler
<a href="#"><u>IAuthenticateRTSP</u></a>	<a href="#"><u>getAuthenticatePublishHandler()</u></a> Get the RTP authentication handler
ConnectionHolder	<a href="#"><u>getConnectionHolder()</u></a> Get connection holder, Internal use.
String	<a href="#"><u>getCookieStr()</u></a> Get cookie string
<a href="#"><u>ElapsedTimer</u></a>	<a href="#"><u>getElapsedTime()</u></a> Get the elapsed timer for this RTP session
<a href="#"><u>IRTPEncryptionProvider</u></a>	<a href="#"><u>getEncryptionProvider()</u></a>
int	<a href="#"><u>getIdleFrequency()</u></a> Get idle frequency (milliseconds)
RTPIdleHandler	<a href="#"><u>getIdleHandler()</u></a> Get idle handler
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getIOPerformanceCounter()</u></a> Get IO performance counter
org.apache.mina.common.support.BaseIoSession	<a href="#"><u>getIoSession()</u></a>
String	<a href="#"><u>getIp()</u></a> Get remote IP address
int	<a href="#"><u>getLastAuthenticateMethod()</u></a> Get the last method received
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get properties
String	<a href="#"><u>getQueryStr()</u></a> Get query string
int	<a href="#"><u>getRedirectSessionCode()</u></a>
String	<a href="#"><u>getRedirectSessionMessage()</u></a>

String	<a href="#"><u>getRedirectSessionURL()</u></a>
String	<a href="#"><u>getReferrer()</u></a> Get referrer
RTPWriteListener	<a href="#"><u>getRTPWriteListener()</u></a> Get the RTP write listener for this session
double	<a href="#"><u>getRTSPPlayRangeStart()</u></a> Get play start range, Internal use.
double	<a href="#"><u>getRTSPPlayRangeStop()</u></a> Get play stop range, Internal use.
<a href="#"><u>RTPStream</u></a>	<a href="#"><u>getRTSPStream()</u></a> Get the default RTP Stream (all RTP sessions have a single RTP Stream)
<a href="#"><u>RTPStream</u></a>	<a href="#"><u>getRTSPStream(String streamId)</u></a> Get RTP Stream
String	<a href="#"><u>getRTSPTunnelingSessionId()</u></a> Get the RTSP/RTP tunneling session id
String	<a href="#"><u>getServerIp()</u></a> Get the server IP address
int	<a href="#"><u>getServerPort()</u></a> Get server port
String	<a href="#"><u>getSessionId()</u></a> Get session id
RTPPacketizerItem	<a href="#"><u>getStreamPacketizerItem(RTPContext rtpContext, IApplicationInstance appInstance, int codecId)</u></a> Get stream packetizer for a given codec id.
String	<a href="#"><u>getTimeRunning()</u></a> Get the time running for this RTP session
double	<a href="#"><u>getTimeRunningSeconds()</u></a> Get the number of second this RTP session has been running
String	<a href="#"><u>getUri()</u></a> Get URI
String	<a href="#"><u>getUserAgent()</u></a> Get user agent
<a href="#"><u>IVHost</u></a>	<a href="#"><u>getVHost()</u></a> Get vhost
RTPPacketizerItem	<a href="#"><u>getVideoPacketizerItem(RTPContext rtpContext, IApplicationInstance appInstance, int codecId)</u></a> Get video packetizer for a given codec id.
com.wowza.wms.webrtc. model.WebRTCSession	<a href="#"><u>getWebRTCSession()</u></a>
boolean	<a href="#"><u>isActive()</u></a>

boolean	<a href="#"><u>isAnnounce()</u></a> Has ANNOUNCE command been called on this session
boolean	<a href="#"><u>isAnnounceOrDescribe()</u></a> Has announce or described been called
boolean	<a href="#"><u>isConnected()</u></a> Is session connection
boolean	<a href="#"><u>isDebugRTSPSession()</u></a> True if debugging RTSP session
boolean	<a href="#"><u>isDescribe()</u></a> Has DESCRIBE command been called on this session
boolean	<a href="#"><u>isLoggedConnect()</u></a> Is connect logged
boolean	<a href="#"><u>isRedirectSession()</u></a>
boolean	<a href="#"><u>isSessionValid()</u></a> Is this session valid
boolean	<a href="#"><u>isShutdownClient()</u></a> Is RTP session shutdown
boolean	<a href="#"><u>isWebRTC()</u></a>
void	<a href="#"><u>onAnnounce()</u></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on ANNOUNCE command
void	<a href="#"><u>onDescribe()</u></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on DESCRIBE command
void	<a href="#"><u>onGetParameter()</u></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on GET_PARAMETER command
void	<a href="#"><u>onOptions()</u></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on OPTIONS command
void	<a href="#"><u>onPause()</u></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on PAUSE command
void	<a href="#"><u>onPlay()</u></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on PLAY command
void	<a href="#"><u>onRecord()</u></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on RECORD command
void	<a href="#"><u>onRedirect()</u></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on REDIRECT command

void	<a href="#"><code>onSetParameter</code></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on SET_PARAMETER command
void	<a href="#"><code>onSetup</code></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on SETUP command
void	<a href="#"><code>onTeardown</code></a> (com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp) Invoked on TEARDOWN command
void	<a href="#"><code>putAudioPacketizerItem</code></a> (int codecId, String classPath) Set the audio packetizer for a given codec id
void	<a href="#"><code>putStreamPacketizerItem</code></a> (int codecId, String classPath) Set the stream packetizer for a given codec id
void	<a href="#"><code>putVideoPacketizerItem</code></a> (int codecId, String classPath) Set the video packetizer for a given codec id
void	<a href="#"><code>redirectSession</code></a> (String redirectSessionURL)
void	<a href="#"><code>redirectSession</code></a> (String redirectSessionURL, int redirectSessionCode)
void	<a href="#"><code>rejectSession</code></a> () Reject this session
void	<a href="#"><code>removeActionListener</code></a> ( <a href="#"><code>IRTSPActionNotify</code></a> actionListener) Remove action listener
<a href="#"><code>RTPStream</code></a>	<a href="#"><code>removeRTSPStream</code></a> (String streamId) Remove RTP stream
void	<a href="#"><code>setAnnounce</code></a> (boolean isAnnounce) Set ANNOUNCE command been called on this session
void	<a href="#"><code>setAppInstance</code></a> ( <a href="#"><code>IApplicationInstance</code></a> appInstance) Set application instance
void	<a href="#"><code>setAuthenticatePlayHandler</code></a> ( <a href="#"><code>IAuthenticateRTSP</code></a> authenticatePlayHandler) Set the authentication play handler
void	<a href="#"><code>setAuthenticatePublishHandler</code></a> ( <a href="#"><code>IAuthenticateRTSP</code></a> authenticatePublishHandler) Set the RTP authentication handler
void	<a href="#"><code>setConnected</code></a> (boolean isConnected) Set session is connected
void	<a href="#"><code>setCookieStr</code></a> (String cookieStr) Set cooking string
void	<a href="#"><code>setDebugRTSPSession</code></a> (boolean debugRTSPSession) Set debugging RTSP session
void	<a href="#"><code>setDescribe</code></a> (boolean isDescribe) Set DESCRIBE command been called on this session

void	<a href="#"><u>setEncryptionProvider</u></a> ( <a href="#"><u>IRTPEncryptionProvider</u></a> encryptionProvider)
void	<a href="#"><u>setIdleFrequency</u></a> (int idleFrequency) Set idle frequency (milliseconds)
void	<a href="#"><u>setIdleHandler</u></a> (RTPIIdleHandler idleHandler) Set idle handler
void	<a href="#"><u>setIOPerformanceCounter</u></a> ( <a href="#"><u>IOPerformanceCounter</u></a> ioPerformanceCounter) Set IO performance counter
void	<a href="#"><u>setIoSession</u></a> (org.apache.mina.common.support.BaseIoSession ioSession)
void	<a href="#"><u>setIp</u></a> (String ip) Set remote IP address
void	<a href="#"><u>setLastAuthenticateMethod</u></a> (int lastAuthenticateMethod) Set last method received
void	<a href="#"><u>setLoggedConnect</u></a> (boolean loggedConnect) Set connect logged
void	<a href="#"><u>setQueryStr</u></a> (String queryStr) Set query string
void	<a href="#"><u>setRedirectSession</u></a> (boolean redirectSession)
void	<a href="#"><u>setRedirectSessionCode</u></a> (int redirectSessionCode)
void	<a href="#"><u>setRedirectSessionMessage</u></a> (String redirectSessionMessage)
void	<a href="#"><u>setRedirectSessionURL</u></a> (String redirectSessionURL)
void	<a href="#"><u>setReferrer</u></a> (String referrer) Set referrer
void	<a href="#"><u>setRTSPPlayRangeStart</u></a> (double rtspPlayRangeStart) Set play start range, Internal use.
void	<a href="#"><u>setRTSPPlayRangeStop</u></a> (double rtspPlayRangeStop) Set play stop range, Internal use.
void	<a href="#"><u>setRTSPTunnelingSessionId</u></a> (String rtspTunnelingSessionId) Set the RTSP/RTP tunneling session id
void	<a href="#"><u>setServerIp</u></a> (String serverIp) Set the server IP address
void	<a href="#"><u>setServerPort</u></a> (int serverPort) Set server port
void	<a href="#"><u>setSessionId</u></a> (String sessionId) Set session id
void	<a href="#"><u>setSessionValid</u></a> (boolean isSessionValid) Set session valid

void	<a href="#"><code>setShutdownClient</code></a> (boolean shutdownClient) Set RTP session shutdown
void	<a href="#"><code>setUri</code></a> (String uri) Set URI
void	<a href="#"><code>setUserAgent</code></a> (String userAgent) Set user agent
void	<a href="#"><code>setVHost</code></a> ( <a href="#"><code>IVHost</code></a> vhost) Set vhost
void	<a href="#"><code>setWebRTCSession</code></a> (com.wowza.wms.webrtc.model.WebRTCSession webRTCSession)
void	<a href="#"><code>shutdown</code></a> ( ) shutdown RTP session, Internal use.
void	<a href="#"><code>shutdown</code></a> (RTPRequestStatus status) shutdown RTP session, Internal use.
void	<a href="#"><code>touch</code></a> ( ) Touch the stream so it doesn't timeout
void	<a href="#"><code>updateLoggingValues</code></a> ( ) Update logging values, Internal use.

## Constructors

### RTPSession

```
public RTPSession(String sessionId)
```

Constructor

**Parameters:**

sessionId - session id

## Methods

### acceptSession

```
public void acceptSession()
```

Accept this session

---

### rejectSession

```
public void rejectSession()
```

Reject this session

---

### getSessionId

```
public String getSessionId()
```

Get session id

**Returns:**

session id

---

### setSessionId

```
public void setSessionId(String sessionId)
```

Set session id

**Parameters:**

sessionId - session id

---

(continued from last page)

## addRTSPStream

```
public void addRTSPStream(RTPStream stream)
```

Add RTP stream

**Parameters:**

stream - RTP stream

---

## removeRTSPStream

```
public RTPStream removeRTSPStream(String streamId)
```

Remove RTP stream

**Parameters:**

streamId - stream id

**Returns:**

RTP stream

---

## getRTSPStream

```
public RTPStream getRTSPStream(String streamId)
```

Get RTP Stream

**Parameters:**

streamId - stream id

**Returns:**

RTP Stream

---

## getRTSPStream

```
public RTPStream getRTSPStream()
```

Get the default RTP Stream (all RTP sessions have a single RTP Stream)

**Returns:**

RTP stream

---

## getVHost

```
public IVHost getVHost()
```

Get vhost

**Returns:**

vhost

---

## setVHost

```
public void setVHost(IVHost vhost)
```

Set vhost

**Parameters:**

(continued from last page)

vhost - vhost

---

## getUserAgent

```
public String getUserAgent()
```

Get user agent

**Returns:**

user agent

---

## setUserAgent

```
public void setUserAgent(String userAgent)
```

Set user agent

**Parameters:**

userAgent - user agent

---

## touch

```
public void touch()
```

Touch the stream so it doesn't timeout

---

## shutdown

```
public void shutdown()
```

shutdown RTP session, Internal use.

---

## shutdown

```
public void shutdown(RTPRequestStatus status)
```

shutdown RTP session, Internal use.

**Parameters:**

status

---

## allPortsConnected

```
public boolean allPortsConnected()
```

---

## isSessionValid

```
public boolean isSessionValid()
```

Is this session valid

**Returns:**

true if valid

---

(continued from last page)

## setSessionValid

```
public void setSessionValid(boolean isSessionValid)
```

Set session valid

**Parameters:**

isSessionValid - true if valid

---

## getAuthenticatePublishHandler

```
public IAuthenticateRTSP getAuthenticatePublishHandler()
```

Get the RTP authentication handler

**Returns:**

RTP authentication handler

---

## setAuthenticatePublishHandler

```
public void setAuthenticatePublishHandler(IAuthenticateRTSP  
authenticatePublishHandler)
```

Set the RTP authentication handler

**Parameters:**

authenticatePublishHandler - RTP authentication handler

---

## getAuthenticatePlayHandler

```
public IAuthenticateRTSP getAuthenticatePlayHandler()
```

Get the authentication play handler

**Returns:**

authentication play handler

---

## setAuthenticatePlayHandler

```
public void setAuthenticatePlayHandler(IAuthenticateRTSP authenticatePlayHandler)
```

Set the authentication play handler

**Parameters:**

authenticatePlayHandler - authentication play handler

---

## getLastAuthenticateMethod

```
public int getLastAuthenticateMethod()
```

Get the last method received

**Returns:**

last method received

---

## setLastAuthenticateMethod

```
public void setLastAuthenticateMethod(int lastAuthenticateMethod)
```

---

(continued from last page)

Set last method received

**Parameters:**

lastAuthenticateMethod - last method received

---

## getAppInstance

```
public IApplicationInstance getAppInstance()
```

Get application instance

**Returns:**

application instance

---

## setAppInstance

```
public void setAppInstance(IApplicationInstance appInstance)
```

Set application instance

**Parameters:**

appInstance - application instance

---

## isLoggedConnect

```
public boolean isLoggedConnect()
```

Is connect logged

**Returns:**

true if logged

---

## setLoggedConnect

```
public void setLoggedConnect(boolean loggedConnect)
```

Set connect logged

**Parameters:**

loggedConnect - true if logged

---

## getIp

```
public String getIp()
```

Get remote IP address

**Returns:**

remote IP address

---

## setIp

```
public void setIp(String ip)
```

Set remote IP address

**Parameters:**

ip - remote IP address

## getProperties

```
public WMSProperties getProperties()
```

Get properties

**Returns:**  
properties

---

## isDescribe

```
public boolean isDescribe()
```

Has DESCRIBE command been called on this session

**Returns:**  
true if called

---

## setDescribe

```
public void setDescribe(boolean isDescribe)
```

Set DESCRIBE command been called on this session

**Parameters:**  
isDescribe - true if called

---

## isAnnounce

```
public boolean isAnnounce()
```

Has ANNOUNCE command been called on this session

**Returns:**  
true if called

---

## setAnnounce

```
public void setAnnounce(boolean isAnnounce)
```

Set ANNOUNCE command been called on this session

**Parameters:**  
isAnnounce - true if called

---

## isAnnounceOrDescribe

```
public boolean isAnnounceOrDescribe()
```

Has announce or described been called

**Returns:**  
true if either called

---

## getRTPWriteListener

```
public RTPWriteListener getRTPWriteListener()
```

---

(continued from last page)

Get the RTP write listener for this session

**Returns:**

RTP write listener

---

## addIOPerformance

```
public void addIOPerformance(IOPerformanceCounter totalIOPerformanceResult)
```

Internal use

**Parameters:**

totalIOPerformanceResult - IO performance counter

---

## addIOPerformance2

```
public void addIOPerformance2(IOPerformanceCounter totalIOPerformanceResult)
```

Internal use

**Parameters:**

totalIOPerformanceResult - IO performance counter

---

## getConnectionHolder

```
public ConnectionHolder getConnectionHolder()
```

Get connection holder, Internal use.

**Returns:**

connection holder

---

## isConnected

```
public boolean isConnected()
```

Is session connection

**Returns:**

true if connected

---

## setConnected

```
public void setConnected(boolean isConnected)
```

Set session is connected

**Parameters:**

isConnected - true if connected

---

## getIdleHandler

```
public RTPIdleHandler getIdleHandler()
```

Get idle handler

**Returns:**

idle handler

## setIdleHandler

```
public void setIdleHandler(RTPIIdleHandler idleHandler)
```

Set idle handler

**Parameters:**

idleHandler - idle handler

---

## getServerIp

```
public String getServerIp()
```

Get the server IP address

**Returns:**

IP address

---

## setServerIp

```
public void setServerIp(String serverIp)
```

Set the server IP address

**Parameters:**

serverIp - IP address

---

## getServerPort

```
public int getServerPort()
```

Get server port

**Returns:**

server port

---

## setServerPort

```
public void setServerPort(int serverPort)
```

Set server port

**Parameters:**

serverPort - server port

---

## getUri

```
public String getUri()
```

Get URI

**Returns:**

URI

---

## setUri

```
public void setUri(String uri)
```

---

(continued from last page)

Set URI

**Parameters:**

uri - URI

---

**getReferrer**

```
public String getReferrer()
```

Get referrer

**Returns:**

referrer

---

**setReferrer**

```
public void setReferrer(String referrer)
```

Set referrer

**Parameters:**

referrer - referrer

---

**getQueryStr**

```
public String getQueryStr()
```

Get query string

**Returns:**

query string

---

**setQueryStr**

```
public void setQueryStr(String queryStr)
```

Set query string

**Parameters:**

queryStr - query string

---

**updateLoggingValues**

```
public void updateLoggingValues()
```

Update logging values, Internal use.

---

**clearLoggingValues**

```
public void clearLoggingValues()
```

Clear logging values, Internal use.

---

**addActionListener**

```
public void addActionListener(IRTSPActionNotify actionListener)
```

Add action listener

(continued from last page)

**Parameters:**

actionListener - action listener

---

**removeActionListener**

```
public void removeActionListener(IRTSPActionNotify actionListener)
```

Remove action listener

**Parameters:**

actionListener - action listener

---

**onDescribe**

```
public void onDescribe(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on DESCRIBE command

**Parameters:**

req - RTP request

resp - RTP response

---

**onAnnounce**

```
public void onAnnounce(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on ANNOUNCE command

**Parameters:**

req - RTP request

resp - RTP response

---

**onGetParameter**

```
public void onGetParameter(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on GET\_PARAMETER command

**Parameters:**

req - RTP request

resp - RTP response

---

**onSetParameter**

```
public void onSetParameter(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on SET\_PARAMETER command

**Parameters:**

req - RTP request

resp - RTP response

(continued from last page)

## onOptions

```
public void onOptions(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on OPTIONS command

### Parameters:

req - RTP request  
resp - RTP response

---

## onPause

```
public void onPause(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on PAUSE command

### Parameters:

req - RTP request  
resp - RTP response

---

## onPlay

```
public void onPlay(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on PLAY command

### Parameters:

req - RTP request  
resp - RTP response

---

## onRecord

```
public void onRecord(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on RECORD command

### Parameters:

req - RTP request  
resp - RTP response

---

## onRedirect

```
public void onRedirect(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on REDIRECT command

### Parameters:

req - RTP request  
resp - RTP response

---

## onSetup

```
public void onSetup(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

(continued from last page)

Invoked on SETUP command

**Parameters:**

req - RTP request  
resp - RTP response

---

## onTeardown

```
public void onTeardown(com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Invoked on TEARDOWN command

**Parameters:**

req - RTP request  
resp - RTP response

---

## getIdleFrequency

```
public int getIdleFrequency()
```

Get idle frequency (milliseconds)

**Returns:**

idle frequency (milliseconds)

---

## setIdleFrequency

```
public void setIdleFrequency(int idleFrequency)
```

Set idle frequency (milliseconds)

**Parameters:**

idleFrequency - idle frequency (milliseconds)

---

## isDebugRTSPSession

```
public boolean isDebugRTSPSession()
```

True if debugging RTSP session

**Returns:**

true if debugging RTSP session

---

## setDebugRTSPSession

```
public void setDebugRTSPSession(boolean debugRTSPSession)
```

Set debugging RTSP session

**Parameters:**

debugRTSPSession - true if debugging RTSP session

---

## getRTSPTunnelingSessionId

```
public String getRTSPTunnelingSessionId()
```

Get the RTSP/RTP tunneling session id

---

(continued from last page)

**Returns:**

RTSP/RTP tunneling session id

---

**setRTSPTunnelingSessionId**

```
public void setRTSPTunnelingSessionId(String rtspTunnelingSessionId)
```

Set the RTSP/RTP tunneling session id

**Parameters:**

rtspTunnelingSessionId - RTSP/RTP tunneling session id

---

**getRTSPPlayRangeStart**

```
public double getRTSPPlayRangeStart()
```

Get play start range, Internal use.

**Returns:**

start range

---

**setRTSPPlayRangeStart**

```
public void setRTSPPlayRangeStart(double rtspPlayRangeStart)
```

Set play start range, Internal use.

**Parameters:**

rtspPlayRangeStart - start range

---

**getRTSPPlayRangeStop**

```
public double getRTSPPlayRangeStop()
```

Get play stop range, Internal use.

**Returns:**

stop range

---

**setRTSPPlayRangeStop**

```
public void setRTSPPlayRangeStop(double rtspPlayRangeStop)
```

Set play stop range, Internal use.

**Parameters:**

rtspPlayRangeStop - stop range

---

**getCookieStr**

```
public String getCookieStr()
```

Get cookie string

**Returns:**

cookie string

## setCookieStr

```
public void setCookieStr(String cookieStr)
```

Set cooking string

**Parameters:**

cookieStr - cooking string

---

## getIOPerformanceCounter

```
public IOPerformanceCounter getIOPerformanceCounter()
```

Get IO performance counter

**Returns:**

IO performance counter

---

## setIOPerformanceCounter

```
public void setIOPerformanceCounter(IOPerformanceCounter ioPerformanceCounter)
```

Set IO performance counter

**Parameters:**

ioPerformanceCounter - IO performance counter

---

## isShutdownClient

```
public boolean isShutdownClient()
```

Is RTP session shutdown

**Returns:**

true if shutdown

---

## setShutdownClient

```
public void setShutdownClient(boolean shutdownClient)
```

Set RTP session shutdown

**Parameters:**

shutdownClient - true if shutdown

---

## getAudioPacketizerItem

```
public RTPPacketizerItem getAudioPacketizerItem(RTPContext rtpContext,  
    IApplicationInstance appInstance,  
    int codecId)
```

Get audio packetizer for a given codec id.

**Parameters:**

rtpContext - RTP context

appInstance - application instance

codecId - codec id

---

(continued from last page)

**Returns:**

packetizer info

---

## getVideoPacketizerItem

```
public RTPPacketizerItem getVideoPacketizerItem(RTPContext rtpContext,  
        IApplicationInstance appInstance,  
        int codecId)
```

Get video packetizer for a given codec id.

**Parameters:**

rtpContext - RTP context  
appInstance - application instance  
codecId - codec id

**Returns:**

packetizer info

---

## getStreamPacketizerItem

```
public RTPPacketizerItem getStreamPacketizerItem(RTPContext rtpContext,  
        IApplicationInstance appInstance,  
        int codecId)
```

Get stream packetizer for a given codec id.

**Parameters:**

rtpContext - RTP context  
appInstance - application instance  
codecId - codec id

**Returns:**

packetizer info

---

## putAudioPacketizerItem

```
public void putAudioPacketizerItem(int codecId,  
        String classPath)
```

Set the audio packetizer for a given codec id

**Parameters:**

codecId - codec id  
classPath - class path

---

## putVideoPacketizerItem

```
public void putVideoPacketizerItem(int codecId,  
        String classPath)
```

Set the video packetizer for a given codec id

**Parameters:**

codecId - codec id  
classPath - class path

(continued from last page)

## putStreamPacketizerItem

```
public void putStreamPacketizerItem(int codecId,  
    String classPath)
```

Set the stream packetizer for a given codec id

**Parameters:**

codecId - codec id

classPath - class path

---

## getElapsedTime

```
public ElapsedTimer getElapsedTime()
```

Get the elapsed timer for this RTP session

**Returns:**

elapsed timer

---

## getTimeRunning

```
public String getTimeRunning()
```

Get the time running for this RTP session

**Returns:**

time running as a string

---

## getTimeRunningSeconds

```
public double getTimeRunningSeconds()
```

Get the number of second this RTP session has been running

**Returns:**

number of second this RTP session has been running

---

## isRedirectSession

```
public boolean isRedirectSession()
```

---

## setRedirectSession

```
public void setRedirectSession(boolean redirectSession)
```

---

## getRedirectSessionCode

```
public int getRedirectSessionCode()
```

---

(continued from last page)

---

**setRedirectSessionCode**

```
public void setRedirectSessionCode(int redirectSessionCode)
```

---

**getRedirectSessionURL**

```
public String getRedirectSessionURL()
```

---

**setRedirectSessionURL**

```
public void setRedirectSessionURL(String redirectSessionURL)
```

---

**redirectSession**

```
public void redirectSession(String redirectSessionURL)
```

---

**redirectSession**

```
public void redirectSession(String redirectSessionURL,  
    int redirectSessionCode)
```

---

**getRedirectSessionMessage**

```
public String getRedirectSessionMessage()
```

---

**setRedirectSessionMessage**

```
public void setRedirectSessionMessage(String redirectSessionMessage)
```

---

**getIoSession**

```
public org.apache.mina.common.support.BaseIoSession getIoSession()
```

---

**setIoSession**

```
public void setIoSession(org.apache.mina.common.support.BaseIoSession ioSession)
```

---

**doIdle**

```
public void doIdle()
```

---

(continued from last page)

---

### getEncryptionProvider

```
public IRTPEncryptionProvider getEncryptionProvider()
```

---

### setEncryptionProvider

```
public void setEncryptionProvider(IRTPEncryptionProvider encryptionProvider)
```

---

### isActive

```
public boolean isActive()
```

---

### getWebRTCSession

```
public com.wowza.wms.webrtc.model.WebRTCSession getWebRTCSession()
```

---

### setWebRTCSession

```
public void setWebRTCSession(com.wowza.wms.webrtc.model.WebRTCSession webRTCSession)
```

---

### isWebRTC

```
public boolean isWebRTC()
```

## com.wowza.wms.rtp.model

### Class RTPSessions

java.lang.Object

└─com.wowza.wms.rtp.model.RTPSessions

public class **RTPSessions**  
extends Object

RTPSessions: collection of RTP sessions

#### Constructor Summary

public	<a href="#">RTPSessions</a> ( <a href="#">IVHost</a> vhost) Constructor
--------	--

#### Method Summary

<a href="#">RTPSession</a>	<a href="#">addSession</a> ( <a href="#">RTPSession</a> session) Add RTP session
void	<a href="#">addSessionListener</a> ( <a href="#">IRTPSessionNotify</a> listener) Add a RTP session listener
String	<a href="#">getNextSessionId</a> () Get next RTP session id for new session
<a href="#">RTPSession</a>	<a href="#">getSession</a> (String sessionId) Get RTP session by session id
java.util.List	<a href="#">getSessionIds</a> () Get list of current RTP session ids
<a href="#">IVHost</a>	<a href="#">getVHost</a> () Get vhost
void	<a href="#">notifySessionCreate</a> ( <a href="#">IApplicationInstance</a> appInstance, <a href="#">RTPSession</a> rtpSession) Notify session create
void	<a href="#">notifySessionCreate</a> ( <a href="#">RTPSession</a> rtpSession) Notify session create
void	<a href="#">notifySessionDestroy</a> ( <a href="#">IApplicationInstance</a> appInstance, <a href="#">RTPSession</a> rtpSession) Notify session destroy
void	<a href="#">notifySessionDestroy</a> ( <a href="#">RTPSession</a> rtpSession) Notify session destroy
void	<a href="#">releaseSessionId</a> (String sessionIdStr) Release an RTP session id

<a href="#">RTPSession</a>	<a href="#">removeSession</a> ( <a href="#">RTPSession</a> session) Remove RTP session by object
<a href="#">RTPSession</a>	<a href="#">removeSession</a> (String sessionId) Remove RTP session by session id
void	<a href="#">removeSessionListener</a> ( <a href="#">IRTPSessionNotify</a> listener) Remove an RTP session listener

**Methods inherited from class** java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### RTPSessions

```
public RTPSessions(IVHost vhost)
```

Constructor

**Parameters:**

vhost - vhost

## Methods

### getNextSessionId

```
public String getNextSessionId()
```

Get next RTP session id for new session

**Returns:**

RTP session id

### getSessionIds

```
public java.util.List getSessionIds()
```

Get list of current RTP session ids

**Returns:**

list of current RTP session ids

### releaseSessionId

```
public void releaseSessionId(String sessionIdStr)
```

Release an RTP session id

**Parameters:**

sessionIdStr - RTP session id

(continued from last page)

## getSession

```
public RTPSession getSession(String sessionId)
```

Get RTP session by session id

**Parameters:**

sessionId - session id

**Returns:**

RTP session

---

## removeSession

```
public RTPSession removeSession(String sessionId)
```

Remove RTP session by session id

**Parameters:**

sessionId - session id

**Returns:**

RTP session if removed

---

## removeSession

```
public RTPSession removeSession(RTPSession session)
```

Remove RTP session by object

**Parameters:**

session - RTP session

**Returns:**

RTP session if removed

---

## addSession

```
public RTPSession addSession(RTPSession session)
```

Add RTP session

**Parameters:**

session - RTP session

**Returns:**

RTP session added

---

## getVHost

```
public IVHost getVHost()
```

Get vhost

**Returns:**

vhost

---

(continued from last page)

---

## addSessionListener

```
public void addSessionListener(IRTPSessionNotify listener)
```

Add a RTP session listener

**Parameters:**

listener - RTP session listener

---

## removeSessionListener

```
public void removeSessionListener(IRTPSessionNotify listener)
```

Remove an RTP session listener

**Parameters:**

listener - RTP session listener

---

## notifySessionCreate

```
public void notifySessionCreate(IApplicationInstance appInstance,  
    RTPSession rtpSession)
```

Notify session create

**Parameters:**

appInstance - application instance

rtpSession - RTP session

---

## notifySessionDestroy

```
public void notifySessionDestroy(IApplicationInstance appInstance,  
    RTPSession rtpSession)
```

Notify session destroy

**Parameters:**

appInstance - application instance

rtpSession - RTP session

---

## notifySessionCreate

```
public void notifySessionCreate(RTPSession rtpSession)
```

Notify session create

**Parameters:**

rtpSession - RTP session

---

## notifySessionDestroy

```
public void notifySessionDestroy(RTPSession rtpSession)
```

Notify session destroy

**Parameters:**

rtpSession - RTP session

---

## com.wowza.wms.rtp.model

### Class RTPStream

java.lang.Object

└--com.wowza.wms.rtp.model.RTPStream

public class **RTPStream**  
extends Object

RTPStream: RTP Stream class which encapsulates an IMediaStream class for RTP streaming.

#### Field Summary

public static final	<a href="#">AVSYNCMETHODS_RTPTIMECODE</a> Value: <b>3</b>
public static final	<a href="#">AVSYNCMETHODS_SENDERREPORT</a> Value: <b>1</b>
public static final	<a href="#">AVSYNCMETHODS_SYSTEMCLOCK</a> Value: <b>2</b>
public static final	<a href="#">AVSYNCMETHODS_UNKNOWN</a> Value: <b>0</b>
public static final	<a href="#">DEFAULT_RTP_TRANSPORT_STR</a> Value: <b>RTP/AVP</b>
public static final	<a href="#">DEFAULT_RTPIgnorePROFILELEVELID</a> Value: <b>false</b>
public static final	<a href="#">DEFAULT_RTPIgnoreSPROPPARAMETERSETS</a> Value: <b>false</b>
public static final	<a href="#">DEFAULT_RTSPSESSIONNAME</a> Value:
public static final	<a href="#">MODE_PLAY</a> Value: <b>1</b>
public static final	<a href="#">MODE_PUBLISH</a> Value: <b>2</b>
public static final	<a href="#">MODE_UNKNOWN</a> Value: <b>0</b>

public static final	<a href="#"><u>SDPLOCATION_AUDIO</u></a> Value: <b>1</b>
public static final	<a href="#"><u>SDPLOCATION_STREAM</u></a> Value: <b>0</b>
public static final	<a href="#"><u>SDPLOCATION_VIDEO</u></a> Value: <b>2</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONATTRIBUTES</u></a> Value: <b>attributes</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONBANDWIDTH</u></a> Value: <b>bandwidth</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONCONNECTIONDATA</u></a> Value: <b>connectiondata</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONEMAILADDRESS</u></a> Value: <b>emailaddress</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONINFORMATION</u></a> Value: <b>information</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONNAME</u></a> Value: <b>name</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONPHONENUMBER</u></a> Value: <b>phonenumber</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONPORIGIN</u></a> Value: <b>origin</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONPROTOCOLVERSION</u></a> Value: <b>protocolversion</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONREPEATTIMES</u></a> Value: <b>repeattimes</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONTIMEZONES</u></a> Value: <b>timezones</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONTIMING</u></a> Value: <b>timing</b>
public static final	<a href="#"><u>STREAMINFO_SESSIONURI</u></a> Value: <b>uri</b>

## Constructor Summary

public	<a href="#">RTPStream</a> ( <a href="#">RTPContext</a> context, String streamId) Constructor
--------	---

## Method Summary

void	<a href="#">addLockRepeaterStreams</a> (String streamName, <a href="#">MediaCasterStreamItem</a> mediaCasterStreamItem)
void	<a href="#">addStreamAttribute</a> (String key, String value) Add a name value pair to the stream attribute collection
void	<a href="#">addStreamInfo</a> (String key, String value) Add a name value pair to the stream info collection
void	<a href="#">addTrack</a> (RTPTrack track) Add a track
void	<a href="#">addTrackId</a> (String seq, String trackId) Add track
void	<a href="#">addTrackInternal</a> (RTPTrack track) Add RTP track
void	<a href="#">announce</a> (RTPRequestStatus status) Execute announce command
void	<a href="#">attachToWMSSession</a> (RtmpSessionInfo wmsSessionInfo) Attach to WMS session, Internal use
static int	<a href="#">avSyncNameToId</a> (String avSyncName) Get audio/video sync id from name
void	<a href="#">checkSendMetadata</a> (long adjTimecode, RTPTrack rtpTrack) Check to see if we have sent onMetadata event, if not send
void	<a href="#">clearRTSPSessionExtraLines</a> () Clear SDP extra lines
void	<a href="#">clearTracks</a> () Clear all tracks
boolean	<a href="#">createStream</a> (RTPRequestStatus status)
boolean	<a href="#">createStream</a> (RTPRequestStatus status, <a href="#">IApplicationInstance</a> appInstance) Create IMediaStream, Internal use.
String	<a href="#">describe</a> ( <a href="#">RTPSession</a> rtspSession, int isStreamPacketizer, RTPRequestStatus status, int[] validCodecsAudio, int[] validCodecsVideo) Get RTP describe details
String	<a href="#">describe</a> ( <a href="#">RTPSession</a> rtspSession, RTPRequestStatus status) Execute describe command

RTPSDPParts	<a href="#">describeGetDetails</a> ( <a href="#">RTPSession</a> rtspSession, int isStreamPacketizer, <a href="#">RTPRequestStatus</a> status, int[] validCodecsAudio, int[] validCodecsVideo) Get RTP describe details
void	<a href="#">detachFromWMSSession</a> ( <a href="#">RtmpSessionInfo</a> wmsSessionInfo) Detach from WMS session, Internal use.
void	<a href="#">extractCodecConfigFromTrackInfo</a> () Extract codec config information from SDP data
String	<a href="#">formatRTPInfo</a> (long timecode, int videoSeq, int audioSeq) Format RTP info
<a href="#">IApplicationInstance</a>	<a href="#">getAppInstance</a> () Get application instance
String	<a href="#">getAppInstanceName</a> () Get the application instance name
String	<a href="#">getAppName</a> () Get the application name
RTPTrack	<a href="#">getAudioTrack</a> () Get the most likely audio track
int	<a href="#">getAutoAllocateInterleavePorts</a> ()
int	<a href="#">getAVSyncMethod</a> () Get the audio/video sync method.
double	<a href="#">getDuration</a> () Get the duration of the stream if video on demand
String	<a href="#">getHost</a> () Get host
<a href="#">AMFPacket[]</a>	<a href="#">getLastPacketsByType</a> ( <a href="#">IMediaReader</a> localReader, double startTime) Analyzes stream to get information, Internal use.
<a href="#">AMFPacket[]</a>	<a href="#">getLastPacketsByType</a> ( <a href="#">IMediaStream</a> localStream) Analyzes stream to get information, Internal use.
int	<a href="#">getMaxRTCPWaitTime</a> () Get max time to wait for RTCP sender reports (milliseconds)
String	<a href="#">getMediaCasterType</a> () Get the media caster stream type for this stream
<a href="#">IMediaReader</a>	<a href="#">getMediaReader</a> () Get media reader if video on demand stream
byte[]	<a href="#">getMetadataPacket</a> () Get the onMetadata packet for this RTP stream
int	<a href="#">getMode</a> () Get the current play/publish mode
String	<a href="#">getModeName</a> ()

int	<a href="#"><u>getMPEGTSAudioBitrate()</u></a>
String	<a href="#"><u>getMPEGTSAudioLanguage()</u></a>
int	<a href="#"><u>getMPEGTSAudioPID()</u></a> Get the audio PID id if MPEG-TS stream
int	<a href="#"><u>getMPEGTSProgramID()</u></a>
int	<a href="#"><u>getMPEGTSVideoBitrate()</u></a>
int	<a href="#"><u>getMPEGTSVideoPID()</u></a> Get the video PID id if MPEG-TS stream
long	<a href="#"><u>getNormalizedNTPTimecode()</u></a> (long timecode) Turn a millisecond timcode into an NTP timecode
String	<a href="#"><u>getOutHost()</u></a> Get the out host
String	<a href="#"><u>getResyncAudioVideoOnSRLogStreamSuffix()</u></a> Get the stream suffixes that are set for timing information logging
<a href="#"><u>RTPContext</u></a>	<a href="#"><u>getRTPContext()</u></a> Get the RTP context
<a href="#"><u>RTPDestination</u></a>	<a href="#"><u>getRTPDestination()</u></a> Get RTP destination
RTPStream.RTPInfo	<a href="#"><u>getRTPInfo()</u></a> (double startTime, int videoSeq, int audioSeq) Get the RTP info
RTPStreamContext	<a href="#"><u>getRTPStreamContext()</u></a>
String	<a href="#"><u>getRTSPBindIpAddress()</u></a> Get the bind RTSP bind IP address
String	<a href="#"><u>getRTSPConnectionAddressType()</u></a> Get the connection address type
String	<a href="#"><u>getRTSPConnectionIpAddress()</u></a> Get the connection IP address
int	<a href="#"><u>getRTSPMaximumPendingWriteBytes()</u></a> Get the maximum number of waiting bytes allow for this RTSP session
String	<a href="#"><u>getRTSPOriginAddressType()</u></a> Get the origin address type
String	<a href="#"><u>getRTSPOriginIpAddress()</u></a> Get the origin IP address
String	<a href="#"><u>getRTSPSessionDescription()</u></a> Get session description
java.util.List	<a href="#"><u>getRTSPSessionExtraLines()</u></a> Get extra SDP lines

String	<a href="#"><u>getRTSPSessionName()</u></a> Get session name
int	<a href="#"><u>getRTSPSessionTimeout()</u></a> Get RTP session timeout (milliseconds)
String	<a href="#"><u>getSDPLang()</u></a> Get the SDP language
String	<a href="#"><u>getSDPTransportStr()</u></a>
<a href="#"><u>RTPSession</u></a>	<a href="#"><u>getSession()</u></a> Get the RTP session
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getStream()</u></a> Get the IMediaStream
java.util.Map	<a href="#"><u>getStreamAttributes()</u></a> Get all name/value pairs in the stream attributes collection
String	<a href="#"><u>getStreamExt()</u></a> Get the stream extension
String	<a href="#"><u>getStreamId()</u></a> Get the stream id
java.util.Map	<a href="#"><u>getStreamInfo()</u></a> Get all name/value pairs in the stream info collection
String	<a href="#"><u>getStreamInfo()</u></a> (String key) Get stream info by name
Object	<a href="#"><u>getStreamLock()</u></a> Get the synchronization lock for this stream
String	<a href="#"><u>getStreamName()</u></a> Get stream name
String	<a href="#"><u>getStreamNameLogging()</u></a> Get the stream name used for logging
String	<a href="#"><u>getStreamQueryStr()</u></a> Get the stream query string
long	<a href="#"><u>getStreamSessionId()</u></a> Get the stream session id
String	<a href="#"><u>getStreamSessionIp()</u></a> Get the stream session ip
long	<a href="#"><u>getStreamSessionVersion()</u></a> Get the stream session version
RTPTrack	<a href="#"><u>getStreamTrack()</u></a> Get the most likely stream track
String	<a href="#"><u>getStreamType()</u></a> Get the stream type

RTPTrack	<a href="#"><u>getTrack</u></a> (String trackId) Get track by id
String	<a href="#"><u>getTrackId</u></a> (String seq) Get track by sequence number
java.util.List	<a href="#"><u>getTrackNames</u></a> () Get a list of track ids
String	<a href="#"><u>getTransportMode</u></a> () Get the transport mode
int	<a href="#"><u>getUDPManagedDeliveryCount</u></a> ()
int	<a href="#"><u>getUDPManagedDeliveryDelay</u></a> ()
<a href="#"><u>IUDPTransport</u></a>	<a href="#"><u>getUDPTransport</u></a> (boolean isMulticast) Get the UDP transport for this stream
<a href="#"><u>IVHost</u></a>	<a href="#"><u>getVHost</u></a> () Get vhost
RTPTrack	<a href="#"><u>getVideoTrack</u></a> () Get the most likely video track
long	<a href="#"><u>getVODLastTimeTC</u></a> () Get the last timecode (milliseconds) sent for video on demand
long	<a href="#"><u>getVODPlayLen</u></a> () Get the video on demand play duration (milliseconds)
long	<a href="#"><u>getVODStartTimeTC</u></a> () Get the video on demand start time (milliseconds)
void	<a href="#"><u>idle</u></a> (org.apache.mina.common.IoSession session, RtmpResponseMessage resp) Process idle event
void	<a href="#"><u>incrementMediaInBytes</u></a> (long bytes) Increment the media bytes in, Internal use.
void	<a href="#"><u>initProperties</u></a> ( <a href="#"><u>IApplicationInstance</u></a> appInstance)
boolean	<a href="#"><u>isAVSyncNonSR</u></a> () Is sync method based on RTCP packets (sender report)
boolean	<a href="#"><u>isBlockUDPOut</u></a> ()
boolean	<a href="#"><u>isCheckIpAddr</u></a> () Are we checking the ip address of each incoming RTP packet
boolean	<a href="#"><u>isCheckSSRC</u></a> () Are we checking the ssrc values of each incoming RTP packet
boolean	<a href="#"><u>isForceMPEGTSOut</u></a> ()

boolean	<a href="#"><u>isForceRTSPInterleaved()</u></a> True if forcing RTSP interleaved
boolean	<a href="#"><u>isLive()</u></a> Is live stream
boolean	<a href="#"><u>isModePlay()</u></a> Is this a play stream
boolean	<a href="#"><u>isModePublish()</u></a> Is this a publish stream
boolean	<a href="#"><u>isModeUnknown()</u></a> Is the stream mode unknown (publish vs play)
boolean	<a href="#"><u>isMPEGTSOut()</u></a> Is MPEG-TS out
boolean	<a href="#"><u>isPaused()</u></a> Is stream paused
boolean	<a href="#"><u>isPublishStreamReady()</u></a> See if a publishing stream has enough data to start playback
boolean	<a href="#"><u>isRefuseIncomingUDPConnections()</u></a>
boolean	<a href="#"><u>isRefuseOutgoingUDPConnections()</u></a>
boolean	<a href="#"><u>isResetPlayStream()</u></a> Is reset stream trigger, Internal use.
boolean	<a href="#"><u>isResyncAudioVideoOnSR()</u></a> Reset audio/video sync on new RTCP packets (not just first packet)
boolean	<a href="#"><u>isResyncAudioVideoOnSRLog()</u></a> Log audio/video sync on new RTCP packets (not just first packet)
boolean	<a href="#"><u>isRTPIgnoreProfileLevelId()</u></a>
boolean	<a href="#"><u>isRTPIgnoreSPropParameterSets()</u></a>
boolean	<a href="#"><u>isRTSP()</u></a> Is this RTP Stream managed by RTSP session
boolean	<a href="#"><u>isRTSPAlwaysUseSDPPorts()</u></a> Force RTSP to use ports in SDP data
boolean	<a href="#"><u>isRTSPPull()</u></a> Is this RTP Stream managed by RTSP session
boolean	<a href="#"><u>isSendSDESEvents()</u></a> Send RTCP SDES events
boolean	<a href="#"><u>isStreamStarted()</u></a> Is stream started
boolean	<a href="#"><u>isTimeout()</u></a> (long currTime, int timeout) Is the stream timeout out

boolean	<a href="#"><u>isUDPTransportOverride()</u></a>
boolean	<a href="#"><u>isWebRTC()</u></a>
void	<a href="#"><u>lockRepeaterStreams()</u></a> (java.util.List streamNames) Lock a list of live repeater stream names, Internal use.
void	<a href="#"><u>notifyEncryptionProvider()</u></a> (RTPTrack rtpTrack)
void	<a href="#"><u>notifyEncryptionProviderAllTracks()</u></a>
void	<a href="#"><u>pause()</u></a> (RTPRequestStatus status) Execute pause
RTPStreamPlayResult	<a href="#"><u>play()</u></a> (RTPRequestStatus status) Execute play
RTPStreamPlayResult	<a href="#"><u>play()</u></a> (RTPRequestStatus status, double startTime, double stopTime) Execute play
void	<a href="#"><u>putRTSPSessionExtraLine()</u></a> (int location, String line) Add an extra line to the SDP data
RTPStreamPlayResult	<a href="#"><u>record()</u></a> (RTPRequestStatus status) Execute record
RTPStreamPlayResult	<a href="#"><u>record()</u></a> (RTPRequestStatus status, double startTime, double stopTime) Execute record
RTPTrack	<a href="#"><u>removeTrack()</u></a> (String trackId) Remove a track by id
RTPTrack	<a href="#"><u>removeTrackInternal()</u></a> (String trackId) Remove track by track id
void	<a href="#"><u>resetSentMetadataFlag()</u></a> Reset sendMetadata flag
void	<a href="#"><u>setAppInstanceName()</u></a> (String appInstanceName) Set the application instance name
void	<a href="#"><u>setAppName()</u></a> (String appName) Get the application name
void	<a href="#"><u>setAVSyncMethod()</u></a> (int avSyncMethod) Set the audio/video sync method.
void	<a href="#"><u>setBlockUDPOut()</u></a> (boolean blockUDPOut)
void	<a href="#"><u>setCheckIpAddr()</u></a> (boolean checkIpAddr) Are we checking the ip address of each incoming RTP packet
void	<a href="#"><u>setCheckSSRC()</u></a> (boolean checkSSRC) Are we checking the ssrc values of each incoming RTP packet
void	<a href="#"><u>setForceMPEGTSOut()</u></a> (boolean isForceMPEGTSOut)

void	<a href="#"><u>setForceRTSPInterleaved</u></a> (boolean isForceRTSPInterleaved) True if forcing RTSP interleaved
void	<a href="#"><u>setHost</u></a> (String host) Set host
void	<a href="#"><u>setLive</u></a> (boolean isLive) Is live stream
void	<a href="#"><u>setMaxRTCPWaitTime</u></a> (int maxRTCPWaitTime) Set max time to wait for RTCP sender reports (milliseconds)
void	<a href="#"><u>setMode</u></a> (int mode) Set the play/publish mode
void	<a href="#"><u>setMPEGTSAudioBitrate</u></a> (int mpegtsAudioBitrate)
void	<a href="#"><u>setMPEGTSAudioLanguage</u></a> (String mpegtsAudioLanguage)
void	<a href="#"><u>setMPEGTSAudioPID</u></a> (int mpegtsAudioPID) Set the audio PID id if MPEG-TS stream
void	<a href="#"><u>setMPEGTSOut</u></a> (boolean isMPEGTSOut) Is MPEG-TS out
void	<a href="#"><u>setMPEGTSProgramID</u></a> (int mpegtsProgramId)
void	<a href="#"><u>setMPEGTSVideoBitrate</u></a> (int mpegtsVideoBitrate)
void	<a href="#"><u>setMPEGTSVideoPID</u></a> (int mpegtsVideoPID) Set the video PID id if MPEG-TS stream
void	<a href="#"><u>setOutHost</u></a> (String outHost) Set out host
void	<a href="#"><u>setRefuseIncomingUDPConnections</u></a> (boolean refuseIncomingUDPConnections)
void	<a href="#"><u>setRefuseOutgoingUDPConnections</u></a> (boolean refuseOutgoingUDPConnections)
void	<a href="#"><u>setResetPlayStream</u></a> (boolean doResetPlayStream) Set reset stream trigger
void	<a href="#"><u>setResyncAudioVideoOnSR</u></a> (boolean resyncAudioVideoOnSR) Reset audio/video sync on new RTCP packets (not just first packet)
void	<a href="#"><u>setResyncAudioVideoOnSRLog</u></a> (boolean resyncAudioVideoOnSRLog) Log audio/video sync on new RTCP packets (not just first packet)
void	<a href="#"><u>setResyncAudioVideoOnSRLogStreamSuffix</u></a> (String names) Set the stream names that require to be logged for timing information
void	<a href="#"><u>setRTPDestination</u></a> ( <a href="#"><u>RTPDestination</u></a> rtpDestination) Set RTP destination
void	<a href="#"><u>setRTPIgnoreProfileLevelId</u></a> (boolean rtpIgnoreProfileLevelId)

void	<a href="#"><u>setRTPIgnoreSPropParameterSets</u></a> (boolean rtpIgnoreSPropParameterSets) Is this RTP Stream managed by RTSP session
void	<a href="#"><u>setRTPStreamContext</u></a> (RTPStreamContext rtpStreamContext)
void	<a href="#"><u>setRTSP</u></a> (boolean isRTSP) Is this RTP Stream managed by RTSP session
void	<a href="#"><u>setRTSPAlwaysUseSDPPorts</u></a> (boolean rtspAlwaysUseSDPPorts) Force RTSP to use ports in SDP data
void	<a href="#"><u>setRTSPBindIpAddress</u></a> (String rtspBindIpAddress) Set the bind RTSP bind IP address
void	<a href="#"><u>setRTSPConnectionAddressType</u></a> (String rtspConnectionAddressType) Set the connection address type
void	<a href="#"><u>setRTSPConnectionIpAddress</u></a> (String rtspConnectionIpAddress) Set the connection IP address
void	<a href="#"><u>setRTSPMaximumPendingWriteBytes</u></a> (int rtspMaximumPendingWriteBytes) Set the maximum number of waiting bytes allow for this RTSP session
void	<a href="#"><u>setRTSPOriginAddressType</u></a> (String rtspOriginAddressType) Set the origin address type
void	<a href="#"><u>setRTSPOriginIpAddress</u></a> (String rtspOriginIpAddress) Set the origin IP address
void	<a href="#"><u>setRTSPPull</u></a> (boolean isRTSPPull) Is this RTP Stream managed by RTSP session
void	<a href="#"><u>setRTSPSessionDescription</u></a> (String rtspSessionDescription) Get session description
void	<a href="#"><u>setRTSPSessionName</u></a> (String rtspSessionName) Set session name
void	<a href="#"><u>setRTSPSessionTimeout</u></a> (int rtspSessionTimeout) Set RTP session timeout (milliseconds)
void	<a href="#"><u>setSDPLang</u></a> (String sdpLang) Set the SDP language
void	<a href="#"><u>setSDPTransportStr</u></a> (String sdpTransportStr)
void	<a href="#"><u>setSendSDESEvents</u></a> (boolean sendSDESEvents) Send RTCP SDES events
void	<a href="#"><u>setSession</u></a> ( <a href="#"><u>RTPSession</u></a> session) Set the RTP session
void	<a href="#"><u>setStreamExt</u></a> (String streamExt) Set the stream extension
void	<a href="#"><u>setStreamName</u></a> (String streamName) Set stream name

void	<a href="#"><u>setStreamNameLogging</u></a> (String streamNameLogging) Set the stream name used for logging
void	<a href="#"><u>setStreamQueryStr</u></a> (String streamQueryStr) Set the stream query string
void	<a href="#"><u>setStreamSessionId</u></a> (long streamSessionId) Set the stream session id
void	<a href="#"><u>setStreamSessionIp</u></a> (String streamSessionIp) Set the stream session ip
void	<a href="#"><u>setStreamSessionVersion</u></a> (long streamSessionVersion) Set the stream session version
void	<a href="#"><u>setStreamType</u></a> (String streamType) Set the stream type
void	<a href="#"><u>setTransportMode</u></a> (String transportMode) Set the transport mode
void	<a href="#"><u>setUDPMangedDeliveryCount</u></a> (int udpManagedDeliveryCount)
void	<a href="#"><u>setUDPMangedDeliveryDelay</u></a> (int udpManagedDeliveryDelay)
void	<a href="#"><u>setUDPTransport</u></a> ( <a href="#"><u>IUDPTransport</u></a> udpTransport)
void	<a href="#"><u>setVODLastTimeTC</u></a> (long vodLastTimeTC) Set the last timecode (milliseconds) sent for video on demand
void	<a href="#"><u>setVODPlayLen</u></a> (long vodPlayLen) Set the video on demand play duration (milliseconds)
void	<a href="#"><u>setVODStartTimeTC</u></a> (long vodStartTimeTC) Set the video on demand start time (milliseconds)
void	<a href="#"><u>setWebRTC</u></a> (boolean isWebRTC)
void	<a href="#"><u>shutdown</u></a> (RTPRequestStatus status) shutdown RTP stream, Internal use.
RTPTrack	<a href="#"><u>sloppyGetTrack</u></a> (String trackId) Sloppy method for finding track by name, Internal use.
boolean	<a href="#"><u>streamExists</u></a> () Return true if RTP stream contains a IMediaStream
void	<a href="#"><u>switchSetupToMPEGTS</u></a> () Switch a stream to MPEG-TS, Internal use.
void	<a href="#"><u>touch</u></a> () Touch the stream so that it does not timeout
String	<a href="#"><u>transportFindBestMatch</u></a> (String transport) Based on a trasport string from SETUP command find best match
void	<a href="#"><u>unlockRepeaterStreams</u></a> () Unlock live repeater streams

## Fields

### **SDPLOCATION\_STREAM**

```
public static final int SDPLOCATION_STREAM
```

Constant value: **0**

### **SDPLOCATION\_AUDIO**

```
public static final int SDPLOCATION_AUDIO
```

Constant value: **1**

### **SDPLOCATION\_VIDEO**

```
public static final int SDPLOCATION_VIDEO
```

Constant value: **2**

### **MODE\_UNKNOWN**

```
public static final int MODE_UNKNOWN
```

Constant value: **0**

### **MODE\_PLAY**

```
public static final int MODE_PLAY
```

Constant value: **1**

### **MODE\_PUBLISH**

```
public static final int MODE_PUBLISH
```

Constant value: **2**

### **AVSYNCMETHODS\_UNKNOWN**

```
public static final int AVSYNCMETHODS_UNKNOWN
```

Constant value: **0**

---

## AVSYNCMETHODS\_SENDERREPORT

```
public static final int AVSYNCMETHODS_SENDERREPORT
```

Constant value: **1**

---

## AVSYNCMETHODS\_SYSTEMCLOCK

```
public static final int AVSYNCMETHODS_SYSTEMCLOCK
```

Constant value: **2**

---

## AVSYNCMETHODS\_RTPTIMECODE

```
public static final int AVSYNCMETHODS_RTPTIMECODE
```

Constant value: **3**

---

## STREAMINFO\_SESSIONPROTOCOLVERSION

```
public static final java.lang.String STREAMINFO_SESSIONPROTOCOLVERSION
```

Constant value: **protocolversion**

---

## STREAMINFO\_SESSIONPORIGIN

```
public static final java.lang.String STREAMINFO_SESSIONPORIGIN
```

Constant value: **origin**

---

## STREAMINFO\_SESSIONNAME

```
public static final java.lang.String STREAMINFO_SESSIONNAME
```

Constant value: **name**

---

## STREAMINFO\_SESSIONINFORMATION

```
public static final java.lang.String STREAMINFO_SESSIONINFORMATION
```

Constant value: **information**

---

## STREAMINFO\_SESSIONURI

```
public static final java.lang.String STREAMINFO_SESSIONURI
```

Constant value: **uri**

---

## STREAMINFO\_SESSIONEMAILADDRESS

```
public static final java.lang.String STREAMINFO_SESSIONEMAILADDRESS
```

(continued from last page)

---

Constant value: **emailaddress**

---

## STREAMINFO\_SESSIONPHONENUMBER

```
public static final java.lang.String STREAMINFO_SESSIONPHONENUMBER
```

Constant value: **phonenumber**

---

## STREAMINFO\_SESSIONCONNECTIONDATA

```
public static final java.lang.String STREAMINFO_SESSIONCONNECTIONDATA
```

Constant value: **connectiondata**

---

## STREAMINFO\_SESSIONBANDWIDTH

```
public static final java.lang.String STREAMINFO_SESSIONBANDWIDTH
```

Constant value: **bandwidth**

---

## STREAMINFO\_SESSIONTIMING

```
public static final java.lang.String STREAMINFO_SESSIONTIMING
```

Constant value: **timing**

---

## STREAMINFO\_SESSIONREPEATTIMES

```
public static final java.lang.String STREAMINFO_SESSIONREPEATTIMES
```

Constant value: **repeattimes**

---

## STREAMINFO\_SESSIONTIMEZONES

```
public static final java.lang.String STREAMINFO_SESSIONTIMEZONES
```

Constant value: **timezones**

---

## STREAMINFO\_SESSIONATTRIBUTES

```
public static final java.lang.String STREAMINFO_SESSIONATTRIBUTES
```

Constant value: **attributes**

---

## DEFAULT\_RTSPSESSIONNAME

```
public static final java.lang.String DEFAULT_RTSPSESSIONNAME
```

Constant value:

---

## DEFAULT\_RTPIGNOREPROFILELEVELID

```
public static final boolean DEFAULT_RTPIGNOREPROFILELEVELID
```

Constant value: **false**

---

## DEFAULT\_RTPIGNORESPROPPARAMETERSETS

```
public static final boolean DEFAULT_RTPIGNORESPROPPARAMETERSETS
```

Constant value: **false**

---

## DEFAULT\_RTP\_TRANSPORT\_STR

```
public static final java.lang.String DEFAULT_RTP_TRANSPORT_STR
```

Constant value: **RTP/AVP**

## Constructors

### RTPStream

```
public RTPStream(RTPContext context,  
                String streamId)
```

Constructor

**Parameters:**

context - RTP context  
streamId - stream id

## Methods

### getRTPContext

```
public RTPContext getRTPContext()
```

Get the RTP context

**Returns:**

RTP context

---

### getStreamLock

```
public Object getStreamLock()
```

Get the synchronization lock for this stream

**Returns:**

synchronization lock for this stream

---

### addTrack

```
public void addTrack(RTPTrack track)
```

(continued from last page)

Add a track

**Parameters:**

track - RTP track

---

**removeTrack**

```
public RTPTrack removeTrack(String trackId)
```

Remove a track by id

**Parameters:**

trackId - track id

**Returns:**

RTP track

---

**addTrackInternal**

```
public void addTrackInternal(RTPTrack track)
```

Add RTP track

**Parameters:**

track - RTP track

---

**removeTrackInternal**

```
public RTPTrack removeTrackInternal(String trackId)
```

Remove track by track id

**Parameters:**

trackId - track id

**Returns:**

RTP track that was removed

---

**clearTracks**

```
public void clearTracks()
```

Clear all tracks

---

**incrementMediaInBytes**

```
public void incrementMediaInBytes(long bytes)
```

Increment the media bytes in, Internal use.

**Parameters:**

bytes

---

**sloppyGetTrack**

```
public RTPTrack sloppyGetTrack(String trackId)
```

Sloppy method for finding track by name, Internal use.

(continued from last page)

**Parameters:**

trackId - track name

**Returns:**

RTP track

---

## getTrack

```
public RTPTrack getTrack(String trackId)
```

Get track by id

**Parameters:**

trackId - track id

**Returns:**

RTP track

---

## addTrackId

```
public void addTrackId(String seq,  
                        String trackId)
```

Add track

**Parameters:**

seq - sequence number

trackId - track id

---

## getTrackId

```
public String getTrackId(String seq)
```

Get track by sequence number

**Parameters:**

seq - sequence number

**Returns:**

RTP track

---

## getTrackNames

```
public java.util.List getTrackNames()
```

Get a list of track ids

**Returns:**

list of track ids

---

## getSession

```
public RTPSession getSession()
```

Get the RTP session

**Returns:**

RTP session

## setSession

```
public void setSession(RTPSession session)
```

Set the RTP session

**Parameters:**

session - RTP session

---

## getStreamId

```
public String getStreamId()
```

Get the stream id

**Returns:**

stream id

---

## getStream

```
public IMediaStream getStream()
```

Get the IMediaStream

**Returns:**

stream (IMediaStream) interface

---

## getAudioTrack

```
public RTPTrack getAudioTrack()
```

Get the most likely audio track

**Returns:**

RTP track

---

## getVideoTrack

```
public RTPTrack getVideoTrack()
```

Get the most likely video track

**Returns:**

RTP track

---

## getStreamTrack

```
public RTPTrack getStreamTrack()
```

Get the most likely stream track

**Returns:**

RTP track

---

(continued from last page)

## addStreamInfo

```
public void addStreamInfo(String key,  
    String value)
```

Add a name value pair to the stream info collection

**Parameters:**

key - name  
value - value

---

## getStreamInfo

```
public String getStreamInfo(String key)
```

Get stream info by name

**Parameters:**

key - name

**Returns:**

value

---

## addStreamAttribute

```
public void addStreamAttribute(String key,  
    String value)
```

Add a name value pair to the stream attribute collection

**Parameters:**

key - name  
value - value

---

## getVHost

```
public IVHost getVHost()
```

Get vhost

**Returns:**

vhost

---

## getHost

```
public String getHost()
```

Get host

**Returns:**

host

---

## setHost

```
public void setHost(String host)
```

Set host

**Parameters:**

(continued from last page)

host - host

---

## streamExists

```
public boolean streamExists()
```

Return true if RTP stream contains a IMediaStream

**Returns:**

true if RTP stream contains a IMediaStream

---

## isPublishStreamReady

```
public boolean isPublishStreamReady()
```

See if a publishing stream has enough data to start playback

**Returns:**

true, if the stream is ready for playback

---

## lockRepeaterStreams

```
public void lockRepeaterStreams(java.util.List streamNames)
```

Lock a list of live repeater stream names, Internal use.

**Parameters:**

streamNames - stream names

---

## addLockRepeaterStreams

```
public void addLockRepeaterStreams(String streamName,  
    MediaCasterStreamItem mediaCasterStreamItem)
```

---

## unlockRepeaterStreams

```
public void unlockRepeaterStreams()
```

Unlock live repeater streams

---

## getMediaCasterType

```
public String getMediaCasterType()
```

Get the media caster stream type for this stream

**Returns:**

media caster stream type

---

## createStream

```
public boolean createStream(RTPRequestStatus status)
```

---

(continued from last page)

## createStream

```
public boolean createStream(RTPRequestStatus status,  
    IApplicationInstance appInstance)
```

Create IMediaStream, Internal use.

**Parameters:**

status - status

**Returns:**

true if successful

---

## shutdown

```
public void shutdown(RTPRequestStatus status)
```

shutdown RTP stream, Internal use.

**Parameters:**

status - status

---

## initProperties

```
public void initProperties(IApplicationInstance appInstance)
```

---

## getAppInstance

```
public IApplicationInstance getAppInstance()
```

Get application instance

**Returns:**

application instance

---

## isPaused

```
public boolean isPaused()
```

Is stream paused

**Returns:**

true if stream is paused

---

## getDuration

```
public double getDuration()
```

Get the duration of the stream if video on demand

**Returns:**

duration in seconds

---

## isResetPlayStream

```
public boolean isResetPlayStream()
```

(continued from last page)

Is reset stream trigger, Internal use.

**Returns:**

true if reset trigger

---

## setResetPlayStream

```
public void setResetPlayStream(boolean doResetPlayStream)
```

Set reset stream trigger

**Parameters:**

doResetPlayStream - true if reset trigger

---

## record

```
public RTPStreamPlayResult record(RTPRequestStatus status)
```

Execute record

**Parameters:**

status - RTP status

**Returns:**

status

---

## record

```
public RTPStreamPlayResult record(RTPRequestStatus status,  
    double startTime,  
    double stopTime)
```

Execute record

**Parameters:**

status - RTP status

startTime - playback start time

stopTime - playback stop time

**Returns:**

status

---

## play

```
public RTPStreamPlayResult play(RTPRequestStatus status)
```

Execute play

**Parameters:**

status - RTP status

**Returns:**

status

(continued from last page)

## play

```
public RTPStreamPlayResult play(RTPRequestStatus status,  
    double startTime,  
    double stopTime)
```

Execute play

### Parameters:

status - RTP status  
startTime - playback start time  
stopTime - playback stop time

### Returns:

status

---

## attachToWMSession

```
public void attachToWMSession(RtmpSessionInfo wmsSessionInfo)
```

Attach to WMS session, Internal use

### Parameters:

wmsSessionInfo - session info

---

## detachFromWMSession

```
public void detachFromWMSession(RtmpSessionInfo wmsSessionInfo)
```

Detach from WMS session, Internal use.

### Parameters:

wmsSessionInfo - session info

---

## pause

```
public void pause(RTPRequestStatus status)
```

Execute pause

### Parameters:

status - RTP status

---

## announce

```
public void announce(RTPRequestStatus status)
```

Execute announce command

### Parameters:

status - RTP status

---

## isResyncAudioVideoOnSR

```
public boolean isResyncAudioVideoOnSR()
```

Reset audio/video sync on new RTCP packets (not just first packet)

### Returns:

(continued from last page)

true if resetting audio/video on new RTCP packets

---

## setResyncAudioVideoOnSR

```
public void setResyncAudioVideoOnSR(boolean resyncAudioVideoOnSR)
```

Reset audio/video sync on new RTCP packets (not just first packet)

### Parameters:

resyncAudioVideoOnSR - true if resetting audio/video on new RTCP packets

---

## isResyncAudioVideoOnSRLog

```
public boolean isResyncAudioVideoOnSRLog()
```

Log audio/video sync on new RTCP packets (not just first packet)

### Returns:

true if logging audio/video on new RTCP packets

---

## setResyncAudioVideoOnSRLog

```
public void setResyncAudioVideoOnSRLog(boolean resyncAudioVideoOnSRLog)
```

Log audio/video sync on new RTCP packets (not just first packet)

### Parameters:

resyncAudioVideoOnSRLog - true if logging audio/video on new RTCP packets

---

## setResyncAudioVideoOnSRLogStreamSuffix

```
public void setResyncAudioVideoOnSRLogStreamSuffix(String names)
```

Set the stream names that require to be logged for timing information

### Parameters:

names

---

## getResyncAudioVideoOnSRLogStreamSuffix

```
public String getResyncAudioVideoOnSRLogStreamSuffix()
```

Get the stream suffixes that are set for timing information logging

### Returns:

resyncAudioVideoOnSRLogStreamNames

---

## getMetadataPacket

```
public byte[] getMetadataPacket()
```

Get the onMetadata packet for this RTP stream

### Returns:

onMetadata packet

(continued from last page)

---

## resetSentMetadataFlag

```
public void resetSentMetadataFlag()
```

Reset sendMetadata flag

---

## checkSendMetadata

```
public void checkSendMetadata(long adjTimecode,  
    RTPTrack rtpTrack)
```

Check to see if we have sent onMetadata event, if not send

**Parameters:**

adjTimecode - timecode (milliseconds)

---

## extractCodecConfigFromTrackInfo

```
public void extractCodecConfigFromTrackInfo()
```

Extract codec config information from SDP data

---

## getStreamType

```
public String getStreamType()
```

Get the stream type

**Returns:**

stream type

---

## setStreamType

```
public void setStreamType(String streamType)
```

Set the stream type

**Parameters:**

streamType - stream type

---

## getAppName

```
public String getAppName()
```

Get the application name

**Returns:**

application name

---

## setAppName

```
public void setAppName(String appName)
```

Get the application name

**Parameters:**

appName - application name

---

## getAppName

```
public String getAppName()
```

Get the application instance name

**Returns:**

application instance name

---

## setAppName

```
public void setAppName(String appName)
```

Set the application instance name

**Parameters:**

appName - application instance name

---

## getStreamExt

```
public String getStreamExt()
```

Get the stream extension

**Returns:**

stream extension

---

## setStreamExt

```
public void setStreamExt(String streamExt)
```

Set the stream extension

**Parameters:**

streamExt - stream extension

---

## getStreamName

```
public String getStreamName()
```

Get stream name

**Returns:**

stream name

---

## setStreamName

```
public void setStreamName(String streamName)
```

Set stream name

**Parameters:**

streamName - stream name

---

## getStreamNameLogging

```
public String getStreamNameLogging()
```

---

---

(continued from last page)

Get the stream name used for logging

**Returns:**

stream name used for logging

---

## setStreamNameLogging

```
public void setStreamNameLogging(String streamNameLogging)
```

Set the stream name used for logging

**Parameters:**

streamNameLogging - stream name used for logging

---

## getStreamSessionId

```
public long getStreamSessionId()
```

Get the stream session id

**Returns:**

stream session id

---

## setStreamSessionId

```
public void setStreamSessionId(long streamSessionId)
```

Set the stream session id

**Parameters:**

streamSessionId - stream session id

---

## getStreamSessionVersion

```
public long getStreamSessionVersion()
```

Get the stream session version

**Returns:**

stream session version

---

## setStreamSessionVersion

```
public void setStreamSessionVersion(long streamSessionVersion)
```

Set the stream session version

**Parameters:**

streamSessionVersion - stream session version

---

## getStreamSessionIp

```
public String getStreamSessionIp()
```

Get the stream session ip

**Returns:**

stream session ip

---

## setStreamSessionIp

```
public void setStreamSessionIp(String streamSessionIp)
```

Set the stream session ip

**Parameters:**

streamSessionIp - stream session ip

---

## isCheckSSRC

```
public boolean isCheckSSRC()
```

Are we checking the ssrc values of each incoming RTP packet

**Returns:**

true if checking

---

## setCheckSSRC

```
public void setCheckSSRC(boolean checkSSRC)
```

Are we checking the ssrc values of each incoming RTP packet

**Parameters:**

checkSSRC - true if checking

---

## isCheckIpAddr

```
public boolean isCheckIpAddr()
```

Are we checking the ip address of each incoming RTP packet

**Returns:**

true if checking ip address of each incoming RTP packet

---

## setCheckIpAddr

```
public void setCheckIpAddr(boolean checkIpAddr)
```

Are we checking the ip address of each incoming RTP packet

**Parameters:**

checkIpAddr - true if checking ip address of each incoming RTP packet

---

## getUDPTransport

```
public IUDPTransport getUDPTransport(boolean isMulticast)
```

Get the UDP transport for this stream

**Parameters:**

isMulticast - true if multicast

**Returns:**

UDP transport

---

## getAVSyncMethod

```
public int getAVSyncMethod()
```

Get the audio/video sync method. See AVSYNCMETHODS\_\*

**Returns:**

audio/video sync method. See AVSYNCMETHODS\_\*

---

## setAVSyncMethod

```
public void setAVSyncMethod(int avSyncMethod)
```

Set the audio/video sync method. See AVSYNCMETHODS\_\*

**Parameters:**

avSyncMethod - audio/video sync method. See AVSYNCMETHODS\_\*

---

## isAVSyncNonSR

```
public boolean isAVSyncNonSR()
```

Is sync method based on RTCP packets (sender report)

**Returns:**

true if based in RTCP sender reports

---

## getMaxRTCPWaitTime

```
public int getMaxRTCPWaitTime()
```

Get max time to wait for RTCP sender reports (milliseconds)

**Returns:**

max time to wait for RTCP sender reports (milliseconds)

---

## setMaxRTCPWaitTime

```
public void setMaxRTCPWaitTime(int maxRTCPWaitTime)
```

Set max time to wait for RTCP sender reports (milliseconds)

**Parameters:**

maxRTCPWaitTime - max time to wait for RTCP sender reports (milliseconds)

---

## getStreamInfo

```
public java.util.Map getStreamInfo()
```

Get all name/value pairs in the stream info collection

**Returns:**

map of name/value pairs

---

## getStreamAttributes

```
public java.util.Map getStreamAttributes()
```

---

(continued from last page)

Get all name/value pairs in the stream attributes collection

**Returns:**

map of name/value pairs

---

## avSyncNameToId

```
public static int avSyncNameToId(String avSyncName)
```

Get audio/video sync id from name

**Parameters:**

avSyncName - audio/video sync name

**Returns:**

audio/video sync id, see AVSYNCMETHODS\_\*

---

## getMPEGTSAudioLanguage

```
public String getMPEGTSAudioLanguage()
```

---

## setMPEGTSAudioLanguage

```
public void setMPEGTSAudioLanguage(String mpegtsAudioLanguage)
```

---

## getMPEGTSProgramID

```
public int getMPEGTSProgramID()
```

---

## setMPEGTSProgramID

```
public void setMPEGTSProgramID(int mpegtsProgramId)
```

---

## getMPEGTSVideoPID

```
public int getMPEGTSVideoPID()
```

Get the video PID id if MPEG-TS stream

**Returns:**

video PID id if MPEG-TS stream

---

## setMPEGTSVideoPID

```
public void setMPEGTSVideoPID(int mpegtsVideoPID)
```

Set the video PID id if MPEG-TS stream

**Parameters:**

mpegtsVideoPID - video PID id if MPEG-TS stream

## getMPEGTSAudioPID

```
public int getMPEGTSAudioPID()
```

Get the audio PID id if MPEG-TS stream

**Returns:**

audio PID id if MPEG-TS stream

---

## setMPEGTSAudioPID

```
public void setMPEGTSAudioPID(int mpegtsAudioPID)
```

Set the audio PID id if MPEG-TS stream

**Parameters:**

mpegtsAudioPID - audio PID id if MPEG-TS stream

---

## isRTSP

```
public boolean isRTSP()
```

Is this RTP Stream managed by RTSP session

**Returns:**

true if managed by RTSP session

---

## setRTSP

```
public void setRTSP(boolean isRTSP)
```

Is this RTP Stream managed by RTSP session

**Parameters:**

isRTSP - true if managed by RTSP session

---

## isRTSPPull

```
public boolean isRTSPPull()
```

Is this RTP Stream managed by RTSP session

**Returns:**

true if managed by RTSP session

---

## setRTSPPull

```
public void setRTSPPull(boolean isRTSPPull)
```

Is this RTP Stream managed by RTSP session

**Parameters:**

isRTSPPull - true if managed by RTSP session

---

## getStreamQueryStr

```
public String getStreamQueryStr()
```

---

---

(continued from last page)

Get the stream query string

**Returns:**

stream query string

---

## setStreamQueryStr

```
public void setStreamQueryStr(String streamQueryStr)
```

Set the stream query string

**Parameters:**

streamQueryStr - stream query string

---

## getModeName

```
public String getModeName()
```

---

## isModePublish

```
public boolean isModePublish()
```

Is this a publish stream

**Returns:**

true if publish stream

---

## isModePlay

```
public boolean isModePlay()
```

Is this a play stream

**Returns:**

true if play stream

---

## isModeUnknown

```
public boolean isModeUnknown()
```

Is the stream mode unknown (publish vs play)

**Returns:**

true if stream mode is unknown

---

## getOutHost

```
public String getOutHost()
```

Get the out host

**Returns:**

out host

---

(continued from last page)

---

## setOutHost

```
public void setOutHost(String outHost)
```

Set out host

### Parameters:

outHost - out host

---

## idle

```
public void idle(org.apache.mina.common.IoSession session,  
    RtmpResponseMessage resp)
```

Process idle event

### Parameters:

session - io session

resp - idle request

---

## getLastPacketsByType

```
public AMFPacket\[\] getLastPacketsByType(IMediaStream localStream)
```

Analyzes stream to get information, Internal use.

### Parameters:

localStream - local stream

### Returns:

important packets

---

## getLastPacketsByType

```
public AMFPacket\[\] getLastPacketsByType(IMediaReader localReader,  
    double startTime)
```

Analyzes stream to get information, Internal use.

### Parameters:

localReader - media reader

startTime - start time

### Returns:

important packets

---

## switchSetupToMPEGTS

```
public void switchSetupToMPEGTS()
```

Switch a stream to MPEG-TS, Internal use.

---

## describe

```
public String describe(RTPSession rtspSession,  
    RTPRequestStatus status)
```

Execute describe command

---

(continued from last page)

**Parameters:**

rtspSession - RTP session  
status - RTP status

**Returns:**

describe response

---

## describe

```
public String describe(RTPSession rtspSession,  
    int isStreamPacketizer,  
    RTPRequestStatus status,  
    int[] validCodecsAudio,  
    int[] validCodecsVideo)
```

Get RTP describe details

**Parameters:**

rtspSession - rtp session  
isStreamPacketizer - is packetizing as a stream  
status - status  
validCodecsAudio - list of valid audio codecs  
validCodecsVideo - list of valid video codecs

**Returns:**

SDP info as a string

---

## describeGetDetails

```
public RTPSDPParts describeGetDetails(RTPSession rtspSession,  
    int isStreamPacketizer,  
    RTPRequestStatus status,  
    int[] validCodecsAudio,  
    int[] validCodecsVideo)
```

Get RTP describe details

**Parameters:**

rtspSession - rtp session  
isStreamPacketizer - is packetizing as a stream  
status - status  
validCodecsAudio - list of valid audio codecs  
validCodecsVideo - list of valid video codecs

**Returns:**

SDP parts

---

## getMode

```
public int getMode()
```

Get the current play/publish mode

**Returns:**

play/publish mode

---

## setMode

```
public void setMode(int mode)
```

(continued from last page)

Set the play/publish mode

**Parameters:**

mode - play/publish mode

---

## getTransportMode

```
public String getTransportMode()
```

Get the transport mode

**Returns:**

transport mode

---

## setTransportMode

```
public void setTransportMode(String transportMode)
```

Set the transport mode

**Parameters:**

transportMode - transport mode

---

## getNormalizedNTPTimecode

```
public long getNormalizedNTPTimecode(long timecode)
```

Turn a millisecond timecode into an NTP timecode

**Parameters:**

timecode - timecode (milliseconds)

**Returns:**

NTP timecode

---

## isForceRTSPInterleaved

```
public boolean isForceRTSPInterleaved()
```

True if forcing RTSP interleaved

**Returns:**

true if forcing RTSP interleaved

---

## setForceRTSPInterleaved

```
public void setForceRTSPInterleaved(boolean isForceRTSPInterleaved)
```

True if forcing RTSP interleaved

**Parameters:**

isForceRTSPInterleaved - true if forcing RTSP interleaved

---

## getRTPInfo

```
public RTPStream.RTPInfo getRTPInfo(double startTime,  
    int videoSeq,  
    int audioSeq)
```

---

(continued from last page)

Get the RTP info

**Parameters:**

startTime - start time  
videoSeq - video sequence number  
audioSeq - audio sequence number

**Returns:**

RTP info string

---

## formatRTPInfo

```
public String formatRTPInfo(long timecode,  
    int videoSeq,  
    int audioSeq)
```

Format RTP info

**Parameters:**

timecode - timecode  
videoSeq - video sequence number  
audioSeq - audio sequence number

**Returns:**

RTP Info string

---

## getRTSPSessionName

```
public String getRTSPSessionName()
```

Get session name

**Returns:**

session name

---

## setRTSPSessionName

```
public void setRTSPSessionName(String rtspSessionName)
```

Set session name

**Parameters:**

rtspSessionName - session name

---

## getRTSPSessionDescription

```
public String getRTSPSessionDescription()
```

Get session description

**Returns:**

session description

---

## setRTSPSessionDescription

```
public void setRTSPSessionDescription(String rtspSessionDescription)
```

Get session description

---

(continued from last page)

**Parameters:**`rtspSessionDescription` - session description

---

**isSendSDESEvents**

```
public boolean isSendSDESEvents()
```

Send RTCP SDES events

**Returns:**

true if sending RTCP SDES events

---

**setSendSDESEvents**

```
public void setSendSDESEvents(boolean sendSDESEvents)
```

Send RTCP SDES events

**Parameters:**

`sendSDESEvents` - true if sending RTCP SDES events

---

**isMPEGTSOut**

```
public boolean isMPEGTSOut()
```

Is MPEG-TS out

**Returns:**

true if MPEG-TS out

---

**setMPEGTSOut**

```
public void setMPEGTSOut(boolean isMPEGTSOut)
```

Is MPEG-TS out

**Parameters:**

`isMPEGTSOut` - true if MPEG-TS out

---

**transportFindBestMatch**

```
public String transportFindBestMatch(String transport)
```

Based on a transport string from SETUP command find best match

**Parameters:**

`transport` - transport string

**Returns:**

best match

---

**getAutoAllocateInterleavePorts**

```
public int getAutoAllocateInterleavePorts()
```

---

(continued from last page)

## isLive

```
public boolean isLive()
```

Is live stream

**Returns:**

true if live

---

## setLive

```
public void setLive(boolean isLive)
```

Is live stream

**Parameters:**

isLive - true if live

---

## getMediaReader

```
public IMediaReader getMediaReader()
```

Get media reader if video on demand stream

**Returns:**

media reader

---

## getRTSPSessionTimeout

```
public int getRTSPSessionTimeout()
```

Get RTP session timeout (milliseconds)

**Returns:**

RTP session timeout (milliseconds)

---

## setRTSPSessionTimeout

```
public void setRTSPSessionTimeout(int rtspSessionTimeout)
```

Set RTP session timeout (milliseconds)

**Parameters:**

rtspSessionTimeout - RTP session timeout (milliseconds)

---

## getRTSPMaximumPendingWriteBytes

```
public int getRTSPMaximumPendingWriteBytes()
```

Get the maximum number of waiting bytes allow for this RTSP session

**Returns:**

maximum number of waiting bytes allow for this RTSP session

---

## setRTSPMaximumPendingWriteBytes

```
public void setRTSPMaximumPendingWriteBytes(int rtspMaximumPendingWriteBytes)
```

(continued from last page)

Set the maximum number of waiting bytes allow for this RTSP session

**Parameters:**

rtspMaximumPendingWriteBytes - maximum number of waiting bytes allow for this RTSP session

---

## isTimeout

```
public boolean isTimeout(long currTime,  
    int timeout)
```

Is the stream timeout out

**Parameters:**

currTime - current time

timeout - timeout value

**Returns:**

true if timed out

---

## touch

```
public void touch()
```

Touch the stream so that it does not timeout

---

## getRTSPBindIpAddress

```
public String getRTSPBindIpAddress()
```

Get the bind RTSP bind IP address

**Returns:**

bind RTSP bind IP address

---

## setRTSPBindIpAddress

```
public void setRTSPBindIpAddress(String rtspBindIpAddress)
```

Set the bind RTSP bind IP address

**Parameters:**

rtspBindIpAddress - bind RTSP bind IP address

---

## getRTSPConnectionIpAddress

```
public String getRTSPConnectionIpAddress()
```

Get the connection IP address

**Returns:**

connection IP address

---

## setRTSPConnectionIpAddress

```
public void setRTSPConnectionIpAddress(String rtspConnectionIpAddress)
```

Set the connection IP address

**Parameters:**

(continued from last page)

---

rtspConnectionIpAddress - connection IP address

---

## getRTSPConnectionAddressType

```
public String getRTSPConnectionAddressType()
```

Get the connection address type

**Returns:**

connection address type

---

## setRTSPConnectionAddressType

```
public void setRTSPConnectionAddressType(String rtspConnectionAddressType)
```

Set the connection address type

**Parameters:**

rtspConnectionAddressType - connection address type

---

## getRTSPOriginIpAddress

```
public String getRTSPOriginIpAddress()
```

Get the origin IP address

**Returns:**

origin IP address

---

## setRTSPOriginIpAddress

```
public void setRTSPOriginIpAddress(String rtspOriginIpAddress)
```

Set the origin IP address

**Parameters:**

rtspOriginIpAddress - origin IP address

---

## getRTSPOriginAddressType

```
public String getRTSPOriginAddressType()
```

Get the origin address type

**Returns:**

origin address type

---

## setRTSPOriginAddressType

```
public void setRTSPOriginAddressType(String rtspOriginAddressType)
```

Set the origin address type

**Parameters:**

rtspOriginAddressType - origin address type

---

(continued from last page)

## getVODStartTimeTC

```
public long getVODStartTimeTC( )
```

Get the video on demand start time (milliseconds)

**Returns:**

video on demand start time (milliseconds)

---

## setVODStartTimeTC

```
public void setVODStartTimeTC(long vodStartTimeTC)
```

Set the video on demand start time (milliseconds)

**Parameters:**

vodStartTimeTC - video on demand start time (milliseconds)

---

## getVODLastTimeTC

```
public long getVODLastTimeTC( )
```

Get the last timecode (milliseconds) sent for video on demand

**Returns:**

last timecode (milliseconds) sent for video on demand

---

## setVODLastTimeTC

```
public void setVODLastTimeTC(long vodLastTimeTC)
```

Set the last timecode (milliseconds) sent for video on demand

**Parameters:**

vodLastTimeTC - last timecode (milliseconds) sent for video on demand

---

## getVODPlayLen

```
public long getVODPlayLen( )
```

Get the video on demand play duration (milliseconds)

**Returns:**

video on demand play duration (milliseconds)

---

## setVODPlayLen

```
public void setVODPlayLen(long vodPlayLen)
```

Set the video on demand play duration (milliseconds)

**Parameters:**

vodPlayLen - video on demand play duration (milliseconds)

---

## isStreamStarted

```
public boolean isStreamStarted( )
```

(continued from last page)

Is stream started

**Returns:**

true if stream has started playback

---

**isRTSPAlwaysUseSDPPorts**

```
public boolean isRTSPAlwaysUseSDPPorts()
```

Force RTSP to use ports in SDP data

**Returns:**

true if using ports in SDP data

---

**setRTSPAlwaysUseSDPPorts**

```
public void setRTSPAlwaysUseSDPPorts(boolean rtspAlwaysUseSDPPorts)
```

Force RTSP to use ports in SDP data

**Parameters:**

rtspAlwaysUseSDPPorts - true if using ports in SDP data

---

**putRTSPSessionExtraLine**

```
public void putRTSPSessionExtraLine(int location,  
    String line)
```

Add an extra line to the SDP data

**Parameters:**

location - location of line, see SDPLOCATION\_

line - line to add

---

**clearRTSPSessionExtraLines**

```
public void clearRTSPSessionExtraLines()
```

Clear SDP extra lines

---

**getRTSPSessionExtraLines**

```
public java.util.List getRTSPSessionExtraLines()
```

Get extra SDP lines

**Returns:**

extra SDP lines

---

**getRTPDestination**

```
public RTPDestination getRTPDestination()
```

Get RTP destination

**Returns:**

RTP destination

(continued from last page)

---

## setRTPDestination

```
public void setRTPDestination(RTPDestination rtpDestination)
```

Set RTP destination

### Parameters:

rtpDestination - RTP destination

---

## getSDPLang

```
public String getSDPLang()
```

Get the SDP language

### Returns:

SDP language

---

## setSDPLang

```
public void setSDPLang(String sdpLang)
```

Set the SDP language

### Parameters:

sdpLang - SDP language

---

## isRTPIgnoreProfileLevelId

```
public boolean isRTPIgnoreProfileLevelId()
```

---

## setRTPIgnoreProfileLevelId

```
public void setRTPIgnoreProfileLevelId(boolean rtpIgnoreProfileLevelId)
```

---

## getUDPManagedDeliveryDelay

```
public int getUDPManagedDeliveryDelay()
```

---

## setUDPManagedDeliveryDelay

```
public void setUDPManagedDeliveryDelay(int udpManagedDeliveryDelay)
```

---

## getUDPManagedDeliveryCount

```
public int getUDPManagedDeliveryCount()
```

---

(continued from last page)

---

**setUDPManagedDeliveryCount**

```
public void setUDPManagedDeliveryCount(int udpManagedDeliveryCount)
```

---

**isForceMPEGTSOut**

```
public boolean isForceMPEGTSOut()
```

---

**setForceMPEGTSOut**

```
public void setForceMPEGTSOut(boolean isForceMPEGTSOut)
```

---

**isBlockUDPOut**

```
public boolean isBlockUDPOut()
```

---

**setBlockUDPOut**

```
public void setBlockUDPOut(boolean blockUDPOut)
```

---

**getMPEGTSAudioBitrate**

```
public int getMPEGTSAudioBitrate()
```

---

**setMPEGTSAudioBitrate**

```
public void setMPEGTSAudioBitrate(int mpegtsAudioBitrate)
```

---

**getMPEGTSVideoBitrate**

```
public int getMPEGTSVideoBitrate()
```

---

**setMPEGTSVideoBitrate**

```
public void setMPEGTSVideoBitrate(int mpegtsVideoBitrate)
```

---

**isRTPIgnoreSPropParameterSets**

```
public boolean isRTPIgnoreSPropParameterSets()
```

---

(continued from last page)

---

### setRTPIgnoreSPropParameterSets

```
public void setRTPIgnoreSPropParameterSets(boolean rtpIgnoreSPropParameterSets)
```

---

### getRTPStreamContext

```
public RTPStreamContext getRTPStreamContext()
```

---

### setRTPStreamContext

```
public void setRTPStreamContext(RTPStreamContext rtpStreamContext)
```

---

### isRefuseIncomingUDPConnections

```
public boolean isRefuseIncomingUDPConnections()
```

---

### setRefuseIncomingUDPConnections

```
public void setRefuseIncomingUDPConnections(boolean refuseIncomingUDPConnections)
```

---

### isRefuseOutgoingUDPConnections

```
public boolean isRefuseOutgoingUDPConnections()
```

---

### setRefuseOutgoingUDPConnections

```
public void setRefuseOutgoingUDPConnections(boolean refuseOutgoingUDPConnections)
```

---

### notifyEncryptionProviderAllTracks

```
public void notifyEncryptionProviderAllTracks()
```

---

### notifyEncryptionProvider

```
public void notifyEncryptionProvider(RTPTrack rtpTrack)
```

---

(continued from last page)

---

## isUDPTransportOverride

```
public boolean isUDPTransportOverride()
```

---

## setUDPTransport

```
public void setUDPTransport(IUDPTransport udpTransport)
```

---

## getSDPTransportStr

```
public String getSDPTransportStr()
```

---

## setSDPTransportStr

```
public void setSDPTransportStr(String sdpTransportStr)
```

---

## isWebRTC

```
public boolean isWebRTC()
```

---

## setWebRTC

```
public void setWebRTC(boolean isWebRTC)
```

---

---

Package

**com.wowza.wms.rtp.transport**

## com.wowza.wms.rtp.transport Interface IUDPMessageHandler

All Known Implementing Classes:

[RTPPort](#)

public interface **IUDPMessageHandler**  
extends

### Method Summary

void	<a href="#">handleMessage</a> (java.net.SocketAddress socketAddr, Object message)
void	<a href="#">sessionClosed</a> ( <a href="#">IUDPTransportSession</a> session)
void	<a href="#">sessionOpened</a> ( <a href="#">IUDPTransportSession</a> session)

### Methods

#### handleMessage

```
public void handleMessage(java.net.SocketAddress socketAddr,  
    Object message)
```

#### sessionOpened

```
public void sessionOpened(IUDPTransportSession session)
```

#### sessionClosed

```
public void sessionClosed(IUDPTransportSession session)
```

## com.wowza.wms.rtp.transport Interface IUDPTransport

public interface **IUDPTransport**  
extends

### Field Summary

public static final	<a href="#"><u>DIRECTION_IN</u></a> Value: <b>1</b>
public static final	<a href="#"><u>DIRECTION_OUT</u></a> Value: <b>2</b>

### Method Summary

java.net.InetSocketAddress	<a href="#"><u>bind</u></a> (RTPUDPDatagramConfig datagramConfig, <a href="#"><u>IUDPMessageHandler</u></a> handler, String inIPAddress, int inPort, String outIPAddress, int outPort, int direction)
void	<a href="#"><u>copyContext</u></a> ( <a href="#"><u>IUDPTransport</u></a> transport)
String	<a href="#"><u>getLoggingContextStr</u></a> ()
java.net.InetAddress	<a href="#"><u>getMulticastInterfaceAddress</u></a> ()
long	<a href="#"><u>getReceivedPacketCount</u></a> (java.net.InetSocketAddress socketAddress)
<a href="#"><u>RTPContext</u></a>	<a href="#"><u>getRTPContext</u></a> ()
long	<a href="#"><u>getSentPacketCount</u></a> (java.net.InetSocketAddress socketAddress)
int	<a href="#"><u>getTimeToLive</u></a> ()
void	<a href="#"><u>setLoggingContextStr</u></a> (String loggingContextStr)
void	<a href="#"><u>setMulticastInterfaceAddress</u></a> (java.net.InetAddress multicastInterfaceAddress)
void	<a href="#"><u>setRTPContext</u></a> ( <a href="#"><u>RTPContext</u></a> rtpContext)
void	<a href="#"><u>setTimeToLive</u></a> (int timeToLive)
void	<a href="#"><u>unbind</u></a> (java.net.InetSocketAddress socketAddress)
void	<a href="#"><u>unbindAll</u></a> ()

## Fields

### DIRECTION\_IN

```
public static final int DIRECTION_IN
```

Constant value: **1**

---

### DIRECTION\_OUT

```
public static final int DIRECTION_OUT
```

Constant value: **2**

---

## Methods

### bind

```
public java.net.InetSocketAddress bind(RTPUDPDatagramConfig datagramConfig,
    IUDPMessageHandler handler,
    String inIPAddress,
    int inPort,
    String outIPAddress,
    int outPort,
    int direction)
```

---

### unbindAll

```
public void unbindAll()
```

---

### unbind

```
public void unbind(java.net.InetSocketAddress socketAddress)
```

---

### setRTPContext

```
public void setRTPContext(RTPContext rtpContext)
```

---

### getRTPContext

```
public RTPContext getRTPContext()
```

---

(continued from last page)

## setTimeToLive

```
public void setTimeToLive(int timeToLive)
```

---

## getTimeToLive

```
public int getTimeToLive()
```

---

## setMulticastInterfaceAddress

```
public void setMulticastInterfaceAddress( java.net.InetAddress  
multicastInterfaceAddress)
```

---

## getLoggingContextStr

```
public String getLoggingContextStr()
```

---

## setLoggingContextStr

```
public void setLoggingContextStr(String loggingContextStr)
```

---

## getMulticastInterfaceAddress

```
public java.net.InetAddress getMulticastInterfaceAddress()
```

---

## copyContext

```
public void copyContext(IUDPTransport transport)
```

---

## getReceivedPacketCount

```
public long getReceivedPacketCount( java.net.InetSocketAddress socketAddress)
```

---

## getSentPacketCount

```
public long getSentPacketCount( java.net.InetSocketAddress socketAddress)
```

---

---

## com.wowza.wms.rtp.transport Interface IUDPTransportSession

---

public interface **IUDPTransportSession**  
extends

---

### Method Summary

void	<a href="#">write</a> (byte[] buffer, int offset, int len, java.net.SocketAddress destination, long timecode)
------	---

---

### Methods

#### **write**

```
public void write(byte[] buffer,  
    int offset,  
    int len,  
    java.net.SocketAddress destination,  
    long timecode)
```

---

Package

**com.wowza.wms.server**

com.wowza.wms.server

# Interface ICommandInterfaceCommand

public interface **ICommandInterfaceCommand**  
extends

Method Summary	
boolean	<a href="#">canHandle</a> (CommandInterfaceRequestMessage req)
void	<a href="#">invoke</a> (CommandInterfaceRequestMessage req, CommandInterfaceResponseMessage resp)

## Methods

**invoke**

public void **invoke**(CommandInterfaceRequestMessage req,  
CommandInterfaceResponseMessage resp)

**canHandle**

public boolean **canHandle**(CommandInterfaceRequestMessage req)

## com.wowza.wms.server Interface ICompilerDirectives

public interface **ICompilerDirectives**  
extends

### Field Summary

public static final

[RTMPENABLED](#)

Value: **true**

### Fields

#### RTMPENABLED

public static final boolean **RTMPENABLED**

Constant value: **true**

---

## com.wowza.wms.server Interface IResponseListener

---

public interface **IResponseListener**  
extends

IResponseListener: Internal use.

---

### Method Summary

void	<a href="#"><u>onResponseWriteStart</u></a> (RtmpResponseMessage response)
void	<a href="#"><u>onResponseWriteStop</u></a> (RtmpResponseMessage response)

---

### Methods

#### **onResponseWriteStart**

public void **onResponseWriteStart**(RtmpResponseMessage response)

---

#### **onResponseWriteStop**

public void **onResponseWriteStop**(RtmpResponseMessage response)

## com.wowza.wms.server Interface IServer

public interface **IServer**  
extends

IServer: public interface to Server object.

### Field Summary

public static final	<a href="#"><u>SERVER_DEFAULT</u></a> Value: <b>_defaultServer_</b>
---------------------	--

### Method Summary

boolean	<a href="#"><u>addAuthorizedRESTAPI</u></a> (Class classType) Returns true if the class has been added to the REST API.
boolean	<a href="#"><u>addAuthorizedRESTAPI</u></a> (Class classType, String url) Returns true if the class has been added to the REST API at the specified URL
void	<a href="#"><u>addServerListener</u></a> ( <a href="#"><u>IServerNotify</u></a> serverListener) Add server listener
boolean	<a href="#"><u>addUnAuthorizedRESTAPI</u></a> (Class classType) Returns true if the class has been added to the REST API.
boolean	<a href="#"><u>addUnAuthorizedRESTAPI</u></a> (Class classType, String url) Returns true if the class has been added to the REST API at the specified URL
com.wowza.wms.admin.AdminAgent	<a href="#"><u>getAdminAgent</u></a> () Get the JMX interface
String	<a href="#"><u>getAdminGUID</u></a> () Get the admin guid
java.util.List	<a href="#"><u>getAdminInterfaceObjectList</u></a> () Get the list of objects exposed through JMX interface
RandomIdGenerator	<a href="#"><u>getClientIdGenerator</u></a> () Get the client id generator for the server
int	<a href="#"><u>getClientIdGeneratorRecycleDelaySize</u></a> () Get the client ID generator recycle delay size
int	<a href="#"><u>getClientIdGeneratorRecycleSize</u></a> () Get the client ID generator recycle size
long	<a href="#"><u>getClientIdGeneratorTimeout</u></a> () Get the client ID generator timeout
CommandInterfaceCommandHandler	<a href="#"><u>getCommandInterfaceCommandHandler</u></a> () Get the command interface command handler

<a href="#">HostPort</a>	<a href="#">getCommandInterfaceHostPort()</a> Get the definition of the command interface
long	<a href="#">getCommittedVirtualMemory()</a> Get the committed virtual memory
<a href="#">ConnectionCounter</a>	<a href="#">getConnectionCounter()</a> Get the server connection counter.
ConnectionCounterSimple	<a href="#">getConnectionCounter(int counterIndex)</a> Get the server connection counter for a specific technology (see IVHost.COUNTER_*)
long	<a href="#">getConnectionsMaximum()</a> Returns maximum number of connections allowed to the server (-1 means unlimited)
int	<a href="#">getCoreHandlerPoolSize()</a> Get the handler core thread pool size.
int	<a href="#">getCoreTransportPoolSize()</a> Get the transport core thread pool size.
long	<a href="#">getCurrentHeapSize()</a> Get the current heap size
String	<a href="#">getDateStarted()</a> Get the date and time the server was started.
String	<a href="#">getDefaultStreamPrefix()</a> Get the default stream prefix used if the stream name does not include a prefix (default is mp4)
java.util.Properties	<a href="#">getDynamicLogProperties()</a> Get the dynamic log properties defined at the server level in conf/log4j.properties
String	<a href="#">getGUID()</a> Get the base guid
<a href="#">ThreadPool</a>	<a href="#">getHandlerThreadPool()</a> Get the server handler thread pool.
String	<a href="#">getHTTPHeaderServer()</a> Get the Server header used for HTTP responses
<a href="#">IOPerformanceCounter</a>	<a href="#">getIoPerformanceCounter()</a> Get the server performance counter.
<a href="#">IOPerformanceCounter</a>	<a href="#">getIoPerformanceCounter(int counterIndex)</a> Get the server performance counter for a specific technology (see IVHost.COUNTER_*)
long	<a href="#">getLiveStreamTranscoderSessionCount()</a> Get the current number of live stream transcoder sessions.
long	<a href="#">getLiveThreads()</a> Get the count of live threads
<a href="#">WMSProperties</a>	<a href="#">getManagerProperties()</a> Get server's manager's properties collection
long	<a href="#">getMaxHeapSize()</a> Get the max heap size

long	<a href="#"><u>getPeakThreads()</u></a> Get the count of peak threads
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get server level properties collection
Server.ProtocolUsageSessionTracker	<a href="#"><u>getProtocolUsageTracker()</u></a> Get the server level protocol usage tracker
long	<a href="#"><u>getPublishersMaximum()</u></a> Get the maximum number of streams that can be published to the server
<a href="#"><u>PushPublishUsageTracker</u></a>	<a href="#"><u>getPushPublishUsageTracker()</u></a> Get the server level push publishing usage tracker
com.wowza.wms.rest.restserver.RESTUsageTracker	<a href="#"><u>getRESTUsageTracker()</u></a> Get the server level REST usage tracker
String	<a href="#"><u>getRTMPTHeaderServer()</u></a> Get the Server header used for RTMPT responses
String	<a href="#"><u>getServerGUID()</u></a> Get the server guid
String	<a href="#"><u>getSessionGUID()</u></a> Get the session guid
<a href="#"><u>ThreadPool</u></a>	<a href="#"><u>getThreadPool()</u></a> Get the server handler thread pool.
com.wowza.wms.transcoder.thumbnailer.ThumbnailerUsageTracker	<a href="#"><u>getThumbnailerUsageTracker()</u></a> Get the server level thumbnail usage tracker
String	<a href="#"><u>getTimeRunning()</u></a> Get a formatted String of how long the server has been running.
double	<a href="#"><u>getTimeRunningSeconds()</u></a> Get time running in seconds
com.wowza.wms.transcoder.capture.TranscoderCaptureManager	<a href="#"><u>getTranscoderCaptureManager()</u></a> Get the transcoder capture manager
TranscoderContextServer	<a href="#"><u>getTranscoderContextServer()</u></a> Get the server level transcoder context
long	<a href="#"><u>getTranscoderLicenseInUse()</u></a> Get the total number of transcoder licenses in use.
long	<a href="#"><u>getTranscoderLicenseTotal()</u></a> Get the total number of transcoder licenses (-1 means unlimited - subscription)
TranscoderUsageTracker	<a href="#"><u>getTranscoderUsageTracker()</u></a> Get the server level live transcoder usage tracker
com.wowza.wms.transcoder.vod.TranscoderVODUsageTracker	<a href="#"><u>getTranscoderVODUsageTracker()</u></a> Get the server level VOD transcoder usage tracker

<a href="#">ThreadPool</a>	<a href="#">getTransportThreadPool()</a> Get the server transport thread pool.
ServerTuningHandler	<a href="#">getTuningHandler()</a> Get the handler that control automatic server tuning
com.wowza.wms.transpo rt.udp.UDPPortManager	<a href="#">getUDPPortManager()</a> Get the UDP port manager which manages the allocation of incoming UDP port binding to be sure there are not port conflicts
com.wowza.wms.transpo rt.udp.UDPPortSharing Manager	<a href="#">getUDPPortSharingManager()</a> Get the UDP port sharing manager.
String[]	<a href="#">getUserAgents()</a> Get a pipe " " delimited list of user agents that the server recognizes as RTMPT client.
String	<a href="#">getVersion()</a> Get server version number.
<a href="#">VHostList</a>	<a href="#">getVHostList()</a> Returns the interface to the VHostList for the server
boolean	<a href="#">isAcceptWOWZConnections()</a> If true, WOWZ connections will use the WOWZ protocol.
boolean	<a href="#">isDRMAvailable()</a> Returns true if DRM is properly licensed.
boolean	<a href="#">isDRMInUse()</a> Returns true if DRM is in-use.
boolean	<a href="#">isDVRAvailable()</a> Returns true if nDVR is properly licensed.
boolean	<a href="#">isDVRInUse()</a> Returns true if nDVR is in-use.
boolean	<a href="#">isDynamicLogContextLoaded(String logContext)</a> Returns true of the given dynamic log context is already loaded.
boolean	<a href="#">isHTTPOriginAvailable()</a> Returns true if HTTP origin is properly licensed.
boolean	<a href="#">isInitiateWOWZConnections()</a> If true, NetConnection attempts will use the WOWZ protocol when possible.
boolean	<a href="#">isLoggingRemoveStdoutIfRunningAsService()</a> If true, stdout log4j appender is removed from logging configuration if running as a service.
boolean	<a href="#">isPushPublishAvailable()</a> Returns true if Push Publish is properly licensed.
boolean	<a href="#">isRESTAPIAvailable()</a> Returns true if REST API is properly licensed.
boolean	<a href="#">isRestDocumentationServerEnabled()</a> Returns true if REST API documentation server is enabled

boolean	<a href="#"><u>isRestServerEnabled()</u></a> Returns true if REST API is enabled
boolean	<a href="#"><u>isSuspended()</u></a> Is the server current suspended
boolean	<a href="#"><u>isTranscoderWatermark()</u></a> Return true if transcoder has a watermark
boolean	<a href="#"><u>isVHostRunning(String name)</u></a> Returns true if the name provided is a running VHost name
String	<a href="#"><u>readConfig(String sName)</u></a> Method to read xml config file..
void	<a href="#"><u>reloadVHostConfig()</u></a> Reload the VHosts.xml file.
void	<a href="#"><u>removeServerListener(IServerNotify serverListener)</u></a> Remove server listener
void	<a href="#"><u>setAcceptWOWZConnections(boolean acceptWOWZConnections)</u></a> If true, WOWZ connections will use the WOWZ protocol.
void	<a href="#"><u>setCommandInterfaceHostPort(HostPort commandInterfaceHostPort)</u></a> Set the definition for the command interface.
void	<a href="#"><u>setCoreHandlerPoolSize(int corePoolSize)</u></a> Set the handler core thread pool size.
void	<a href="#"><u>setCoreTransportPoolSize(int corePoolSize)</u></a> Set the transport core thread pool size.
void	<a href="#"><u>setDefaultStreamPrefix(String defaultStreamPrefix)</u></a> Set the default stream prefix used if the stream name does not include a prefix (default is mp4)
void	<a href="#"><u>setDynamicLogProperties(java.util.Properties dynamicLogProperties)</u></a> Set the dynamic log properties set at the server level
void	<a href="#"><u>setHTTPHeaderServer(String httpHeaderServer)</u></a> Set the Server header used for HTTP responses
void	<a href="#"><u>setInitiateWOWZConnections(boolean initiateWOWZConnections)</u></a> If true, NetConnection attempts will use the WOWZ protocol when possible.
void	<a href="#"><u>setLoggingRemoveStdoutIfRunningAsService(boolean loggingRemoveStdoutIfRunningAsService)</u></a> If true, stdout log4j appender is removed from logging configuration if running as a service.
void	<a href="#"><u>setRestDocumentationServerEnabled(boolean restDocumentationServerEnabled)</u></a> Sets if REST API documentation server will be enabled
void	<a href="#"><u>setRestServerEnabled(boolean restServerEnabled)</u></a> Sets if REST API server will be enabled
void	<a href="#"><u>setRTMPTHeaderServer(String rtmptHeaderServer)</u></a> Set the Server header used for RTMPT responses

void	<a href="#"><u>setUserAgents</u></a> (String[] userAgents) Set a pipe " " delimited list of user agents that the server recognizes as RTMPT client.
void	<a href="#"><u>startCommandInterface</u></a> () Start the command interface as defined in Server.xml.
void	<a href="#"><u>startStats</u></a> () Starts the statistics manager to collect server and application statistics
void	<a href="#"><u>startVHost</u></a> (String vhostName) Start a vHost by name.
void	<a href="#"><u>startVHosts</u></a> () Start all vHosts
void	<a href="#"><u>stopAdminAgent</u></a> () Stop the JMX interface
void	<a href="#"><u>stopCommandInterface</u></a> () Stop the command interface as defined in Server.xml.
void	<a href="#"><u>stopStats</u></a> () Stops the statistics manager
void	<a href="#"><u>stopVHost</u></a> (String vhostName) Stop a vHost by name.
void	<a href="#"><u>stopVHosts</u></a> () Stop all vHosts
void	<a href="#"><u>suspendAllVHosts</u></a> () Suspend all virtual hosts (Calls IVHost.suspendAllHostPorts for each vhost)
void	<a href="#"><u>suspendCommandInterface</u></a> () Suspend the command interface as defined in Server.xml.
void	<a href="#"><u>suspendServer</u></a> () Suspend all virtual hosts and the command interface
void	<a href="#"><u>unbindAllVHosts</u></a> () Unbind all virtual hosts (Calls IVHost.unbindAllHostPorts for each vhost)
boolean	<a href="#"><u>writeConfig</u></a> (String sName, String data) Method to write xml config file..

## Fields

### SERVER\_DEFAULT

```
public static final java.lang.String SERVER_DEFAULT
```

Constant value: **\_defaultServer\_**

## Methods

(continued from last page)

## startCommandInterface

```
public void startCommandInterface()
```

Start the command interface as defined in Server.xml. The command interface is used by shutdown.sh script to stop the server. It is also used by ant task to stop and start the server on build events.

---

## stopCommandInterface

```
public void stopCommandInterface()
```

Stop the command interface as defined in Server.xml. The command interface is used by shutdown.sh script to stop the server. It is also used by ant task to stop and start the server on build events.

---

## suspendCommandInterface

```
public void suspendCommandInterface()
```

Suspend the command interface as defined in Server.xml. The command interface is used by shutdown.sh script to stop the server. It is also used by ant task to stop and start the server on build events.

---

## getVersion

```
public String getVersion()
```

Get server version number.

**Returns:**

server version number

---

## reloadVHostConfig

```
public void reloadVHostConfig()
```

Reload the VHosts.xml file. This method can be invoked through the JMX interface to manage vHosts while the server is running.

---

## stopVHost

```
public void stopVHost(String vhostName)
```

Stop a vHost by name.

**Parameters:**

vhostName - vHost name

---

## stopVHosts

```
public void stopVHosts()
```

Stop all vHosts

---

## isVHostRunning

```
public boolean isVHostRunning(String name)
```

Returns true if the name provided is a running VHost name

---

---

(continued from last page)

**Parameters:**

name - of a running VHost

**Returns:**

true if the name provided is a running VHost name

---

## startVHost

```
public void startVHost(String vhostName)
```

Start a vHost by name.

**Parameters:**

vhostName - vHost name

---

## startVHosts

```
public void startVHosts()
```

Start all vHosts

---

## getIoPerformanceCounter

```
public IoPerformanceCounter getIoPerformanceCounter()
```

Get the server performance counter.

**Returns:**

io performance counter

---

## getIoPerformanceCounter

```
public IoPerformanceCounter getIoPerformanceCounter(int counterIndex)
```

Get the server performance counter for a specific technology (see IVHost.COUNTER\_\*)

**Parameters:**

counterIndex - counter index (see IVHost.COUNTER\_\*)

**Returns:**

io performance counter

---

## getConnectionCounter

```
public ConnectionCounter getConnectionCounter()
```

Get the server connection counter.

**Returns:**

connection counter

---

## getPublishersMaximum

```
public long getPublishersMaximum()
```

Get the maximum number of streams that can be published to the server

**Returns:**

(continued from last page)

maximum number of streams that can be published to the server

---

## getConnectionCounter

```
public ConnectionCounterSimple getConnectionCounter(int counterIndex)
```

Get the server connection counter for a specific technology (see IVHost.COUNTER\_\*)

**Parameters:**

counterIndex - counter index (see IVHost.COUNTER\_\*)

**Returns:**

connection counter

---

## getDateStarted

```
public String getDateStarted()
```

Get the date and time the server was started.

**Returns:**

date and time the server was started

---

## getTimeRunning

```
public String getTimeRunning()
```

Get a formatted String of how long the server has been running.

**Returns:**

formatted String of how long the server has been running

---

## getTimeRunningSeconds

```
public double getTimeRunningSeconds()
```

Get time running in seconds

**Returns:**

time running in seconds

---

## getCommandInterfaceHostPort

```
public HostPort getCommandInterfaceHostPort()
```

Get the definition of the command interface

**Returns:**

host port definition of command interface

---

## setCommandInterfaceHostPort

```
public void setCommandInterfaceHostPort(HostPort commandInterfaceHostPort)
```

Set the definition for the command interface.

**Parameters:**

commandInterfaceHostPort - host port definition of command interface

---

## getUserAgents

```
public String[] getUserAgents()
```

Get a pipe "|" delimited list of user agents that the server recognizes as RTMPT client.

**Returns:**

pipe "|" delimited list of user agents that the server recognizes as RTMPT client

---

## setUserAgents

```
public void setUserAgents(String[] userAgents)
```

Set a pipe "|" delimited list of user agents that the server recognizes as RTMPT client.

**Parameters:**

userAgents - pipe "|" delimited list of user agents that the server recognizes as RTMPT client

---

## addServerListener

```
public void addServerListener(IServerNotify serverListener)
```

Add server listener

**Parameters:**

serverListener - server listener

---

## removeServerListener

```
public void removeServerListener(IServerNotify serverListener)
```

Remove server listener

**Parameters:**

serverListener - server listener

---

## getAdminInterfaceObjectList

```
public java.util.List getAdminInterfaceObjectList()
```

Get the list of objects exposed through JMX interface

**Returns:**

list of objects exposed through JMX interface

---

## getCoreTransportPoolSize

```
public int getCoreTransportPoolSize()
```

Get the transport core thread pool size.

**Returns:**

default core thread pool size

---

## setCoreTransportPoolSize

```
public void setCoreTransportPoolSize(int corePoolSize)
```

---

---

(continued from last page)

Set the transport core thread pool size.

**Parameters:**

corePoolSize - core thread pool size

---

## getCoreHandlerPoolSize

```
public int getCoreHandlerPoolSize()
```

Get the handler core thread pool size.

**Returns:**

default core thread pool size

---

## setCoreHandlerPoolSize

```
public void setCoreHandlerPoolSize(int corePoolSize)
```

Set the handler core thread pool size.

**Parameters:**

corePoolSize - core thread pool size

---

## getThreadPool

```
public ThreadPool getThreadPool()
```

Get the server handler thread pool. Same as getHandlerThreadPool.

**Returns:**

server handler thread pool

---

## getTransportThreadPool

```
public ThreadPool getTransportThreadPool()
```

Get the server transport thread pool. This thread pool is used to read/write data from the transports sockets.

**Returns:**

server transport thread pool

---

## getHandlerThreadPool

```
public ThreadPool getHandlerThreadPool()
```

Get the server handler thread pool. This thread pool is used to process the incoming events.

**Returns:**

server handler thread pool

---

## getProperties

```
public WMSProperties getProperties()
```

Get server level properties collection

**Returns:**

server level properties collection

---

## getManagerProperties

```
public WMSProperties getManagerProperties()
```

Get server's manager's properties collection

**Returns:**

manager's property collection

---

## getClientIdGenerator

```
public RandomIdGenerator getClientIdGenerator()
```

Get the client id generator for the server

**Returns:**

client id generator for the server

---

## getDynamicLogProperties

```
public java.util.Properties getDynamicLogProperties()
```

Get the dynamic log properties defined at the server level in conf/log4j.properties

**Returns:**

dynamic log properties defined at the server level

---

## setDynamicLogProperties

```
public void setDynamicLogProperties(java.util.Properties dynamicLogProperties)
```

Set the dynamic log properties set at the server level

**Parameters:**

dynamicLogProperties - dynamic log properties defined at the server level

---

## isDynamicLogContextLoaded

```
public boolean isDynamicLogContextLoaded(String logContext)
```

Returns true if the given dynamic log context is already loaded. If not loaded it will return false and add it to the a Set of loaded log context. Log context is [VHost].[Application].[AppInstance]

---

## getVHostList

```
public VHostList getVHostList()
```

Returns the interface to the VHostList for the server

**Returns:**

vhostList

---

## suspendAllVHosts

```
public void suspendAllVHosts()
```

Suspend all virtual hosts (Calls IVHost.suspendAllHostPorts for each vhost)

---

## unbindAllVHosts

```
public void unbindAllVHosts()
```

Unbind all virtual hosts (Calls IVHost.unbindAllHostPorts for each vhost)

---

## suspendServer

```
public void suspendServer()
```

Suspend all virtual hosts and the command interface

---

## isSuspended

```
public boolean isSuspended()
```

Is the server current suspended

---

## stopAdminAgent

```
public void stopAdminAgent()
```

Stop the JMX interface

---

## getAdminAgent

```
public com.wowza.wms.admin.AdminAgent getAdminAgent()
```

Get the JMX interface

**Returns:**

JMX Admin agent

---

## getSessionGUID

```
public String getSessionGUID()
```

Get the session guid

**Returns:**

session guid

---

## getServerGUID

```
public String getServerGUID()
```

Get the server guid

**Returns:**

server guid

---

## getGUID

```
public String getGUID()
```

Get the base guid

---

(continued from last page)

**Returns:**

base guid

---

**getAdminGUID**

```
public String getAdminGUID()
```

Get the admin guid

**Returns:**

admin guid

---

**getUDPPortManager**

```
public com.wowza.wms.transport.udp.UDPPortManager getUDPPortManager()
```

Get the UDP port manager which manages the allocation of incoming UDP port binding to be sure there are not port conflicts

**Returns:**

UDP port manager

---

**getUDPPortSharingManager**

```
public com.wowza.wms.transport.udp.UDPPortSharingManager getUDPPortSharingManager()
```

Get the UDP port sharing manager.

**Returns:**

UDP port sharing manager

---

**getLiveThreads**

```
public long getLiveThreads()
```

Get the count of live threads

**Returns:**

count of live threads

---

**getPeakThreads**

```
public long getPeakThreads()
```

Get the count of peak threads

**Returns:**

count of peak threads

---

**getCurrentHeapSize**

```
public long getCurrentHeapSize()
```

Get the current heap size

**Returns:**

current heap size

(continued from last page)

## getMaxHeapSize

```
public long getMaxHeapSize()
```

Get the max heap size

**Returns:**

map heap size

---

## getCommittedVirtualMemory

```
public long getCommittedVirtualMemory()
```

Get the committed virtual memory

**Returns:**

committed virtual memory

---

## readConfig

```
public String readConfig(String sName)
```

Method to read xml config file..

---

## writeConfig

```
public boolean writeConfig(String sName,  
String data)
```

Method to write xml config file..

---

## getClientIdGeneratorTimeout

```
public long getClientIdGeneratorTimeout()
```

Get the client ID generator timeout

**Returns:**

client ID generator timeout

---

## getClientIdGeneratorRecycleSize

```
public int getClientIdGeneratorRecycleSize()
```

Get the client ID generator recycle size

**Returns:**

client ID generator recycle size

---

## getClientIdGeneratorRecycleDelaySize

```
public int getClientIdGeneratorRecycleDelaySize()
```

Get the client ID generator recycle delay size

**Returns:**

client ID generator recycle delay size

## getCommandInterfaceCommandHandler

```
public CommandInterfaceCommandHandler getCommandInterfaceCommandHandler()
```

Get the command interface command handler

**Returns:**

command interface command handler

---

## getProtocolUsageTracker

```
public Server.ProtocolUsageSessionTracker getProtocolUsageTracker()
```

Get the server level protocol usage tracker

**Returns:**

server level protocol usage tracker

---

## isAcceptWOWZConnections

```
public boolean isAcceptWOWZConnections()
```

If true, WOWZ connections will use the WOWZ protocol. If false, WOWZ connection attempts will fall back to RTMP.

**Returns:**

true, WOWZ connections will use the WOWZ protocol

---

## setAcceptWOWZConnections

```
public void setAcceptWOWZConnections(boolean acceptWOWZConnections)
```

If true, WOWZ connections will use the WOWZ protocol. If false, WOWZ connection attempts will fall back to RTMP.

**Parameters:**

acceptWOWZConnections - true, WOWZ connections will use the WOWZ protocol

---

## isInitiateWOWZConnections

```
public boolean isInitiateWOWZConnections()
```

If true, NetConnection attempts will use the WOWZ protocol when possible.

**Returns:**

true, NetConnection attempts will use the WOWZ protocol when possible.

---

## setInitiateWOWZConnections

```
public void setInitiateWOWZConnections(boolean initiateWOWZConnections)
```

If true, NetConnection attempts will use the WOWZ protocol when possible.

**Parameters:**

initiateWOWZConnections - true, NetConnection attempts will use the WOWZ protocol when possible.

---

## getLiveStreamTranscoderSessionCount

```
public long getLiveStreamTranscoderSessionCount()
```

---

---

(continued from last page)

Get the current number of live stream transcoder sessions.

**Returns:**

current number of live stream transcoder sessions

---

## getTuningHandler

```
public ServerTuningHandler getTuningHandler()
```

Get the handler that control automatic server tuning

**Returns:**

handler that control automatic server tuning

---

## getTranscoderLicenseInUse

```
public long getTranscoderLicenseInUse()
```

Get the total number of transcoder licenses in use.

**Returns:**

total number of transcoder licenses in use.

---

## getTranscoderLicenseTotal

```
public long getTranscoderLicenseTotal()
```

Get the total number of transcoder licenses (-1 means unlimited - subscription)

**Returns:**

total number of transcoder licenses

---

## isTranscoderWatermark

```
public boolean isTranscoderWatermark()
```

Return true if transcoder has a watermark

**Returns:**

true if transcoder has a watermark

---

## isDVRAvailable

```
public boolean isDVRAvailable()
```

Returns true if nDVR is properly licensed.

**Returns:**

true if nDVR is properly licensed

---

## isDVRInUse

```
public boolean isDVRInUse()
```

Returns true if nDVR is in-use.

**Returns:**

true if nDVR is in-use

---

## isDRMAvailable

```
public boolean isDRMAvailable()
```

Returns true if DRM is properly licensed.

**Returns:**

true if DRM is properly licensed

---

## isDRMInUse

```
public boolean isDRMInUse()
```

Returns true if DRM is in-use.

**Returns:**

true if DRM is in-use

---

## isHTTPOriginAvailable

```
public boolean isHTTPOriginAvailable()
```

Returns true if HTTP origin is properly licensed.

**Returns:**

true if HTTP origin is properly licensed

---

## isRESTAPIAvailable

```
public boolean isRESTAPIAvailable()
```

Returns true if REST API is properly licensed.

**Returns:**

true if REST API is properly licensed

---

## isPushPublishAvailable

```
public boolean isPushPublishAvailable()
```

Returns true if Push Publish is properly licensed.

**Returns:**

true if Push Publish is properly licensed.

---

## setRestServerEnabled

```
public void setRestServerEnabled(boolean restServerEnabled)
```

Sets if REST API server will be enabled

**Parameters:**

restServerEnabled - if the REST API server will be enabled

---

## isRestServerEnabled

```
public boolean isRestServerEnabled()
```

---

(continued from last page)

Returns true if REST API is enabled

**Returns:**

true if REST API is enabled

---

## setRestDocumentationServerEnabled

```
public void setRestDocumentationServerEnabled(boolean restDocumentationServerEnabled)
```

Sets if REST API documentation server will be enabled

**Parameters:**

restDocumentationServerEnabled - if the REST API server will be enabled

---

## isRestDocumentationServerEnabled

```
public boolean isRestDocumentationServerEnabled()
```

Returns true if REST API documentation server is enabled

**Returns:**

true if REST API documentation server is enabled

---

## addAuthorizedRESTAPI

```
public boolean addAuthorizedRESTAPI(Class classType)
```

Returns true if the class has been added to the REST API.

**Returns:**

true if the class has been added to the REST API

---

## addUnauthorizedRESTAPI

```
public boolean addUnauthorizedRESTAPI(Class classType,  
String url)
```

Returns true if the class has been added to the REST API at the specified URL

**Returns:**

true if the class has been added to the REST API at the specified URL

---

## addUnauthorizedRESTAPI

```
public boolean addUnauthorizedRESTAPI(Class classType)
```

Returns true if the class has been added to the REST API.

**Returns:**

true if the class has been added to the REST API

---

## addAuthorizedRESTAPI

```
public boolean addAuthorizedRESTAPI(Class classType,  
String url)
```

Returns true if the class has been added to the REST API at the specified URL

(continued from last page)

**Returns:**

true if the class has been added to the REST API at the specified URL

---

**getConnectionsMaximum**

```
public long getConnectionsMaximum()
```

Returns maximum number of connections allowed to the server (-1 means unlimited)

**Returns:**

maximum number of connections allowed to the server (-1 means unlimited)

---

**startStats**

```
public void startStats()
```

Starts the statistics manager to collect server and application statistics

---

**stopStats**

```
public void stopStats()
```

Stops the statistics manager

---

**getDefaultStreamPrefix**

```
public String getDefaultStreamPrefix()
```

Get the default stream prefix used if the stream name does not include a prefix (default is mp4)

**Returns:**

default stream prefix

---

**setDefaultStreamPrefix**

```
public void setDefaultStreamPrefix(String defaultStreamPrefix)
```

Set the default stream prefix used if the stream name does not include a prefix (default is mp4)

**Parameters:**

defaultStreamPrefix - default stream prefix

---

**getRTMPTHeaderServer**

```
public String getRTMPTHeaderServer()
```

Get the Server header used for RTMPT responses

**Returns:**

Server header used for RTMPT responses

---

**setRTMPTHeaderServer**

```
public void setRTMPTHeaderServer(String rtmptHeaderServer)
```

Set the Server header used for RTMPT responses

**Parameters:**

(continued from last page)

---

rtmptHeaderServer - Server header used for RTMPT responses

---

## getHTTPHeaderServer

```
public String getHTTPHeaderServer()
```

Get the Server header used for HTTP responses

**Returns:**

the Server header used for HTTP responses

---

## setHTTPHeaderServer

```
public void setHTTPHeaderServer(String httpHeaderServer)
```

Set the Server header used for HTTP responses

**Parameters:**

httpHeaderServer

---

## isLoggingRemoveStdoutIfRunningAsService

```
public boolean isLoggingRemoveStdoutIfRunningAsService()
```

If true, stdout log4j appender is removed from logging configuration if running as a service.

**Returns:**

stdout log4j appender is removed from logging configuration if running as a service

---

## setLoggingRemoveStdoutIfRunningAsService

```
public void setLoggingRemoveStdoutIfRunningAsService(boolean  
loggingRemoveStdoutIfRunningAsService)
```

If true, stdout log4j appender is removed from logging configuration if running as a service.

**Parameters:**

loggingRemoveStdoutIfRunningAsService - stdout log4j appender is removed from logging configuration if running as a service

---

## getTranscoderUsageTracker

```
public TranscoderUsageTracker getTranscoderUsageTracker()
```

Get the server level live transcoder usage tracker

**Returns:**

server level live transcoder usage tracker

---

## getTranscoderVODUsageTracker

```
public com.wowza.wms.transcoder.vod.TranscoderVODUsageTracker  
getTranscoderVODUsageTracker()
```

Get the server level VOD transcoder usage tracker

**Returns:**

server level VOD transcoder usage tracker

---

---

## getThumbnailerUsageTracker

```
public com.wowza.wms.transcoder.thumbnailer.ThumbnailerUsageTracker  
getThumbnailerUsageTracker()
```

Get the server level thumbnail usage tracker

**Returns:**

server level thumbnail usage tracker

---

## getRESTUsageTracker

```
public com.wowza.wms.rest.restserver.RESTUsageTracker getRESTUsageTracker()
```

Get the server level REST usage tracker

**Returns:**

server level REST usage tracker

---

## getTranscoderContextServer

```
public TranscoderContextServer getTranscoderContextServer()
```

Get the server level transcoder context

**Returns:**

server level transcoder context

---

## getTranscoderCaptureManager

```
public com.wowza.wms.transcoder.capture.TranscoderCaptureManager  
getTranscoderCaptureManager()
```

Get the transcoder capture manager

**Returns:**

transcoder capture manager

---

## getPushPublishUsageTracker

```
public PushPublishUsageTracker getPushPublishUsageTracker()
```

Get the server level push publishing usage tracker

**Returns:**

server level push publishing usage tracker

---

## com.wowza.wms.server Interface IServerNotify

All Subinterfaces:

[IServerNotify2](#), [IServerNotify3](#)

public interface **IServerNotify**  
extends

IServerNotify: listener interface. Configured by adding class entries definitions to Server.xml.Startup order is: [constructor]; onServerConfigLoaded, onServerCreate, onServerInit Shutdown order is: onServerShutdownStart, onServerShutdownComplete, [exit]

### Method Summary

void	<a href="#">onServerCreate</a> ( <a href="#">IServer</a> server) Triggered when server object is first created.
void	<a href="#">onServerInit</a> ( <a href="#">IServer</a> server) Triggered when server initialization is complete and all VHosts have been started
void	<a href="#">onServerShutdownComplete</a> ( <a href="#">IServer</a> server) Triggered at the end of server shutdown
void	<a href="#">onServerShutdownStart</a> ( <a href="#">IServer</a> server) Triggered at the beginning of server shutdown

### Methods

#### onServerCreate

public void **onServerCreate**([IServer](#) server)

Triggered when server object is first created.

**Parameters:**

server - server object

#### onServerInit

public void **onServerInit**([IServer](#) server)

Triggered when server initialization is complete and all VHosts have been started

**Parameters:**

server - server object

#### onServerShutdownStart

public void **onServerShutdownStart**([IServer](#) server)

Triggered at the beginning of server shutdown

(continued from last page)

**Parameters:**server - server object

---

**onServerShutdownComplete**

```
public void onServerShutdownComplete(IServer server)
```

Triggered at the end of server shutdown

**Parameters:**

server - server object

## com.wowza.wms.server Interface IServerNotify2

All Superinterfaces:

[IServerNotify](#)

All Subinterfaces:

[IServerNotify3](#)

All Known Implementing Classes:

[ServerListenerStreamDemoPublisher](#)

---

public interface **IServerNotify2**  
extends [IServerNotify](#)

IServerNotify2: listener interface. Configured by adding class entries definitions to Server.xml.Startup order is: [constructor]; onServerConfigLoaded, onServerCreate, onServerInit Shutdown order is: onServerShutdownStart, onServerShutdownComplete, [exit]

---

### Method Summary

void	<a href="#">onServerConfigLoaded</a> ( <a href="#">IServer</a> server) Triggered when server configuration is loaded
------	---

Methods inherited from interface [com.wowza.wms.server.IServerNotify](#)

[onServerCreate](#), [onServerInit](#), [onServerShutdownComplete](#), [onServerShutdownStart](#)

---

### Methods

#### onServerConfigLoaded

public void **onServerConfigLoaded**([IServer](#) server)

Triggered when server configuration is loaded

**Parameters:**

server - server object

## com.wowza.wms.server Interface IServerNotify3

All Superinterfaces:

[IServerNotify2](#), [IServerNotify](#)

public interface **IServerNotify3**  
extends [IServerNotify2](#)

### Method Summary

void	<a href="#">onServerAfterVHostStartup</a> ( <a href="#">IServer</a> server) Triggered just after virtual hosts are started.
void	<a href="#">onServerBeforeVHostStartup</a> ( <a href="#">IServer</a> server) Triggered just before virtual hosts are started.

Methods inherited from interface [com.wowza.wms.server.IServerNotify2](#)

[onServerConfigLoaded](#)

Methods inherited from interface [com.wowza.wms.server.IServerNotify](#)

[onServerCreate](#), [onServerInit](#), [onServerShutdownComplete](#), [onServerShutdownStart](#)

### Methods

#### **onServerBeforeVHostStartup**

public void **onServerBeforeVHostStartup**([IServer](#) server)

Triggered just before virtual hosts are started.

**Parameters:**

server - server object

#### **onServerAfterVHostStartup**

public void **onServerAfterVHostStartup**([IServer](#) server)

Triggered just after virtual hosts are started.

**Parameters:**

server - server object

---

Package

**com.wowza.wms.sharedobject**

## com.wowza.wms.sharedobject Interface ISharedObject

All Known Implementing Classes:

[SharedObject](#)

public interface **ISharedObject**  
extends

ISharedObject: public interface to SharedObject class.

### Field Summary

public static final	<a href="#">FILEEXTENSION</a> Value: <b>rso</b>
public static final	<a href="#">SHARED_OBJECT_CMD_CONNECT</a> shared object command: connect Value: <b>1</b>
public static final	<a href="#">SHARED_OBJECT_CMD_CONNECTSUCCESS</a> shared object command: clear Value: <b>11</b>
public static final	<a href="#">SHARED_OBJECT_CMD_DELETE</a> shared object command: delete Value: <b>10</b>
public static final	<a href="#">SHARED_OBJECT_CMD_DISCONNECT</a> shared object command: disconnect Value: <b>2</b>
public static final	<a href="#">SHARED_OBJECT_CMD_ERROR</a> shared object command: error Value: <b>7</b>
public static final	<a href="#">SHARED_OBJECT_CMD_SEND</a> shared object command: send Value: <b>6</b>
public static final	<a href="#">SHARED_OBJECT_CMD_SETVALUE</a> shared object command: setvalue Value: <b>3</b>
public static final	<a href="#">SHARED_OBJECT_STATUS_CHANGE</a> shared object status: change Value: <b>4</b>
public static final	<a href="#">SHARED_OBJECT_STATUS_CLEAR</a> shared object status: clear Value: <b>8</b>

public static final	<a href="#">SHARED_OBJECT_STATUS_DELETE</a> shared object status: delete Value: <b>9</b>
public static final	<a href="#">SHARED_OBJECT_STATUS_SUCCESS</a> shared object status: success Value: <b>5</b>

## Method Summary

void	<a href="#">acquire()</a> Increment the reference count to this shared object.
void	<a href="#">addClient(IClient client)</a> Add a client to this shared object.
void	<a href="#">addSlotListener(ISharedObjectSlotNotify slotListener)</a> Add a slot listener.
void	<a href="#">clear()</a> Clear all properties from a shared object
void	<a href="#">close()</a> Force close this shared object (not implemented)
boolean	<a href="#">containsProperty(String slotName)</a> Returns true is slot/property name exists
boolean	<a href="#">containsSlot(String slotName)</a> Returns true is slot/property name exists
void	<a href="#">deleteSlot(IClient client, String slotName)</a> Remove a slot (property)
void	<a href="#">deleteSlot(String slotName)</a> Remove slot (property)
void	<a href="#">disconnect(IClient client)</a> Disconnect client from shared object.
void	<a href="#">flush()</a> Flush (write to disk) shared object
java.util.List	<a href="#">getClients()</a> Get a list of client that are connected to this shared object.
String	<a href="#">getName()</a> Get shared object name
<a href="#">ISharedObjects</a>	<a href="#">getParent()</a> Get the shared object container to which this shared object belongs.
<a href="#">AMFData</a>	<a href="#">getProperty(String slotName)</a> Get slot (property) value.
int	<a href="#">getRefCount()</a> Get the current reference (clients) connected to this shared object.

<a href="#"><u>ISharedObjectSlot</u></a>	<a href="#"><u>getSlot</u></a> (String name) Get ISharedObjectSlot interface to a slot (property) by name
java.util.List	<a href="#"><u>getSlotNames</u></a> ( ) Get a list of slot (property) names
java.util.List	<a href="#"><u>getSlots</u></a> ( ) Get a list of active slots
String	<a href="#"><u>getStorageDir</u></a> ( ) Get path used to store shared object.
int	<a href="#"><u>getVersion</u></a> ( ) Get the interval version number.
boolean	<a href="#"><u>isClient</u></a> ( <a href="#"><u>IClient</u></a> client) Is this client connected to shared object
boolean	<a href="#"><u>isPersistent</u></a> ( ) Is this shared object being persisted.
void	<a href="#"><u>lock</u></a> ( ) Lock a shared object for write access
int	<a href="#"><u>purge</u></a> (int version) Purge all deleted properties older than the version number
void	<a href="#"><u>putSlot</u></a> (String name, <a href="#"><u>ISharedObjectSlot</u></a> slot) Add a new slot (property) to a shared object.
void	<a href="#"><u>release</u></a> ( ) Decrement the reference count to this shared object.
void	<a href="#"><u>removeClient</u></a> ( <a href="#"><u>IClient</u></a> client) Remove a client from this shared object.
void	<a href="#"><u>removeSlotListener</u></a> ( <a href="#"><u>ISharedObjectSlotNotify</u></a> slotListener) Remove slot listener
void	<a href="#"><u>send</u></a> (String handlerName) Call client side handler attached to shared object (no parameters).
void	<a href="#"><u>send</u></a> (String handlerName, Object[] params) Call client side handler attached to shared object.
void	<a href="#"><u>setName</u></a> (String name) Set shared object name
void	<a href="#"><u>setPersistent</u></a> (boolean isPersistent) Set is shared object persisted.
void	<a href="#"><u>setProperty</u></a> (String slotName, <a href="#"><u>AMFData</u></a> data) Set slot (property) value as AMFData object.
void	<a href="#"><u>setProperty</u></a> (String slotName, boolean value) Set slot (property) value as a boolean value (will be wrapped in an AMFDataItem object)
void	<a href="#"><u>setProperty</u></a> (String slotName, java.util.Date value) Set slot (property) value as a date value (will be wrapped in an AMFDataItem object)

void	<a href="#"><code>setProperty</code></a> (String slotName, double value) Set slot (property) value as a double value (will be wrapped in an AMFDataItem object)
void	<a href="#"><code>setProperty</code></a> (String slotName, int value) Set slot (property) value as a int value (will be wrapped in an AMFDataItem object)
void	<a href="#"><code>setProperty</code></a> (String slotName, long value) Set slot (property) value as a long value (will be wrapped in an AMFDataItem object)
void	<a href="#"><code>setProperty</code></a> (String slotName, String value) Set slot (property) value as a string value (will be wrapped in an AMFDataItem object)
void	<a href="#"><code>setStorageDir</code></a> (String storageDir) Set path used to store shared object.
void	<a href="#"><code>setVersion</code></a> (int version) Set the internal version number.
int	<a href="#"><code>size</code></a> () Get the number of active slot (properties).
void	<a href="#"><code>unlock</code></a> () Unlock a shared object for write access
void	<a href="#"><code>writeDeleteError</code></a> (IClient client, String soName, boolean isPersistent, String slotName, String errorMsg) Write an delete error message back to the client
void	<a href="#"><code>writeSetValueError</code></a> (IClient client, String soName, boolean isPersistent, String slotName, String errorMsg) Write an set value error message back to the client

## Fields

### FILEEXTENSION

```
public static final java.lang.String FILEEXTENSION
```

Constant value: **rs0**

### SHARED\_OBJECT\_CMD\_CONNECT

```
public static final byte SHARED_OBJECT_CMD_CONNECT
```

shared object command: connect

Constant value: **1**

### SHARED\_OBJECT\_CMD\_DISCONNECT

```
public static final byte SHARED_OBJECT_CMD_DISCONNECT
```

shared object command: disconnect

Constant value: **2**

(continued from last page)

---

## SHARED\_OBJECT\_CMD\_SETVALUE

```
public static final byte SHARED_OBJECT_CMD_SETVALUE
```

shared object command: setvalue  
Constant value: **3**

---

## SHARED\_OBJECT\_CMD\_SEND

```
public static final byte SHARED_OBJECT_CMD_SEND
```

shared object command: send  
Constant value: **6**

---

## SHARED\_OBJECT\_CMD\_ERROR

```
public static final byte SHARED_OBJECT_CMD_ERROR
```

shared object command: error  
Constant value: **7**

---

## SHARED\_OBJECT\_CMD\_DELETE

```
public static final byte SHARED_OBJECT_CMD_DELETE
```

shared object command: delete  
Constant value: **10**

---

## SHARED\_OBJECT\_CMD\_CONNECTSUCCESS

```
public static final byte SHARED_OBJECT_CMD_CONNECTSUCCESS
```

shared object command: clear  
Constant value: **11**

---

## SHARED\_OBJECT\_STATUS\_CHANGE

```
public static final byte SHARED_OBJECT_STATUS_CHANGE
```

shared object status: change  
Constant value: **4**

---

## SHARED\_OBJECT\_STATUS\_SUCCESS

```
public static final byte SHARED_OBJECT_STATUS_SUCCESS
```

shared object status: success  
Constant value: **5**

---

## SHARED\_OBJECT\_STATUS\_CLEAR

```
public static final byte SHARED_OBJECT_STATUS_CLEAR
```

shared object status: clear  
Constant value: **8**

---

## SHARED\_OBJECT\_STATUS\_DELETE

```
public static final byte SHARED_OBJECT_STATUS_DELETE
```

---

(continued from last page)

shared object status: delete  
Constant value: **9**

## Methods

### getSlotNames

```
public java.util.List getSlotNames()
```

Get a list of slot (property) names

**Returns:**

list of slot (property) names

### getSlot

```
public ISharedObjectSlot getSlot(String name)
```

Get ISharedObjectSlot interface to a slot (property) by name

**Parameters:**

name - slot (property) name

**Returns:**

ISharedObjectSlot interface

### putSlot

```
public void putSlot(String name,  
    ISharedObjectSlot slot)
```

Add a new slot (property) to a shared object.

**Parameters:**

name - slot (property) name

slot - new slot

### getClients

```
public java.util.List getClients()
```

Get a list of client that are connected to this shared object.

**Returns:**

list of client that are connected to this shared object

### isClient

```
public boolean isClient(IClient client)
```

Is this client connected to shared object

**Parameters:**

client - client

**Returns:**

true if client is conencted to shared object

---

## addClient

```
public void addClient(IClient client)
```

Add a client to this shared object.

**Parameters:**

client - client

---

## removeClient

```
public void removeClient(IClient client)
```

Remove a client from this shared object.

**Parameters:**

client - client

---

## size

```
public int size()
```

Get the number of active slot (properties). Deleted slots are not counted.

**Returns:**

number of active slot (properties). Deleted slots are not counted

---

## acquire

```
public void acquire()
```

Increment the reference count to this shared object.

---

## release

```
public void release()
```

Decrement the reference count to this shared object.

---

## close

```
public void close()
```

Force close this shared object (not implemented)

---

## getRefCount

```
public int getRefCount()
```

Get the current reference (clients) connected to this shared object. Includes unbalanced count of calls to acquire.

**Returns:**

the current reference (clients) connected to this shared object

---

## isPersistent

```
public boolean isPersistent()
```

---

(continued from last page)

Is this shared object being persisted.

**Returns:**

true if shared object is being persisted

---

**setPersistent**

```
public void setPersistent(boolean isPersistent)
```

Set is shared object persisted.

**Parameters:**

isPersistent - true if shared object is being persisted

---

**getVersion**

```
public int getVersion()
```

Get the interval version number.

**Returns:**

interval version number

---

**setVersion**

```
public void setVersion(int version)
```

Set the internal version number.

**Parameters:**

version - internal version number

---

**flush**

```
public void flush()
```

Flush (write to disk) shared object

---

**deleteSlot**

```
public void deleteSlot(IClient client,  
    String slotName)
```

Remove a slot (property)

**Parameters:**

client - client removing slot or null if server side code  
slotName - slot (property) name

---

**deleteSlot**

```
public void deleteSlot(String slotName)
```

Remove slot (property)

**Parameters:**

slotName - slot (property) name

## getProperty

```
public AMFData getProperty(String slotName)
```

Get slot (property) value.

**Parameters:**

slotName - slot (property) name

**Returns:**

slot (property) value as AMFData object

---

## setProperty

```
public void setProperty(String slotName,  
    String value)
```

Set slot (property) value as a string value (will be wrapped in an AMFDataItem object)

**Parameters:**

slotName - slot (property) name

value - string value

---

## setProperty

```
public void setProperty(String slotName,  
    double value)
```

Set slot (property) value as a double value (will be wrapped in an AMFDataItem object)

**Parameters:**

slotName - slot (property) name

value - double value

---

## setProperty

```
public void setProperty(String slotName,  
    int value)
```

Set slot (property) value as a int value (will be wrapped in an AMFDataItem object)

**Parameters:**

slotName - slot (property) name

value - int value

---

## setProperty

```
public void setProperty(String slotName,  
    long value)
```

Set slot (property) value as a long value (will be wrapped in an AMFDataItem object)

**Parameters:**

slotName - slot (property) name

value - long value

---

(continued from last page)

## setProperty

```
public void setProperty(String slotName,  
    java.util.Date value)
```

Set slot (property) value as a date value (will be wrapped in an AMFDataItem object)

**Parameters:**

slotName - slot (property) name  
value - date value

---

## setProperty

```
public void setProperty(String slotName,  
    boolean value)
```

Set slot (property) value as a boolean value (will be wrapped in an AMFDataItem object)

**Parameters:**

slotName - slot (property) name  
value - boolean value

---

## setProperty

```
public void setProperty(String slotName,  
    AMFData data)
```

Set slot (property) value as AMFData object.

**Parameters:**

slotName - slot (property) name  
data - slot value as AMFData object. Example: new AMFDataItem((double)1.234) or new AMFDataItem()

---

## disconnect

```
public void disconnect(IClient client)
```

Disconnect client from shared object.

**Parameters:**

client - client to disconnect

---

## getName

```
public String getName()
```

Get shared object name

**Returns:**

shared object name

---

## setName

```
public void setName(String name)
```

Set shared object name

**Parameters:**

name - shared object name

## send

```
public void send(String handlerName,  
                 Object[] params)
```

Call client side handler attached to shared object.

**Parameters:**

handlerName - handler name

params - variable argument list of parameters

---

## send

```
public void send(String handlerName)
```

Call client side handler attached to shared object (no parameters).

**Parameters:**

handlerName - handler name

---

## addSlotListener

```
public void addSlotListener(ISharedObjectSlotNotify slotListener)
```

Add a slot listener. Will receive the following events: onSlotSetValue and onSlotDelete

**Parameters:**

slotListener - slot listener

---

## removeSlotListener

```
public void removeSlotListener(ISharedObjectSlotNotify slotListener)
```

Remove slot listener

**Parameters:**

slotListener - slot listener

---

## getStorageDir

```
public String getStorageDir()
```

Get path used to store shared object.

**Returns:**

path used to store shared object

---

## setStorageDir

```
public void setStorageDir(String storageDir)
```

Set path used to store shared object.

**Parameters:**

storageDir - path used to store shared object

---

(continued from last page)

---

## writeSetValueError

```
public void writeSetValueError(IClient client,  
    String soName,  
    boolean isPersistent,  
    String slotName,  
    String errorMsg)
```

Write an set value error message back to the client

### Parameters:

client - client removing slot or null if server side code  
soName - sharedObject name  
isPersistent - is persistent  
slotName - slot name  
errorMsg - error message

---

## writeDeleteError

```
public void writeDeleteError(IClient client,  
    String soName,  
    boolean isPersistent,  
    String slotName,  
    String errorMsg)
```

Write an delete error message back to the client

### Parameters:

client - client removing slot or null if server side code  
soName - sharedObject name  
isPersistent - is persistent  
slotName - slot name  
errorMsg - error message

---

## clear

```
public void clear()
```

Clear all properties from a shared object

---

## purge

```
public int purge(int version)
```

Purge all deleted properties older than the version number

### Returns:

number of slots purged

---

## getSlots

```
public java.util.List getSlots()
```

Get a list of active slots

### Returns:

list of active slots

---

(continued from last page)

## containsProperty

```
public boolean containsProperty(String slotName)
```

Returns true is slot/property name exists

**Parameters:**

slotName - slot/property name

**Returns:**

true is slot/property name exists

---

## containsSlot

```
public boolean containsSlot(String slotName)
```

Returns true is slot/property name exists

**Parameters:**

slotName - slot/property name

**Returns:**

true is slot/property name exists

---

## lock

```
public void lock()
```

Lock a shared object for write access

---

## unlock

```
public void unlock()
```

Unlock a shared object for write access

---

## getParent

```
public ISharedObjects getParent()
```

Get the shared object container to which this shared object belongs.

**Returns:**

shared object container

---

## com.wowza.wms.sharedobject Interface ISharedObjectNotify

public interface **ISharedObjectNotify**  
extends

ISharedObjectNotify: listener interface used by IApplicationInstance addSharedObjectListener

### Method Summary

void	<a href="#">onSharedObjectConnect</a> ( <a href="#">ISharedObject</a> sharedObject, <a href="#">IClient</a> client) Triggered when client connects to sharedObject
void	<a href="#">onSharedObjectCreate</a> ( <a href="#">ISharedObject</a> sharedObject) Triggered when sharedObject created
void	<a href="#">onSharedObjectDestroy</a> ( <a href="#">ISharedObject</a> sharedObject) Triggered when sharedObject destroyed
void	<a href="#">onSharedObjectDisconnect</a> ( <a href="#">ISharedObject</a> sharedObject, <a href="#">IClient</a> client) Triggered when client disconnects from sharedObject

### Methods

#### onSharedObjectCreate

public void **onSharedObjectCreate**([ISharedObject](#) sharedObject)

Triggered when sharedObject created

**Parameters:**

sharedObject - sharedObject

#### onSharedObjectDestroy

public void **onSharedObjectDestroy**([ISharedObject](#) sharedObject)

Triggered when sharedObject destroyed

**Parameters:**

sharedObject - sharedObject

#### onSharedObjectConnect

public void **onSharedObjectConnect**([ISharedObject](#) sharedObject, [IClient](#) client)

Triggered when client connects to sharedObject

**Parameters:**

sharedObject - sharedObject

client - client

## onSharedObjectDisconnect

```
public void onSharedObjectDisconnect(ISharedObject sharedObject,  
    IClient client)
```

Triggered when client disconnects from sharedObject

### Parameters:

sharedObject - sharedObject

client - client

## com.wowza.wms.sharedobject Interface ISharedObjects

public interface **ISharedObjects**  
extends

ISharedObjects: public interface to SharedObjects. Represent the list of shared objects managed by IApplicationInstance.

### Method Summary

void	<a href="#"><u>addSharedObjectListener</u></a> ( <a href="#"><u>ISharedObjectNotify</u></a> sharedObjectListener)
	Add a shared object listener.
void	<a href="#"><u>disconnect</u></a> ( <a href="#"><u>IClient</u></a> client)
	Disconnect client from all shared objects in list.
boolean	<a href="#"><u>exists</u></a> ( <a href="#"><u>ISharedObject</u></a> sharedObject)
	Is sharedObject in this list (by shared object reference).
boolean	<a href="#"><u>exists</u></a> (String objectName)
	Is sharedObject in this list (by name).
void	<a href="#"><u>flush</u></a> ()
	Flush all persistent shared objects to disk.
<a href="#"><u>ISharedObject</u></a>	<a href="#"><u>get</u></a> (String name)
	Get shared object by name.
java.util.List	<a href="#"><u>getObjectNames</u></a> ()
	Get a list of shared object names.
<a href="#"><u>ISharedObject</u></a>	<a href="#"><u>getOrCreate</u></a> (String name)
	Get shared object by name if it does not exist create a new shared object with the given name.
String	<a href="#"><u>getStorageDir</u></a> ()
	Get the storage directory for all shared objects in list.
boolean	<a href="#"><u>isPersistent</u></a> ()
	Are shared objects in list persistent.
void	<a href="#"><u>load</u></a> ()
	Load persistent shared objects from file system.
void	<a href="#"><u>put</u></a> (String objectName, <a href="#"><u>ISharedObject</u></a> sharedObject)
	Add or replace a shared object.
void	<a href="#"><u>remove</u></a> (String objectName)
	Remove a shared object.
void	<a href="#"><u>removeClient</u></a> ( <a href="#"><u>IClient</u></a> client)
	Remove a client from any shared object that it is connected to in this list.
void	<a href="#"><u>removeSharedObjectListener</u></a> ( <a href="#"><u>ISharedObjectNotify</u></a> sharedObjectListener)
	Remove a shared object listener.

void	<a href="#"><code>setPersistent</code></a> (boolean isPersistent) Set is shared object in list persistent
void	<a href="#"><code>setStorageDir</code></a> (String storageDir) Set the storage directory for all shared objects in list.
int	<a href="#"><code>size</code></a> () Get number of shared objects.

## Methods

### size

```
public int size()
```

Get number of shared objects.

**Returns:**

number of shared objects

### get

```
public ISharedObject get(String name)
```

Get shared object by name. If the shared object does not exist null will be returned. (see ISharedObjects.getOrCreate)

**Parameters:**

name - shared object name

**Returns:**

shared object

### getOrCreate

```
public ISharedObject getOrCreate(String name)
```

Get shared object by name if it does not exist create a new shared object with the given name.

**Parameters:**

name - shared object name

**Returns:**

shared object

### getObjectNames

```
public java.util.List getObjectNames()
```

Get a list of shared object names.

**Returns:**

list of shared object names

(continued from last page)

## put

```
public void put(String objectName,  
    ISharedObject sharedObject)
```

Add or replace a shared object.

### Parameters:

objectName - shared object name  
sharedObject - shared object

---

## remove

```
public void remove(String objectName)
```

Remove a shared object.

### Parameters:

objectName - shared object name

---

## exists

```
public boolean exists(String objectName)
```

Is sharedObject in this list (by name).

### Parameters:

objectName - shared object name

### Returns:

true if shared object in list

---

## exists

```
public boolean exists(ISharedObject sharedObject)
```

Is sharedObject in this list (by shared object reference).

### Parameters:

sharedObject - shared object

### Returns:

true if shared object in list

---

## isPersistent

```
public boolean isPersistent()
```

Are shared objects in list persistent.

### Returns:

true if shared objects in list are persistent

---

## setPersistent

```
public void setPersistent(boolean isPersistent)
```

Set if shared object in list persistent

---

(continued from last page)

**Parameters:**

isPersistent - true is shared objects in list are persistent

---

**removeClient**

```
public void removeClient(IClient client)
```

Remove a client from any shared object that it is connected to in this list.

**Parameters:**

client - client

---

**flush**

```
public void flush()
```

Flush all persistent shared objects to disk.

---

**disconnect**

```
public void disconnect(IClient client)
```

Disconnect client from all shared objects in list.

**Parameters:**

client - client

---

**addSharedObjectListener**

```
public void addSharedObjectListener(ISharedObjectNotify sharedObjectListener)
```

Add a shared object listener. The listener will receive the following events: onSharedObjectCreate, onSharedObjectDestroy, onSharedObjectConnect, onSharedObjectDisconnect.

**Parameters:**

sharedObjectListener

---

**removeSharedObjectListener**

```
public void removeSharedObjectListener(ISharedObjectNotify sharedObjectListener)
```

Remove a shared object listener.

**Parameters:**

sharedObjectListener

---

**getStorageDir**

```
public String getStorageDir()
```

Get the storage directory for all shared objects in list.

**Returns:**

storage dir

---

**setStorageDir**

```
public void setStorageDir(String storageDir)
```

(continued from last page)

Set the storage directory for all shared objects in list.

**Parameters:**

storageDir

---

## load

```
public void load()
```

Load persistent shared objects from file system.

## com.wowza.wms.sharedobject Interface ISharedObjectSlot

public interface **ISharedObjectSlot**  
extends

ISharedObjectSlot: public interface to SharedObjectSlot class.

### Method Summary

<a href="#">AMFData</a>	<a href="#">getData()</a> Get slot data as AMFData object.
int	<a href="#">getLastClientId()</a> Get client id of client that performed last operation on slot.
int	<a href="#">getLastOperation()</a> Get last slot (property) operation.
String	<a href="#">getName()</a> Get slot (property) name.
int	<a href="#">getSlotVersion()</a> Get slot version
int	<a href="#">getSoVersion()</a> Get parent shared object version
void	<a href="#">incSlotVersion()</a> Increment slot version by 1.
void	<a href="#">init</a> (String name, <a href="#">AMFData</a> data, int slotVersion) Initialize shared object slot
void	<a href="#">setData</a> ( <a href="#">AMFData</a> data) Set slot data as AMFData object.
void	<a href="#">setData</a> (byte[] data) Set slot data as byte[].
void	<a href="#">setData</a> (byte[] data, <a href="#">AMFDataContextDeserialize</a> context) Set slot data as byte[].
void	<a href="#">setLastClientId</a> (int lastClientId) Set client id of client that performed last operation on slot.
void	<a href="#">setLastOperation</a> (int lastOperation) Set last slot (property) operation.
void	<a href="#">setName</a> (String name) Set slot (property) name
void	<a href="#">setSlotVersion</a> (int slotVersion) Set slot version

void	<a href="#">setSoVersion</a> (int soVersion) Set parent shared object version
------	--

## Methods

### init

```
public void init(String name,  
    AMFData data,  
    int slotVersion)
```

Initialize shared object slot

**Parameters:**

name - slot (property) name  
data - data  
slotVersion - version

### getData

```
public AMFData getData()
```

Get slot data as AMFData object.

**Returns:**

slot data as AMFData object

### setData

```
public void setData(byte[] data,  
    AMFDataContextDeserialize context)
```

Set slot data as byte[]. Data will be deserialized as AMFData object.

**Parameters:**

data - data as byte[]  
context - deserialization context

### setData

```
public void setData(byte[] data)
```

Set slot data as byte[]. Data will be deserialized as AMFData object.

**Parameters:**

data - data as byte[]

### setData

```
public void setData(AMFData data)
```

Set slot data as AMFData object.

**Parameters:**

data - data as AMFData object

## getName

```
public String getName()
```

Get slot (property) name.

**Returns:**

slot (property) name

---

## setName

```
public void setName(String name)
```

Set slot (property) name

**Parameters:**

name - slot (property) name

---

## getSlotVersion

```
public int getSlotVersion()
```

Get slot version

**Returns:**

slot version

---

## setSlotVersion

```
public void setSlotVersion(int slotVersion)
```

Set slot version

**Parameters:**

slotVersion - slot version

---

## incSlotVersion

```
public void incSlotVersion()
```

Increment slot version by 1.

---

## getSoVersion

```
public int getSoVersion()
```

Get parent shared object version

**Returns:**

parent shared object version

---

## setSoVersion

```
public void setSoVersion(int soVersion)
```

Set parent shared object version

---

---

(continued from last page)

**Parameters:**

soVersion - parent shared object version

---

**getLastOperation**

```
public int getLastOperation()
```

Get last slot (property) operation. See ISharedObject.SHAREDOBJECT\_CMD\_\*.

**Returns:**

last slot (property) operation (ISharedObject.SHAREDOBJECT\_CMD\_\*)

---

**setLastOperation**

```
public void setLastOperation(int lastOperation)
```

Set last slot (property) operation. See ISharedObject.SHAREDOBJECT\_CMD\_\*.

**Parameters:**

lastOperation - last slot (property) operation (ISharedObject.SHAREDOBJECT\_CMD\_\*)

---

**getLastClientId**

```
public int getLastClientId()
```

Get client id of client that performed last operation on slot.

**Returns:**

client id of client that performed last operation on slot

---

**setLastClientId**

```
public void setLastClientId(int lastClientId)
```

Set client id of client that performed last operation on slot.

**Parameters:**

lastClientId - client id of client that performed last operation on slot

---

# com.wowza.wms.sharedobject

## Interface ISharedObjectSlotNotify

public interface **ISharedObjectSlotNotify**  
extends

ISharedObjectNotify: listener interface used by ISharedObject addSlotListener

Method Summary	
void	<a href="#">onSlotDelete</a> ( <a href="#">ISharedObject</a> sharedObject, <a href="#">ISharedObjectSlot</a> slot) Triggered when sharedObject slot value deleted
void	<a href="#">onSlotSetValue</a> ( <a href="#">ISharedObject</a> sharedObject, <a href="#">ISharedObjectSlot</a> slot) Triggered when sharedObject slot value set

## Methods

### onSlotSetValue

public void **onSlotSetValue**([ISharedObject](#) sharedObject, [ISharedObjectSlot](#) slot)

Triggered when sharedObject slot value set

**Parameters:**  
sharedObject  
slot

### onSlotDelete

public void **onSlotDelete**([ISharedObject](#) sharedObject, [ISharedObjectSlot](#) slot)

Triggered when sharedObject slot value deleted

**Parameters:**  
sharedObject  
slot

## com.wowza.wms.sharedobject Class SharedObject

java.lang.Object

└─com.wowza.wms.sharedobject.SharedObject

All Implemented Interfaces:

[ISharedObject](#)

public class **SharedObject**  
extends Object  
implements [ISharedObject](#)

### Field Summary

public static final	<a href="#">READACCESS</a> Value: <b>0</b>
public static final	<a href="#">WRITEACCESS</a> Value: <b>1</b>

## Fields

### READACCESS

public static final int **READACCESS**

Constant value: **0**

### WRITEACCESS

public static final int **WRITEACCESS**

Constant value: **1**

(continued from last page)

## Constructors

### SharedObject

```
public SharedObject(String name)
```

Create new shared object

**Parameters:**

name - shared object name

---

### SharedObject

```
public SharedObject(String name,  
                    boolean isPersistent,  
                    String storageDir)
```

Create new shared object

**Parameters:**

name - shared object name

isPersistent - is persistent

storageDir - storage directory for persistent shared object

## Methods

### size

```
public int size()
```

---

### purge

```
public int purge(int version)
```

---

### clear

```
public void clear()
```

---

### getSlots

```
public java.util.List getSlots()
```

---

### getSlotNames

```
public java.util.List getSlotNames()
```

---

(continued from last page)

---

## getSlot

```
public ISharedObjectSlot getSlot(String name)
```

---

## putSlot

```
public void putSlot(String name,  
    ISharedObjectSlot slot)
```

---

## getClients

```
public java.util.List getClients()
```

---

## isClient

```
public boolean isClient(IClient client)
```

---

## addClient

```
public void addClient(IClient client)
```

---

## removeClient

```
public void removeClient(IClient client)
```

---

## acquire

```
public void acquire()
```

---

## release

```
public void release()
```

---

## getRefCount

```
public int getRefCount()
```

---

## isPersistent

```
public boolean isPersistent()
```

---

(continued from last page)

---

### setPersistent

```
public void setPersistent(boolean isPersistent)
```

---

### getVersion

```
public int getVersion()
```

---

### setVersion

```
public void setVersion(int version)
```

---

### deleteSlot

```
public void deleteSlot(String slotName)
```

---

### containsProperty

```
public boolean containsProperty(String slotName)
```

---

### containsSlot

```
public boolean containsSlot(String slotName)
```

---

### deleteSlot

```
public void deleteSlot(IClient client,  
                        String slotName)
```

---

### getProperty

```
public AMFData getProperty(String slotName)
```

---

### setProperty

```
public void setProperty(String slotName,  
                        boolean value)
```

---

**setProperty**

```
public void setProperty(String slotName,  
    java.util.Date value)
```

---

**setProperty**

```
public void setProperty(String slotName,  
    double value)
```

---

**setProperty**

```
public void setProperty(String slotName,  
    long value)
```

---

**setProperty**

```
public void setProperty(String slotName,  
    int value)
```

---

**setProperty**

```
public void setProperty(String slotName,  
    String value)
```

---

**setProperty**

```
public void setProperty(String slotName,  
    AMFData data)
```

---

**setSlotValue**

```
public void setSlotValue(IClient client,  
    String slotName,  
    AMFData amfData)
```

---

**setSlotValue**

```
public void setSlotValue(IClient client,  
    String slotName,  
    byte[] byteData)
```

---

(continued from last page)

---

## setSlotValue

```
public void setSlotValue(IClient client,  
    String slotName,  
    byte[] byteData,  
    AMFDataContextDeserialize context)
```

---

## setSlotValue

```
public void setSlotValue(IClient client,  
    String slotName,  
    byte[] byteData,  
    AMFData amfData)
```

---

## setSlotValue

```
public void setSlotValue(IClient client,  
    String slotName,  
    byte[] byteData,  
    AMFData amfData,  
    AMFDataContextDeserialize context)
```

---

## writeError

```
public static void writeError(IClient client,  
    String soName,  
    boolean isPersistent,  
    String errorMsg,  
    boolean isConnect)
```

---

## writeSetValueError

```
public void writeSetValueError(IClient client,  
    String soName,  
    boolean isPersistent,  
    String slotName,  
    String errorMsg)
```

---

## writeDeleteError

```
public void writeDeleteError(IClient client,  
    String soName,  
    boolean isPersistent,  
    String slotName,  
    String errorMsg)
```

---

## getClientUpdates

```
public void getClientUpdates(IClient client)
```

---

(continued from last page)

---

## disconnect

```
public void disconnect(IClient client)
```

---

## getName

```
public String getName()
```

---

## setName

```
public void setName(String name)
```

---

## send

```
public void send(String handlerName,  
                 Object[] params)
```

---

## send

```
public void send(String handlerName)
```

---

## sendInternal

```
public void sendInternal(String handlerName,  
                        AMFData\[\] params)
```

---

## sendInternal

```
public void sendInternal(IClient client,  
                        String handlerName,  
                        byte[] msgBytes)
```

---

## sendInternal

```
public void sendInternal(IClient client,  
                        String handlerName,  
                        byte[] msgBytes,  
                        AMFDataContextDeserialize context)
```

---

(continued from last page)

---

## addSlotListener

```
public void addSlotListener(ISharedObjectSlotNotify slotListener)
```

---

## removeSlotListener

```
public void removeSlotListener(ISharedObjectSlotNotify slotListener)
```

---

## notifySlotSetValue

```
public void notifySlotSetValue(ISharedObjectSlot slot)
```

---

## notifySlotDelete

```
public void notifySlotDelete(ISharedObjectSlot slot)
```

---

## getStorageDir

```
public String getStorageDir()
```

---

## setStorageDir

```
public void setStorageDir(String storageDir)
```

---

## flush

```
public void flush()
```

---

## load

```
public void load()
```

---

## close

```
public void close()
```

---

## lock

```
public void lock()
```

---

(continued from last page)

---

## unlock

```
public void unlock()
```

---

## setParent

```
public void setParent(ISharedObjects parent)
```

---

## getParent

```
public ISharedObjects getParent()
```

---

## getAccess

```
public static boolean[] getAccess(IClient client,  
    String soName)
```

Package

**com.wowza.wms.sourcecontrol**

com.wowza.wms.sourcecontrol

# Interface ISourceControl

All Subinterfaces:  
[ISourceControlCamera](#)

public interface **ISourceControl**  
extends

Public interface to generic source control device.

Method Summary	
SourceControlContext	<a href="#">createContext()</a> Create an empty context structure
<a href="#">ISourceControlSession</a>	<a href="#">createSourceControlSession</a> (String streamName, <a href="#">IApplicationInstance</a> appInstance) Create a SourceControlSession for the device and associate it with the provided stream name and application instance
SourceControlContext	<a href="#">getContext()</a> Get the SourceControlContext for the device.
SourceControlInformation	<a href="#">getSouceFeatures()</a> Get the SourceControlFeatures for the device.
SourceControlInformation	<a href="#">getSouceInformation()</a> Get the SourceControlInformation for the device.
void	<a href="#">setContext</a> (SourceControlContext context) Set the SourceControlContext for the device.

## Methods

### createContext

```
public SourceControlContext createContext()
```

Create an empty context structure

### setContext

```
public void setContext(SourceControlContext context)
```

Set the SourceControlContext for the device.

**Parameters:**  
context

---

(continued from last page)

## getContext

```
public SourceControlContext getContext()
```

Get the SourceControlContext for the device.

**Returns:**

SourceControlContext the source control context for this source control device

---

## getSouceInformation

```
public SourceControlInformation getSouceInformation()
```

Get the SourceControlInformation for the device.

**Returns:**

SourceControlInformation class containing information and features about the source control device

---

## getSouceFeatures

```
public SourceControlInformation getSouceFeatures()
```

Get the SourceControlFeatures for the device.

**Returns:**

SourceControlFeatures class containing information and features about the source control device

---

## createSourceControlSession

```
public ISourceControlSession createSourceControlSession(String streamName,  
    IApplicationInstance appInstance)
```

Create a SourceControlSession for the device and associate it with the provided stream name and application instance

**Parameters:**

streamName - the stream name to associate the source control session with

appInstance - the application instance to associate the source control session with

## com.wowza.wms.sourcecontrol Interface ISourceControlCamera

All Superinterfaces:

[ISourceControl](#)

public interface **ISourceControlCamera**

extends [ISourceControl](#)

Public interface for a Camera Source Control device.

### Method Summary

String	<a href="#">captureImage()</a> Command the camera to capture a single frame image and return it in a base64 encoded string
boolean	<a href="#">panTiltStep(String direction)</a> Command the camera to Pan/Tilt one step in the direction indicated.
boolean	<a href="#">zoomStep(String direction)</a> Command the camera to Zoom one step in the direction indicated.

Methods inherited from interface [com.wowza.wms.sourcecontrol.ISourceControl](#)

[createContext](#), [createSourceControlSession](#), [getContext](#), [getSouceFeatures](#),  
[getSouceInformation](#), [setContext](#)

### Methods

#### panTiltStep

public boolean **panTiltStep**(String direction)

Command the camera to Pan/Tilt one step in the direction indicated.

**Parameters:**

direction - to Pan/Tilt the camera (see SourceControlCameraFeature for list of available directions, see SourceControlInformation.features for the list of supported directions)

**Returns:**

true if the command was successfully performed

#### zoomStep

public boolean **zoomStep**(String direction)

Command the camera to Zoom one step in the direction indicated.

**Parameters:**

direction - to zoom the camera (see SourceControlCameraFeature for list of available directions, see SourceControlInformation.features for the list of supported directions)

(continued from last page)

**Returns:**

true if the command was successfully performed

---

**captureImage**

```
public String captureImage()
```

Command the camera to capture a single frame image and return it in a base64 encoded string

**Returns:**

base64 encoded image or null if the capture failed.

## com.wowza.wms.sourcecontrol Interface ISourceControlSession

public interface **ISourceControlSession**  
extends

Public interface for a Source Control device session

### Method Summary

<a href="#">IApplicationInstance</a>	<a href="#">getApplicationInstance()</a> Get the IApplicationInstance associated with this session
<a href="#">ISourceControl</a>	<a href="#">getSourceControlImpl()</a> Get the underlying ISourceControl implementation
String	<a href="#">getStreamName()</a> Get the stream name associated with this session
void	<a href="#">setApplicationInstance(IApplicationInstance appInstance)</a> Set the IApplicationInstance associated wit this session
void	<a href="#">setSrouceControlImpl(ISourceControl sourceControlImpl)</a> Set the underlying ISourceControl Implementation
void	<a href="#">setStreamName(String streamName)</a> Set the stream name associated with this session

### Methods

#### getSourceControlImpl

public [ISourceControl](#) **getSourceControlImpl()**

Get the underlying ISourceControl implementation

**Returns:**

ISourceControl implementation

#### setSrouceControlImpl

public void **setSrouceControlImpl**([ISourceControl](#) sourceControlImpl)

Set the underlying ISourceControl Implementation

**Parameters:**

sourceControlImpl - implementation

#### getApplicationInstance

public [IApplicationInstance](#) **getApplicationInstance()**

(continued from last page)

Get the IApplicationInstance associated with this session

**Returns:**

IApplicationInstance associated with this session

---

## setApplicationInstance

```
public void setApplicationInstance(IApplicationInstance appInstance)
```

Set the IApplicationInstance associated with this session

**Parameters:**

appInstance - IApplicationInstance to associate with this session

---

## getStreamName

```
public String getStreamName()
```

Get the stream name associated with this session

**Returns:**

String containing the stream name

---

## setStreamName

```
public void setStreamName(String streamName)
```

Set the stream name associated with this session

**Parameters:**

streamName - A String containing the stream name to associate with this session

---

## com.wowza.wms.sourcecontrol Interface ISourceControlSessionNotify

public interface **ISourceControlSessionNotify**  
extends

### Method Summary

void	<a href="#"><code>onSourceControlSessionCreate</code></a> (String streamName, <a href="#"><code>ISourceControlSession</code></a> sourceControlSession) Invoked when source control session is created
void	<a href="#"><code>onSourceControlSessionDestroy</code></a> (String streamName, <a href="#"><code>ISourceControlSession</code></a> sourceControlSession) Invoked when source control session is destroyed

### Methods

#### **onSourceControlSessionCreate**

```
public void onSourceControlSessionCreate(String streamName,  
    ISourceControlSession sourceControlSession)
```

Invoked when source control session is created

**Parameters:**

streamName - stream name  
sourceControlSession - source control session

#### **onSourceControlSessionDestroy**

```
public void onSourceControlSessionDestroy(String streamName,  
    ISourceControlSession sourceControlSession)
```

Invoked when source control session is destroyed

**Parameters:**

streamName - stream name  
sourceControlSession - source Control session

---

Package

**com.wowza.wms.sourcecontrol.drivers**

## com.wowza.wms.sourcecontrol.drivers

### Class SourceControlDriverItem

java.lang.Object

└─com.wowza.wms.sourcecontrol.drivers.SourceControlDriverItem

public class **SourceControlDriverItem**  
extends Object

SourceControlDriverItem: data class that holds the definition of a Source Control Driver.

#### Constructor Summary

public	<a href="#">SourceControlDriverItem</a> (String name, String baseClass) Create a SourceControlDriverItem with the provided name and baseClass settings.
--------	--

#### Method Summary

void	<a href="#">clearProperty</a> (String name) Clear a property by name.
String	<a href="#">getBaseClass</a> () Get the baseClass of the driver.
String	<a href="#">getDescription</a> () Get the description.
String	<a href="#">getName</a> () Get the name used to refer to this driver item.
<a href="#">WMSProperties</a>	<a href="#">getProperties</a> () Get the set of properties defined.
String	<a href="#">getProperty</a> (String name) Get a property by name.
void	<a href="#">setBaseClass</a> (String baseClass) Set the baseClass of the driver.
void	<a href="#">setDescription</a> (String description) Set the description.
void	<a href="#">setName</a> (String name) Set the name use to refer to this driver item.
void	<a href="#">setProperty</a> (String name, String value) Set a property to a string value.
String	<a href="#">toString</a> () Returns a string presentation of the driver item.

Methods inherited from class java.lang.Object

```
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait
```

## Constructors

### SourceControlDriverItem

```
public SourceControlDriverItem(String name,  
                               String baseClass)
```

Create a SourceControlDriverItem with the provided name and baseClass settings.

**Parameters:**

name - The name used when configuring a source control driver that uses the supplied baseClass

baseClass - the baseClass to use for a SourceControlDriver configured with the supplied name

## Methods

### getBaseClass

```
public String getBaseClass()
```

Get the baseClass of the driver.

**Returns:**

the string name of the baseClass

### setBaseClass

```
public void setBaseClass(String baseClass)
```

Set the baseClass of the driver.

**Parameters:**

baseClass - the string name of the baseClass

### getName

```
public String getName()
```

Get the name used to refer to this driver item.

**Returns:**

the name used to refer to this driver item

### setName

```
public void setName(String name)
```

Set the name use to refer to this driver item.

**Parameters:**

name - the name to refer to this driver item by

(continued from last page)

## setProperty

```
public void setProperty(String name,  
                        String value)
```

Set a property to a string value.

**Parameters:**

name - property name

value - property value

---

## clearProperty

```
public void clearProperty(String name)
```

Clear a property by name.

**Parameters:**

name - of the property to clear

---

## getProperty

```
public String getProperty(String name)
```

Get a property by name.

**Parameters:**

name - of the property to get

**Returns:**

the value of the property or null if not set

---

## getProperties

```
public WMSPProperties getProperties()
```

Get the set of properties defined.

**Returns:**

WMSPProperties containing the set of defined properties

---

## getDescription

```
public String getDescription()
```

Get the description.

**Returns:**

the description of the SourceControlDriverItem

---

## setDescription

```
public void setDescription(String description)
```

Set the description.

**Parameters:**

description

## toString

```
public String toString()
```

Returns a string presentation of the driver item.

**Returns:**

string presentation for the driver item

## com.wowza.wms.sourcecontrol.drivers Class SourceControlResponse

java.lang.Object

└─com.wowza.wms.sourcecontrol.drivers.SourceControlResponse

public class **SourceControlResponse**  
extends Object

Container of the response code as well as data for communications with a Source Control Driver.

### Field Summary

public	<a href="#"><u>responseCode</u></a> the response code return from the request to the device
public	<a href="#"><u>responseData</u></a> Any data that might be returned from a request to a device

### Constructor Summary

public	<a href="#"><u>SourceControlResponse()</u></a>
--------	--

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Fields

#### responseCode

public int **responseCode**

the response code return from the request to the device

#### responseData

public byte **responseData**

Any data that might be returned from a request to a device

### Constructors

#### SourceControlResponse

public **SourceControlResponse()**

---

Package

**com.wowza.wms.sourcecontrol.manager**

## com.wowza.wms.sourcecontrol.manager Class SourceControlManager

java.lang.Object

└-com.wowza.wms.sourcecontrol.SourceControlLogging

└-com.wowza.wms.sourcecontrol.manager.SourceControlManager

public class **SourceControlManager**  
extends SourceControlLogging

Class for the management and construction of Source Control devices

### Method Summary

<a href="#">ISourceControlSession</a>	<a href="#">createSourceControlSession</a> (String streamName, <a href="#">IApplicationInstance</a> appInstance) Creates a SourceControlSession for the indicated stream and application instance.
java.util.List	<a href="#">getDriverList</a> () Get a list of the Source Control Drivers
static <a href="#">SourceControlManager</a>	<a href="#">getInstance</a> () Static method to reference a single instance of the Source Control Manager.
<a href="#">ISourceControl</a>	<a href="#">getSourceControlInstance</a> (SourceControlContext context) Gets the ISourceControl implementation for the provided SourceControlContext
static String	<a href="#">getXMLConfigPath</a> () For testing purposes only
boolean	<a href="#">isDriverListLoaded</a> () Returns true if the list of Source Control Drivers was successfully loaded.
SourceControlContext	<a href="#">loadContext</a> (JSON jsonData) Get a SourceControlContext for the source control device described by the provided JSON data
static void	<a href="#">reset</a> () Static method to clear the Source Control Manager, you will need to get a new reference via the getInstance() method.

#### Methods inherited from class com.wowza.wms.sourcecontrol.SourceControlLogging

enableDebug, logDebug, logError, logError, logInfo, logWarn

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Methods

(continued from last page)

---

## getInstance

```
public static SourceControlManager getInstance()
```

Static method to reference a single instance of the Source Control Manager.

**Returns:**

a reference to the single instance of the source control manager

---

## reset

```
public static void reset()
```

Static method to clear the Source Control Manager, you will need to get a new reference via the getInstance() method.

---

## getXMLConfigPath

```
public static String getXMLConfigPath()
```

For testing purposes only

---

## isDriverListLoaded

```
public boolean isDriverListLoaded()
```

Returns true if the list of Source Control Drivers was successfully loaded.

**Returns:**

true if the list of Source Control Drivers was successfully loaded

---

## getDriverList

```
public java.util.List getDriverList()
```

Get a list of the Source Control Drivers

**Returns:**

a list of the Source Control Drivers

---

## loadContext

```
public SourceControlContext loadContext(JSON jsonData)
```

Get a SourceControlContext for the source control device described by the provided JSON data

**Parameters:**

jsonData - JSON class that contains the key value pairs that describe a source control device

**Returns:**

SourceControlContext for the device if the JSON data describes one, otherwise returns NULL

---

## getSourceControlInstance

```
public ISourceControl getSourceControlInstance(SourceControlContext context)
```

Gets the ISourceControl implementation for the provided SourceControlContext

**Parameters:**

(continued from last page)

context - that contains the information to instantiate an ISourceControl device

**Returns:**

ISourceControl if the context properly describes a source Control Device, otherwise NULL

---

## createSourceControlSession

```
public ISourceControlSession createSourceControlSession(String streamName,  
    IApplicationInstance appInstance)
```

Creates a SourceControlSession for the indicated stream and application instance. This will create the session, underlying ISourceControl instance as well and associate them in the returned ISourceControlSession.

**Parameters:**

streamName - the stream name to associate it with

appInstance - the application instance to associate it with

**Returns:**

ISourceControlSession

---

Package

**com.wowza.wms.stats**

## com.wowza.wms.stats Interface IStatsManager

public interface **IStatsManager**  
extends

### Field Summary

public static final	<a href="#"><u>DAYS_OF_DAILY_STORAGE</u></a> Value: <b>365</b>
public static final	<a href="#"><u>DAYS_OF_HOURLY_STORAGE</u></a> Value: <b>30</b>
public static final	<a href="#"><u>DAYS_OF_MINUTES_STORAGE</u></a> Value: <b>3</b>
public static final	<a href="#"><u>HOURS_OF_REALTIME_STORAGE</u></a> Value: <b>12</b>
public static final	<a href="#"><u>SECONDS_RESOLUTION</u></a> Value: <b>5</b>

### Method Summary

<a href="#"><u>IStatsDatabaseManager</u></a>	<a href="#"><u>getStatsDatabaseManager</u></a> ( ) Gets the currently used IStatsDBManager interface
boolean	<a href="#"><u>isEnabled</u></a> ( ) Indicates if the Stats Manager is enabled.
void	<a href="#"><u>rollup</u></a> ( <a href="#"><u>IStatsDatabase</u></a> database) Rollups up the provided database
void	<a href="#"><u>setDebugLogging</u></a> (boolean enable) enables/disables debug logging in the StatsManager.
void	<a href="#"><u>setStatsDatabaseManager</u></a> ( <a href="#"><u>IStatsDatabaseManager</u></a> dbManager) Sets the DBManager to be used by the stats manager for open/closing the various databases
void	<a href="#"><u>startManager</u></a> ( <a href="#"><u>IServer</u></a> server) Starts the stats manager collecting stats data
void	<a href="#"><u>stopManager</u></a> ( ) Stops the Stats manager collecting stats data

### Fields

(continued from last page)

---

## SECONDS\_RESOLUTION

```
public static final int SECONDS_RESOLUTION
```

Constant value: **5**

---

## HOURS\_OF\_REALTIME\_STORAGE

```
public static final int HOURS_OF_REALTIME_STORAGE
```

Constant value: **12**

---

## DAYS\_OF\_MINUTES\_STORAGE

```
public static final int DAYS_OF_MINUTES_STORAGE
```

Constant value: **3**

---

## DAYS\_OF\_HOURLY\_STORAGE

```
public static final int DAYS_OF_HOURLY_STORAGE
```

Constant value: **30**

---

## DAYS\_OF\_DAILY\_STORAGE

```
public static final int DAYS_OF_DAILY_STORAGE
```

Constant value: **365**

## Methods

### startManager

```
public void startManager(IServer server)
```

Starts the stats manager collecting stats data

**Parameters:**

server -- IServer to collect data from

---

### stopManager

```
public void stopManager()
```

Stops the Stats manager collecting stats data

---

### isEnabled

```
public boolean isEnabled()
```

Indicates if the Stats Manager is enabled.

---

## setStatsDatabaseManager

```
public void setStatsDatabaseManager(IStatsDatabaseManager dbManager)
```

Sets the DBManager to be used by the stats manager for open/closing the various databases

**Parameters:**

dbManager - - IStatsDBManager database manager

---

## getStatsDatabaseManager

```
public IStatsDatabaseManager getStatsDatabaseManager()
```

Gets the currently used IStatsDBManager interface

**Returns:**

IStatsDBManager

---

## rollup

```
public void rollup(IStatsDatabase database)
```

Rollups up the provided database

**Parameters:**

database - server - IServer to collect data from

---

## setDebugLogging

```
public void setDebugLogging(boolean enable)
```

enables/disables debug logging in the StatsManager.

**Parameters:**

enable

---

---

Package

**com.wowza.wms.stats.database**

## com.wowza.wms.stats.database Interface IStatsDatabase

public interface **IStatsDatabase**  
extends

### Field Summary

public static final	<a href="#"><u>APPLICATION_FIELD_COUNT</u></a> Value: <b>10</b>
public static final	<a href="#"><u>FIELD_ALL</u></a> Value: <b>-1</b>
public static final	<a href="#"><u>FIELD_ALL_CONN</u></a> Value: <b>2</b>
public static final	<a href="#"><u>FIELD_BW_IN</u></a> Value: <b>0</b>
public static final	<a href="#"><u>FIELD_BW_OUT</u></a> Value: <b>1</b>
public static final	<a href="#"><u>FIELD_CPU</u></a> Value: <b>0</b>
public static final	<a href="#"><u>FIELD_DASH_CONN</u></a> Value: <b>9</b>
public static final	<a href="#"><u>FIELD_DISK</u></a> Value: <b>2</b>
public static final	<a href="#"><u>FIELD_HDS_CONN</u></a> Value: <b>4</b>
public static final	<a href="#"><u>FIELD_HEAP_MEMORY</u></a> Value: <b>3</b>
public static final	<a href="#"><u>FIELD_HLS_CONN</u></a> Value: <b>5</b>
public static final	<a href="#"><u>FIELD_INVALID</u></a> Value: <b>-2</b>
public static final	<a href="#"><u>FIELD_MEM</u></a> Value: <b>1</b>

public static final	<a href="#"><u>FIELD_RTMP_CONN</u></a> Value: <b>2</b>
public static final	<a href="#"><u>FIELD_RTSP_CONN</u></a> Value: <b>3</b>
public static final	<a href="#"><u>FIELD_SMOOTH_CONN</u></a> Value: <b>6</b>
public static final	<a href="#"><u>FIELD_WEBM_CONN</u></a> Value: <b>8</b>
public static final	<a href="#"><u>FIELD_WEBRTC_CONN</u></a> Value: <b>7</b>
public static final	<a href="#"><u>LEVEL_COUNT</u></a> Value: <b>4</b>
public static final	<a href="#"><u>LEVEL_DAYS</u></a> Value: <b>3</b>
public static final	<a href="#"><u>LEVEL_HOURS</u></a> Value: <b>2</b>
public static final	<a href="#"><u>LEVEL_INVALID</u></a> Value: <b>-1</b>
public static final	<a href="#"><u>LEVEL_MINUTES</u></a> Value: <b>1</b>
public static final	<a href="#"><u>LEVEL_SECONDS</u></a> Value: <b>0</b>
public static final	<a href="#"><u>MACHINE_FIELD_COUNT</u></a> Value: <b>3</b>
public static final	<a href="#"><u>SERVER_FIELD_COUNT</u></a> Value: <b>4</b>
public static final	<a href="#"><u>TABLE_AVE</u></a> Value: <b>2</b>
public static final	<a href="#"><u>TABLE_COUNT</u></a> Value: <b>3</b>
public static final	<a href="#"><u>TABLE_INVALID</u></a> Value: <b>-1</b>

public static final	<a href="#"><u>TABLE_MAX</u></a> Value: <b>1</b>
public static final	<a href="#"><u>TABLE_MIN</u></a> Value: <b>0</b>
public static final	<a href="#"><u>TABLE_SECONDS</u></a> Value: <b>0</b>
public static final	<a href="#"><u>VHOST_FIELD_COUNT</u></a> Value: <b>3</b>

## Method Summary

void	<a href="#"><u>close()</u></a> Closes the database for reading and writing
boolean	<a href="#"><u>create</u></a> (String filename, int fieldCount) Creates an empty database for use
boolean	<a href="#"><u>delete</u></a> (int level, org.joda.time.DateTime datetime) Deletes all entries in the level from the date time provided (inclusive) to the end of the table
void	<a href="#"><u>dumpDebug</u></a> ( ) dumps debug data for the database.
String	<a href="#"><u>getFilename</u></a> ( ) Gets the filename of the file on disk to be used
int	<a href="#"><u>getRefCount</u></a> ( ) Debug only.
boolean	<a href="#"><u>open</u></a> ( ) Opens the database for reading/writing
java.util.List	<a href="#"><u>read</u></a> (int level, int table, org.joda.time.DateTime start, org.joda.time.DateTime end) Reads the Stats Entries from the database
void	<a href="#"><u>setDebugLogging</u></a> (boolean enable) Enables/disables debug logging on within the database methods
void	<a href="#"><u>setFilename</u></a> (String filename) Sets the filename of the file on disk to be used
boolean	<a href="#"><u>write</u></a> (int level, StatsEntry[] data) Writes the provided stats entries to the database.

## Fields

### LEVEL\_INVALID

public static final int **LEVEL\_INVALID**

(continued from last page)

Constant value: **-1**

---

**LEVEL\_SECONDS**

```
public static final int LEVEL_SECONDS
```

Constant value: **0**

---

**LEVEL\_MINUTES**

```
public static final int LEVEL_MINUTES
```

Constant value: **1**

---

**LEVEL\_HOURS**

```
public static final int LEVEL_HOURS
```

Constant value: **2**

---

**LEVEL\_DAYS**

```
public static final int LEVEL_DAYS
```

Constant value: **3**

---

**LEVEL\_COUNT**

```
public static final int LEVEL_COUNT
```

Constant value: **4**

---

**TABLE\_INVALID**

```
public static final int TABLE_INVALID
```

Constant value: **-1**

---

**TABLE\_SECONDS**

```
public static final int TABLE_SECONDS
```

Constant value: **0**

---

**TABLE\_MIN**

```
public static final int TABLE_MIN
```

Constant value: **0**

(continued from last page)

---

## TABLE\_MAX

```
public static final int TABLE_MAX
```

Constant value: **1**

---

## TABLE\_AVE

```
public static final int TABLE_AVE
```

Constant value: **2**

---

## TABLE\_COUNT

```
public static final int TABLE_COUNT
```

Constant value: **3**

---

## FIELD\_BW\_IN

```
public static final int FIELD_BW_IN
```

Constant value: **0**

---

## FIELD\_BW\_OUT

```
public static final int FIELD_BW_OUT
```

Constant value: **1**

---

## FIELD\_RTMP\_CONN

```
public static final int FIELD_RTMP_CONN
```

Constant value: **2**

---

## FIELD\_RTSP\_CONN

```
public static final int FIELD_RTSP_CONN
```

Constant value: **3**

---

## FIELD\_HDS\_CONN

```
public static final int FIELD_HDS_CONN
```

Constant value: **4**

---

## FIELD\_HLS\_CONN

```
public static final int FIELD_HLS_CONN
```

---

(continued from last page)

Constant value: **5**

---

**FIELD\_SMOOTH\_CONN**

```
public static final int FIELD_SMOOTH_CONN
```

Constant value: **6**

---

**FIELD\_WEBRTC\_CONN**

```
public static final int FIELD_WEBRTC_CONN
```

Constant value: **7**

---

**FIELD\_WEBM\_CONN**

```
public static final int FIELD_WEBM_CONN
```

Constant value: **8**

---

**FIELD\_DASH\_CONN**

```
public static final int FIELD_DASH_CONN
```

Constant value: **9**

---

**APPLICATION\_FIELD\_COUNT**

```
public static final int APPLICATION_FIELD_COUNT
```

Constant value: **10**

---

**FIELD\_CPU**

```
public static final int FIELD_CPU
```

Constant value: **0**

---

**FIELD\_MEM**

```
public static final int FIELD_MEM
```

Constant value: **1**

---

**FIELD\_DISK**

```
public static final int FIELD_DISK
```

Constant value: **2**

---

## MACHINE\_FIELD\_COUNT

```
public static final int MACHINE_FIELD_COUNT
```

Constant value: **3**

---

## FIELD\_ALL\_CONN

```
public static final int FIELD_ALL_CONN
```

Constant value: **2**

---

## FIELD\_HEAP\_MEMORY

```
public static final int FIELD_HEAP_MEMORY
```

Constant value: **3**

---

## SERVER\_FIELD\_COUNT

```
public static final int SERVER_FIELD_COUNT
```

Constant value: **4**

---

## VHOST\_FIELD\_COUNT

```
public static final int VHOST_FIELD_COUNT
```

Constant value: **3**

---

## FIELD\_ALL

```
public static final int FIELD_ALL
```

Constant value: **-1**

---

## FIELD\_INVALID

```
public static final int FIELD_INVALID
```

Constant value: **-2**

---

## Methods

### setFilename

```
public void setFilename(String filename)
```

Sets the filename of the file on disk to be used

**Parameters:**

(continued from last page)

filename

---

## getFilename

```
public String getFilename()
```

Gets the filename of the file on disk to be used

**Returns:**

returns null if setFilename has not been called

---

## create

```
public boolean create(String filename,  
    int fieldCount)
```

Creates an empty database for use

**Parameters:**

filename - to be used.

fieldCount - number of fields being stored

**Returns:**

returns false if unable to create the DB otherwise true

---

## open

```
public boolean open()
```

Opens the database for reading/writing

**Returns:**

returns false if unable to open the database otherwise true

---

## read

```
public java.util.List read(int level,  
    int table,  
    org.joda.time.DateTime start,  
    org.joda.time.DateTime end)
```

Reads the Stats Entries from the database

**Parameters:**

level - to read from

table - to read from

start - start date and time (inclusive) to start reading from

end - end date and time (inclusive) to stop reading from. Okay if null, reads to end of table then.

**Returns:**

returns a List of the stats entries (appropriate class) from the database

---

## write

```
public boolean write(int level,  
    StatsEntry[] data)
```

Writes the provided stats entries to the database. The first entry is written to the first table of the level, the second to the second table of the level etc. Must provide an entry for all tables in the level.

---

---

(continued from last page)

**Parameters:**

level  
data

**Returns:**

returns false if unable to write or incorrect number of entries for the level

---

## delete

```
public boolean delete(int level,  
                      org.joda.time.DateTime datetime)
```

Deletes all entries in the level from the date time provided (inclusive) to the end of the table

**Parameters:**

level - to delete from  
datetime

**Returns:**

returns false if unable to delete the requested entries, true otherwise. Doesn't not return false if there are no entries that meet the criteria

---

## close

```
public void close()
```

Closes the database for reading and writing

---

## getRefCount

```
public int getRefCount()
```

Debug only. Gets the current refcount for the database

**Returns:**

ref count for the database

---

## setDebugLogging

```
public void setDebugLogging(boolean enable)
```

Enables/disables debug logging on within the database methods

**Parameters:**

enable

---

## dumpDebug

```
public void dumpDebug()
```

dumps debug data for the database.

---

## com.wowza.wms.stats.database Interface IStatsDatabaseManager

public interface **IStatsDatabaseManager**  
extends

### Method Summary

void	<a href="#"><u>applicationDeleteDatabase</u></a> (String vhost, String appName) Deletes the stats database used to store the specified application stats data
<a href="#"><u>IStatsDatabase</u></a>	<a href="#"><u>applicationGetDatabase</u></a> (String vhost, String appName) Gets the IStatsDB database reference for use in reading and writing to the specified application stats data
void	<a href="#"><u>checkStorage</u></a> ( ) Checks the permissions on the storage root provided.
boolean	<a href="#"><u>isStorageAvailable</u></a> ( ) Indicates if the DB manager can read/write to the supplied storage root.
void	<a href="#"><u>machineDeleteDatabase</u></a> ( ) Deletes the stats database used to store the machine stats data
<a href="#"><u>IStatsDatabase</u></a>	<a href="#"><u>machineGetDatabase</u></a> ( ) Gets the IStatsDB database reference for use in reading and writing to the machine stats data
void	<a href="#"><u>serverDeleteDatabase</u></a> ( ) Deletes the stats database used to store the server stats data
<a href="#"><u>IStatsDatabase</u></a>	<a href="#"><u>serverGetDatabase</u></a> ( ) Gets the IStatsDB database reference for use in reading and writing to the server stats data
void	<a href="#"><u>setDebugLogging</u></a> (boolean enable) sets debug logging within the DB manager as well as any Stats Databases opened/created
void	<a href="#"><u>setStorageRoot</u></a> (String storageRoot) Sets the storage root for the stats database files
void	<a href="#"><u>vhostDeleteDatabase</u></a> (String vhost) Deletes the stats database used to store the specified vhost stats data
<a href="#"><u>IStatsDatabase</u></a>	<a href="#"><u>vhostGetDatabase</u></a> (String vhost) Gets the IStatsDB database reference for use in reading and writing to the specified vhost stats data

### Methods

#### setStorageRoot

public void **setStorageRoot**(String storageRoot)

Sets the storage root for the stats database files

(continued from last page)

**Parameters:**

storageRoot - absolute or relative paths accepted

---

**checkStorage**

```
public void checkStorage()
```

Checks the permissions on the storage root provided. Call only if you suspect permissions has changed.

---

**isStorageAvailable**

```
public boolean isStorageAvailable()
```

Indicates if the DB manager can read/write to the supplied storage root.

**Returns:**

returns false if unable to access/create the provided storage root otherwise true.

---

**serverGetDatabase**

```
public IStatsDatabase serverGetDatabase()
```

Gets the IStatsDB database reference for use in reading and writing to the server stats data

**Returns:**

returns null if unable to find/create the server stats database

---

**machineGetDatabase**

```
public IStatsDatabase machineGetDatabase()
```

Gets the IStatsDB database reference for use in reading and writing to the machine stats data

**Returns:**

returns null if unable to find/create the machine stats database

---

**vhostGetDatabase**

```
public IStatsDatabase vhostGetDatabase(String vhost)
```

Gets the IStatsDB database reference for use in reading and writing to the specified vhost stats data

**Returns:**

returns null if unable to find/create the specified vhost stats database

---

**applicationGetDatabase**

```
public IStatsDatabase applicationGetDatabase(String vhost,  
String appName)
```

Gets the IStatsDB database reference for use in reading and writing to the specified application stats data

**Returns:**

returns null if unable to find/create the specified application stats database

---

(continued from last page)

## serverDeleteDatabase

```
public void serverDeleteDatabase()
```

Deletes the stats database used to store the server stats data

---

## machineDeleteDatabase

```
public void machineDeleteDatabase()
```

Deletes the stats database used to store the machine stats data

---

## vhostDeleteDatabase

```
public void vhostDeleteDatabase(String vhost)
```

Deletes the stats database used to store the specified vhost stats data

---

## applicationDeleteDatabase

```
public void applicationDeleteDatabase(String vhost,  
                                       String appName)
```

Deletes the stats database used to store the specified application stats data

---

## setDebugLogging

```
public void setDebugLogging(boolean enable)
```

sets debug logging within the DB manager as well as any Stats Databases opened/created

### Parameters:

enable

---

Package

**com.wowza.wms.stats.database.file**

## com.wowza.wms.stats.database.file Interface IStatsFileDatabase

public interface **IStatsFileDatabase**  
extends

### Field Summary

public static final	<a href="#"><u>ATOMID_HEADER</u></a> Value: <b>head</b>
public static final	<a href="#"><u>ATOMID_LEVEL</u></a> Value: <b>levl</b>
public static final	<a href="#"><u>ATOMID_LEVEL_DATATABLE</u></a> Value: <b>ldat</b>
public static final	<a href="#"><u>ATOMID_LEVEL_HEADER</u></a> Value: <b>lhdr</b>
public static final	<a href="#"><u>ATOMID_LEVEL_TIME</u></a> Value: <b>ltme</b>
public static final	<a href="#"><u>ATOMID_LEVEL_TIMEINDEX</u></a> Value: <b>ltmi</b>
public static final	<a href="#"><u>ATOMSIZE</u></a> Value: <b>8</b>
public static final	<a href="#"><u>BYTESPERTIMECODE</u></a> Value: <b>4</b>
public static final	<a href="#"><u>DEFAULT_BYTESPERFIELD</u></a> Value: <b>3</b>
public static final	<a href="#"><u>DEFAULT_FIELDSPERROW</u></a> Value: <b>12</b>
public static final	<a href="#"><u>DEFAULT_TABLECOUNT</u></a> Value: <b>1</b>
public static final	<a href="#"><u>DEFAULT_TIMEINDEX_FACTOR</u></a> Value: <b>10</b>
public static final	<a href="#"><u>EPOCH_SECS</u></a> Value: <b>1341360000</b>

<code>public static final</code>	<a href="#"><u>FILE_SIGNATURE</u></a> Value: <b>WSDB</b>
<code>public static final</code>	<a href="#"><u>FILE_VERSION</u></a> Value: <b>0</b>

## Method Summary

<code>void</code>	<a href="#"><u>close()</u></a> Close open database (will leak descriptors if not closed)
<code>long</code>	<a href="#"><u>getEpoch()</u></a> Get the defined time epoch
<code>int</code>	<a href="#"><u>getFlags()</u></a> Get the flags
<a href="#"><u>IStatsFileDatabaseLevel</u></a>	<a href="#"><u>getLevel(int levelIndex)</u></a> Get level
<code>StatsFileDatabaseStorageContext</code>	<a href="#"><u>getStorageContext()</u></a> Get the storage context for open database.
<code>int</code>	<a href="#"><u>getVersion()</u></a> Get version
<code>boolean</code>	<a href="#"><u>isValidSecondsTime(long timecode)</u></a> Returns true if valid timecode value (in seconds).
<code>void</code>	<a href="#"><u>putLevel(int levelIndex, StatsFileDatabaseLevel level)</u></a> Put level
<code>boolean</code>	<a href="#"><u>writeEmptyDatabase(String path)</u></a> Write empty database

## Fields

### ATOMSIZE

```
public static final int ATOMSIZE
```

Constant value: **8**

### FILE\_SIGNATURE

```
public static final java.lang.String FILE_SIGNATURE
```

Constant value: **WSDB**

### FILE\_VERSION

```
public static final int FILE_VERSION
```

(continued from last page)

Constant value: **0**

---

## ATOMID\_HEADER

```
public static final java.lang.String ATOMID_HEADER
```

Constant value: **head**

---

## ATOMID\_LEVEL

```
public static final java.lang.String ATOMID_LEVEL
```

Constant value: **levl**

---

## ATOMID\_LEVEL\_HEADER

```
public static final java.lang.String ATOMID_LEVEL_HEADER
```

Constant value: **lhdr**

---

## ATOMID\_LEVEL\_TIME

```
public static final java.lang.String ATOMID_LEVEL_TIME
```

Constant value: **ltme**

---

## ATOMID\_LEVEL\_TIMEINDEX

```
public static final java.lang.String ATOMID_LEVEL_TIMEINDEX
```

Constant value: **ltmi**

---

## ATOMID\_LEVEL\_DATATABLE

```
public static final java.lang.String ATOMID_LEVEL_DATATABLE
```

Constant value: **ldat**

---

## EPOCH\_SECS

```
public static final long EPOCH_SECS
```

Constant value: **1341360000**

---

## BYTESPERTIMECODE

```
public static final int BYTESPERTIMECODE
```

Constant value: **4**

(continued from last page)

## DEFAULT\_TIMEINDEX\_FACTOR

```
public static final int DEFAULT_TIMEINDEX_FACTOR
```

Constant value: **10**

## DEFAULT\_BYTESPERFIELD

```
public static final int DEFAULT_BYTESPERFIELD
```

Constant value: **3**

## DEFAULT\_FIELDSPERROW

```
public static final int DEFAULT_FIELDSPERROW
```

Constant value: **12**

## DEFAULT\_TABLECOUNT

```
public static final int DEFAULT_TABLECOUNT
```

Constant value: **1**

## Methods

### writeEmptyDatabase

```
public boolean writeEmptyDatabase(String path)
```

Write empty database

**Parameters:**

path

**Returns:**

true if successful

### getLevel

```
public IStatsFileDatabaseLevel getLevel(int levelIndex)
```

Get level

**Parameters:**

levelIndex

**Returns:**

level index

### putLevel

```
public void putLevel(int levelIndex,  
    StatsFileDatabaseLevel level)
```

(continued from last page)

Put level

**Parameters:**

levelIndex  
level

---

## isValidSecondsTime

```
public boolean isValidSecondsTime(long timecode)
```

Returns true if valid timecode value (in seconds). Must be greater than define epoch and less than epoch+Inter.MAX\_VALUE

**Parameters:**

timecode

**Returns:**

true if valid timecode

---

## getStorageContext

```
public StatsFileDatabaseStorageContext getStorageContext()
```

Get the storage context for open database. You can get read/write stats

**Returns:**

storage context for open database

---

## getEpoch

```
public long getEpoch()
```

Get the defined time epoch

**Returns:**

epoch time

---

## getVersion

```
public int getVersion()
```

Get version

**Returns:**

version

---

## getFlags

```
public int getFlags()
```

Get the flags

**Returns:**

flags

---

## close

```
public void close()
```

Close open database (will leak descriptors if not closed)

## com.wowza.wms.stats.database.file Interface IStatsFileDatabaseLevel

public interface **IStatsFileDatabaseLevel**  
extends

### Method Summary

boolean	<a href="#"><u>deleteRows</u></a> (int row) Deletes all rows equal to and greater than supplied row.
boolean	<a href="#"><u>deleteRowsAll</u></a> () Deletes all data in level.
void	<a href="#"><u>dropIndexData</u></a> () As time and records are read/written some storage is used to speed operation.
boolean	<a href="#"><u>findTime</u></a> (long time, StatsFileDatabaseTime timeResult) Find the closest row with a given time.
int	<a href="#"><u>getBytesPerField</u></a> () Get the number of bytes per-field
int	<a href="#"><u>getFieldCount</u></a> () Get the number of fields per-row.
boolean	<a href="#"><u>getFirstTime</u></a> (StatsFileDatabaseTime timeResult) Get the time of row 0
int	<a href="#"><u>getFlags</u></a> () Get flags
boolean	<a href="#"><u>getLastTime</u></a> (StatsFileDatabaseTime timeResult) Get the time of last row
long	<a href="#"><u>getLastWriteTime</u></a> () Get the time of the last row written.
int	<a href="#"><u>getLevelIndex</u></a> () Get level index
int	<a href="#"><u>getRowCountCurrent</u></a> () Get the current number of rows in the level
int	<a href="#"><u>getRowCountMax</u></a> () Get the maximum number of rows for this level
int	<a href="#"><u>getRowStorageSize</u></a> () Get the storage size in bytes for a single row of data.
int	<a href="#"><u>getTableCount</u></a> () Get the number of tables
boolean	<a href="#"><u>getTime</u></a> (int row, StatsFileDatabaseTime timeResult) Get time associated with a given row.

int	<a href="#"><u>getTimeIncrement()</u></a> Get the time increment for this level (only informational)
int	<a href="#"><u>getTimeIndexFactor()</u></a> Not really used - may use in the future
int	<a href="#"><u>getTimes(int row, int count, long[] time)</u></a> Get time for a range or rows.
int	<a href="#"><u>getVersion()</u></a> Get version
boolean	<a href="#"><u>readRows(int table, int row, int count, byte[] rowBytes, int offset)</u></a> Read the data for a range of rows.
void	<a href="#"><u>setBytesPerField(int bytesPerField)</u></a> Set the number of bytes per-field (only when creating empty database)
void	<a href="#"><u>setFieldCount(int fieldCount)</u></a> Set the number of fields per-row (only when creating empty database)
void	<a href="#"><u>setRowCountMax(int rowCountMax)</u></a> Get the max number of rows (only when creating empty database)
void	<a href="#"><u>setTableCount(int tableCount)</u></a> Set number of tables (only when creating empty database)
void	<a href="#"><u>setTimeIncrement(int timeIncrement)</u></a> Set the time increment for this level v
void	<a href="#"><u>setTimeIndexFactor(int timeIndexFactor)</u></a> Not really used - may use in the future
boolean	<a href="#"><u>writeRow(long timecode, int[] fields)</u></a> Write a row to the level.
boolean	<a href="#"><u>writeRow(long timecode, int[][] fieldsArr)</u></a> Write a row to the level.

## Methods

### getLevelIndex

public int **getLevelIndex()**

Get level index

**Returns:**

level index

### dropIndexData

public void **dropIndexData()**

As time and records are read/written some storage is used to speed operation. This will dump the storage. It will be re-created if needed by underlying APIs.

## findTime

```
public boolean findTime(long time,  
                        StatsFileDatabaseTime timeResult)
```

Find the closest row with a given time. If the time is greater then the last row false will be returned. If the level is empty false will be returned. It will find closets time not greater then the requested time.

**Parameters:**

time  
timeResult

**Returns:**

returns false if time is greater than last row in level or level is empty

---

## getFirstTime

```
public boolean getFirstTime(StatsFileDatabaseTime timeResult)
```

Get the time of row 0

**Parameters:**

timeResult

**Returns:**

returns false if level is empty

---

## getLastTime

```
public boolean getLastTime(StatsFileDatabaseTime timeResult)
```

Get the time of last row

**Parameters:**

timeResult

**Returns:**

returns false if level is empty

---

## getTime

```
public boolean getTime(int row,  
                      StatsFileDatabaseTime timeResult)
```

Get time associated with a given row.

**Parameters:**

row  
timeResult

**Returns:**

returns false if row is greater then total row count or level is empty

---

## getTimes

```
public int getTimes(int row,  
                   int count,  
                   long[] time)
```

---

(continued from last page)

Get time for a range or rows. If count = -1 it will get times for all rows to end of table.

**Parameters:**

row  
count  
time

**Returns:**

returns false if row+count is greater then total row count or level is empty

---

## getLastWriteTime

```
public long getLastWriteTime()
```

Get the time of the last row written. writeRow will fail if try to write row using timecode less than this value. If returns -1 means level is empty.

**Returns:**

time of the last row written (milliseconds)

---

## deleteRowsAll

```
public boolean deleteRowsAll()
```

Deletes all data in level.

**Returns:**

true, if rows deleted

---

## deleteRows

```
public boolean deleteRows(int row)
```

Deletes all rows equal to and greater than supplied row.

**Parameters:**

row

**Returns:**

true, if rows deleted

---

## getRowStorageSize

```
public int getRowStorageSize()
```

Get the storage size in bytes for a single row of data.

**Returns:**

storage size in bytes

---

## readRows

```
public boolean readRows(int table,  
    int row,  
    int count,  
    byte[] rowBytes,  
    int offset)
```

Read the data for a range of rows. If count = -1 will read from row to the end of the level.

---

---

(continued from last page)

**Parameters:**

table  
row  
count  
rowBytes  
offset

**Returns:**

true if successful

---

## writeRow

```
public boolean writeRow(long timecode,  
    int[] fields)
```

Write a row to the level. This is for writing the level with only a single table's worth of data.

**Parameters:**

timecode  
fields

**Returns:**

true if successful

---

## writeRow

```
public boolean writeRow(long timecode,  
    int[][] fieldsArr)
```

Write a row to the level. This is for writing to a level with more than one table (avg, min, max)

**Parameters:**

timecode  
fieldsArr

**Returns:**

true if successful

---

## getRowCountMax

```
public int getRowCountMax()
```

Get the maximum number of rows for this level

**Returns:**

maximum number of rows for this level

---

## setRowCountMax

```
public void setRowCountMax(int rowCountMax)
```

Get the max number of rows (only when creating empty database)

**Parameters:**

rowCountMax

---

(continued from last page)

## getRowCountCurrent

```
public int getRowCountCurrent()
```

Get the current number of rows in the level

**Returns:**

current number of rows in the level

---

## getFieldCount

```
public int getFieldCount()
```

Get the number of fields per-row.

**Returns:**

number of fields per-row

---

## setFieldCount

```
public void setFieldCount(int fieldCount)
```

Set the number of fields per-row (only when creating empty database)

**Parameters:**

fieldCount

---

## getTableCount

```
public int getTableCount()
```

Get the number of tables

**Returns:**

number of tables

---

## setTableCount

```
public void setTableCount(int tableCount)
```

Set number of tables (only when creating empty database)

**Parameters:**

tableCount

---

## getBytesPerField

```
public int getBytesPerField()
```

Get the number of bytes per-field

**Returns:**

number of bytes per-field

---

## setBytesPerField

```
public void setBytesPerField(int bytesPerField)
```

---

(continued from last page)

Set the number of bytes per-field (only when creating empty database)

**Parameters:**

bytesPerField

---

## getTimeIncrement

```
public int getTimeIncrement()
```

Get the time increment for this level (only informational)

**Returns:**

time increment for this level

---

## setTimeIncrement

```
public void setTimeIncrement(int timeIncrement)
```

Set the time increment for this level v

**Parameters:**

timeIncrement

---

## getTimeIndexFactor

```
public int getTimeIndexFactor()
```

Not really used - may use in the future

**Returns:**

not used

---

## setTimeIndexFactor

```
public void setTimeIndexFactor(int timeIndexFactor)
```

Not really used - may use in the future

**Parameters:**

timeIndexFactor

---

## getVersion

```
public int getVersion()
```

Get version

**Returns:**

version

---

## getFlags

```
public int getFlags()
```

Get flags

**Returns:**

flags

---

Package

**com.wowza.wms.stream**

## com.wowza.wms.stream Interface IMediaIndexItem

public interface **IMediaIndexItem**  
extends

IMediaIndexItem: generic interface to mediaIndex

### Field Summary

public static final	<a href="#">MISSING</a> media file is missing Value: <b>**missing**</b>
---------------------	---

### Method Summary

<a href="#">IMediaIndexItem</a>	<a href="#">clone()</a> Make a clone copy of media index
String	<a href="#">getChecksum()</a> Get checksum for media index
int	<a href="#">getExtent()</a> Get the duration (milliseconds) of media index
long	<a href="#">getLastAccessed()</a> Get last time media index was accessed (milliseconds)
boolean	<a href="#">isHitEnd()</a> Is media index complete
void	<a href="#">setChecksum(IRandomAccessReader file)</a> Set media index checksum.
void	<a href="#">setChecksum(String checksum)</a> Set media index checksum
void	<a href="#">setLastAccessed(long time)</a> Set last time media index accessed (milliseconds)
void	<a href="#">touch()</a> Set last time accessed to current time

### Fields

#### MISSING

public static final java.lang.String **MISSING**

media file is missing  
Constant value: **\*\*missing\*\***

(continued from last page)

## Methods

### getExtent

```
public int getExtent()
```

Get the duration (milliseconds) of media index

**Returns:**

duration (milliseconds)

### getChecksum

```
public String getChecksum()
```

Get checksum for media index

**Returns:**

checksum

### setChecksum

```
public void setChecksum(String checksum)
```

Set media index checksum

**Parameters:**

checksum

### setChecksum

```
public void setChecksum(IRandomAccessReader file)
```

Set media index checksum. Extract data from File spec

**Parameters:**

file

### clone

```
public IMediaIndexItem clone()
```

Make a clone copy of media index

**Returns:**

shallow copy of media index

### getLastAccessed

```
public long getLastAccessed()
```

Get last time media index was accessed (milliseconds)

**Returns:**

time media index was accessed (milliseconds)

(continued from last page)

## setLastAccessed

```
public void setLastAccessed(long time)
```

Set last time media index accessed (milliseconds)

**Parameters:**

time - media index was accessed (milliseconds)

---

## isHitEnd

```
public boolean isHitEnd()
```

Is media index complete

**Returns:**

true if media index is complete

---

## touch

```
public void touch()
```

Set last time accessed to current time

## com.wowza.wms.stream Interface IMediaListProvider

public interface **IMediaListProvider**  
extends

### Method Summary

<a href="#">MediaList</a>	<a href="#">resolveMediaList</a> ( <a href="#">IMediaListReader</a> mediaListReader, <a href="#">IMediaStream</a> stream, String streamName) Called to resolve a amlst:streamname to a media list
---------------------------	--

### Methods

#### **resolveMediaList**

```
public MediaList resolveMediaList(IMediaListReader mediaListReader,  
    IMediaStream stream,  
    String streamName)
```

Called to resolve a amlst:streamname to a media list

##### **Parameters:**

mediaListReader - mediaListReader  
stream - media stream  
streamName - stream name

##### **Returns:**

media list

## com.wowza.wms.stream Interface IMediaListReader

public interface **IMediaListReader**  
extends

### Method Summary

void	<a href="#"><code>close()</code></a> close file
<a href="#"><code>IHTTPStreamerSession</code></a>	<a href="#"><code>getHTTPStreamerSession()</code></a> Get the HTTPStreamerSession associated with this media list reader
String	<a href="#"><code>getMediaExtension()</code></a> Get media extension
<a href="#"><code>MediaList</code></a>	<a href="#"><code>getMediaList()</code></a> Get the MediaList object
String	<a href="#"><code>getPath()</code></a> Get abstract path to the media item
void	<a href="#"><code>init(IApplicationInstance appInstance, IMediaStream stream, String mediaReadType, String basePath, String mediaName, IHTTPStreamerSession httpStreamerSession)</code></a> Initialize mediaReader
boolean	<a href="#"><code>isOpen()</code></a> is file open
void	<a href="#"><code>open(String basePath, String name)</code></a> Open the file for reading
void	<a href="#"><code>setHTTPStreamerSession(IHTTPStreamerSession httpStreamerSession)</code></a> Set the HTTPStreamerSession associated with this media list reader
void	<a href="#"><code>setMediaReaderItem(MediaReaderItem mediaReaderItem)</code></a> Set the mediaReader item definition
void	<a href="#"><code>setProperties(WMSProperties properties)</code></a> Set the properties for this media reader

### Methods

#### init

```
public void init(IApplicationInstance appInstance,
IMediaStream stream,
String mediaReadType,
String basePath,
String mediaName,
IHTTPStreamerSession httpStreamerSession)
```

(continued from last page)

Initialize mediaReader

**Parameters:**

stream - parent stream  
mediaReadType - media reader type id. Example: flv  
basePath - Base path for application instance  
mediaName - name of the media item

---

## setMediaReaderItem

```
public void setMediaReaderItem(MediaReaderItem mediaReaderItem)
```

Set the mediaReader item definition

**Parameters:**

mediaReaderItem

---

## open

```
public void open(String basePath,  
String name)
```

Open the file for reading

**Parameters:**

basePath - base path to file  
name - file name without extension

---

## close

```
public void close()
```

close file

---

## isOpen

```
public boolean isOpen()
```

is file open

**Returns:**

is file open

---

## setProperties

```
public void setProperties(WMSPProperties properties)
```

Set the properties for this media reader

**Parameters:**

properties - properties

---

## getPath

```
public String getPath()
```

Get abstract path to the media item

**Returns:**

(continued from last page)

abstract path to the media item

---

## getMediaExtension

```
public String getMediaExtension()
```

Get media extension

**Returns:**

media extension

---

## getMediaList

```
public MediaList getMediaList()
```

Get the MediaList object

**Returns:**

MediaList object

---

## getHTTPStreamerSession

```
public IHTTPStreamerSession getHTTPStreamerSession()
```

Get the HTTPStreamerSession associated with this media list reader

**Returns:**

HTTPStreamerSession

---

## setHTTPStreamerSession

```
public void setHTTPStreamerSession(IHTTPStreamerSession httpStreamerSession)
```

Set the HTTPStreamerSession associated with this media list reader

**Parameters:**

httpStreamerSession - HTTPStreamerSession

## com.wowza.wms.stream Interface IMediaReader

All Subinterfaces:

[IMediaReaderSmoothStreamer](#), [IMediaReaderSanJose](#), [IMediaReaderMPEGDash](#), [IMediaReaderCupertino](#)

public interface **IMediaReader**  
extends

IMediaReader: generic media reader interface. All media types implement this interface to interact with PlaylistPlayer.

### Field Summary

public static final	<a href="#">CONTENTTYPE_MEDIA</a> Value: <b>1</b>
public static final	<a href="#">CONTENTTYPE_MEDIALIST</a> Value: <b>2</b>
public static final	<a href="#">DEFAULT_RANDOMACCESSREADER</a> Value: <b>com.wowza.io.DirectRandomAccessReader</b>
public static final	<a href="#">DEFAULT_RANDOMACCESSREADEROPTIMIZER</a> Value: <b>com.wowza.io.RandomAccessReadOptimizer</b>
public static final	<a href="#">PLAYEVENT_AFTERBUFFERFILL</a> Value: <b>5</b>
public static final	<a href="#">PLAYEVENT_AFTERMETADATA</a> Value: <b>3</b>
public static final	<a href="#">PLAYEVENT_BEFOREBUFFERFILL</a> Value: <b>4</b>
public static final	<a href="#">PLAYEVENT_BEFOREMETADATA</a> Value: <b>2</b>
public static final	<a href="#">PLAYEVENT_STARTPLAYBACK</a> Value: <b>1</b>
public static final	<a href="#">SEEK_EXACT</a> Seek direction: closest frame (audio, video) (key, no-key) Value: <b>4</b>
public static final	<a href="#">SEEK_KEYCLOSE</a> Seek direction: closest key frame Value: <b>3</b>

public static final	<a href="#">SEEK_KEYDOWN</a> Seek direction: down to closets key frame Value: <b>2</b>
public static final	<a href="#">SEEK_KEYUP</a> Seek direction: up to closets key frame Value: <b>1</b>
public static final	<a href="#">SEEKTARGET_AUDIO</a> Value: <b>3</b>
public static final	<a href="#">SEEKTARGET_ENHANCED</a> Value: <b>4</b>
public static final	<a href="#">SEEKTARGET_VIDEOKEYFRAME</a> Value: <b>1</b>

## Method Summary

void	<a href="#">close()</a> close file
long	<a href="#">getDuration()</a> Get duration or time (milliseconds) of the media file
long	<a href="#">getLength()</a> Get the stream length in bytes
String	<a href="#">getMediaExtension()</a> Get media extension
java.util.List	<a href="#">getMetadata()</a> Get a collection of metadata packets in ByteBuffers for this file.
String	<a href="#">getPath()</a> Get abstract path to the media item
<a href="#">IMediaReaderStreamPosition</a>	<a href="#">getStreamPosition()</a> Get a reference to the current stream position
void	<a href="#">init(IApplicationInstance appInstance, IMediaStream stream, String mediaReadType, String basePath, String mediaName)</a> Initialize mediaReader
boolean	<a href="#">isOpen()</a> is file open
void	<a href="#">open(String basePath, String name)</a> Open the file for reading
void	<a href="#">rewind()</a> rewind file to start
PlaylistSeekResult	<a href="#">seek(long timecode, int seektype)</a> seek to timecode in file

int	<a href="#">sendZeroLengthPacket</a> (int type, int timecode, boolean isAbsolute, <a href="#">IMediaStream</a> stream, java.io.OutputStream out, <a href="#">AMFObj</a> wmsObj, <a href="#">PlaylistCursor</a> flvCursor, <a href="#">PlaylistWriteControl</a> control, <a href="#">PlaylistReaderWriteResults</a> results, long[] sizes, boolean isForceTCZero)
void	<a href="#">setMediaReaderItem</a> (MediaReaderItem mediaReaderItem) Set the mediaReader item definition
void	<a href="#">setProperties</a> ( <a href="#">WMSProperties</a> properties) Set the properties for this media reader
void	<a href="#">setStreamPosition</a> ( <a href="#">IMediaReaderStreamPosition</a> pos) Set the file position within the media file
void	<a href="#">startPlayback</a> () Called each time the player being playback (before the buffer it filled)
int	<a href="#">writeGeneratedKeyFrame</a> ( <a href="#">IMediaStream</a> stream, java.io.OutputStream out, <a href="#">AMFObj</a> wmsObjAudio, <a href="#">AMFObj</a> wmsObjVideo, <a href="#">AMFObj</a> wmsObjData, <a href="#">PlaylistCursor</a> flvCursor, <a href="#">PlaylistWriteControl</a> control, <a href="#">PlaylistReaderWriteResults</a> results, long[] sizes, <a href="#">FastPlaySettings</a> fastPlaySettings, boolean isForceTCZero) From current location in file generate a key frame (enhanced seek) and write it to out
int	<a href="#">writePackets</a> ( <a href="#">IMediaStream</a> stream, java.io.OutputStream out, <a href="#">AMFObj</a> wmsObjAudio, <a href="#">AMFObj</a> wmsObjVideo, <a href="#">AMFObj</a> wmsObjData, <a href="#">PlaylistCursor</a> flvCursor, <a href="#">PlaylistWriteControl</a> control, <a href="#">PlaylistReaderWriteResults</a> results, long[] sizes, <a href="#">FastPlaySettings</a> fastPlaySettings, boolean isForceTCZero) From current location in file write packets to output
int	<a href="#">writePackets</a> (java.util.List packetList, <a href="#">PlaylistCursor</a> flvCursor, <a href="#">PlaylistWriteControl</a> control, <a href="#">PlaylistReaderWriteResults</a> results, long[] sizes, <a href="#">FastPlaySettings</a> fastPlaySettings) Write packets to the packetList as AMFPackets

## Fields

### CONTENTTYPE\_MEDIA

```
public static final int CONTENTTYPE_MEDIA
```

Constant value: **1**

### CONTENTTYPE\_MEDIALIST

```
public static final int CONTENTTYPE_MEDIALIST
```

Constant value: **2**

### DEFAULT\_RANDOMACCESSREADER

```
public static final java.lang.String DEFAULT_RANDOMACCESSREADER
```

Constant value: **com.wowza.io.DirectRandomAccessReader**

---

## DEFAULT\_RANDOMACCESSREADEROPTIMIZER

```
public static final java.lang.String DEFAULT_RANDOMACCESSREADEROPTIMIZER
```

Constant value: **com.wowza.io.RandomAccessReadOptimizer**

---

## SEEKTARGET\_VIDEOKEYFRAME

```
public static final int SEEKTARGET_VIDEOKEYFRAME
```

Constant value: **1**

---

## SEEKTARGET\_AUDIO

```
public static final int SEEKTARGET_AUDIO
```

Constant value: **3**

---

## SEEKTARGET\_ENHANCED

```
public static final int SEEKTARGET_ENHANCED
```

Constant value: **4**

---

## PLAYEVENT\_STARTPLAYBACK

```
public static final int PLAYEVENT_STARTPLAYBACK
```

Constant value: **1**

---

## PLAYEVENT\_BEFOREMETADATA

```
public static final int PLAYEVENT_BEFOREMETADATA
```

Constant value: **2**

---

## PLAYEVENT\_AFTERMETADATA

```
public static final int PLAYEVENT_AFTERMETADATA
```

Constant value: **3**

---

## PLAYEVENT\_BEFOREBUFFERFILL

```
public static final int PLAYEVENT_BEFOREBUFFERFILL
```

Constant value: **4**

---

(continued from last page)

## PLAYEVENT\_AFTERBUFFERFILL

```
public static final int PLAYEVENT_AFTERBUFFERFILL
```

Constant value: **5**

## SEEK\_KEYUP

```
public static final int SEEK_KEYUP
```

Seek direction: up to closets key frame  
Constant value: **1**

## SEEK\_KEYDOWN

```
public static final int SEEK_KEYDOWN
```

Seek direction: down to closets key frame  
Constant value: **2**

## SEEK\_KEYCLOSE

```
public static final int SEEK_KEYCLOSE
```

Seek direction: closest key frame  
Constant value: **3**

## SEEK\_EXACT

```
public static final int SEEK_EXACT
```

Seek direction: closest frame (audio, video) (key, no-key)  
Constant value: **4**

## Methods

### init

```
public void init(IApplicationInstance appInstance,  
                IMediaStream stream,  
                String mediaReadType,  
                String basePath,  
                String mediaName)
```

Initialize mediaReader

#### Parameters:

stream - parent stream  
mediaReadType - media reader type id. Example: flv  
basePath - Base path for application instance  
mediaName - name of the media item

### setMediaReaderItem

```
public void setMediaReaderItem(MediaReaderItem mediaReaderItem)
```

Set the mediaReader item definition

#### Parameters:

(continued from last page)

mediaReaderItem

---

## open

```
public void open(String basePath,  
                String name)
```

Open the file for reading

### Parameters:

basePath - base path to file

name - file name without extension

---

## getMetadata

```
public java.util.List getMetadata()
```

Get a collection of metadata packets in ByteBuffers for this file. You can use 'new AMFDataList(data)' to convert to AMF objects.

### Returns:

collection of metadata packets in ByteBuffers

---

## rewind

```
public void rewind()
```

rewind file to start

---

## close

```
public void close()
```

close file

---

## isOpen

```
public boolean isOpen()
```

is file open

### Returns:

is file open

---

## seek

```
public PlaylistSeekResult seek(long timecode,  
                                int seektype)
```

seek to timecode in file

### Parameters:

timecode - timecode (milliseconds) to seek to

seektype - seek type IMediaReader.SEEK\_\*

### Returns:

detailed results object of seek or null if failure

(continued from last page)

## writePackets

```
public int writePackets(IMediaStream stream,
    java.io.OutputStream out,
    AMFObj wmsObjAudio,
    AMFObj wmsObjVideo,
    AMFObj wmsObjData,
    PlaylistCursor flvCursor,
    PlaylistWriteControl control,
    PlaylistReaderWriteResults results,
    long[] sizes,
    FastPlaySettings fastPlaySettings,
    boolean isForceTCZero)
```

From current location in file write packets to output

### Parameters:

stream - parent mediaStream  
 out - output stream  
 wmsObjAudio - audio channel amfObj  
 wmsObjVideo - video channel amfObj  
 wmsObjData - data channel amfObj  
 flvCursor - current cursor that keeps track of timecodes and flags indicating position in media file  
 control - write control flags. Mainly used to control when it should stop writing  
 results - write results returned from this routine  
 sizes - array of values that keep track of number of bytes written and number of packets for each data type (audio, video, data). See IMediaStreamPlay.PLAYSIZES\_\*  
 fastPlaySettings - current fastPlay settings for the stream  
 isForceTCZero - are we forcing all timecodes to zero

### Returns:

number of bytes written

## writePackets

```
public int writePackets(java.util.List packetList,
    PlaylistCursor flvCursor,
    PlaylistWriteControl control,
    PlaylistReaderWriteResults results,
    long[] sizes,
    FastPlaySettings fastPlaySettings)
```

Write packets to the packetList as AMFPackets

### Parameters:

packetList - list to which to write packets  
 flvCursor - current cursor that keeps track of timecodes and flags indicating position in media file  
 control - write control flags. Mainly used to control when it should stop writing  
 results - write results returned from this routine  
 sizes - array of values that keep track of number of bytes written and number of packets for each data type (audio, video, data). See IMediaStreamPlay.PLAYSIZES\_\*  
 fastPlaySettings - current fastPlay settings for the stream

### Returns:

number of bytes written

(continued from last page)

## writeGeneratedKeyFrame

```
public int writeGeneratedKeyFrame(IMediaStream stream,
    java.io.OutputStream out,
    AMFObj wmsObjAudio,
    AMFObj wmsObjVideo,
    AMFObj wmsObjData,
    PlaylistCursor flvCursor,
    PlaylistWriteControl control,
    PlaylistReaderWriteResults results,
    long[] sizes,
    FastPlaySettings fastPlaySettings,
    boolean isForceTCZero)
```

From current location in file generate a key frame (enhanced seek) and write it to out

### Parameters:

stream - parent mediaStream  
 out - output stream  
 wmsObjAudio - audio channel amfObj  
 wmsObjVideo - video channel amfObj  
 wmsObjData - data channel amfObj  
 flvCursor - current cursor that keeps track of timecodes and flags indicating position in media file  
 control - write control flags. Mainly used to control when it should stop writing  
 results - write results returned from this routine  
 sizes - array of values that keep track of number of bytes written and number of packets for each data type (audio, video, data). See IMediaStreamPlay.PLAYSIZES\_\*  
 fastPlaySettings - current fastPlay settings for the stream  
 isForceTCZero - are we forcing all timecodes to zero

### Returns:

number of bytes written

## sendZeroLengthPacket

```
public int sendZeroLengthPacket(int type,
    int timecode,
    boolean isAbsolute,
    IMediaStream stream,
    java.io.OutputStream out,
    AMFObj wmsObj,
    PlaylistCursor flvCursor,
    PlaylistWriteControl control,
    PlaylistReaderWriteResults results,
    long[] sizes,
    boolean isForceTCZero)
```

## startPlayback

```
public void startPlayback()
```

Called each time the player being playback (before the buffer it filled)

## getDuration

```
public long getDuration()
```

Get duration or time (milliseconds) of the media file

### Returns:

(continued from last page)

duration or time (milliseconds) of the media file

---

## getLength

```
public long getLength()
```

Get the stream length in bytes

**Returns:**

stream length in bytes

---

## getPath

```
public String getPath()
```

Get abstract path to the media item

**Returns:**

abstract path to the media item

---

## getMediaExtension

```
public String getMediaExtension()
```

Get media extension

**Returns:**

media extension

---

## getStreamPosition

```
public IMediaReaderStreamPosition getStreamPosition()
```

Get a reference to the current stream position

**Returns:**

stream position

---

## setStreamPosition

```
public void setStreamPosition(IMediaReaderStreamPosition pos)
```

Set the file position within the media file

**Parameters:**

pos - stream position

---

## setProperty

```
public void setProperty(WMSProperties properties)
```

Set the properties for this media reader

**Parameters:**

properties - properties

## com.wowza.wms.stream Interface IMediaReaderActionNotify

All Known Implementing Classes:  
[MediaReaderActionNotifyBase](#)

public interface **IMediaReaderActionNotify**  
extends

IMediaReaderActionNotify: listener interface for IMediaReader actions: See  
IApplicationInstance.addMediaReaderListener(IMediaReaderActionNotify mediaReaderListener)

### Method Summary

void	<a href="#">onMediaReaderClose</a> ( <a href="#">IMediaReader</a> mediaReader, <a href="#">IMediaStream</a> stream) Called when media reader is closed
void	<a href="#">onMediaReaderCreate</a> ( <a href="#">IMediaReader</a> mediaReader) Called when media reader is created
void	<a href="#">onMediaReaderExtractMetaData</a> ( <a href="#">IMediaReader</a> mediaReader, <a href="#">IMediaStream</a> stream) Called after media reader metadata is extracted from the file
void	<a href="#">onMediaReaderInit</a> ( <a href="#">IMediaReader</a> mediaReader, <a href="#">IMediaStream</a> stream) Called after media reader is initialized
void	<a href="#">onMediaReaderOpen</a> ( <a href="#">IMediaReader</a> mediaReader, <a href="#">IMediaStream</a> stream) Called after media reader is opened

### Methods

#### onMediaReaderCreate

public void **onMediaReaderCreate**([IMediaReader](#) mediaReader)

Called when media reader is created

**Parameters:**

mediaReader - media reader

#### onMediaReaderInit

public void **onMediaReaderInit**([IMediaReader](#) mediaReader, [IMediaStream](#) stream)

Called after media reader is initialized

**Parameters:**

mediaReader - media reader

stream - stream

## onMediaReaderOpen

```
public void onMediaReaderOpen(IMediaReader mediaReader,  
    IMediaStream stream)
```

Called after media reader is opened

**Parameters:**

mediaReader - media reader  
stream - stream

---

## onMediaReaderExtractMetaData

```
public void onMediaReaderExtractMetaData(IMediaReader mediaReader,  
    IMediaStream stream)
```

Called after media reader metadata is extraced from the file

**Parameters:**

mediaReader - media reader  
stream - stream

---

## onMediaReaderClose

```
public void onMediaReaderClose(IMediaReader mediaReader,  
    IMediaStream stream)
```

Called when media reader is closed

**Parameters:**

mediaReader - media reader  
stream - stream

---

com.wowza.wms.stream  
Interface IMediaReaderEncInfo

public interface IMediaReaderEncInfo  
extends

Method Summary	
<a href="#">MediaReaderEncInfo</a>	<a href="#">getEncInfo()</a>

Methods

**getEncInfo**  
public [MediaReaderEncInfo](#) **getEncInfo()**

com.wowza.wms.stream

# Interface IMediaReaderStreamPosition

public interface **IMediaReaderStreamPosition**  
extends

IMediaReaderStreamPosition: Internal use

Method Summary	
boolean	<a href="#">isValid()</a>

## Methods

### isValid

public boolean **isValid()**

## com.wowza.wms.stream Interface IMediaStream

public interface **IMediaStream**  
extends

IMediaStream: public, generic interface to mediaStream object. Upon creation of a new mediaStream, the client connection's default streamType value will be used to dynamically create a mediaStream object based on the definitions available in the vHosts.mediaStreamMap. All mediaStream implementations implement this interface.

### Field Summary

public static final	<a href="#"><u>AUDIOSAMPLEACCESS</u></a> Value: <b>2</b>
public static final	<a href="#"><u>PACKET_COUNTS_AUDIO</u></a> Value: <b>0</b>
public static final	<a href="#"><u>PACKET_COUNTS_DATA</u></a> Value: <b>3</b>
public static final	<a href="#"><u>PACKET_COUNTS_SIZE</u></a> Value: <b>4</b>
public static final	<a href="#"><u>PACKET_COUNTS_VIDEO</u></a> Value: <b>1</b>
public static final	<a href="#"><u>PACKET_COUNTS_VIDEOKEY</u></a> Value: <b>2</b>
public static final	<a href="#"><u>PUBLISH_BITRATE_SOURCE_MEASURE</u></a> Value: <b>1</b>
public static final	<a href="#"><u>PUBLISH_BITRATE_SOURCE_METADATA</u></a> Value: <b>2</b>

public static final	<a href="#"><u>PUBLISH_FRAMERATE_SOURCE_METADATA</u></a> Value: <b>2</b>
public static final	<a href="#"><u>READACCESS</u></a> Value: <b>0</b>
public static final	<a href="#"><u>VIDEOSAMPLEACCESS</u></a> Value: <b>3</b>

public static final	<a href="#">WRITEACCESS</a> Value: <b>1</b>
---------------------	--

## Method Summary

void	<a href="#">addAudioCodecConfigPacket</a> (long timecode, <a href="#">AMFPacket</a> packet) Set audio codec configuration packet (needed for H.264/AAC playback)
void	<a href="#">addAudioData</a> (byte[] data, int offset, int size) Add data to current audio packet
void	<a href="#">addAudioExtraData</a> (java.util.Map extraData) Add extra data to the current audio packet
void	<a href="#">addCallbackListener</a> ( <a href="#">IMediaStreamCallback</a> callbackListener) Add a callback listener to listen for all stream metadata
void	<a href="#">addClientListener</a> ( <a href="#">IMediaStreamActionNotify</a> actionListener) Add client listener.
void	<a href="#">addClientListener</a> ( <a href="#">IMediaStreamActionNotify2</a> actionListener) Add client listener.
void	<a href="#">addClientListener</a> ( <a href="#">IMediaStreamActionNotify3</a> actionListener) Add client listener.
void	<a href="#">addDataData</a> (byte[] data, int offset, int size) Add data to current data packet
void	<a href="#">addDataExtraData</a> (java.util.Map extraData) Add extra data to the current data packet
void	<a href="#">addLivePacketListener</a> ( <a href="#">IMediaStreamLivePacketNotify</a> listener) Add a listener to receiver notification of new live AMF packets
void	<a href="#">addVideoCodecConfigPacket</a> (long timecode, <a href="#">AMFPacket</a> packet) Set video codec configuration packet (needed for H.264/AAC playback)
void	<a href="#">addVideoData</a> (byte[] data, int offset, int size) Add data to current video packet
void	<a href="#">addVideoExtraData</a> (java.util.Map extraData) Add extra data to the current video packet
void	<a href="#">addVideoH264SEIListener</a> ( <a href="#">IMediaStreamH264SEINotify</a> h264SEIListener) Add an H.264 SEI listener.
void	<a href="#">clear</a> () Delete media file pointed to by this mediaStream (be careful)
void	<a href="#">clearFastPlaySettings</a> () Clear fastPlay settings
void	<a href="#">clearLoggingValues</a> ()
void	<a href="#">close</a> () Close mediaStream

void	<a href="#"><u>flush()</u></a> Force publishing packets to be flushed from the input buffers to the output buffers
boolean[]	<a href="#"><u>getAccess(IClient client, String name)</u></a> Get the read/write access to this stream for this client
<a href="#"><u>AMFPacket</u></a>	<a href="#"><u>getAudioCodecConfigPacket(long timecode)</u></a> Get audio codec configuration packet (needed for H.264/AAC playback)
int	<a href="#"><u>getAudioMissing()</u></a> Get number of audio bytes missing from current audio packet
int	<a href="#"><u>getAudioSize()</u></a> Get the size of the current audio packet that is being streamed from the client to the server
long	<a href="#"><u>getAudioTC()</u></a> Get last absolute audio timecode (milliseconds) sent to mediaStream
int	<a href="#"><u>getBufferTime()</u></a> Get buffer time for mediaStream (milliseconds)
byte[]	<a href="#"><u>getBurstStartStop(boolean isStart)</u></a> Get the dynamic streaming burst start/stop AMF packet
String	<a href="#"><u>getCacheName()</u></a> not used
<a href="#"><u>IClient</u></a>	<a href="#"><u>getClient()</u></a> Get parent client connection
int	<a href="#"><u>getClientId()</u></a> Get parent client connection (id)
String	<a href="#"><u>getContextStr()</u></a> Returns the stream context string in the form [application]/[appInstance]/[streamName].
int	<a href="#"><u>getDataMissing()</u></a> Get number of data bytes missing from current data packet
int	<a href="#"><u>getDataSize()</u></a> Get the size of the current data packet that is being streamed from the client to the server
long	<a href="#"><u>getDataTC()</u></a> Get last absolute data timecode (milliseconds) sent to mediaStream
int	<a href="#"><u>getDataType()</u></a> Get the data packet type: IVHost.CONTENTTYPE_DATA0 or IVHost.CONTENTTYPE_DATA3)
String	<a href="#"><u>getDvrRecorder()</u></a> Get the DVR Recorder for this stream
<a href="#"><u>ILiveStreamDvrRecorder</u></a>	<a href="#"><u>getDvrRecorder(String name)</u></a> Get the DVR Recorder interface to a stream by name
String	<a href="#"><u>getDvrRecorderList()</u></a> Get the comma separated list of DVR Recorder names being used by this stream (see conf/Dvr.xml)

String	<a href="#"><u>getDvrRepeater()</u></a> Get the DVR repeater name for this stream
<a href="#"><u>ElapsedTimer</u></a>	<a href="#"><u>getElapsedTime()</u></a> Get the interface to the elapse timer
String	<a href="#"><u>getExt()</u></a> Get media file extension
FastPlaySettings	<a href="#"><u>getFastPlaySettings()</u></a> Get current fastPlay settings
int	<a href="#"><u>getHeaderSize()</u></a> Get the last packet header size (debugging)
<a href="#"><u>IHTTPStreamerSession</u></a>	<a href="#"><u>getHTTPStreamerSession()</u></a> Get the HTTPStreamer session associated with this stream
boolean	<a href="#"><u>getIsWebRTC()</u></a>
<a href="#"><u>AMFPacket</u></a>	<a href="#"><u>getLastKeyFrame()</u></a> Get most recent video key frame
<a href="#"><u>AMFPacket</u></a>	<a href="#"><u>getLastPacket()</u></a> Get most recent live packet
String	<a href="#"><u>getLiveStreamPacketizer()</u></a> Get the live stream packetizer that this stream is using
<a href="#"><u>ILiveStreamPacketizer</u></a>	<a href="#"><u>getLiveStreamPacketizer(String name)</u></a> Get the LiveStreamPacketizer interface to a stream by name
String	<a href="#"><u>getLiveStreamPacketizerList()</u></a> Get the comma separated list of LiveStreamPacketizers names being used by this stream (see conf/LiveStreamPacketizers.xml)
String	<a href="#"><u>getLiveStreamRepeater()</u></a> Get the live stream repeater name for the stream
<a href="#"><u>ILiveStreamTranscoder</u></a>	<a href="#"><u>getLiveStreamTranscoder(String name)</u></a> Get a live stream transcoder for this stream by name
String	<a href="#"><u>getLiveStreamTranscoderList()</u></a> Get the comma separated list of LiveStreamTranscoders names being used by this stream (see conf/LiveStreamTranscoders.xml)
java.util.Map	<a href="#"><u>getLiveStreamTranscoders()</u></a> Get the list of transcoders for this stream.
long	<a href="#"><u>getMaxTimecode()</u></a> Get the timecode of the latest received packet
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getMediaIOPerformance()</u></a> Get IO performance counter
<a href="#"><u>IMediaStreamMetaDataProvider</u></a>	<a href="#"><u>getMetaDataProvider()</u></a> Get the metaData provider

String	<a href="#"><u>getName()</u></a> Get stream name
<a href="#"><u>INetConnection</u></a>	<a href="#"><u>getNetConnection()</u></a> Get parent netConnection (future server to server communication)
<a href="#"><u>IMediaStreamPlay</u></a>	<a href="#"><u>getPlayer()</u></a> Get underlying player (IMediaStreamPlay) object
java.util.List	<a href="#"><u>getPlayPackets()</u></a> Get all available live packets
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get mediaStream properties
int	<a href="#"><u>getPublishAudioCodecId()</u></a> Get the codec id of the most recently published audio packet
int	<a href="#"><u>getPublishBitrateAudio()</u></a> Get the audio bitrate of an incoming live published stream (bits per second).
int	<a href="#"><u>getPublishBitrateAudio(int source)</u></a> Get the audio bitrate of an incoming live published stream (bits per second).
int	<a href="#"><u>getPublishBitrateVideo()</u></a> Get the video bitrate of an incoming live published stream (bits per second).
int	<a href="#"><u>getPublishBitrateVideo(int source)</u></a> Get the video bitrate of an incoming live published stream (bits per second).
long	<a href="#"><u>getPublishFrameCountAudio()</u></a> Get the total number of audio frames received for an incoming live stream.
long	<a href="#"><u>getPublishFrameCountData()</u></a> Get the total number of data frames received for an incoming live stream.
long	<a href="#"><u>getPublishFrameCounts(long[] counts)</u></a> Get the total number of frames received for an incoming live stream.
long	<a href="#"><u>getPublishFrameCountVideo()</u></a> Get the total number of video frames received for an incoming live stream.
long	<a href="#"><u>getPublishFrameCountVideoKey()</u></a> Get the total number of video key frames received for an incoming live stream.
double	<a href="#"><u>getPublishFramerateVideo()</u></a> Get the video framerate of an incoming live published stream (frames per second).
double	<a href="#"><u>getPublishFramerateVideo(int source)</u></a> Get the video framerate of an incoming live published stream (frames per second).
int[]	<a href="#"><u>getPublishKeyFrameIntervalsVideo()</u></a> Get the last n key frame intervals for an incoming publish stream (frames per GOP), Most recent GOPs are first in the list.
int	<a href="#"><u>getPublishVideoCodecId()</u></a> Get the codec id of the most recently published video packet
String	<a href="#"><u>getQueryStr()</u></a> Get play/publish name query string.

int	<a href="#"><u>getReceiveVideoFPS()</u></a> Set frame per seconds for video (not currently implemented)
<a href="#"><u>AMFObj</u></a>	<a href="#"><u>getRespAMFAudioObj()</u></a> Get audio response channel object
<a href="#"><u>AMFObj</u></a>	<a href="#"><u>getRespAMFDataObj()</u></a> Get data response channel object
<a href="#"><u>AMFObj</u></a>	<a href="#"><u>getRespAMFVideoObj()</u></a> Get video response channel object
<a href="#"><u>RTPStream</u></a>	<a href="#"><u>getRTPStream()</u></a> Get the RTP based stream this stream is associated with
int	<a href="#"><u>getSrc()</u></a> Get the stream id
java.io.File	<a href="#"><u>getStreamFileForRead()</u></a> Get the File object to read from a stream (get stream name, ext and query from stream object)
java.io.File	<a href="#"><u>getStreamFileForRead(String name, String ext, String query)</u></a> Get the File object to read from a stream (specify name, ext and query)
java.io.File	<a href="#"><u>getStreamFileForWrite()</u></a> Get the File object to write to a stream (get stream name, ext and query from stream object)
java.io.File	<a href="#"><u>getStreamFileForWrite(String name, String ext, String query)</u></a> Get the File object to write to a stream (specify name, ext and query)
<a href="#"><u>MediaStreamMap</u></a>	<a href="#"><u>getStreams()</u></a> Get parent mediaStreamMap (owned by applicationInstance)
String	<a href="#"><u>getStreamType()</u></a> Get mediaStream streamType
com.wowza.wms.transcoder.encoder.Transcode rEncoderStreamInfo	<a href="#"><u>getTranscoderEncoderStreamInfo()</u></a> Get the transcoder encoder context information for this stream.
String	<a href="#"><u>getUniqueStreamIdStr()</u></a> Get a string that uniquely identifies this stream
<a href="#"><u>AMFPacket</u></a>	<a href="#"><u>getVideoCodecConfigPacket(long timecode)</u></a> Get video codec configuration packet (needed for H.264/AAC playback)
int	<a href="#"><u>getVideoMissing()</u></a> Get number of video bytes missing from current video packet
int	<a href="#"><u>getVideoSize()</u></a> Get the size of the current video packet that is being streamed from the client to the server
long	<a href="#"><u>getVideoTC()</u></a> Get last absolute video timecode (milliseconds) sent to mediaStream
void	<a href="#"><u>handleCallback</u></a> (com.wowza.wms.request.RequestFunction function) Routes request function to callback handler onStatus, onPlayStatus or [method/handler]
boolean	<a href="#"><u>idle()</u></a> Allow the mediaStream to perform idle work (not currently in use)

long	<a href="#"><u>incrementMediaInBytes</u></a> (long increment) Increment the number of mediaStream bytes received
long	<a href="#"><u>incrementMediaLossBytes</u></a> (long bytes, long count) Increment the number of mediaStream loss bytes sent and number of packets sent
long	<a href="#"><u>incrementMediaOutBytes</u></a> (long bytes, long count) Increment the number of mediaStream bytes sent and number of packets sent
void	<a href="#"><u>init</u></a> ( <a href="#"><u>MediaStreamMap</u></a> parent, int src, <a href="#"><u>WMSProperties</u></a> properties) Initialize the mediaStream object after creation.
void	<a href="#"><u>initLiveStreamRepeating</u></a> (String liveStreamPacketizer, String liveStreamRepeater) Initialize this stream for live stream repeating
boolean	<a href="#"><u>isAppend</u></a> ( ) Is append to media file (only valid if isRecord)
boolean	<a href="#"><u>isClustered</u></a> ( ) not used
boolean	<a href="#"><u>isMediaCasterPlay</u></a> ( ) Is MediaCaster play enabled (if true, will trigger MediaCaster startup)
boolean	<a href="#"><u>isMergeOnMetadata</u></a> ( ) If true, merge incoming onMetadata events with the current onMetadata event data.
boolean	<a href="#"><u>isOpen</u></a> ( ) Is mediaStream open
boolean	<a href="#"><u>isPlay</u></a> ( ) Is the stream a play stream (vs a publish stream)
boolean	<a href="#"><u>isPlaying</u></a> ( ) Is mediaStream playing (or paused - false)
boolean	<a href="#"><u>isPublisherStream</u></a> ( ) Returns true if stream was created by stream publisher API.
boolean	<a href="#"><u>isPublishStreamReady</u></a> (boolean checkAudio, boolean checkVideo) Returns true if the publishing stream contains enough video/audio data to start playback
boolean	<a href="#"><u>isReceiveAudio</u></a> ( ) Is client currently receiving audio.
boolean	<a href="#"><u>isReceiveVideo</u></a> ( ) Is client currently receiving video.
boolean	<a href="#"><u>isRecord</u></a> ( ) Is set to true if second parameter of NetStream.publish is "record"
boolean	<a href="#"><u>isSendPlayStopLogEvent</u></a> ( ) Get need to send a log event for stop
boolean	<a href="#"><u>isSendPublishStopLogEvent</u></a> ( ) Get need to send a log event for publishing
boolean	<a href="#"><u>isSendRecordStopLogEvent</u></a> ( ) Get need to send a log event for recording

boolean	<a href="#"><u>isTranscoderEncoderStreamRoot()</u></a> True if this stream object is a transcoder encoder stream root.
boolean	<a href="#"><u>isTranscodeResult()</u></a> Is this stream the result of a transcode operation.
boolean	<a href="#"><u>isVideoH264SEIListenerEmpty()</u></a> Is H.264 SEI listener list empty.
double	<a href="#"><u>length()</u></a> Get length/duration (seconds) of media file pointed to by mediaStream
void	<a href="#"><u>notifyActionOnCodecInfoAudio()</u></a> (com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio) Notify client listeners of audio codec information change
void	<a href="#"><u>notifyActionOnCodecInfoVideo()</u></a> (com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo) Notify client listeners of video codec information change
void	<a href="#"><u>notifyActionOnMetaData()</u></a> ( <a href="#"><u>AMFPacket</u></a> metaDataPacket) Notify client listeners of onMetaData change
void	<a href="#"><u>notifyActionPause()</u></a> (boolean isPause, long location) Notify client listeners of pause action
void	<a href="#"><u>notifyActionPauseRaw()</u></a> (boolean isPause, long location) Notify client listeners of pauseRaw action
void	<a href="#"><u>notifyActionPlay()</u></a> (String streamName, double playStart, double playLen, int playReset) Notify client listeners of play action
void	<a href="#"><u>notifyActionPublish()</u></a> (String streamName, boolean isRecord, boolean isAppend) Notify client listeners of publish action
void	<a href="#"><u>notifyActionSeek()</u></a> (double location) Notify client listeners of seek action
void	<a href="#"><u>notifyActionStop()</u></a> Notify client listeners of stop action
void	<a href="#"><u>notifyActionUnPublish()</u></a> (String streamName, boolean isRecord, boolean isAppend) Notify client listeners of unpublish action
void	<a href="#"><u>notifyLivePacket()</u></a> ( <a href="#"><u>AMFPacket</u></a> packet) Notify new live AMF packet
void	<a href="#"><u>notifyVideoH264Packet()</u></a> ( <a href="#"><u>AMFPacket</u></a> packet, com.wowza.wms.media.h264.H264SEIMessages seiMessages) Notify H.264 SEI listener.
void	<a href="#"><u>packetComplete()</u></a> Invoked by requestAdapter when at the end of a set of packets
void	<a href="#"><u>publish()</u></a> Publish mediaStream

void	<a href="#"><u>putDvrRecorder</u></a> (String name, <a href="#"><u>ILiveStreamDvrRecorder</u></a> dvr) Add a live stream dvr to this stream
void	<a href="#"><u>putLiveStreamTranscoder</u></a> (String name, <a href="#"><u>ILiveStreamTranscoder</u></a> liveStreamTranscoder) Add a live stream transcoder to this stream
void	<a href="#"><u>registerCallback</u></a> (String handlerName, <a href="#"><u>IMediaStreamCallback</u></a> callback) Register a callback handler
void	<a href="#"><u>registerOnPlayStatus</u></a> ( <a href="#"><u>IMediaStreamCallback</u></a> callback) Register onPlayStatus handler
void	<a href="#"><u>registerOnStatus</u></a> ( <a href="#"><u>IMediaStreamCallback</u></a> callback) Register onStatus handler
void	<a href="#"><u>removeCalbackListener</u></a> ( <a href="#"><u>IMediaStreamCallback</u></a> callbackListener) Remove a callback listener to listen for all stream metadata
void	<a href="#"><u>removeClientListener</u></a> ( <a href="#"><u>IMediaStreamActionNotify</u></a> actionListener) Remove client listener.
void	<a href="#"><u>removeClientListener</u></a> ( <a href="#"><u>IMediaStreamActionNotify2</u></a> actionListener) Remove client listener.
void	<a href="#"><u>removeClientListener</u></a> ( <a href="#"><u>IMediaStreamActionNotify3</u></a> actionListener) Remove client listener.
<a href="#"><u>ILiveStreamDvrRecorder</u></a>	<a href="#"><u>removeDvrRecorder</u></a> (String name) Remove a live stream dvr by name
void	<a href="#"><u>removeLivePacketListener</u></a> ( <a href="#"><u>IMediaStreamLivePacketNotify</u></a> listener) Remove a listener to receiver notification of new live AMF packets
<a href="#"><u>ILiveStreamTranscoder</u></a>	<a href="#"><u>removeLiveStreamTranscoder</u></a> (String name) Remove a live stream transcoder by name
void	<a href="#"><u>removeVideoH264SEIListener</u></a> ( <a href="#"><u>IMediaStreamH264SEINotify</u></a> h264SEIListener) Remove an H.264 SEI listener.
void	<a href="#"><u>send</u></a> (String handlerName) Call client side NetStream method/handler with no parameters
void	<a href="#"><u>send</u></a> (String handlerName, Object[] params) Call client side NetStream method/handler
void	<a href="#"><u>sendAMF3</u></a> (String handlerName) Call client side NetStream method/handler with no parameters.
void	<a href="#"><u>sendAMF3</u></a> (String handlerName, Object[] params) Call client side NetStream method/handler.
int	<a href="#"><u>sendControlBytes</u></a> (int controlType, java.io.OutputStream out) Send playback control bytes.
void	<a href="#"><u>sendDirect</u></a> (String handlerName) Call client side NetStream method/handler and send event to underlying stream (will record event)

void	<a href="#"><code>sendDirect</code></a> (String handlerName, Object[] params) Call client side NetStream method/handler and send event to underlying stream (will record event)
void	<a href="#"><code>sendDirectAMF3</code></a> (String handlerName) Call client side NetStream method/handler and send event to underlying stream (will record event).
void	<a href="#"><code>sendDirectAMF3</code></a> (String handlerName, Object[] params) Call client side NetStream method/handler and send event to underlying stream (will record event).
int	<a href="#"><code>sendLivePlaySeek</code></a> (java.io.OutputStream out, String name, long timecode) Send onStatus(NetStream.Seek.Notify) event
int	<a href="#"><code>sendLivePlayStart</code></a> (java.io.OutputStream out, String name, long timecode, long timecodeOffset) Send onStatus(NetStream.Play.Start) event
int	<a href="#"><code>sendLivePlaySwitch</code></a> (java.io.OutputStream out, String name, long timecode) Send onStatus(NetStream.Play.Transition) event
int	<a href="#"><code>sendPauseNotify</code></a> (long timecode, String name) Send onStatus(NetStream.Pause.Notify) event
int	<a href="#"><code>sendPauseNotify</code></a> (java.io.OutputStream out, long timecode, String name) Send onStatus(NetStream.Pause.Notify) event.
int	<a href="#"><code>sendPlayReset</code></a> (java.io.OutputStream out, String name) Send onStatus(NetStream.Play.Reset) event.
int	<a href="#"><code>sendPlayReset</code></a> (String name) Send onStatus(NetStream.Play.Reset) event
int	<a href="#"><code>sendPlaySeek</code></a> (long location, long seekLocation, String name) Send onStatus(NetStream.Seek.Notify) event.
int	<a href="#"><code>sendPlaySeek</code></a> (java.io.OutputStream out, long location, long seekLocation, String name) Send onStatus(NetStream.Seek.Notify) event.
int	<a href="#"><code>sendPlaySeek</code></a> (java.io.OutputStream out, long location, long seekLocation, String name, java.util.List seekTypes) Send onStatus(NetStream.Seek.Notify) event.
int	<a href="#"><code>sendPlayStart</code></a> (java.io.OutputStream out, String name, boolean isSwitch, boolean isLive, long timecode, java.util.List seekTypes) Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch).
int	<a href="#"><code>sendPlayStart</code></a> (java.io.OutputStream out, String name, boolean isSwitch, long timecode) Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch).
int	<a href="#"><code>sendPlayStart</code></a> (java.io.OutputStream out, String name, boolean isSwitch, long timecode, java.util.List seekTypes) Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch).

int	<a href="#"><code>sendPlayStart</code></a> (String name, long timecode) Send onStatus(NetStream.Play.Start) event
int	<a href="#"><code>sendPlayStatus</code></a> (long timecode, int statusType, double duration, double bytesSent) Send onPlayStatus(NetStream.Play.Switch, NetStream.Play.Complete, NetStream.Play.Stop) event
int	<a href="#"><code>sendPlayStatus</code></a> (java.io.OutputStream out, long timecode, int statusType, double duration, double bytesSent) Send onPlayStatus(NetStream.Play.Switch, NetStream.Play.Complete, NetStream.Play.Stop) event.
int	<a href="#"><code>sendPlayStop</code></a> (long location, String name) Send onStatus(NetStream.Play.Stop) event
int	<a href="#"><code>sendPlayStop</code></a> (java.io.OutputStream out, long location, String name) Send onStatus(NetStream.Play.Stop) event.
int	<a href="#"><code>sendPlaySwitch</code></a> (java.io.OutputStream out, String name, boolean isSwitch, long timecode) Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch).
int	<a href="#"><code>sendPlaySwitch</code></a> (String name, long timecode) Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch).
int	<a href="#"><code>sendStreamNotFound</code></a> (java.io.OutputStream out, String name) Send onStatus(NetStream.Play.StreamNotFound) event.
int	<a href="#"><code>sendStreamNotFound</code></a> (String name) Send onStatus(NetStream.Play.StreamNotFound) event
int	<a href="#"><code>sendUnpauseNotify</code></a> (long location, String name) Send onStatus(NetStream.Unpause.Notify) event
int	<a href="#"><code>sendUnpauseNotify</code></a> (java.io.OutputStream out, long location, String name) Send onStatus(NetStream.Unpause.Notify) event.
int	<a href="#"><code>sendUnpauseNotify</code></a> (java.io.OutputStream out, long location, String name, java.util.List seekTypes) Send onStatus(NetStream.Unpause.Notify) event
int	<a href="#"><code>sendVODPlaySwitch</code></a> (java.io.OutputStream out, String name, long timecode) Send onStatus(NetStream.Play.Transition) event
void	<a href="#"><code>setAppend</code></a> (boolean isAppend) Set is append to media file (only valid if isRecord)
void	<a href="#"><code>setAudioSize</code></a> (int audioSize) Set the size of the current audio packet that is being streamed from the client to the server
void	<a href="#"><code>setAudioTC</code></a> (long audioTC) Set last absolute audio timecode (milliseconds) sent to mediaStream
void	<a href="#"><code>setAudioTC</code></a> (long audioTC, boolean isAbsolute) Set last absolute audio timecode (milliseconds) sent to mediaStream
void	<a href="#"><code>setBufferTime</code></a> (int bufferTime) Set buffer time for mediaStream (milliseconds)

void	<a href="#"><u>setClient</u></a> ( <a href="#"><u>IClient</u></a> client) Set parent client connection
void	<a href="#"><u>setClustered</u></a> (boolean isClustered) not used
void	<a href="#"><u>setDataSize</u></a> (int dataSize) Set the size of the current data packet that is being streamed from the client to the server
void	<a href="#"><u>setDataTC</u></a> (long dataTC) Set last absolute data timecode (milliseconds) sent to mediaStream
void	<a href="#"><u>setDataTC</u></a> (long dataTC, boolean isAbsolute) Set last absolute data timecode (milliseconds) sent to mediaStream
void	<a href="#"><u>setDataType</u></a> (int dataType) Set the data packet type: (IVHost.CONTENTTYPE_DATA0 or IVHost.CONTENTTYPE_DATA3)
void	<a href="#"><u>setDvrRecorder</u></a> (String recorderName) Set the DVR Recorder that this stream is using
void	<a href="#"><u>setDvrRecorderList</u></a> (String recorderList) Set the comma separated list of DVR Recorder names being used by this stream (see conf/Dvr.xml)
void	<a href="#"><u>setExt</u></a> (String ext) Set media file extension
void	<a href="#"><u>setFastPlaySettings</u></a> (FastPlaySettings fastPlaySettings) Set fastPlay settings
void	<a href="#"><u>setHeaderSize</u></a> (int headerSize) Set the last packet header size (debugging)
void	<a href="#"><u>setHTTPStreamerSession</u></a> ( <a href="#"><u>IHTTPStreamerSession</u></a> httpStreamerSession) Set the HTTPStreamer session associated with this stream
void	<a href="#"><u>setIsPlaying</u></a> (boolean isPlaying) Set is mediaStream playing
void	<a href="#"><u>setIsWebRTC</u></a> (boolean isWebRTC)
void	<a href="#"><u>setLiveStreamPacketizer</u></a> (String liveStreamPacketizer) Set the live stream packetizer that this stream is using
void	<a href="#"><u>setLiveStreamPacketizerList</u></a> (String liveStreamPacketizerList) Set the comma separated list of LiveStreamPacketizers names being used by this stream (see conf/LiveStreamPacketizers.xml)
void	<a href="#"><u>setLiveStreamRepeater</u></a> (String liveStreamRepeater) Set the live stream repeater name for the stream
void	<a href="#"><u>setLiveStreamTranscoderList</u></a> (String liveStreamTranscoderList) Set the comma separated list of LiveStreamTranscoders names being used by this stream (see conf/LiveStreamTranscoders.xml)
void	<a href="#"><u>setMediaCasterPlay</u></a> (boolean isMediaCasterPlay) Is MediaCaster play enabled (if true, will trigger MediaCaster startup)

void	<a href="#"><u>setMergeOnMetadata</u></a> (boolean mergeOnMetadata) If true, merge incoming onMetadata events with the current onMetadata event data.
void	<a href="#"><u>setMetaDataProvider</u></a> ( <a href="#"><u>IMediaStreamMetaDataProvider</u></a> metaDataProvider) Set the metaData provider
void	<a href="#"><u>setName</u></a> (String name) Set stream name
void	<a href="#"><u>setName</u></a> (String name, String ext) Set stream name and extension.
void	<a href="#"><u>setName</u></a> (String name, String oldName, String ext, String queryStr, double playStart, double playLen, int playTransition) Set stream name, extension, query string, play start, play len and play reset from play command.
void	<a href="#"><u>setNetConnection</u></a> ( <a href="#"><u>INetConnection</u></a> netConnection) Set parent netConnection (future server to server communication)
void	<a href="#"><u>setOpen</u></a> (boolean isOpen) Set mediaStream open
void	<a href="#"><u>setPlay</u></a> (boolean isPlay) Set is the stream a play stream (vs a publish stream)
void	<a href="#"><u>setPlayer</u></a> ( <a href="#"><u>IMediaStreamPlay</u></a> player) Set underlying player (IMediaStreamPlay) object
void	<a href="#"><u>setPublishAudioCodecId</u></a> (int publishAudioCodecId) Set the codec id of the most recently published audio packet
void	<a href="#"><u>setPublisherStream</u></a> (boolean isPublisherStream) Set stream was created by stream publisher.
void	<a href="#"><u>setPublishVideoCodecId</u></a> (int publishVideoCodecId) Set the codec id of the most recently published video packet
void	<a href="#"><u>setQueryStr</u></a> (String queryStr) Set play/publish name query string.
void	<a href="#"><u>setReceiveAudio</u></a> (boolean receiveAudio) Set receive audio
void	<a href="#"><u>setReceiveVideo</u></a> (boolean receiveVideo) Set receive video
void	<a href="#"><u>setReceiveVideoFPS</u></a> (int receiveVideoFPS) Set frame per second for video (not currently implemented)
void	<a href="#"><u>setRecord</u></a> (boolean isRecord) Set to true if second parameter of NetStream.publish is "record"
void	<a href="#"><u>setRTPStream</u></a> ( <a href="#"><u>RTPStream</u></a> rtpStream) Set the RTP based stream this stream is associated with
void	<a href="#"><u>setSendPlayStopLogEvent</u></a> (boolean sendPlayStopLogEvent) Set need to send a log event for stop
void	<a href="#"><u>setSendPublishStopLogEvent</u></a> (boolean sendPlayStopLogEvent) Set need to send a log event for publishing

void	<a href="#"><u>setSendRecordStopLogEvent</u></a> (boolean sendPlayStopLogEvent) Set need to send a log event for recording
void	<a href="#"><u>setSrc</u></a> (int src) Set stream id
void	<a href="#"><u>setStreamType</u></a> (String streamType) Set mediaStream streamType.
void	<a href="#"><u>setTranscoderEncoderStreamInfo</u></a> (com.wowza.wms.transcoder.encoder.TranscoderEncoderStreamInfo transcoderEncoderStreamInfo) Set the transcoder encoder context information for this stream.
void	<a href="#"><u>setTranscodeResult</u></a> (boolean isTranscodeResult) Is this stream the result of a transcode operation.
void	<a href="#"><u>setVideoSize</u></a> (int videoSize) Set the size of the current video packet that is being streamed from the client to the server
void	<a href="#"><u>setVideoTC</u></a> (long videoTC) Set last absolute video timecode (milliseconds) sent to mediaStream
void	<a href="#"><u>setVideoTC</u></a> (long videoTC, boolean isAbsolute) Set last absolute video timecode (milliseconds) sent to mediaStream
void	<a href="#"><u>shutdown</u></a> () shutdown or close this mediaStream
long	<a href="#"><u>size</u></a> () Get size (bytes) of media file pointed to by mediaStream
void	<a href="#"><u>startAudioPacket</u></a> () Called when an audio packet is first being populated with data
void	<a href="#"><u>startDataPacket</u></a> () Called when a data packet is first being populated with data
void	<a href="#"><u>startPublishing</u></a> () Start publishing live stream
void	<a href="#"><u>startVideoPacket</u></a> () Called when a video packet is first being populated with data
void	<a href="#"><u>stopName</u></a> (String name, String oldName, String ext, String queryStr, double playStart, double playLen, int playTransition) Stop stream name
void	<a href="#"><u>stopPublishing</u></a> () Stop publishing live stream
void	<a href="#"><u>switchName</u></a> (String name, String oldName, String ext, String queryStr, double playStart, double playLen, int playTransition) Switch to stream name
void	<a href="#"><u>trim</u></a> () Trim mediaStream.
void	<a href="#"><u>unregisterCallback</u></a> (String handlerName) Unregister a callback handler

void	<a href="#">unregisterOnPlayStatus</a> ( <a href="#">IMediaStreamCallback</a> callback) Unregister onPlayStatus handler
void	<a href="#">unregisterOnStatus</a> ( <a href="#">IMediaStreamCallback</a> callback) Unregister onStatus handler
void	<a href="#">updateLoggingDuration</a> () Update logging.MDC with mediaStream logging information
void	<a href="#">updateLoggingValues</a> () Update logging.MDC with mediaStream logging information

## Fields

### READACCESS

```
public static final int READACCESS
```

Constant value: **0**

### WRITEACCESS

```
public static final int WRITEACCESS
```

Constant value: **1**

### AUDIOSAMPLEACCESS

```
public static final int AUDIOSAMPLEACCESS
```

Constant value: **2**

### VIDEOSAMPLEACCESS

```
public static final int VIDEOSAMPLEACCESS
```

Constant value: **3**

### PUBLISH\_BITRATE\_SOURCE\_MEASURE

```
public static final int PUBLISH_BITRATE_SOURCE_MEASURE
```

Constant value: **1**

### PUBLISH\_BITRATE\_SOURCE\_METADATA

```
public static final int PUBLISH_BITRATE_SOURCE_METADATA
```

Constant value: **2**

(continued from last page)

---

## PUBLISH\_FRAMERATE\_SOURCE\_MEASURE

```
public static final int PUBLISH_FRAMERATE_SOURCE_MEASURE
```

Constant value: **1**

---

## PUBLISH\_FRAMERATE\_SOURCE\_METADATA

```
public static final int PUBLISH_FRAMERATE_SOURCE_METADATA
```

Constant value: **2**

---

## PACKET\_COUNTS\_AUDIO

```
public static final int PACKET_COUNTS_AUDIO
```

Constant value: **0**

---

## PACKET\_COUNTS\_VIDEO

```
public static final int PACKET_COUNTS_VIDEO
```

Constant value: **1**

---

## PACKET\_COUNTS\_VIDEOKEY

```
public static final int PACKET_COUNTS_VIDEOKEY
```

Constant value: **2**

---

## PACKET\_COUNTS\_DATA

```
public static final int PACKET_COUNTS_DATA
```

Constant value: **3**

---

## PACKET\_COUNTS\_SIZE

```
public static final int PACKET_COUNTS_SIZE
```

Constant value: **4**

## Methods

### init

```
public void init(MediaStreamMap parent,  
                int src,  
                WMSProperties properties)
```

Initialize the mediaStream object after creation. Creation and initialization are separated due to the order of the creation events.

**Parameters:**

(continued from last page)

parent - parent mediaStreamMap of the parent applicationInstance

src - stream id for this stream

properties - initial properties as defined in Streams.xml

---

## getBufferTime

```
public int getBufferTime()
```

Get buffer time for mediaStream (milliseconds)

**Returns:**

buffer time (milliseconds)

---

## setBufferTime

```
public void setBufferTime(int bufferTime)
```

Set buffer time for mediaStream (milliseconds)

**Parameters:**

bufferTime - buffer time (milliseconds)

---

## isPlaying

```
public boolean isPlaying()
```

Is mediaStream playing (or paused - false)

**Returns:**

is playing

---

## setIsPlaying

```
public void setIsPlaying(boolean isPlaying)
```

Set is mediaStream playing

**Parameters:**

isPlaying

---

## getAudioSize

```
public int getAudioSize()
```

Get the size of the current audio packet that is being streamed from the client to the server

**Returns:**

size

---

## getVideoSize

```
public int getVideoSize()
```

Get the size of the current video packet that is being streamed from the client to the server

**Returns:**

size

---

---

## getDataSize

```
public int getDataSize()
```

Get the size of the current data packet that is being streamed from the client to the server

**Returns:**  
size

---

## setAudioSize

```
public void setAudioSize(int audioSize)
```

Set the size of the current audio packet that is being streamed from the client to the server

**Parameters:**  
audioSize

---

## setVideoSize

```
public void setVideoSize(int videoSize)
```

Set the size of the current video packet that is being streamed from the client to the server

**Parameters:**  
videoSize

---

## setDataSize

```
public void setDataSize(int dataSize)
```

Set the size of the current data packet that is being streamed from the client to the server

**Parameters:**  
dataSize

---

## addAudioExtraData

```
public void addAudioExtraData(java.util.Map extraData)
```

Add extra data to the current audio packet

**Parameters:**  
extraData - extra data

---

## addVideoExtraData

```
public void addVideoExtraData(java.util.Map extraData)
```

Add extra data to the current video packet

**Parameters:**  
extraData - extra data

---

## addDataExtraData

```
public void addDataExtraData(java.util.Map extraData)
```

---

(continued from last page)

Add extra data to the current data packet

**Parameters:**

extraData - extra data

---

## getSrc

```
public int getSrc()
```

Get the stream id

**Returns:**

stream id

---

## setSrc

```
public void setSrc(int src)
```

Set stream id

**Parameters:**

src - stream id

---

## getName

```
public String getName()
```

Get stream name

**Returns:**

stream name

---

## setName

```
public void setName(String name)
```

Set stream name

**Parameters:**

name - stream name

---

## setName

```
public void setName(String name,  
String ext)
```

Set stream name and extension. Example: if play command sent flv:test name=test, ext=flv.

**Parameters:**

name - stream name

ext - stream extension

(continued from last page)

## setName

```
public void setName(String name,  
    String oldName,  
    String ext,  
    String queryStr,  
    double playStart,  
    double playLen,  
    int playTransition)
```

Set stream name, extension, query string, play start, play len and play reset from play command.

### Parameters:

name - stream name  
oldName - old stream name  
ext - stream extension  
queryStr - query string  
playStart - play start  
playLen - play len  
playTransition - play transition (see MediaBase.PLAYTRANSITION\_\*)

---

## switchName

```
public void switchName(String name,  
    String oldName,  
    String ext,  
    String queryStr,  
    double playStart,  
    double playLen,  
    int playTransition)
```

Switch to stream name

### Parameters:

name - stream name  
oldName - old stream name  
ext - stream extension  
queryStr - query string  
playStart - play start  
playLen - play len  
playTransition - play transition (see MediaBase.PLAYTRANSITION\_\*)

---

## stopName

```
public void stopName(String name,  
    String oldName,  
    String ext,  
    String queryStr,  
    double playStart,  
    double playLen,  
    int playTransition)
```

Stop stream name

### Parameters:

name - stream name  
oldName - old stream name  
ext - stream extension  
queryStr - query string  
playStart - play start  
playLen - play len  
playTransition - play transition (see MediaBase.PLAYTRANSITION\_\*)

## shutdown

```
public void shutdown()
```

shutdown or close this mediaStream

---

## getAudioTC

```
public long getAudioTC()
```

Get last absolute audio timecode (milliseconds) sent to mediaStream

**Returns:**

last absolute audio timecode (milliseconds)

---

## setAudioTC

```
public void setAudioTC(long audioTC,  
    boolean isAbsolute)
```

Set last absolute audio timecode (milliseconds) sent to mediaStream

**Parameters:**

audioTC - timecode (milliseconds)

isAbsolute - is the timecode value relative to last timecode or absolute

---

## setAudioTC

```
public void setAudioTC(long audioTC)
```

Set last absolute audio timecode (milliseconds) sent to mediaStream

**Parameters:**

audioTC - timecode (milliseconds)

---

## getVideoTC

```
public long getVideoTC()
```

Get last absolute video timecode (milliseconds) sent to mediaStream

**Returns:**

last absolute video timecode (milliseconds)

---

## setVideoTC

```
public void setVideoTC(long videoTC,  
    boolean isAbsolute)
```

Set last absolute video timecode (milliseconds) sent to mediaStream

**Parameters:**

videoTC - timecode (milliseconds)

isAbsolute - is the timecode value relative to last timecode or absolute

---

(continued from last page)

## setVideoTC

```
public void setVideoTC(long videoTC)
```

Set last absolute video timecode (milliseconds) sent to mediaStream

**Parameters:**

videoTC - timecode (milliseconds)

---

## getDataTC

```
public long getDataTC()
```

Get last absolute data timecode (milliseconds) sent to mediaStream

**Returns:**

last absolute data timecode (milliseconds)

---

## setDataTC

```
public void setDataTC(long dataTC,  
    boolean isAbsolute)
```

Set last absolute data timecode (milliseconds) sent to mediaStream

**Parameters:**

dataTC - timecode (milliseconds)

isAbsolute - is the timecode value relative to last timecode or absolute

---

## getDataType

```
public int getDataType()
```

Get the data packet type: (IVHost.CONTENTTYPE\_DATA0 or IVHost.CONTENTTYPE\_DATA3)

**Returns:**

data packet type

---

## setDataType

```
public void setDataType(int dataType)
```

Set the data packet type: (IVHost.CONTENTTYPE\_DATA0 or IVHost.CONTENTTYPE\_DATA3)

**Parameters:**

dataType - data packet type

---

## setDataTC

```
public void setDataTC(long dataTC)
```

Set last absolute data timecode (milliseconds) sent to mediaStream

**Parameters:**

dataTC - timecode (milliseconds)

---

(continued from last page)

## isRecord

```
public boolean isRecord( )
```

Is set to true if second parameter of NetStream.publish is "record"

**Returns:**

is true if second parameter of NetStream.publish is "record"

---

## setRecord

```
public void setRecord(boolean isRecord)
```

Set to true if second parameter of NetStream.publish is "record"

**Parameters:**

isRecord - true if second parameter of NetStream.publish is "record"

---

## isPlay

```
public boolean isPlay( )
```

Is the stream a play stream (vs a publish stream)

**Returns:**

is play stream (has nothing to do with if its playing just that its play vs publish)

---

## setPlay

```
public void setPlay(boolean isPlay)
```

Set is the stream a play stream (vs a publish stream)

**Parameters:**

isPlay - is play stream (has nothing to do with if its playing just that its play vs publish)

---

## idle

```
public boolean idle( )
```

Allow the mediaStream to perform idle work (not currently in use)

**Returns:**

true if it did some work

---

## getClientId

```
public int getClientId( )
```

Get parent client connection (id)

**Returns:**

parent client connection (id)

---

## getClient

```
public IClient getClient( )
```

---

(continued from last page)

Get parent client connection

**Returns:**

parent client connection

---

## getNetConnection

```
public INetConnection getNetConnection()
```

Get parent netConnection (future server to server communication)

**Returns:**

parent netConnection connection

---

## setNetConnection

```
public void setNetConnection(INetConnection netConnection)
```

Set parent netConnection (future server to server communication)

**Parameters:**

netConnection - netConnection connection

---

## setClient

```
public void setClient(IClient client)
```

Set parent client connection

**Parameters:**

client - parent client connection

---

## getStreams

```
public MediaStreamMap getStreams()
```

Get parent mediaStreamMap (owned by applicationInstance)

**Returns:**

parent mediaStreamMap

---

## packetComplete

```
public void packetComplete()
```

Invoked by requestAdapter when at the end of a set of packets

---

## sendStreamNotFound

```
public int sendStreamNotFound(String name)
```

Send onStatus(NetStream.Play.StreamNotFound) event

**Parameters:**

name - stream name

**Returns:**

bytes sent to client

## sendStreamNotFound

```
public int sendStreamNotFound(java.io.OutputStream out,  
    String name)
```

Send onStatus(NetStream.Play.StreamNotFound) event. Send directly to OutputStream.

**Parameters:**

out - OutputStream  
name - stream name

**Returns:**

bytes sent to client

---

## sendLivePlayStart

```
public int sendLivePlayStart(java.io.OutputStream out,  
    String name,  
    long timecode,  
    long timecodeOffset)
```

Send onStatus(NetStream.Play.Start) event

**Parameters:**

out - OutputStream  
name - stream name  
timecode - timecode  
timecodeOffset - timecode offset

**Returns:**

bytes sent to client

---

## sendVODPlaySwitch

```
public int sendVODPlaySwitch(java.io.OutputStream out,  
    String name,  
    long timecode)
```

Send onStatus(NetStream.Play.Transition) event

**Parameters:**

out - OutputStream  
name - stream name  
timecode - timecode

**Returns:**

bytes sent to client

---

## sendLivePlaySwitch

```
public int sendLivePlaySwitch(java.io.OutputStream out,  
    String name,  
    long timecode)
```

Send onStatus(NetStream.Play.Transition) event

**Parameters:**

out - OutputStream  
name - stream name

---

(continued from last page)

timecode - timecode

**Returns:**

bytes sent to client

---

**sendLivePlaySeek**

```
public int sendLivePlaySeek(java.io.OutputStream out,  
    String name,  
    long timecode)
```

Send onStatus(NetStream.Seek.Notify) event

**Parameters:**

out - OutputStream  
name - stream name  
timecode - timecode

**Returns:**

bytes sent to client

---

**sendPlayReset**

```
public int sendPlayReset(String name)
```

Send onStatus(NetStream.Play.Reset) event

**Parameters:**

name - stream name

**Returns:**

bytes sent to client

---

**sendPlayReset**

```
public int sendPlayReset(java.io.OutputStream out,  
    String name)
```

Send onStatus(NetStream.Play.Reset) event. Send directly to OutputStream.

**Parameters:**

out - OutputStream  
name - stream name

**Returns:**

bytes sent to client

---

**sendPlayStop**

```
public int sendPlayStop(long location,  
    String name)
```

Send onStatus(NetStream.Play.Stop) event

**Parameters:**

location - timecode where play stopped  
name - stream name

**Returns:**

(continued from last page)

bytes sent to client

---

## sendPlayStop

```
public int sendPlayStop(java.io.OutputStream out,  
    long location,  
    String name)
```

Send onStatus(NetStream.Play.Stop) event. Send directly to OutputStream

### Parameters:

out - OutputStream  
location - timecode where play stopped  
name - stream name

### Returns:

bytes sent to client

---

## sendPlaySeek

```
public int sendPlaySeek(java.io.OutputStream out,  
    long location,  
    long seekLocation,  
    String name,  
    java.util.List seekTypes)
```

Send onStatus(NetStream.Seek.Notify) event.

### Parameters:

out - OutputStream  
location - request location of seek  
seekLocation - result location of seek  
name - stream name  
seekTypes - list of commands to respond to (seek, unpause, play)

### Returns:

bytes sent to client

---

## sendPlaySeek

```
public int sendPlaySeek(long location,  
    long seekLocation,  
    String name)
```

Send onStatus(NetStream.Seek.Notify) event.

### Parameters:

location - request location of seek  
seekLocation - result location of seek  
name - stream name

### Returns:

bytes sent to client

---

## sendPlaySeek

```
public int sendPlaySeek(java.io.OutputStream out,  
    long location,  
    long seekLocation,  
    String name)
```

(continued from last page)

Send onStatus(NetStream.Seek.Notify) event. Send directly to OutputStream

**Parameters:**

out - OutputStream  
location - request location of seek  
seekLocation - result location of seek  
name - stream name

**Returns:**

bytes sent to client

---

## sendPlayStart

```
public int sendPlayStart(String name,  
    long timecode)
```

Send onStatus(NetStream.Play.Start) event

**Parameters:**

name - stream name

**Returns:**

bytes sent to client

---

## sendPlaySwitch

```
public int sendPlaySwitch(String name,  
    long timecode)
```

Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch).

**Parameters:**

name - stream name  
timecode - timecode of event

**Returns:**

bytes sent to client

---

## sendPlaySwitch

```
public int sendPlaySwitch(java.io.OutputStream out,  
    String name,  
    boolean isSwitch,  
    long timecode)
```

Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch). Send directly to OutputStream

**Parameters:**

out - OutputStream  
name - stream name  
isSwitch - is this a switch or a start  
timecode - timecode of event

**Returns:**

bytes sent to client

(continued from last page)

## sendPlayStart

```
public int sendPlayStart( java.io.OutputStream out,  
    String name,  
    boolean isSwitch,  
    boolean isLive,  
    long timecode,  
    java.util.List seekTypes)
```

Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch). Send directly to OutputStream

### Parameters:

out - OutputStream  
name - stream name  
isSwitch - is this a switch or a start  
isLive - is the stream live  
timecode - timecode of event  
seekTypes - commands to respond to (seek, unpause, play)

---

## sendPlayStart

```
public int sendPlayStart( java.io.OutputStream out,  
    String name,  
    boolean isSwitch,  
    long timecode,  
    java.util.List seekTypes)
```

Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch). Send directly to OutputStream

### Parameters:

out - OutputStream  
name - stream name  
isSwitch - is this a switch or a start  
timecode - timecode of event  
seekTypes - commands to respond to (seek, unpause, play)

### Returns:

bytes sent to client

---

## sendPlayStart

```
public int sendPlayStart( java.io.OutputStream out,  
    String name,  
    boolean isSwitch,  
    long timecode)
```

Send onStatus(NetStream.Play.Start) event (it is not a typo, this also send play start but with different control codes for media switch). Send directly to OutputStream

### Parameters:

out - OutputStream  
name - stream name  
isSwitch - is this a switch or a start  
timecode - timecode of event

### Returns:

bytes sent to client

(continued from last page)

## sendPlayStatus

```
public int sendPlayStatus(long timecode,  
    int statusType,  
    double duration,  
    double bytesSent)
```

Send onPlayStatus(NetStream.Play.Switch, NetStream.Play.Complete, NetStream.Play.Stop) event

### Parameters:

timecode - timecode of event  
statusType - status type IMediaStreamPlay.PLAYSTATUSTYPE\_\*  
duration - (not used)  
bytesSent - (not used)

### Returns:

bytes sent to client

---

## sendPlayStatus

```
public int sendPlayStatus(java.io.OutputStream out,  
    long timecode,  
    int statusType,  
    double duration,  
    double bytesSent)
```

Send onPlayStatus(NetStream.Play.Switch, NetStream.Play.Complete, NetStream.Play.Stop) event. Send directly to OutputStream.

### Parameters:

out - OutputStream  
timecode - timecode of event  
statusType - status type IMediaStreamPlay.PLAYSTATUSTYPE\_\*  
duration - (not used)  
bytesSent - (not used)

### Returns:

bytes sent to client

---

## sendPauseNotify

```
public int sendPauseNotify(long timecode,  
    String name)
```

Send onStatus(NetStream.Pause.Notify) event

### Parameters:

timecode - timecode of event  
name - stream name

### Returns:

bytes sent to client

---

## sendPauseNotify

```
public int sendPauseNotify(java.io.OutputStream out,  
    long timecode,  
    String name)
```

Send onStatus(NetStream.Pause.Notify) event. Send directly to OutputStream.

(continued from last page)

**Parameters:**

out - OutputStream  
timecode - timecode of event  
name - stream name

**Returns:**

bytes sent to client

---

**sendUnpauseNotify**

```
public int sendUnpauseNotify(java.io.OutputStream out,  
    long location,  
    String name,  
    java.util.List seekTypes)
```

Send onStatus(NetStream.Unpause.Notify) event

**Parameters:**

out - OutputStream  
location - timecode of event  
name - stream name  
seekTypes - list of operations to respond to (seek, play, unpause)

**Returns:**

bytes sent to client

---

**sendUnpauseNotify**

```
public int sendUnpauseNotify(long location,  
    String name)
```

Send onStatus(NetStream.Unpause.Notify) event

**Parameters:**

location - timecode of event  
name - stream name

**Returns:**

bytes sent to client

---

**sendUnpauseNotify**

```
public int sendUnpauseNotify(java.io.OutputStream out,  
    long location,  
    String name)
```

Send onStatus(NetStream.Unpause.Notify) event. Send directly to OutputStream.

**Parameters:**

out - OutputStream  
location - timecode of event  
name - stream name

**Returns:**

bytes sent to client

(continued from last page)

## isAppend

```
public boolean isAppend( )
```

Is append to media file (only valid if isRecord)

**Returns:**

is appending or rewriting media file

---

## setAppend

```
public void setAppend(boolean isAppend)
```

Set is append to media file (only valid if isRecord)

**Parameters:**

isAppend - is appending or rewriting media file

---

## setPlayer

```
public void setPlayer(IMediaStreamPlay player)
```

Set underlying player (IMediaStreamPlay) object

**Parameters:**

player - underlying player (IMediaStreamPlay) object

---

## getPlayer

```
public IMediaStreamPlay getPlayer( )
```

Get underlying player (IMediaStreamPlay) object

**Returns:**

underlying player (IMediaStreamPlay) object

---

## getAudioMissing

```
public int getAudioMissing( )
```

Get number of audio bytes missing from current audio packet

**Returns:**

number of bytes missing

---

## getVideoMissing

```
public int getVideoMissing( )
```

Get number of video bytes missing from current video packet

**Returns:**

number of bytes missing

---

## getDataMissing

```
public int getDataMissing( )
```

---

(continued from last page)

Get number of data bytes missing from current data packet

**Returns:**

number of bytes missing

---

## addVideoData

```
public void addVideoData(byte[] data,  
    int offset,  
    int size)
```

Add data to current video packet

**Parameters:**

data - byte array

offset - offset in byte array

size - size of data to add

---

## addAudioData

```
public void addAudioData(byte[] data,  
    int offset,  
    int size)
```

Add data to current audio packet

**Parameters:**

data - byte array

offset - offset in byte array

size - size of data to add

---

## addDataData

```
public void addDataData(byte[] data,  
    int offset,  
    int size)
```

Add data to current data packet

**Parameters:**

data - byte array

offset - offset in byte array

size - size of data to add

---

## getProperties

```
public WMSPProperties getProperties()
```

Get mediaStream properties

**Returns:**

properties

---

## getPlayPackets

```
public java.util.List getPlayPackets()
```

Get all available live packets

**Returns:**

(continued from last page)

play packets

---

## getMaxTimecode

```
public long getMaxTimecode()
```

Get the timecode of the latest received packet

**Returns:**

timecode of the latest received packet

---

## getLastKeyFrame

```
public AMFPacket getLastKeyFrame()
```

Get most recent video key frame

**Returns:**

play packets

---

## getLastPacket

```
public AMFPacket getLastPacket()
```

Get most recent live packet

**Returns:**

most recent live packet or null or no live packets

---

## getStreamType

```
public String getStreamType()
```

Get mediaStream streamType

**Returns:**

streamType

---

## setStreamType

```
public void setStreamType(String streamType)
```

Set mediaStream streamType. This method will not change the type of the current stream.

**Parameters:**

streamType

---

## sendDirectAMF3

```
public void sendDirectAMF3(String handlerName,  
    Object[] params)
```

Call client side NetStream method/handler and send event to underlying stream (will record event). Force AMF3 encoding.

**Parameters:**

handlerName - handler name

params - variable list of parameters. All parameters will be wrapped in AMFDataObj.

---

## sendDirect

```
public void sendDirect(String handlerName,  
    Object[] params)
```

Call client side NetStream method/handler and send event to underlying stream (will record event)

### Parameters:

handlerName - handler name

params - variable list of parameters. All parameters will be wrapped in AMFDataObj.

---

## sendDirectAMF3

```
public void sendDirectAMF3(String handlerName)
```

Call client side NetStream method/handler and send event to underlying stream (will record event). Force AMF3 encoding.

### Parameters:

handlerName - handler name

---

## sendDirect

```
public void sendDirect(String handlerName)
```

Call client side NetStream method/handler and send event to underlying stream (will record event)

### Parameters:

handlerName - handler name

---

## sendAMF3

```
public void sendAMF3(String handlerName,  
    Object[] params)
```

Call client side NetStream method/handler. Force AMF3 encoding.

### Parameters:

handlerName - handler name

params - variable list of parameters. All parameters will be wrapped in AMFDataObj.

---

## send

```
public void send(String handlerName,  
    Object[] params)
```

Call client side NetStream method/handler

### Parameters:

handlerName - handler name

params - variable list of parameters. All parameters will be wrapped in AMFDataObj.

---

## sendAMF3

```
public void sendAMF3(String handlerName)
```

Call client side NetStream method/handler with no parameters. Force AMF3 encoding.

### Parameters:

(continued from last page)

---

handlerName - handler name

---

## send

```
public void send(String handlerName)
```

Call client side NetStream method/handler with no parameters

### Parameters:

handlerName - handler name

---

## close

```
public void close()
```

Close mediaStream

---

## isOpen

```
public boolean isOpen()
```

Is mediaStream open

### Returns:

is mediaStream open

---

## setOpen

```
public void setOpen(boolean isOpen)
```

Set mediaStream open

### Parameters:

isOpen - mediaStream open

---

## getFastPlaySettings

```
public FastPlaySettings getFastPlaySettings()
```

Get current fastPlay settings

### Returns:

fastPlay settings

---

## setFastPlaySettings

```
public void setFastPlaySettings(FastPlaySettings fastPlaySettings)
```

Set fastPlay settings

### Parameters:

fastPlaySettings - fastPlay settings

---

## clearFastPlaySettings

```
public void clearFastPlaySettings()
```

Clear fastPlay settings

---

## isReceiveAudio

```
public boolean isReceiveAudio()
```

Is client currently receiving audio. Controlled by client side call receiveAudio.

**Returns:**

receive audio

---

## setReceiveAudio

```
public void setReceiveAudio(boolean receiveAudio)
```

Set receive audio

**Parameters:**

receiveAudio - receive audio

---

## isReceiveVideo

```
public boolean isReceiveVideo()
```

Is client currently receiving video. Controlled by client side call receiveVideo

**Returns:**

receive video

---

## setReceiveVideo

```
public void setReceiveVideo(boolean receiveVideo)
```

Set receive video

**Parameters:**

receiveVideo - receive video

---

## getReceiveVideoFPS

```
public int getReceiveVideoFPS()
```

Set frame per seconds for video (not currently implemented)

**Returns:**

video frames per second

---

## setReceiveVideoFPS

```
public void setReceiveVideoFPS(int receiveVideoFPS)
```

Set frame per second for video (not currently implemented)

**Parameters:**

receiveVideoFPS - video frames per second

---

## getMediaIOPerformance

```
public IOPerformanceCounter getMediaIOPerformance()
```

---

(continued from last page)

Get IO performance counter

**Returns:**

IO performance counter

---

**incrementMediaOutBytes**

```
public long incrementMediaOutBytes(long bytes,  
    long count)
```

Increment the number of mediaStream bytes sent and number of packets sent

**Parameters:**

bytes - number of bytes sent

count - number of packets sent

**Returns:**

total number of bytes sent (after increment)

---

**incrementMediaLossBytes**

```
public long incrementMediaLossBytes(long bytes,  
    long count)
```

Increment the number of mediaStream loss bytes sent and number of packets sent

**Parameters:**

bytes - number of bytes sent

count - number of packets sent

**Returns:**

total number of bytes sent (after increment)

---

**incrementMediaInBytes**

```
public long incrementMediaInBytes(long increment)
```

Increment the number of mediaStream bytes received

**Parameters:**

increment - number of byte received

**Returns:**

total number of bytes received (after increment)

---

**publish**

```
public void publish()
```

Publish mediaStream

---

**trim**

```
public void trim()
```

Trim mediaStream. This method will remove live packets that are older than the live buffer size.

(continued from last page)

## handleCallback

```
public void handleCallback(com.wowza.wms.request.RequestFunction function)
```

Routes request function to callback handler onStatus, onPlayStatus or [method/handler]

**Parameters:**

function - request function

---

## unregisterCallback

```
public void unregisterCallback(String handlerName)
```

Unregister a callback handler

**Parameters:**

handlerName - handler name

---

## registerCallback

```
public void registerCallback(String handlerName,  
    IMediaStreamCallback callback)
```

Register a callback handler

**Parameters:**

handlerName - handler name

callback - callback object

---

## unregisterOnStatus

```
public void unregisterOnStatus(IMediaStreamCallback callback)
```

Unregister onStatus handler

**Parameters:**

callback

---

## registerOnStatus

```
public void registerOnStatus(IMediaStreamCallback callback)
```

Register onStatus handler

**Parameters:**

callback - callback object

---

## unregisterOnPlayStatus

```
public void unregisterOnPlayStatus(IMediaStreamCallback callback)
```

Unregister onPlayStatus handler

**Parameters:**

callback - callback object

---

(continued from last page)

## registerOnPlayStatus

```
public void registerOnPlayStatus(IMediaStreamCallback callback)
```

Register onPlayStatus handler

### Parameters:

callback - callback object

---

## addClientListener

```
public void addClientListener(IMediaStreamActionNotify actionListener)
```

Add client listener. Listens for (onPlay, onPublish, onPause, onSeek, onStop)

### Parameters:

actionListener - listener

---

## addClientListener

```
public void addClientListener(IMediaStreamActionNotify2 actionListener)
```

Add client listener. Listens for (onPlay, onPublish, onPause, onSeek, onStop)

### Parameters:

actionListener - listener

---

## addClientListener

```
public void addClientListener(IMediaStreamActionNotify3 actionListener)
```

Add client listener. Listens for (onPlay, onPublish, onPause, onSeek, onStop)

### Parameters:

actionListener - listener

---

## removeClientListener

```
public void removeClientListener(IMediaStreamActionNotify actionListener)
```

Remove client listener. Listens for (onPlay, onPublish, onPause, onSeek, onStop)

### Parameters:

actionListener - listener

---

## removeClientListener

```
public void removeClientListener(IMediaStreamActionNotify2 actionListener)
```

Remove client listener. Listens for (onPlay, onPublish, onPause, onSeek, onStop)

### Parameters:

actionListener - listener

---

## removeClientListener

```
public void removeClientListener(IMediaStreamActionNotify3 actionListener)
```

(continued from last page)

Remove client listener. Listens for (onPlay, onPublish, onPause, onSeek, onStop)

**Parameters:**

actionListener - listener

---

## notifyActionPlay

```
public void notifyActionPlay(String streamName,  
    double playStart,  
    double playLen,  
    int playReset)
```

Notify client listeners of play action

**Parameters:**

streamName - stream name

playStart - play start

playLen - play length

playReset - play reset

---

## notifyActionPauseRaw

```
public void notifyActionPauseRaw(boolean isPause,  
    long location)
```

Notify client listeners of pauseRaw action

**Parameters:**

isPause - is pause or unpause

location - timecode (milliseconds) of action

---

## notifyActionPause

```
public void notifyActionPause(boolean isPause,  
    long location)
```

Notify client listeners of pause action

**Parameters:**

isPause - is pause or unpause

location - timecode (milliseconds) of action

---

## notifyActionSeek

```
public void notifyActionSeek(double location)
```

Notify client listeners of seek action

**Parameters:**

location - timecode (milliseconds) of seek request

---

## notifyActionPublish

```
public void notifyActionPublish(String streamName,  
    boolean isRecord,  
    boolean isAppend)
```

Notify client listeners of publish action

**Parameters:**

(continued from last page)

streamName - stream name  
isRecord - is record or live  
isAppend - is append if isRecord is true

---

## notifyActionUnPublish

```
public void notifyActionUnPublish(String streamName,  
    boolean isRecord,  
    boolean isAppend)
```

Notify client listeners of unpublish action

### Parameters:

streamName - stream name  
isRecord - is record or live  
isAppend - is append if isRecord is true

---

## notifyActionOnMetaData

```
public void notifyActionOnMetaData(AMFPacket metaDataPacket)
```

Notify client listeners of onMetaData change

### Parameters:

metaDataPacket - metaDataPacket

---

## notifyActionOnCodecInfoVideo

```
public void notifyActionOnCodecInfoVideo(com.wowza.wms.media.model.MediaCodecInfoVideo  
codecInfoVideo)
```

Notify client listeners of video codec information change

### Parameters:

codecInfoVideo - video codec information

---

## notifyActionOnCodecInfoAudio

```
public void notifyActionOnCodecInfoAudio(com.wowza.wms.media.model.MediaCodecInfoAudio  
codecInfoAudio)
```

Notify client listeners of audio codec information change

### Parameters:

codecInfoAudio - audio codec information

---

## notifyActionStop

```
public void notifyActionStop()
```

Notify client listeners of stop action

---

## isClustered

```
public boolean isClustered()
```

not used

### Returns:

(continued from last page)

isClustered

---

## setClustered

```
public void setClustered(boolean isClustered)
```

not used

**Parameters:**

isClustered

---

## getCacheName

```
public String getCacheName()
```

not used

**Returns:**

cache name

---

## startPublishing

```
public void startPublishing()
```

Start publishing live stream

---

## stopPublishing

```
public void stopPublishing()
```

Stop publishing live stream

---

## getStreamFileForWrite

```
public java.io.File getStreamFileForWrite()
```

Get the File object to write to a stream (get stream name, ext and query from stream object)

**Returns:**

resultant File object

---

## getStreamFileForWrite

```
public java.io.File getStreamFileForWrite(String name,  
                                           String ext,  
                                           String query)
```

Get the File object to write to a stream (specify name, ext and query)

**Parameters:**

name - stream name

ext - stream prefix (Ex. mp4:)

query - query part of stream name (Ex. mystream?param1=value1)

**Returns:**

resultant File object

---

(continued from last page)

## getStreamFileForRead

```
public java.io.File getStreamFileForRead()
```

Get the File object to read from a stream (get stream name, ext and query from stream object)

**Returns:**

resultant File object

---

## getStreamFileForRead

```
public java.io.File getStreamFileForRead(String name,  
String ext,  
String query)
```

Get the File object to read from a stream (specify name, ext and query)

**Parameters:**

name - stream name

ext - stream prefix (Ex. mp4:)

query - query part of stream name (Ex. mystream?param1=value1)

**Returns:**

resultant File object

---

## sendControlBytes

```
public int sendControlBytes(int controlType,  
java.io.OutputStream out)
```

Send playback control bytes. Valid values are (0, 1, 4)

**Parameters:**

controlType - control types (0, 1, 4)

out - OutputStream

**Returns:**

bytes sent to client

---

## getBurstStartStop

```
public byte[] getBurstStartStop(boolean isStart)
```

Get the dynamic streaming burst start/stop AMF packet

**Parameters:**

isStart - is start

**Returns:**

byte array with AMF packet

---

## getRespAMFAudioObj

```
public AMFObj getRespAMFAudioObj()
```

Get audio response channel object

**Returns:**

audio response channel object

---

## getRespAMFVideoObj

```
public AMFObj getRespAMFVideoObj()
```

Get video response channel object

**Returns:**

video response channel object

---

## getRespAMFDataObj

```
public AMFObj getRespAMFDataObj()
```

Get data response channel object

**Returns:**

data response channel object

---

## getQueryStr

```
public String getQueryStr()
```

Get play/publish name query string. Example: if play name is flv:test?param1=data1&param2=data2, query string is "param1=data1&param2=data2".

**Returns:**

query string

---

## setQueryStr

```
public void setQueryStr(String queryStr)
```

Set play/publish name query string. Example: if play name is flv:test?param1=data1&param2=data2, query string is "param1=data1&param2=data2".

**Parameters:**

queryStr

---

## updateLoggingDuration

```
public void updateLoggingDuration()
```

Update logging.MDC with mediaStream logging information

---

## updateLoggingValues

```
public void updateLoggingValues()
```

Update logging.MDC with mediaStream logging information

---

## clearLoggingValues

```
public void clearLoggingValues()
```

---

(continued from last page)

## length

```
public double length()
```

Get length/duration (seconds) of media file pointed to by mediaStream

**Returns:**

length (seconds)

---

## size

```
public long size()
```

Get size (bytes) of media file pointed to by mediaStream

**Returns:**

size (bytes)

---

## getExt

```
public String getExt()
```

Get media file extension

**Returns:**

media file extension

---

## setExt

```
public void setExt(String ext)
```

Set media file extension

**Parameters:**

ext

---

## clear

```
public void clear()
```

Delete media file pointed to by this mediaStream (be careful)

---

## isSendPlayStopLogEvent

```
public boolean isSendPlayStopLogEvent()
```

Get need to send a log event for stop

**Returns:**

need to send a log event for stop

---

## setSendPlayStopLogEvent

```
public void setSendPlayStopLogEvent(boolean sendPlayStopLogEvent)
```

Set need to send a log event for stop

**Parameters:**

(continued from last page)

sendPlayStopLogEvent - need to send a log event for stop

---

## isSendRecordStopLogEvent

```
public boolean isSendRecordStopLogEvent()
```

Get need to send a log event for recording

**Returns:**

need to send a log event for stop

---

## setSendRecordStopLogEvent

```
public void setSendRecordStopLogEvent(boolean sendPlayStopLogEvent)
```

Set need to send a log event for recording

**Parameters:**

sendPlayStopLogEvent - need to send a log event for stop

---

## isSendPublishStopLogEvent

```
public boolean isSendPublishStopLogEvent()
```

Get need to send a log event for publishing

**Returns:**

need to send a log event for stop

---

## setSendPublishStopLogEvent

```
public void setSendPublishStopLogEvent(boolean sendPlayStopLogEvent)
```

Set need to send a log event for publishing

**Parameters:**

sendPlayStopLogEvent - need to send a log event for stop

---

## getAccess

```
public boolean[] getAccess(IClient client,  
    String name)
```

Get the read/write access to this stream for this client

**Parameters:**

client - client  
name - stream name

**Returns:**

array of booleans read[0], write[1]

---

## getMetaDataProvider

```
public IMediaStreamMetaDataProvider getMetaDataProvider()
```

Get the metaData provider

**Returns:**

(continued from last page)

metaData provider

---

## setMetaDataProvider

```
public void setMetaDataProvider(IMediaStreamMetaDataProvider metaDataProvider)
```

Set the metaData provider

**Parameters:**

metaDataProvider - metaData provider

---

## getHeaderSize

```
public int getHeaderSize()
```

Get the last packet header size (debugging)

**Returns:**

last packet header size

---

## setHeaderSize

```
public void setHeaderSize(int headerSize)
```

Set the last packet header size (debugging)

**Parameters:**

headerSize - last packet header size

---

## getAudioCodecConfigPacket

```
public AMFPacket getAudioCodecConfigPacket(long timecode)
```

Get audio codec configuration packet (needed for H.264/AAC playback)

**Parameters:**

timecode - timecode of the packet to which you want to get the codec config information

**Returns:**

audio codec configuration packet (needed for H.264/AAC playback)

---

## addAudioCodecConfigPacket

```
public void addAudioCodecConfigPacket(long timecode,  
    AMFPacket packet)
```

Set audio codec configuration packet (needed for H.264/AAC playback)

**Parameters:**

timecode - timecode in milliseconds of first packet that uses this timecode  
packet - audio codec configuration packet (needed for H.264/AAC playback)

---

## getVideoCodecConfigPacket

```
public AMFPacket getVideoCodecConfigPacket(long timecode)
```

Get video codec configuration packet (needed for H.264/AAC playback)

**Parameters:**

---

(continued from last page)

timecode - timecode of the packet to which you want to get the codec config information

**Returns:**

video codec configuration packet (needed for H.264/AAC playback)

---

## addVideoCodecConfigPacket

```
public void addVideoCodecConfigPacket(long timecode,  
    AMFPacket packet)
```

Set video codec configuration packet (needed for H.264/AAC playback)

**Parameters:**

timecode - timecode in milliseconds of first packet that uses this timecode

packet - video codec configuration packet (needed for H.264/AAC playback)

---

## getRTPStream

```
public RTPStream getRTPStream( )
```

Get the RTP based stream this stream is associated with

**Returns:**

RTP based stream this stream is associated with

---

## setRTPStream

```
public void setRTPStream(RTPStream rtpStream)
```

Set the RTP based stream this stream is associated with

**Parameters:**

rtpStream - RTP based stream this stream is associated with

---

## flush

```
public void flush( )
```

Force publishing packets to be flushed from the input buffers to the output buffers

---

## startAudioPacket

```
public void startAudioPacket( )
```

Called when an audio packet is first being populated with data

---

## startVideoPacket

```
public void startVideoPacket( )
```

Called when a video packet is first being populated with data

---

## startDataPacket

```
public void startDataPacket( )
```

Called when a data packet is first being populated with data

---

## getLiveStreamPacketizerList

```
public String getLiveStreamPacketizerList()
```

Get the comma separated list of LiveStreamPacketizers names being used by this stream (see conf/LiveStreamPacketizers.xml)

**Returns:**

comma separated list of LiveStreamPacketizers names

---

## setLiveStreamPacketizerList

```
public void setLiveStreamPacketizerList(String liveStreamPacketizerList)
```

Set the comma separated list of LiveStreamPacketizers names being used by this stream (see conf/LiveStreamPacketizers.xml)

**Parameters:**

liveStreamPacketizerList - comma separated list of LiveStreamPacketizers names

---

## getLiveStreamTranscoderList

```
public String getLiveStreamTranscoderList()
```

Get the comma separated list of LiveStreamTranscoders names being used by this stream (see conf/LiveStreamTranscoders.xml)

**Returns:**

comma separated list of LiveStreamTranscoders names

---

## setLiveStreamTranscoderList

```
public void setLiveStreamTranscoderList(String liveStreamTranscoderList)
```

Set the comma separated list of LiveStreamTranscoders names being used by this stream (see conf/LiveStreamTranscoders.xml)

**Parameters:**

liveStreamTranscoderList - comma separated list of LiveStreamTranscoders names

---

## getLiveStreamPacketizer

```
public ILiveStreamPacketizer getLiveStreamPacketizer(String name)
```

Get the LiveStreamPacketizer interface to a stream by name

**Parameters:**

name - LiveStreamPacketizer name

**Returns:**

LiveStreamPacketizer interface

---

## getDvrRecorderList

```
public String getDvrRecorderList()
```

Get the comma separated list of DVR Recorder names being used by this stream (see conf/Dvr.xml)

**Returns:**

comma separated list of DVR Recorder names

---

## setDvrRecorderList

```
public void setDvrRecorderList(String recorderList)
```

Set the comma separated list of DVR Recorder names being used by this stream (see conf/Dvr.xml)

**Parameters:**

recorderList - comma separated list of DVR Recorder names

---

## getDvrRecorder

```
public ILiveStreamDvrRecorder getDvrRecorder(String name)
```

Get the DVR Recorder interface to a stream by name

**Parameters:**

name - DVR Recorder name

**Returns:**

DVR Recorder interface

---

## getUniqueStreamIdStr

```
public String getUniqueStreamIdStr()
```

Get a string that uniquely identifies this stream

**Returns:**

unique stream identifier

---

## getHTTPStreamerSession

```
public IHTTPStreamerSession getHTTPStreamerSession()
```

Get the HTTPStreamer session associated with this stream

**Returns:**

HTTPStreamer session associated with this stream

---

## setHTTPStreamerSession

```
public void setHTTPStreamerSession(IHTTPStreamerSession httpStreamerSession)
```

Set the HTTPStreamer session associated with this stream

**Parameters:**

httpStreamerSession - HTTPStreamer session associated with this stream

---

## getElapsedTime

```
public ElapsedTimer getElapsedTime()
```

Get the interface to the elapse timer

**Returns:**

interface to the elapse timer

---

---

## getLiveStreamPacketizer

```
public String getLiveStreamPacketizer()
```

Get the live stream packetizer that this stream is using

**Returns:**

live stream packetizer

---

## setLiveStreamPacketizer

```
public void setLiveStreamPacketizer(String liveStreamPacketizer)
```

Set the live stream packetizer that this stream is using

**Parameters:**

liveStreamPacketizer - live stream packetizer

---

## getLiveStreamRepeater

```
public String getLiveStreamRepeater()
```

Get the live stream repeater name for the stream

**Returns:**

live stream repeater name

---

## setLiveStreamRepeater

```
public void setLiveStreamRepeater(String liveStreamRepeater)
```

Set the live stream repeater name for the stream

**Parameters:**

liveStreamRepeater - live stream repeater name

---

## initLiveStreamRepeating

```
public void initLiveStreamRepeating(String liveStreamPacketizer,  
    String liveStreamRepeater)
```

Initialize this stream for live stream repeating

**Parameters:**

liveStreamPacketizer - live stream packetizer  
liveStreamRepeater - live stream repeater name

---

## getPublishVideoCodecId

```
public int getPublishVideoCodecId()
```

Get the codec id of the most recently published video packet

**Returns:**

codec id of the most recently published video packet

---

(continued from last page)

## setPublishVideoCodecId

```
public void setPublishVideoCodecId(int publishVideoCodecId)
```

Set the codec id of the most recently published video packet

**Parameters:**

publishVideoCodecId - codec id of the most recently published video packet

---

## getPublishAudioCodecId

```
public int getPublishAudioCodecId()
```

Get the codec id of the most recently published audio packet

**Returns:**

codec id of the most recently published audio packet

---

## setPublishAudioCodecId

```
public void setPublishAudioCodecId(int publishAudioCodecId)
```

Set the codec id of the most recently published audio packet

**Parameters:**

publishAudioCodecId - codec id of the most recently published audio packet

---

## isPublishStreamReady

```
public boolean isPublishStreamReady(boolean checkAudio,  
    boolean checkVideo)
```

Returns true if the publishing stream contains enough video/audio data to start playback

**Parameters:**

checkAudio - check audio stream

checkVideo - check video stream

**Returns:**

true if the publishing stream contains enough video/audio data to start playback

---

## getContextStr

```
public String getContextStr()
```

Returns the stream context string in the form [application]/[appInstance]/[streamName].

**Returns:**

stream context string

---

## isMediaCasterPlay

```
public boolean isMediaCasterPlay()
```

Is MediaCaster play enabled (if true, will trigger MediaCaster startup)

**Returns:**

true if MediaCaster play enabled

---

## setMediaCasterPlay

```
public void setMediaCasterPlay(boolean isMediaCasterPlay)
```

Is MediaCaster play enabled (if true, will trigger MediaCaster startup)

**Parameters:**

isMediaCasterPlay - true if MediaCaster play enabled

---

## isMergeOnMetadata

```
public boolean isMergeOnMetadata()
```

If true, merge incoming onMetadata events with the current onMetadata event data. If false, replace.

**Returns:**

true, merge incoming onMetadata events with the current onMetadata event data. If false, replace.

---

## setMergeOnMetadata

```
public void setMergeOnMetadata(boolean mergeOnMetadata)
```

If true, merge incoming onMetadata events with the current onMetadata event data. If false, replace.

**Parameters:**

mergeOnMetadata - true, merge incoming onMetadata events with the current onMetadata event data. If false, replace.

---

## getDvrRecorder

```
public String getDvrRecorder()
```

Get the DVR Recorder for this stream

**Returns:**

DVR Recorder

---

## getDvrRepeater

```
public String getDvrRepeater()
```

Get the DVR repeater name for this stream

**Returns:**

repeater name

---

## setDvrRecorder

```
public void setDvrRecorder(String recorderName)
```

Set the DVR Recorder that this stream is using

**Parameters:**

recorderName - DVR Recorder

---

## removeDvrRecorder

```
public ILiveStreamDvrRecorder removeDvrRecorder(String name)
```

---

(continued from last page)

Remove a live stream dvr by name

**Parameters:**

name - dvr name

**Returns:**

live stream dvr

---

## putDvrRecorder

```
public void putDvrRecorder(String name,  
    ILiveStreamDvrRecorder dvr)
```

Add a live stream dvr to this stream

**Parameters:**

name - dvr name

dvr - live stream dvr

---

## getLiveStreamTranscoders

```
public java.util.Map getLiveStreamTranscoders()
```

Get the list of transcoders for this stream.

**Returns:**

list of transcoders for this stream

---

## getLiveStreamTranscoder

```
public ILiveStreamTranscoder getLiveStreamTranscoder(String name)
```

Get a live stream transcoder for this stream by name

**Parameters:**

name - transcoder name

**Returns:**

live stream transcoder

---

## removeLiveStreamTranscoder

```
public ILiveStreamTranscoder removeLiveStreamTranscoder(String name)
```

Remove a live stream transcoder by name

**Parameters:**

name - transcoder name

**Returns:**

live stream transcoder

---

## putLiveStreamTranscoder

```
public void putLiveStreamTranscoder(String name,  
    ILiveStreamTranscoder liveStreamTranscoder)
```

Add a live stream transcoder to this stream

(continued from last page)

**Parameters:**

name - transcoder name  
liveStreamTranscoder - live stream transcoder

---

**isTranscodeResult**

```
public boolean isTranscodeResult()
```

Is this stream the result of a transcode operation.

**Returns:**

true if stream the result of a transcode operation

---

**setTranscodeResult**

```
public void setTranscodeResult(boolean isTranscodeResult)
```

Is this stream the result of a transcode operation.

**Parameters:**

isTranscodeResult - true if stream the result of a transcode operation

---

**addVideoH264SEIListener**

```
public void addVideoH264SEIListener(IMediaStreamH264SEINotify h264SEIListener)
```

Add an H.264 SEI listener. This listener will be notified of all incoming H.264 video packets and has the ability to read and/or modify SEI section of the video frame.

**Parameters:**

h264SEIListener - H.264 SEI listener

---

**removeVideoH264SEIListener**

```
public void removeVideoH264SEIListener(IMediaStreamH264SEINotify h264SEIListener)
```

Remove an H.264 SEI listener. This listener will be notified of all incoming H.264 video packets and has the ability to read and/or modify SEI section of the video frame.

**Parameters:**

h264SEIListener - H.264 SEI listener

---

**isVideoH264SEIListenerEmpty**

```
public boolean isVideoH264SEIListenerEmpty()
```

Is H.264 SEI listener list empty. This listener will be notified of all incoming H.264 video packets and has the ability to read and/or modify SEI section of the video frame.

**Returns:**

true if H.264 SEI listener list empty

---

**notifyVideoH264Packet**

```
public void notifyVideoH264Packet(AMFPacket packet,  
com.wowza.wms.media.h264.H264SEIMessages seiMessages)
```

Notify H.264 SEI listener.

(continued from last page)

**Parameters:**

packet - AMF Packet  
seiMessages - seiMessages

---

**addCallbackListener**

```
public void addCallbackListener(IMediaStreamCallback callbackListener)
```

Add a callback listener to listen for all stream metadata

**Parameters:**

callbackListener

---

**removeCallbackListener**

```
public void removeCallbackListener(IMediaStreamCallback callbackListener)
```

Remove a callback listener to listen for all stream metadata

**Parameters:**

callbackListener

---

**addLivePacketListener**

```
public void addLivePacketListener(IMediaStreamLivePacketNotify listener)
```

Add a listener to receiver notification of new live AMF packets

**Parameters:**

listener - listener

---

**removeLivePacketListener**

```
public void removeLivePacketListener(IMediaStreamLivePacketNotify listener)
```

Remove a listener to receiver notification of new live AMF packets

**Parameters:**

listener - listener

---

**notifyLivePacket**

```
public void notifyLivePacket(AMFPacket packet)
```

Notify new live AMF packet

**Parameters:**

packet - new live AMF packet

---

**isPublisherStream**

```
public boolean isPublisherStream()
```

Returns true if stream was created by stream publisher API.

**Returns:**

true if stream was created by stream publisher API

## setPublisherStream

```
public void setPublisherStream(boolean isPublisherStream)
```

Set stream was created by stream publisher.

**Parameters:**

isPublisherStream - true if stream was created by stream publisher API

---

## getPublishFrameCounts

```
public long getPublishFrameCounts(long[] counts)
```

Get the total number of frames received for an incoming live stream. See PACKET\_COUNTS\_\* for the index into the array. The array passed in should be PACKET\_COUNTS\_SIZE.

**Returns:**

total total number of frames received (audio + video + data)

---

## getPublishFrameCountVideoKey

```
public long getPublishFrameCountVideoKey()
```

Get the total number of video key frames received for an incoming live stream.

**Returns:**

total number of video key frames received

---

## getPublishFrameCountVideo

```
public long getPublishFrameCountVideo()
```

Get the total number of video frames received for an incoming live stream.

**Returns:**

total number of video frames received

---

## getPublishFrameCountAudio

```
public long getPublishFrameCountAudio()
```

Get the total number of audio frames received for an incoming live stream.

**Returns:**

total number of audio frames received

---

## getPublishFrameCountData

```
public long getPublishFrameCountData()
```

Get the total number of data frames received for an incoming live stream.

**Returns:**

total number of data frames received

---

(continued from last page)

## getPublishBitrateVideo

```
public int getPublishBitrateVideo()
```

Get the video bitrate of an incoming live published stream (bits per second). Value of -1 indicates still measuring bandwidth. Value of 0 indicates the stream does not contain video.

**Returns:**

video bitrate of an incoming live published stream (bits per second)

---

## getPublishFramerateVideo

```
public double getPublishFramerateVideo()
```

Get the video framerate of an incoming live published stream (frames per second). Value of -1 indicates still measuring bandwidth. Value of 0 indicates the stream does not contain video.

**Returns:**

video framerate

---

## getPublishKeyFrameIntervalsVideo

```
public int[] getPublishKeyFrameIntervalsVideo()
```

Get the last n key frame intervals for an incoming publish stream (frames per GOP), Most recent GOPs are first in the list. -1 indicates the end of the list.

**Returns:**

last n key frame intervals for an incoming publish stream (frames per GOP)

---

## getPublishBitrateAudio

```
public int getPublishBitrateAudio()
```

Get the audio bitrate of an incoming live published stream (bits per second). Value of -1 indicates still measuring bandwidth. Value of 0 indicates the stream does not contain audio.

**Returns:**

audio bitrate of an incoming live published stream (bits per second)

---

## getPublishBitrateVideo

```
public int getPublishBitrateVideo(int source)
```

Get the video bitrate of an incoming live published stream (bits per second). Value of -1 indicates still measuring bandwidth. Value of 0 indicates the stream does not contain video.

**Parameters:**

source - source of bitrate (see IMediaStream.PUBLISH\_BITRATE\_SOURCE\_\*)

**Returns:**

video bitrate of an incoming live published stream (bits per second)

---

## getPublishFramerateVideo

```
public double getPublishFramerateVideo(int source)
```

Get the video framerate of an incoming live published stream (frames per second). Value of -1 indicates still measuring bandwidth. Value of 0 indicates the stream does not contain video.

(continued from last page)

**Parameters:**

source - source of framerate (see IMediaStream.PUBLISH\_FRAMERATE\_SOURCE\_\*)

**Returns:**

video frame rate

---

## getPublishBitrateAudio

```
public int getPublishBitrateAudio(int source)
```

Get the audio bitrate of an incoming live published stream (bits per second). Value of -1 indicates still measuring bandwidth. Value of 0 indicates the stream does not contain audio.

**Parameters:**

source - source of bitrate (see IMediaStream.PUBLISH\_BITRATE\_SOURCE\_\*)

**Returns:**

audio bitrate of an incoming live published stream (bits per second)

---

## getTranscoderEncoderStreamInfo

```
public com.wowza.wms.transcoder.encoder.TranscoderEncoderStreamInfo  
getTranscoderEncoderStreamInfo( )
```

Get the transcoder encoder context information for this stream. This object will be available if this stream is an encoder stream root.

**Returns:**

transcoder encoder context information

---

## setTranscoderEncoderStreamInfo

```
public void  
setTranscoderEncoderStreamInfo(com.wowza.wms.transcoder.encoder.TranscoderEncoderStreamInfo transcoderEncoderStreamInfo)
```

Set the transcoder encoder context information for this stream. This object will be available if this stream is an encoder stream root.

**Parameters:**

transcoderEncoderStreamInfo - transcoder encoder context information

---

## isTranscoderEncoderStreamRoot

```
public boolean isTranscoderEncoderStreamRoot( )
```

True if this stream object is a transcoder encoder stream root.

**Returns:**

True if this stream object is a transcoder encoder stream root

---

## setIsWebRTC

```
public void setIsWebRTC(boolean isWebRTC)
```

---

(continued from last page)

## getIsWebRTC

```
public boolean getIsWebRTC()
```

## com.wowza.wms.stream Interface IMediaStreamActionNotify

All Subinterfaces:

[IMediaStreamActionNotify2](#), [IMediaStreamActionNotify3](#)

All Known Implementing Classes:

[MediaStreamActionNotifyBase](#)

public interface **IMediaStreamActionNotify**  
extends

IMediaStreamActionNotify: listener interface used by IMediaStream addClientListener

### Method Summary

void	<a href="#">onPause</a> ( <a href="#">IMediaStream</a> stream, boolean isPause, double location) Triggered on mediaStream pause
void	<a href="#">onPlay</a> ( <a href="#">IMediaStream</a> stream, String streamName, double playStart, double playLen, int playReset) Triggered on mediaStream play
void	<a href="#">onPublish</a> ( <a href="#">IMediaStream</a> stream, String streamName, boolean isRecord, boolean isAppend) Triggered on mediaStream publish
void	<a href="#">onSeek</a> ( <a href="#">IMediaStream</a> stream, double location) Triggered on mediaStream seek
void	<a href="#">onStop</a> ( <a href="#">IMediaStream</a> stream) Triggered on mediaStream stop
void	<a href="#">onUnPublish</a> ( <a href="#">IMediaStream</a> stream, String streamName, boolean isRecord, boolean isAppend) Triggered on mediaStream unpublish

### Methods

#### onPlay

```
public void onPlay(IMediaStream stream,  
    String streamName,  
    double playStart,  
    double playLen,  
    int playReset)
```

Triggered on mediaStream play

#### Parameters:

stream - mediaStream  
streamName - streamName  
playStart - playStart offset  
playLen - playLen

(continued from last page)

playReset - reset playlist

---

## onPublish

```
public void onPublish(IMediaStream stream,  
    String streamName,  
    boolean isRecord,  
    boolean isAppend)
```

Triggered on mediaStream publish

### Parameters:

stream - mediaStream  
streamName - streamName  
isRecord - recording stream  
isAppend - appending to file

---

## onUnPublish

```
public void onUnPublish(IMediaStream stream,  
    String streamName,  
    boolean isRecord,  
    boolean isAppend)
```

Triggered on mediaStream unpublish

### Parameters:

stream - mediaStream  
streamName - streamName  
isRecord - recording stream  
isAppend - appending to file

---

## onPause

```
public void onPause(IMediaStream stream,  
    boolean isPause,  
    double location)
```

Triggered on mediaStream pause

### Parameters:

stream - mediaStream  
isPause - pause or unpause  
location - location (milliseconds)

---

## onSeek

```
public void onSeek(IMediaStream stream,  
    double location)
```

Triggered on mediaStream seek

### Parameters:

stream - mediaStream  
location - location (milliseconds)

---

## onStop

```
public void onStop(IMediaStream stream)
```

(continued from last page)

Triggered on mediaStream stop

**Parameters:**

stream - mediaStream

## com.wowza.wms.stream Interface IMediaStreamActionNotify2

All Superinterfaces:

[IMediaStreamActionNotify](#)

All Subinterfaces:

[IMediaStreamActionNotify3](#)

All Known Implementing Classes:

[MediaStreamActionNotifyBase](#)

public interface **IMediaStreamActionNotify2**  
extends [IMediaStreamActionNotify](#)

### Method Summary

void	<a href="#">onMetaData</a> ( <a href="#">IMediaStream</a> stream, <a href="#">AMFPacket</a> metaDataPacket) Triggered when a published streams metadata is set or changes
void	<a href="#">onPauseRaw</a> ( <a href="#">IMediaStream</a> stream, boolean isPause, double location) Triggered on mediaStream pauseRaw.

Methods inherited from interface [com.wowza.wms.stream.IMediaStreamActionNotify](#)

[onPause](#), [onPlay](#), [onPublish](#), [onSeek](#), [onStop](#), [onUnPublish](#)

### Methods

#### onMetaData

```
public void onMetaData(IMediaStream stream,  
    AMFPacket metaDataPacket)
```

Triggered when a published streams metadata is set or changes

#### onPauseRaw

```
public void onPauseRaw(IMediaStream stream,  
    boolean isPause,  
    double location)
```

Triggered on mediaStream pauseRaw. The pauseRaw method is called when a pause occurs in the player.

##### Parameters:

stream - mediaStream  
isPause - pause or unpause  
location - location (milliseconds)

## com.wowza.wms.stream Interface IMediaStreamActionNotify3

All Superinterfaces:

[IMediaStreamActionNotify2](#), [IMediaStreamActionNotify](#)

All Known Implementing Classes:

[MediaStreamActionNotifyBase](#), [MediaStreamActionNotify3Base](#)

public interface **IMediaStreamActionNotify3**  
extends [IMediaStreamActionNotify2](#)

### Method Summary

void	<a href="#">onCodecInfoAudio</a> ( <a href="#">IMediaStream</a> stream, <a href="#">com.wowza.wms.media.model.MediaCodecInfoAudio</a> codecInfoAudio) Triggered when publishing stream receives codec information.
void	<a href="#">onCodecInfoVideo</a> ( <a href="#">IMediaStream</a> stream, <a href="#">com.wowza.wms.media.model.MediaCodecInfoVideo</a> codecInfoVideo) Triggered when publishing stream receives codec information.

Methods inherited from interface [com.wowza.wms.stream.IMediaStreamActionNotify2](#)

[onMetaData](#), [onPauseRaw](#)

Methods inherited from interface [com.wowza.wms.stream.IMediaStreamActionNotify](#)

[onPause](#), [onPlay](#), [onPublish](#), [onSeek](#), [onStop](#), [onUnPublish](#)

### Methods

#### onCodecInfoVideo

```
public void onCodecInfoVideo(IMediaStream stream,  
    com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo)
```

Triggered when publishing stream receives codec information.

**Parameters:**

stream - mediaStream

codecInfoVideo - video codec information

#### onCodecInfoAudio

```
public void onCodecInfoAudio(IMediaStream stream,  
    com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio)
```

Triggered when publishing stream receives codec information.

**Parameters:**

stream - mediaStream

(continued from last page)

codecInfoAudio - video codec information

com.wowza.wms.stream

# Interface IMediaStreamCallback

public interface **IMediaStreamCallback**  
extends

IMediaStreamCallback: callback interface used by IMediaStream registerCallback, registerOnStatus, registerOnPlayStatus

Method Summary	
void	<div><div>onCallback(<a href="#">IMediaStream</a> stream, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params)</div><div>Triggered on callback event</div></div>

## Methods

### onCallback

```
public void onCallback(IMediaStream stream,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Triggered on callback event

**Parameters:**

- stream - mediaStream
- function - function that triggered callback
- params - function parameters

## com.wowza.wms.stream Interface IMediaStreamFileMapper

public interface **IMediaStreamFileMapper**  
extends

Interface for mapping a IMediaStream to the underlying file system. Implement this interface and set your class using `IApplicationInstance.setStreamFileMapper(IMediaStreamFileMapper streamFileMapper)`. Your class will then be called each time a stream needs to be mapped to the underlying file system.

### Method Summary

java.io.File	<a href="#"><code>streamToFileForRead(IMediaStream stream)</code></a> Get the File object to read from a stream (get stream name, ext and query from stream object)
java.io.File	<a href="#"><code>streamToFileForRead(IMediaStream stream, String name, String ext, String query)</code></a> Get the File object to read from a stream (specify name, ext and query)
java.io.File	<a href="#"><code>streamToFileForWrite(IMediaStream stream)</code></a> Get the File object to write to a stream (get stream name, ext and query from stream object)
java.io.File	<a href="#"><code>streamToFileForWrite(IMediaStream stream, String name, String ext, String query)</code></a> Get the File object to write to a stream (specify name, ext and query)

### Methods

#### **streamToFileForRead**

```
public java.io.File streamToFileForRead(IMediaStream stream,  
    String name,  
    String ext,  
    String query)
```

Get the File object to read from a stream (specify name, ext and query)

**Parameters:**

stream - stream  
name - stream name  
ext - stream prefix (Ex. mp4:)  
query - query part of stream name (Ex. mystream?param1=value1)

**Returns:**

resultant File object

#### **streamToFileForRead**

```
public java.io.File streamToFileForRead(IMediaStream stream)
```

Get the File object to read from a stream (get stream name, ext and query from stream object)

**Parameters:**

---

(continued from last page)

stream - stream

**Returns:**

resultant File object

---

## streamToFileForWrite

```
public java.io.File streamToFileForWrite(IMediaStream stream,  
    String name,  
    String ext,  
    String query)
```

Get the File object to write to a stream (specify name, ext and query)

**Parameters:**

stream - stream

name - stream name

ext - stream prefix (Ex. mp4:)

query - query part of stream name (Ex. mystream?param1=value1)

**Returns:**

resultant File object

---

## streamToFileForWrite

```
public java.io.File streamToFileForWrite(IMediaStream stream)
```

Get the File object to write to a stream (get stream name, ext and query from stream object)

**Parameters:**

stream - stream

**Returns:**

resultant File object

com.wowza.wms.stream

Interface IMediaStreamH264SEINotify

public interface IMediaStreamH264SEINotify

extends

Method Summary	
void	<a href="#">onVideoH264Packet</a> ( <a href="#">IMediaStream</a> stream, <a href="#">AMFPacket</a> packet, <a href="#">com.wowza.wms.media.h264.H264SEIMessages</a> seiMessages)

Methods

onVideoH264Packet

public void **onVideoH264Packet**([IMediaStream](#) stream, [AMFPacket](#) packet, [com.wowza.wms.media.h264.H264SEIMessages](#) seiMessages)

---

**com.wowza.wms.stream****Interface IMediaStreamLivePacketNotify**

All Known Implementing Classes:

[MediaStreamLivePacketNotifyBase](#)

---

**public interface IMediaStreamLivePacketNotify**

extends

---

**Method Summary**

void	<a href="#">onLivePacket</a> ( <a href="#">IMediaStream</a> stream, <a href="#">AMFPacket</a> packet)
------	---

---

**Methods****onLivePacket**

```
public void onLivePacket(IMediaStream stream,  
    AMFPacket packet)
```

com.wowza.wms.stream

# Interface IMediaStreamMediaCaster

public interface **IMediaStreamMediaCaster**  
extends

IMediaStreamMediaCaster: Internal use

Method Summary	
<a href="#">IMediaCaster</a>	<a href="#">getMediaCaster()</a>
void	<a href="#">setMediaCasterItem(MediaCasterItem mediaCasterItem)</a>

## Methods

### setMediaCasterItem

public void **setMediaCasterItem**([MediaCasterItem](#) mediaCasterItem)

### getMediaCaster

public [IMediaCaster](#) **getMediaCaster**()

---

**com.wowza.wms.stream****Interface IMediaStreamMetaDataProvider**

---

public interface **IMediaStreamMetaDataProvider**  
extends

IMediaStreamMetaDataProvider: Live streaming metadata provider.

---

## Method Summary

void	<a href="#"><code>onStreamStart</code></a> (java.util.List metaDataList, long timecode) Called to get the onMetadata data at a particular point in time in the stream
------	--

---

## Methods

### **onStreamStart**

```
public void onStreamStart(java.util.List metaDataList,  
    long timecode)
```

Called to get the onMetadata data at a particular point in time in the stream

**Parameters:**

metaDataList - list of onMetadata data (should always be one item in list)  
timecode - timecode in milliseconds

## com.wowza.wms.stream Interface IMediaStreamNameAliasProvider

All Subinterfaces:

[IMediaStreamNameAliasProvider2](#)

All Known Implementing Classes:

[MediaStreamNameAliasProviderBase](#)

---

public interface **IMediaStreamNameAliasProvider**  
extends

IMediaStreamNameAliasProvider: alias provider interface. See `IApplication.setStreamNameAliasProvider(IMediaStreamNameAliasProvider streamNameAliasProvider)`. See updated interface `IMediaStreamNameAliasProvider2` which provides more complete context information.

---

### Method Summary

String	<a href="#">resolvePlayAlias</a> ( <a href="#">IApplicationInstance</a> appInstance, String name) Called to resolve a play alias
String	<a href="#">resolveStreamAlias</a> ( <a href="#">IApplicationInstance</a> appInstance, String name) Called to resolve a stream alias

---

### Methods

#### resolvePlayAlias

```
public String resolvePlayAlias(IApplicationInstance appInstance,  
    String name)
```

Called to resolve a play alias

**Parameters:**

appInstance - applicationInstance  
name - stream name

**Returns:**

resultant name, null if want to block playback

---

#### resolveStreamAlias

```
public String resolveStreamAlias(IApplicationInstance appInstance,  
    String name)
```

Called to resolve a stream alias

**Parameters:**

appInstance - applicationInstance  
name - stream name

**Returns:**

(continued from last page)

resultant name, null if want to block playback

## com.wowza.wms.stream Interface IMediaStreamNameAliasProvider2

All Superinterfaces:

[IMediaStreamNameAliasProvider](#)

All Known Implementing Classes:

[MediaStreamNameAliasProviderBase](#)

public interface **IMediaStreamNameAliasProvider2**

extends [IMediaStreamNameAliasProvider](#)

IMediaStreamNameAliasProvider: alias provider interface. See

`IApplication.setStreamNameAliasProvider(IMediaStreamNameAliasProvider streamNameAliasProvider)`.

### Method Summary

String	<a href="#">resolvePlayAlias</a> ( <a href="#">IApplicationInstance</a> appInstance, String name, <a href="#">IClient</a> client) Resolve play alias for RTMP streaming
String	<a href="#">resolvePlayAlias</a> ( <a href="#">IApplicationInstance</a> appInstance, String name, <a href="#">IHTTPStreamerSession</a> httpSession) Resolve play alias for HTTP streaming.
String	<a href="#">resolvePlayAlias</a> ( <a href="#">IApplicationInstance</a> appInstance, String name, <a href="#">ILiveStreamPacketizer</a> liveStreamPacketizer) Resolve play alias for live stream packetizer
String	<a href="#">resolvePlayAlias</a> ( <a href="#">IApplicationInstance</a> appInstance, String name, <a href="#">RTPSession</a> rtpSession) Resolve play alias for RTSP/RTP streaming
String	<a href="#">resolveStreamAlias</a> ( <a href="#">IApplicationInstance</a> appInstance, String name, <a href="#">IMediaCaster</a> mediaCaster) Resolve stream alias for MediaCaster

Methods inherited from interface [com.wowza.wms.stream.IMediaStreamNameAliasProvider](#)

[resolvePlayAlias](#), [resolveStreamAlias](#)

### Methods

#### resolvePlayAlias

```
public String resolvePlayAlias(IApplicationInstance appInstance,
    String name,
    IClient client)
```

Resolve play alias for RTMP streaming

**Parameters:**

appInstance - application instance  
name - stream name

(continued from last page)

client - client interface

**Returns:**

resultant name, null if want to block playback

---

**resolvePlayAlias**

```
public String resolvePlayAlias(IApplicationInstance appInstance,  
    String name,  
    IHTTPStreamerSession httpSession)
```

Resolve play alias for HTTP streaming. This callback may be called when there is not a valid HTTP session. In this case a phantom HTTP session will be created and will be populated with information from the underlying HTTP request (such as IP address and query string) but the session Id will be null.

**Parameters:**

appInstance - application instance  
name - name  
httpSession - HTTP session

**Returns:**

resultant name, null if want to block playback

---

**resolvePlayAlias**

```
public String resolvePlayAlias(IApplicationInstance appInstance,  
    String name,  
    RTPSession rtpSession)
```

Resolve play alias for RTSP/RTP streaming

**Parameters:**

appInstance - application instance  
name - name  
rtpSession - RTP session

**Returns:**

resultant name, null if want to block playback

---

**resolvePlayAlias**

```
public String resolvePlayAlias(IApplicationInstance appInstance,  
    String name,  
    ILiveStreamPacketizer liveStreamPacketizer)
```

Resolve play alias for live stream packetizer

**Parameters:**

appInstance - application instance  
name - name  
liveStreamPacketizer - live stream packetizer

**Returns:**

resultant name, null if want to block playback

---

**resolveStreamAlias**

```
public String resolveStreamAlias(IApplicationInstance appInstance,  
    String name,  
    IMediaCaster mediaCaster)
```

(continued from last page)

Resolve stream alias for MediaCaster

**Parameters:**

appInstance - application instance  
name - name  
mediaCaster - media caster

**Returns:**

resultant name, null if want to block playback

## com.wowza.wms.stream Interface IMediaStreamNotify

public interface **IMediaStreamNotify**  
extends

IMediaStreamNotify: listener interface used by IApplicationInstance addMediaStreamListener

### Method Summary

void	<a href="#">onMediaStreamCreate</a> ( <a href="#">IMediaStream</a> stream) Triggered when mediaStream created
void	<a href="#">onMediaStreamDestroy</a> ( <a href="#">IMediaStream</a> stream) Triggered when mediaStream destroyed

### Methods

#### onMediaStreamCreate

public void **onMediaStreamCreate**([IMediaStream](#) stream)

Triggered when mediaStream created

**Parameters:**

stream - mediaStream

#### onMediaStreamDestroy

public void **onMediaStreamDestroy**([IMediaStream](#) stream)

Triggered when mediaStream destroyed

**Parameters:**

stream - mediaStream

## com.wowza.wms.stream Interface IMediaStreamPlay

public interface **IMediaStreamPlay**  
extends

IMediaStreamPlay: public interface of mediaStreamPlayer object.

### Field Summary

public static final	<a href="#"><u>PAUSE_PAUSE</u></a> Pause type: pause Value: <b>1</b>
public static final	<a href="#"><u>PAUSE_PLAY</u></a> Pause type: play Value: <b>0</b>
public static final	<a href="#"><u>PAUSE_TOGGLE</u></a> Pause type: toggle Value: <b>-1</b>
public static final	<a href="#"><u>PLAYSIZES_AUDIO_BYTES</u></a> IMediaReader sizes array: audio byte count Value: <b>0</b>
public static final	<a href="#"><u>PLAYSIZES_AUDIO_COUNT</u></a> IMediaReader sizes array: audio packet count Value: <b>1</b>
public static final	<a href="#"><u>PLAYSIZES_DATA_BYTES</u></a> IMediaReader sizes array: data byte count Value: <b>4</b>
public static final	<a href="#"><u>PLAYSIZES_DATA_COUNT</u></a> IMediaReader sizes array: data packet count Value: <b>5</b>
public static final	<a href="#"><u>PLAYSIZES_LOSS_BYTES</u></a> IMediaReader sizes array: data byte count Value: <b>6</b>
public static final	<a href="#"><u>PLAYSIZES_LOSS_COUNT</u></a> IMediaReader sizes array: data packet count Value: <b>7</b>
public static final	<a href="#"><u>PLAYSIZES_SIZE</u></a> IMediaReader sizes array: size of sizes array long[PLAYSIZES_SIZE] Value: <b>8</b>
public static final	<a href="#"><u>PLAYSIZES_VIDEO_BYTES</u></a> IMediaReader sizes array: video byte count Value: <b>2</b>

public static final	<a href="#">PLAYSIZES_VIDEO_COUNT</a> IMediaReader sizes array: video packet count Value: <b>3</b>
public static final	<a href="#">PLAYSTATUSTYPE_COMPLETE</a> onPlayStatus type: complete Value: <b>2</b>
public static final	<a href="#">PLAYSTATUSTYPE_STOP</a> onPlayStatus type: stop Value: <b>3</b>
public static final	<a href="#">PLAYSTATUSTYPE_SWITCH</a> onPlayStatus type: switch Value: <b>1</b>

## Method Summary

void	<a href="#">close()</a> Close mediaStreamPlay
<a href="#">IMediaStream</a>	<a href="#">getParent()</a> Get the parent media stream object
void	<a href="#">init</a> ( <a href="#">IMediaStream</a> parent, <a href="#">MediaStreamMap</a> streams) Initialize mediaStreamPlayer
void	<a href="#">initLiveStreamRepeating</a> (String liveStreamPacketizer, String liveStreamRepeater) Initialize this stream for live stream repeating
void	<a href="#">interruptPlay()</a> Interrupt play to perform operation.
double	<a href="#">length()</a> Get stream length/seconds (seconds)
void	<a href="#">pause</a> (int pauseType, long timecode) pause mediaPlayStream
void	<a href="#">pauseRaw</a> (int pauseType, long timecode) pauseRaw mediaPlayStream
boolean	<a href="#">play()</a> Return true if there are packets to play
int	<a href="#">play</a> (java.io.OutputStream out, <a href="#">AMFObj</a> wmsObjAudio, <a href="#">AMFObj</a> wmsObjVideo, <a href="#">AMFObj</a> wmsObjData, long[] sizes) Write new packets or play packets
void	<a href="#">reset</a> (boolean isReset) Reset mediaStreamPlayer
void	<a href="#">resetNoLookup()</a> Reset but do not lookup current position in live stream
void	<a href="#">seek</a> (int location) seek mediaPlayStream

void	<a href="#"><code>setBufferTime</code></a> (int bufferTime) Set buffer time
void	<a href="#"><code>setName</code></a> (String name, String oldName, String ext, String queryStr, double playStart, double playLen, int playTransition) Set mediaPlayStream name, extension, query string, play start, play len, play reset
void	<a href="#"><code>shutdown</code></a> () Shutdown mediaStreamPlayer
long	<a href="#"><code>size</code></a> () Get stream media file size
void	<a href="#"><code>startPlay</code></a> () Start playing stream
void	<a href="#"><code>stopName</code></a> (String name, String oldName, String ext, String queryStr, double playStart, double playLen, int playTransition) Stop stream name
void	<a href="#"><code>switchName</code></a> (String name, String oldName, String ext, String queryStr, double playStart, double playLen, int playTransition) Switch to stream name
void	<a href="#"><code>switchPlay</code></a> ()
void	<a href="#"><code>updateLoggingValues</code></a> () Update internal logging values

## Fields

### PAUSE\_PAUSE

public static final int **PAUSE\_PAUSE**

Pause type: pause  
Constant value: **1**

### PAUSE\_TOGGLE

public static final int **PAUSE\_TOGGLE**

Pause type: toggle  
Constant value: **-1**

### PAUSE\_PLAY

public static final int **PAUSE\_PLAY**

Pause type: play  
Constant value: **0**

### PLAYSTATUSTYPE\_SWITCH

public static final int **PLAYSTATUSTYPE\_SWITCH**

onPlayStatus type: switch

(continued from last page)

Constant value: **1**

---

## PLAYSTATUSTYPE\_COMPLETE

```
public static final int PLAYSTATUSTYPE_COMPLETE
```

onPlayStatus type: complete  
Constant value: **2**

---

## PLAYSTATUSTYPE\_STOP

```
public static final int PLAYSTATUSTYPE_STOP
```

onPlayStatus type: stop  
Constant value: **3**

---

## PLAYSIZES\_AUDIO\_BYTES

```
public static final int PLAYSIZES_AUDIO_BYTES
```

IMediaReader sizes array: audio byte count  
Constant value: **0**

---

## PLAYSIZES\_AUDIO\_COUNT

```
public static final int PLAYSIZES_AUDIO_COUNT
```

IMediaReader sizes array: audio packet count  
Constant value: **1**

---

## PLAYSIZES\_VIDEO\_BYTES

```
public static final int PLAYSIZES_VIDEO_BYTES
```

IMediaReader sizes array: video byte count  
Constant value: **2**

---

## PLAYSIZES\_VIDEO\_COUNT

```
public static final int PLAYSIZES_VIDEO_COUNT
```

IMediaReader sizes array: video packet count  
Constant value: **3**

---

## PLAYSIZES\_DATA\_BYTES

```
public static final int PLAYSIZES_DATA_BYTES
```

IMediaReader sizes array: data byte count  
Constant value: **4**

---

## PLAYSIZES\_DATA\_COUNT

```
public static final int PLAYSIZES_DATA_COUNT
```

IMediaReader sizes array: data packet count  
Constant value: **5**

---

(continued from last page)

---

## PLAYSIZES\_LOSS\_BYTES

```
public static final int PLAYSIZES_LOSS_BYTES
```

IMediaReader sizes array: data byte count  
Constant value: **6**

---

## PLAYSIZES\_LOSS\_COUNT

```
public static final int PLAYSIZES_LOSS_COUNT
```

IMediaReader sizes array: data packet count  
Constant value: **7**

---

## PLAYSIZES\_SIZE

```
public static final int PLAYSIZES_SIZE
```

IMediaReader sizes array: size of sizes array long[PLAYSIZES\_SIZE]  
Constant value: **8**

---

## Methods

### init

```
public void init(IMediaStream parent,  
                 MediaStreamMap streams)
```

Initialize mediaStreamPlayer

**Parameters:**

parent - parent mediaStream object  
streams - parent mediaStreamMap

---

### shutdown

```
public void shutdown()
```

Shutdown mediaStreamPlayer

---

### reset

```
public void reset(boolean isReset)
```

Reset mediaStreamPlayer

**Parameters:**

isReset - is this a playlist reset or addition, true if reset

---

### resetNoLookup

```
public void resetNoLookup()
```

Reset but do not lookup current position in live stream

---

(continued from last page)

## play

```
public int play(java.io.OutputStream out,
    AMFObj wmsObjAudio,
    AMFObj wmsObjVideo,
    AMFObj wmsObjData,
    long[] sizes)
```

Write new packets or play packets

### Parameters:

out - OutputStream  
wmsObjAudio - audio response channel  
wmsObjVideo - video response channel  
wmsObjData - data response channel  
sizes - sizes array. See IMediaStreamPlay.PLAYSIZES\_\*

### Returns:

total byte output

## play

```
public boolean play()
```

Return true if there are packets to play

### Returns:

true if packets to play

## seek

```
public void seek(int location)
```

seek mediaPlayStream

### Parameters:

location - timecode (milliseconds)

## pause

```
public void pause(int pauseType,
    long timecode)
```

pause mediaPlayStream

### Parameters:

pauseType - pause type. See IMediaStreamPlay.PAUSE\_\*  
timecode - timecode (milliseconds)

## pauseRaw

```
public void pauseRaw(int pauseType,
    long timecode)
```

pauseRaw mediaPlayStream

### Parameters:

pauseType - pause type. See IMediaStreamPlay.PAUSE\_\*  
timecode - timecode (milliseconds)

## setBufferTime

```
public void setBufferTime(int bufferTime)
```

Set buffer time

**Parameters:**

bufferTime

---

## setName

```
public void setName(String name,  
    String oldName,  
    String ext,  
    String queryStr,  
    double playStart,  
    double playLen,  
    int playTransition)
```

Set mediaPlayStream name, extension, query string, play start, play len, play reset

**Parameters:**

name - stream name  
oldName - old stream name  
ext - extension  
queryStr - query string  
playStart - play start  
playLen - play len  
playTransition - play reset

---

## switchName

```
public void switchName(String name,  
    String oldName,  
    String ext,  
    String queryStr,  
    double playStart,  
    double playLen,  
    int playTransition)
```

Switch to stream name

**Parameters:**

name - stream name  
oldName - old stream name  
ext - stream extension  
queryStr - query string  
playStart - play start  
playLen - play len  
playTransition - play transition (see MediaBase.PLAYTRANSITION\_\*)

---

## stopName

```
public void stopName(String name,  
    String oldName,  
    String ext,  
    String queryStr,  
    double playStart,  
    double playLen,  
    int playTransition)
```

(continued from last page)

Stop stream name

**Parameters:**

name - stream name  
oldName - old stream name  
ext - stream extension  
queryStr - query string  
playStart - play start  
playLen - play len  
playTransition - play transition (see MediaBase.PLAYTRANSITION\_\*)

---

**close**

```
public void close()
```

Close mediaStreamPlay

---

**interruptPlay**

```
public void interruptPlay()
```

Interrupt play to perform operation. Usually for seek or pause.

---

**startPlay**

```
public void startPlay()
```

Start playing stream

---

**switchPlay**

```
public void switchPlay()
```

---

**updateLoggingValues**

```
public void updateLoggingValues()
```

Update internal logging values

---

**length**

```
public double length()
```

Get stream length/seconds (seconds)

**Returns:**

length/duration (seconds)

---

**size**

```
public long size()
```

Get stream media file size

**Returns:**

media file size

## getParent

```
public IMediaStream getParent()
```

Get the parent media stream object

**Returns:**

parent media stream object

---

## initLiveStreamRepeating

```
public void initLiveStreamRepeating(String liveStreamPacketizer,  
    String liveStreamRepeater)
```

Initialize this stream for live stream repeating

**Parameters:**

liveStreamPacketizer - live stream packetizer

liveStreamRepeater - live stream repeater name

---

**com.wowza.wms.stream****Interface IMediaStreamTimecodeControl**

---

public interface **IMediaStreamTimecodeControl**

### **Interface IMediaWriter**

---

public interface **IMediaWriter**  
extends

IMediaWriter: generic media writer interface. The flv recording system using this interface to persist .flv data captured from the Flash client. These classes are referenced in [\[install-dir\]/conf/MediaWriters.xml](#).

### Example IMediaWriter implementation: MediaWriterFLVBasic

This is a basic IMediaWriter implementation that can handle record and append.

void	<a href="#"><u>setVersionFile()</u></a> (boolean versionFile) Set to true if the old file is to be versioned
void	<a href="#"><u>setWaitForVideoKeyFrame()</u></a> (boolean waitForVideoKeyFrame) Set to true if you want the recorder to skip opening frames until it hits a key frame
void	<a href="#"><u>writePackets()</u></a> (java.util.List audioPackets, java.util.List videoPackets, java.util.List dataPackets, java.util.List audioTCs, java.util.List videoTCs, java.util.List dataTCs, java.util.List dataTypes, boolean isFirst, boolean isLast) Invoked each time a set of packets are ready to be presisted.

## Methods

### writePackets

```
public void writePackets(java.util.List audioPackets,  
    java.util.List videoPackets,  
    java.util.List dataPackets,  
    java.util.List audioTCs,  
    java.util.List videoTCs,  
    java.util.List dataTCs,  
    java.util.List dataTypes,  
    boolean isFirst,  
    boolean isLast)
```

Invoked each time a set of packets are ready to be persisted.

**Parameters:**

audioPackets - List of audio packets

videoPackets - List of video packets

dataPackets - List of data packets

audioTCs - List of audio timecodes

videoTCs - List of video timecodes

dataTCs - List of data timecodes

dataTypes - list of integer packets types (IVHost.CONTENTTYPE\_DATA0, IVHost.CONTENTTYPE\_DATA3) - if null assumed to be IVHost.CONTENTTYPE\_DATA0

isFirst - true if first packet to be written

isLast - false if last packet to be written

---

### setMediaWriterItem

```
public void setMediaWriterItem(MediaWriterItem mediaWriterItem)
```

Set the media write definition

**Parameters:**

mediaWriterItem - media write definition

---

### setParent

```
public void setParent(IMediaStream parent)
```

Set the parent stream for this media write object

**Parameters:**

parent

---

### isVersionFile

```
public boolean isVersionFile()
```

Return true if the old file is to be versioned

**Returns:**

true if the old file is to be versioned

---

(continued from last page)

---

## setVersionFile

```
public void setVersionFile(boolean versionFile)
```

Set to true if the old file is to be versioned

### Parameters:

versionFile

---

## isWaitForVideoKeyFrame

```
public boolean isWaitForVideoKeyFrame()
```

get wait for key frame

### Returns:

wait for key frame

---

## setWaitForVideoKeyFrame

```
public void setWaitForVideoKeyFrame(boolean waitForVideoKeyFrame)
```

Set to true if you want the recorder to skip opening frames until it hits a key frame

### Parameters:

waitForVideoKeyFrame - wait for key frame

---

## putMetaData

```
public void putMetaData(String name,  
    AMFData value)
```

Add metadata to the metadata packet. Only metadata added before the first call to writePackets will be included in the file

### Parameters:

name - field name

value - metadata value

---

## getDuration

```
public long getDuration()
```

Get the recorded duration of the file in seconds

### Returns:

recorded duration of the file in seconds

---

## isAudioWaitForVideoKeyFrame

```
public boolean isAudioWaitForVideoKeyFrame()
```

Set to true if waiting for first video key frame to start recording audio

### Returns:

true if waiting for first video key frame to start recording audio

---

(continued from last page)

## setAudioWaitForVideoKeyFrame

```
public void setAudioWaitForVideoKeyFrame(boolean audioWaitForVideoKeyFrame)
```

Set to true if waiting for first video key frame to start recording audio

### Parameters:

audioWaitForVideoKeyFrame - true if waiting for first video key frame to start recording audio

---

## isDataWaitForVideoKeyFrame

```
public boolean isDataWaitForVideoKeyFrame()
```

---

## setDataWaitForVideoKeyFrame

```
public void setDataWaitForVideoKeyFrame(boolean dataWaitForVideoKeyFrame)
```

---

## isUseCalculatedAudioTimecodes

```
public boolean isUseCalculatedAudioTimecodes()
```

Set to true to calculate timecodes based on samples per-frame (more accurate, default is true)

### Returns:

true to calculate timecodes based on samples per-frame

---

## setUseCalculatedAudioTimecodes

```
public void setUseCalculatedAudioTimecodes(boolean calculateTimecodes)
```

Set to true to calculate timecodes based on samples per-frame (more accurate, default is true)

### Parameters:

calculateTimecodes - true to calculate timecodes based on samples per-frame

---

IApplicationInstance.addMediaWriterListener(IMediaWriterActionNotify listener)

### Method Summary

void	<a href="#">onFLVAddMetadata</a> ( <a href="#">IMediaStream</a> stream, java.util.Map extraMetadata) Called just before metadata is written to the file (FLV only)
void	<a href="#">onWriteComplete</a> ( <a href="#">IMediaStream</a> stream, java.io.File file) Called when writing is complete

### Methods

#### onWriteComplete

```
public void onWriteComplete(IMediaStream stream,  
    java.io.File file)
```

Called when writing is complete

**Parameters:**

stream - stream  
file - file handle

#### onFLVAddMetadata

```
public void onFLVAddMetadata(IMediaStream stream,  
    java.util.Map extraMetadata)
```

Called just before metadata is written to the file (FLV only)

**Parameters:**

stream - stream  
extraMetadata - additional metadata, add to this collection to add items to onMetadata event written to FLV file.

## com.wowza.wms.stream Class MediaReaderActionNotifyBase

java.lang.Object

└─com.wowza.wms.stream.MediaReaderActionNotifyBase

All Implemented Interfaces:

[IMediaReaderActionNotify](#)

public abstract class **MediaReaderActionNotifyBase**

extends Object

implements [IMediaReaderActionNotify](#)

Abstract base class for IMediaReaderActionNotify interface

### Constructor Summary

public	<a href="#">MediaReaderActionNotifyBase()</a>
--------	---

### Method Summary

void	<a href="#">onMediaReaderClose</a> ( <a href="#">IMediaReader</a> mediaReader, <a href="#">IMediaStream</a> stream)
void	<a href="#">onMediaReaderCreate</a> ( <a href="#">IMediaReader</a> mediaReader)

## com.wowza.wms.stream Class MediaStreamLivePacketNotifyBase

java.lang.Object

└─com.wowza.wms.stream.MediaStreamLivePacketNotifyBase

All Implemented Interfaces:

[IMediaStreamLivePacketNotify](#)

public abstract class **MediaStreamLivePacketNotifyBase**

extends Object

implements [IMediaStreamLivePacketNotify](#)

### Constructor Summary

public	<a href="#">MediaStreamLivePacketNotifyBase()</a>
--------	---

### Method Summary

void	<a href="#">onLivePacket</a> ( <a href="#">IMediaStream</a> stream, <a href="#">AMFPacket</a> packet)
------	---

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

Methods inherited from interface [com.wowza.wms.stream.IMediaStreamLivePacketNotify](#)

[onLivePacket](#)

### Constructors

#### MediaStreamLivePacketNotifyBase

public **MediaStreamLivePacketNotifyBase**()

### Methods

#### onLivePacket

public void **onLivePacket**([IMediaStream](#) stream, [AMFPacket](#) packet)

## com.wowza.wms.stream

### Class MediaStreamMap

java.lang.Object

└─com.wowza.wms.stream.MediaStreamMap

public class **MediaStreamMap**  
extends Object

MediaStreamMap: collection of IMediaStream object. This collection is usually attached to an IApplicationInstance object.

#### Field Summary

protected	<a href="#">appInstance</a>
public	<a href="#">debugDVRShutdown</a>
protected	<a href="#">dvrRecorders</a>

--------	--

## Method Summary

LicenseHolder	<a href="#">addLicense</a> ( <a href="#">ILiveStreamPacketizer</a> liveStreamPacketizer, int licenseType)
LicenseHolder	<a href="#">addLicense</a> ( <a href="#">IMediaStream</a> stream, int licenseType)
void	<a href="#">addMediaStreamListener</a> ( <a href="#">IMediaStreamNotify</a> mediaStreamListener) Add a media stream listener.
MediaStreamMapGroup	<a href="#">addNameGroup</a> (MediaStreamMapGroup newGroup)
void	<a href="#">broadcastPlayMessage</a> ( <a href="#">IMediaStream</a> stream, long timecode, <a href="#">java.nio.ByteBuffer</a> msg, int objectEncoding) Send a broadcast message to all play stream that are listening to this live published stream.
int	<a href="#">broadcastGetObjectEncoding</a> ( <a href="#">IMediaStream</a> stream) Get the minimum object encoding level for the clients playing this stream.
void	<a href="#">clearStreamName</a> (String name) Unregister a published live media stream name.
void	<a href="#">clearStreamName</a> (String name, <a href="#">IMediaStream</a> stream) Unregister a published live media stream name.
void	<a href="#">doWatchdog</a> ()
<a href="#">IApplicationInstance</a>	<a href="#">getAppInstance</a> () Get the parent applicationInstance.
String	<a href="#">getAppInstanceName</a> () Get the name of the parent applicationInstance.
String	<a href="#">getAppName</a> () Get the name of the parent application.
int	<a href="#">getCount</a> () Get the total number of streams stored in the mediaStreamMap
<a href="#">ILiveStreamDvrRecorder</a>	<a href="#">getDvrRecorder</a> (String streamName, String recorderName, boolean doCreate) Get a DVR recorder by name and recorder name
java.util.List	<a href="#">getDvrRecorders</a> () Returns a list of <a href="#">ILiveStreamDvrRecorder</a> objects

<a href="#"><u>ILiveStreamPacketizer</u></a>	<a href="#"><u>getLiveStreamPacketizer</u></a> (String streamName, String packetizerName, boolean doCreate) Get a live stream packetizer by name and packetizer id
Object	<a href="#"><u>getLiveStreamPacketizerLock</u></a> () Get the lock to the live stream packetizer system
MediaStreamMapGroup	<a href="#"><u>getNameGroupByGroupName</u></a> (String groupName)
int	<a href="#"><u>getNameGroupRemoveDelayTime</u></a> ()
java.util.Set	<a href="#"><u>getNameGroups</u></a> ()
java.util.Set	<a href="#"><u>getNameGroups</u></a> (String streamName)
java.util.Set	<a href="#"><u>getNameGroupStreamNames</u></a> (String streamName)
long	<a href="#"><u>getNextNameGroupId</u></a> (MediaStreamMapGroup newGroup)
int	<a href="#"><u>getNextStreamIndex</u></a> () Reserve a clientless stream id for a new media stream.
int	<a href="#"><u>getNextStreamIndex</u></a> ( <a href="#"><u>IClient</u></a> client) Reserve a stream for a client connection.
int	<a href="#"><u>getNextStreamIndex</u></a> ( <a href="#"><u>INetConnection</u></a> netConnection) Reserve a stream for a netConnection connection.
java.util.List	<a href="#"><u>getPublishStreamNames</u></a> () Returns a List of published stream names
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getStream</u></a> ( <a href="#"><u>IClient</u></a> client, int index) Get a media stream reference by stream id.
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getStream</u></a> ( <a href="#"><u>IClient</u></a> client, int index, boolean doCreate) Get a media stream reference by stream id.
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getStream</u></a> ( <a href="#"><u>INetConnection</u></a> netConnection, int index) Get a media stream object that is owned by a server to server netConnection object (not yet implemented).
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getStream</u></a> ( <a href="#"><u>INetConnection</u></a> netConnection, int index, boolean doCreate) Get a media stream reference by stream id.
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getStream</u></a> (String name) Get a media stream by stream name.
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getStreamClientless</u></a> (int index, String streamTypeStr) Get a media stream reference by stream id.
edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock	<a href="#"><u>getStreamListLock</u></a> () Get the underlying read/write lock associated with the list of streams

edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock	<a href="#">getStreamNameLock()</a> Get the underlying read/write lock associated with the stream names list
java.util.List	<a href="#">getStreams()</a> Returns a list of IMediaStream objects
<a href="#">IVHost</a>	<a href="#">getVHost()</a> Get the parent vHost.
void	<a href="#">notifyMediaStreamCreate(IMediaStream mediaStream)</a> Notify all media stream listeners that a new media stream object has been created.
void	<a href="#">notifyMediaStreamDestroy(IMediaStream mediaStream)</a> Notify all media stream listeners that a media stream object is being destroyed.
void	<a href="#">notifyPlayPublish(IMediaStream stream)</a> Notify all play streams that are listening to this stream that the stream is going into a state of publish (NetStream.Play.PublishNotify).
void	<a href="#">notifyPlayUnpublish(IMediaStream stream)</a> Notify all play streams that are listening to this stream that the stream is going into a state of unpublished (NetStream.Play.UnpublishNotify).
void	<a href="#">notifyPlayUnpublish(String streamName)</a> Notify all play streams that are listening to this stream name that the stream is going into a state of unpublished (NetStream.Play.UnpublishNotify).
void	<a href="#">removeDvrRecorder(String streamName)</a>
<a href="#">ILiveStreamDvrRecorder</a>	<a href="#">removeDvrRecorder(String streamName, String recorderName)</a> Remove DVR Recorder
void	<a href="#">removeLiveStreamPacketizer(String streamName)</a> Remove all live stream packetizers for this stream name
<a href="#">ILiveStreamPacketizer</a>	<a href="#">removeLiveStreamPacketizer(String streamName, String packetizerName)</a> Remove live stream packetizer
void	<a href="#">removeMediaStreamListener(IMediaStreamNotify mediaStreamListener)</a> Remove a media stream listener.
MediaStreamMapGroup	<a href="#">removeNameGroup(int groupId)</a>
MediaStreamMapGroup	<a href="#">removeNameGroup(MediaStreamMapGroup nameGroup)</a>
void	<a href="#">removeStream(IClient client, int index)</a> Remove a stream associated with a client connection
void	<a href="#">removeStream(INetConnection netConnection, int index)</a> Remove a stream associated with a netConnection object
void	<a href="#">removeStream(int index)</a> Remove a clientless media stream
void	<a href="#">setNameGroupRemoveDelayTime(int nameGroupRemoveDelayTime)</a>

void	<a href="#">setStreamName</a> ( <a href="#">IMediaStream</a> stream, String name) Insert live media stream into the mediaStreamMap by name.
long	<a href="#">streamToIndex</a> ( <a href="#">IMediaStream</a> stream) Get the unique stream identifier for a given stream

**Methods inherited from class** `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Fields

### MAXSTREAMINDEX

```
public static final int MAXSTREAMINDEX

---

(continued from last page)

## dvrRecorders

protected java.util.Map **dvrRecorders**

## debugDVRShutdown

public boolean **debugDVRShutdown**

## Constructors

### MediaStreamMap

public **MediaStreamMap**([IApplicationInstance](#) appInstance)

Create empty MediaStreamMap collection

**Parameters:**

appInstance - parent applicationInstance

## Methods

### getStreamListLock

public edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock  
**getStreamListLock**()

Get the underlying read/write lock associated with the list of streams

**Returns:**

underlying read/write lock associated with the list of streams

### getStreamNameLock

public edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock  
**getStreamNameLock**()

Get the underlying read/write lock associated with the stream names list

**Returns:**

underlying read/write lock associated with the stream names list

### getPublishStreamNames

public java.util.List **getPublishStreamNames**()

Returns a List of published stream names

**Returns:**

List of published stream names

### getStreams

public java.util.List **getStreams**()

(continued from last page)

Returns a list of IMediaStream objects

**Returns:**

list of IMediaStream objects

---

## getStream

```
public IMediaStream getStream(IClient client,  
                               int index)
```

Get a media stream reference by stream id.

**Parameters:**

client - client  
index - stream id

**Returns:**

media stream object or null if does not exist.

---

## getStreamClientless

```
public IMediaStream getStreamClientless(int index,  
                                           String streamTypeStr)
```

Get a media stream reference by stream id. If it does not exist, create a new one with the given id. This is a clientless stream that is served by the backend of the server. If creating a new media stream object, its id must first be obtained by calling [getNextStreamIndex\(\)](#).

**Parameters:**

index - stream id  
streamTypeStr - stream type

**Returns:**

media stream object

---

## getStream

```
public IMediaStream getStream(IClient client,  
                               int index,  
                               boolean doCreate)
```

Get a media stream reference by stream id. If it does not exist, create a new one with the given id. If creating a new media stream object, its id must first be obtained by calling [getNextStreamIndex\(IClient\)](#).

**Parameters:**

client - client  
index - stream id  
doCreate - true to create if it does not exist

**Returns:**

media stream object

---

## getStream

```
public IMediaStream getStream(INetConnection netConnection,  
                               int index)
```

Get a media stream object that is owned by a server to server netConnection object (not yet implemented).

**Parameters:**

(continued from last page)

netConnection - netConnection to remote server  
index - stream id

**Returns:**

media stream object or null if does not exist

---

## getStream

```
public IMediaStream getStream(INetConnection netConnection,  
    int index,  
    boolean doCreate)
```

Get a media stream reference by stream id. If it does not exist, create a new one with the given id. If creating a new media stream object, its id must first be obtained by calling [getNextStreamIndex\(INetConnection\)](#).

**Parameters:**

netConnection - netConnection to remote server  
index - stream id  
doCreate - true to create if it does not exist

**Returns:**

media stream object

---

## getStream

```
public IMediaStream getStream(String name)
```

Get a media stream by stream name. Only published live streams are stored in the mediaStreamMap by name. This method is used to lookup a published live stream by name.

**Parameters:**

name - stream name

**Returns:**

media stream object or null if does not exist

---

## setStreamName

```
public void setStreamName(IMediaStream stream,  
    String name)
```

Insert live media stream into the mediaStreamMap by name.

**Parameters:**

stream - media stream object  
name - media stream name

---

## clearStreamName

```
public void clearStreamName(String name)
```

Unregister a published live media stream name.

**Parameters:**

name - stream name

---

## streamToIndex

```
public long streamToIndex(IMediaStream stream)
```

(continued from last page)

Get the unique stream identifier for a given stream

**Parameters:**

stream - stream

**Returns:**

unique stream identifier

---

## clearStreamName

```
public void clearStreamName(String name,  
    IMediaStream stream)
```

Unregister a published live media stream name.

**Parameters:**

name - stream name

stream - stream

---

## getNextStreamIndex

```
public int getNextStreamIndex(INetConnection netConnection)
```

Reserve a stream for a netConnection connection. Use [getStream\(INetConnection, int, boolean\)](#) to create stream.

**Parameters:**

netConnection

**Returns:**

next stream index

---

## getNextStreamIndex

```
public int getNextStreamIndex(IClient client)
```

Reserve a stream for a client connection. Use [getStream\(IClient, int, boolean\)](#) to create stream.

**Parameters:**

client - parent client

**Returns:**

stream index

---

## getNextStreamIndex

```
public int getNextStreamIndex()
```

Reserve a clientless stream id for a new media stream. Use this method to obtain a stream id for a new media stream object that is then created with a call to getClientlessStream().

**Returns:**

new reserved stream id

---

## getCount

```
public int getCount()
```

Get the total number of streams stored in the mediaStreamMap

(continued from last page)

**Returns:**

total number of streams stored in the mediaStreamMap

---

**removeStream**

```
public void removeStream(INetConnection netConnection,  
    int index)
```

Remove a stream associated with a netConnection object

**Parameters:**

netConnection - net connection

index - stream index

---

**removeStream**

```
public void removeStream(IClient client,  
    int index)
```

Remove a stream associated with a client connection

**Parameters:**

client - client

index - stream index

---

**removeStream**

```
public void removeStream(int index)
```

Remove a clientless media stream

**Parameters:**

index - stream index

---

**getAppName**

```
public String getAppName()
```

Get the name of the parent application.

**Returns:**

parent application name.

---

**getAppInstanceName**

```
public String getAppInstanceName()
```

Get the name of the parent applicationInstance.

**Returns:**

parent applicationInstance name

---

**getVHost**

```
public IVHost getVHost()
```

Get the parent vHost.

(continued from last page)

**Returns:**

parent vHost

---

## getAppInstance

```
public IApplicationInstance getAppInstance( )
```

Get the parent applicationInstance.

**Returns:**

parent applicationInstance

---

## notifyPlayUnpublish

```
public void notifyPlayUnpublish(IMediaStream stream)
```

Notify all play streams that are listening to this stream that the stream is going into a state of unpublished (NetStream.Play.UnpublishNotify).

**Parameters:**

stream - live published stream that is being unpublished

---

## notifyPlayUnpublish

```
public void notifyPlayUnpublish(String streamName)
```

Notify all play streams that are listening to this stream name that the stream is going into a state of unpublished (NetStream.Play.UnpublishNotify).

**Parameters:**

streamName - live published stream that is being unpublished

---

## broadcastGetObjectEncoding

```
public int broadcastGetObjectEncoding(IMediaStream stream)
```

Get the minimum object encoding level for the clients playing this stream.

**Parameters:**

stream - publish stream

**Returns:**

object encoding level (AMF0 or AMF3)

---

## broadcastPlayMessage

```
public void broadcastPlayMessage(IMediaStream stream,  
    long timecode,  
    java.nio.ByteBuffer msg,  
    int objectEncoding)
```

Send a broadcast message to all play stream that are listening to this live published stream.

**Parameters:**

stream - media stream

timecode - timecode (milliseconds)

msg - byte[] of data that will be deserialized as an AMFData object.

objectEncoding - object encoding (AMF0 or AMF3)

## notifyPlayPublish

```
public void notifyPlayPublish(IMediaStream stream)
```

Notify all play streams that are listening to this stream that the stream is going into a state of publish (NetStream.Play.PublishNotify).

**Parameters:**

stream - live published stream that is being published

---

## addMediaStreamListener

```
public void addMediaStreamListener(IMediaStreamNotify mediaStreamListener)
```

Add a media stream listener. A media stream listener will receive the following events: onMediaStreamCreate, onMediaStreamDestroy.

**Parameters:**

mediaStreamListener - media stream listener

---

## removeMediaStreamListener

```
public void removeMediaStreamListener(IMediaStreamNotify mediaStreamListener)
```

Remove a media stream listener.

**Parameters:**

mediaStreamListener - media stream listener

---

## notifyMediaStreamCreate

```
public void notifyMediaStreamCreate(IMediaStream mediaStream)
```

Notify all media stream listeners that a new media stream object has been created.

**Parameters:**

mediaStream - new media stream object

---

## notifyMediaStreamDestroy

```
public void notifyMediaStreamDestroy(IMediaStream mediaStream)
```

Notify all media stream listeners that a media stream object is being destroyed.

**Parameters:**

mediaStream - media stream object being destroyed

---

## removeLiveStreamPacketizer

```
public void removeLiveStreamPacketizer(String streamName)
```

Remove all live stream packetizers for this stream name

**Parameters:**

streamName - streamName

---

(continued from last page)

## removeLiveStreamPacketizer

```
public ILiveStreamPacketizer removeLiveStreamPacketizer(String streamName,  
String packetizerName)
```

Remove live stream packetizer

### Parameters:

streamName - stream name  
packetizerName - packetizer id

### Returns:

live stream packetizer

---

## getLiveStreamPacketizerLock

```
public Object getLiveStreamPacketizerLock()
```

Get the lock to the live stream packetizer system

### Returns:

lock to the live stream packetizer system

---

## getLiveStreamPacketizer

```
public ILiveStreamPacketizer getLiveStreamPacketizer(String streamName,  
String packetizerName,  
boolean doCreate)
```

Get a live stream packetizer by name and packetizer id

### Parameters:

streamName - stream name  
packetizerName - packetizer id  
doCreate - create if does not exist

### Returns:

live stream packetizer

---

## getNextNameGroupId

```
public long getNextNameGroupId(MediaStreamMapGroup newGroup)
```

---

## addNameGroup

```
public MediaStreamMapGroup addNameGroup(MediaStreamMapGroup newGroup)
```

---

## removeNameGroup

```
public MediaStreamMapGroup removeNameGroup(int groupId)
```

(continued from last page)

---

## removeNameGroup

```
public MediaStreamMapGroup removeNameGroup(MediaStreamMapGroup nameGroup)
```

---

## getNameGroups

```
public java.util.Set getNameGroups()
```

---

## getNameGroupByGroupName

```
public MediaStreamMapGroup getNameGroupByGroupName(String groupName)
```

---

## getNameGroups

```
public java.util.Set getNameGroups(String streamName)
```

---

## getNameGroupStreamNames

```
public java.util.Set getNameGroupStreamNames(String streamName)
```

---

## getDvrRecorder

```
public ILiveStreamDvrRecorder getDvrRecorder(String streamName,  
String recorderName,  
boolean doCreate)
```

Get a DVR recorder by name and recorder name

### Parameters:

streamName - stream name  
recorderName - packetizer id  
doCreate - create if does not exist

### Returns:

dvr recorder

---

## removeDvrRecorder

```
public void removeDvrRecorder(String streamName)
```

---

## removeDvrRecorder

```
public ILiveStreamDvrRecorder removeDvrRecorder(String streamName,  
String recorderName)
```

Remove DVR Recorder

---

---

(continued from last page)

**Parameters:**

streamName - stream name  
recorderName - recorder name

**Returns:**

DVR Recorder

---

## getDvrRecorders

```
public java.util.List getDvrRecorders()
```

Returns a list of `ILiveStreamDvrRecorder` objects

**Returns:**

list of `ILiveStreamDvrRecorder` objects

---

## addLicense

```
public LicenseHolder addLicense(IMediaStream stream,  
int licenseType)
```

---

## addLicense

```
public LicenseHolder addLicense(ILiveStreamPacketizer liveStreamPacketizer,  
int licenseType)
```

---

## doWatchdog

```
public void doWatchdog()
```

---

## getNameGroupRemoveDelayTime

```
public int getNameGroupRemoveDelayTime()
```

---

## setNameGroupRemoveDelayTime

```
public void setNameGroupRemoveDelayTime(int nameGroupRemoveDelayTime)
```

## com.wowza.wms.stream Class MediaStreamNameAliasProviderBase

java.lang.Object

## Fields

### **FILTER\_OUTPUTALL**

```
public static final int FILTER_OUTPUTALL
```

Constant value: **7**

(continued from last page)

## FILTER\_NODFRAMES

```
public static final int FILTER_NODFRAMES
```

Constant value: **3**

## FILTER\_NOPFRAMES

```
public static final int FILTER_NOPFRAMES
```

Constant value: **1**

## FILTER\_NOKFRAMES

```
public static final int FILTER_NOKFRAMES
```

Constant value: **0**

## BEHINDRESET

```
public static final int BEHINDRESET
```

Constant value: **60000**

## Methods

### init

```
public void init(IMediaStream parent,  
                MediaStreamMap streams)
```

### play

```
public int play(IMediaStream stream,  
               java.io.OutputStream out,  
               AMFObj wmsObjAudio,  
               AMFObj wmsObjVideo,  
               AMFObj wmsObjData,  
               long[] sizes)
```

### play

```
public int play(java.io.OutputStream out,  
               AMFObj wmsObjAudio,  
               AMFObj wmsObjVideo,  
               AMFObj wmsObjData,  
               long[] sizes)
```

(continued from last page)

**play**

```
public boolean play(IMediaStream stream)
```

---

**play**

```
public boolean play()
```

---

**close**

```
public void close()
```

---

**resetNoLookup**

```
public void resetNoLookup()
```

---

**reset**

```
public void reset(boolean isReset)
```

---

**pause**

```
public void pause(int pauseType,  
                  long timecode)
```

---

**pauseRaw**

```
public void pauseRaw(int pauseType,  
                     long timecode)
```

---

**seek**

```
public void seek(int location)
```

---

**setBufferTime**

```
public void setBufferTime(int bufferTime)
```

---

(continued from last page)

## shutdown

```
public void shutdown()
```

---

## setName

```
public void setName(String name,  
    String oldName,  
    String ext,  
    String queryStr,  
    double playStart,  
    double playLen,  
    int playTransition)
```

---

## switchName

```
public void switchName(String name,  
    String oldName,  
    String ext,  
    String queryStr,  
    double playStart,  
    double playLen,  
    int playTransition)
```

---

## stopName

```
public void stopName(String name,  
    String oldName,  
    String ext,  
    String queryStr,  
    double playStart,  
    double playLen,  
    int playTransition)
```

---

## interruptPlay

```
public void interruptPlay()
```

---

## startPlay

```
public void startPlay()
```

---

## switchPlay

```
public void switchPlay()
```

---

(continued from last page)

## updateLoggingValues

```
public void updateLoggingValues()
```

---

## length

```
public double length()
```

---

## size

```
public long size()
```

---

## getLastTimecodeOffset

```
public long getLastTimecodeOffset()
```

---

## getLastSentVideoTC

```
public long getLastSentVideoTC()
```

---

## getLastSentAudioTC

```
public long getLastSentAudioTC()
```

---

## getLastSentDataTC

```
public long getLastSentDataTC()
```

---

## getLastVideoFilter

```
public int getLastVideoFilter()
```

---

## com.wowza.wms.stream.live Interface ILiveReceiver

public interface **ILiveReceiver**  
extends

## Methods

### init

```
public void init(IMediaStream stream)
```

### resetTimecodes

```
public void resetTimecodes()
```

### getVideoMissing

```
public int getVideoMissing(int totalSize)
```

### getDataMissing

```
public int getDataMissing(int totalSize)
```

### getAudioMissing

```
public int getAudioMissing(int totalSize)
```

### startVideoPacket

```
public void startVideoPacket()
```

### addVideoData

```
public void addVideoData(byte[] data,  
    int offset,  
    int size,  
    int totalSize,  
    long videoTC)
```

### startDataPacket

```
public void startDataPacket()
```

(continued from last page)

---

## **addDataData**

```
public void addDataData(byte[] data,  
    int offset,  
    int size,  
    int totalSize,  
    long dataTC)
```

---

## **startAudioPacket**

```
public void startAudioPacket()
```

---

## **addAudioData**

```
public void addAudioData(byte[] data,  
    int offset,  
    int size,  
    int totalSize,  
    long audioTC)
```

---

## **getPacketCount**

```
public int getPacketCount()
```

---

## **getLastPacketTC**

```
public long getLastPacketTC()
```

---

## **getFirstPacketTC**

```
public long getFirstPacketTC()
```

---

## **getLastPacket**

```
public AMFPacket getLastPacket()
```

---

## **getPlayPackets**

```
public java.util.List getPlayPackets()
```

---

(continued from last page)

## getLastKeyFrame

```
public AMFPacket getLastKeyFrame()
```

---

## trim

```
public void trim(java.util.List dataObjs)
```

---

## trim

```
public void trim()
```

---

## getMaximumLiveLatency

```
public int getMaximumLiveLatency()
```

---

## setMaximumLiveLatency

```
public void setMaximumLiveLatency(int maximumLiveLatency)
```

---

## getSrc

```
public int getSrc()
```

---

## setSrc

```
public void setSrc(int src)
```

---

## close

```
public void close()
```

---

## getMaxTimecode

```
public long getMaxTimecode()
```

---

## getTimecodeOffset

```
public long getTimecodeOffset()
```

---

(continued from last page)

---

## updateLoggingValues

```
public void updateLoggingValues()
```

---

## getLastReceivedAudioTC

```
public long getLastReceivedAudioTC()
```

---

## getLastReceivedVideoTC

```
public long getLastReceivedVideoTC()
```

---

## getLastReceivedDataTC

```
public long getLastReceivedDataTC()
```

---

## getLastSentAudioTC

```
public long getLastSentAudioTC()
```

---

## getLastSentVideoTC

```
public long getLastSentVideoTC()
```

---

## getLastSentDataTC

```
public long getLastSentDataTC()
```

---

## getLastFlushAudioTC

```
public long getLastFlushAudioTC()
```

---

## getLastFlushVideoTC

```
public long getLastFlushVideoTC()
```

---

(continued from last page)

---

## getLastFlushDataTC

```
public long getLastFlushDataTC()
```

---

## getLastFlushTimecode

```
public long getLastFlushTimecode()
```

---

## getLastFlushRTTimecode

```
public long getLastFlushRTTimecode()
```

---

## getLastFlushTime

```
public long getLastFlushTime()
```

---

## addAudioCodecConfigPacket

```
public void addAudioCodecConfigPacket(long timecode,  
    AMFPacket packet)
```

---

## getVideoCodecConfigPacket

```
public AMFPacket getVideoCodecConfigPacket(long timecode)
```

---

## addVideoCodecConfigPacket

```
public void addVideoCodecConfigPacket(long timecode,  
    AMFPacket packet)
```

---

## onStreamStart

```
public void onStreamStart(java.util.List metaDataList,  
    long timecode)
```

---

## flush

```
public void flush()
```

---

(continued from last page)

---

## getLiveStreamPacketizer

```
public ILiveStreamPacketizer getLiveStreamPacketizer(String name)
```

---

## getAudioCodecConfigPacket

```
public AMFPacket getAudioCodecConfigPacket(long timecode)
```

---

## getVideoCodecId

```
public int getVideoCodecId()
```

---

## getAudioCodecId

```
public int getAudioCodecId()
```

---

## setVideoCodecId

```
public void setVideoCodecId(int publishVideoCodecId)
```

---

## setAudioCodecId

```
public void setAudioCodecId(int publishAudioCodecId)
```

---

## isPublishStreamReady

```
public boolean isPublishStreamReady(boolean checkAudio,  
    boolean checkVideo)
```

---

## setMaximumPacketsPerSecond

```
public void setMaximumPacketsPerSecond(int maximumPacketsPerSecond)
```

---

## shutdown

```
public void shutdown()
```

---

## addAudioExtraData

```
public void addAudioExtraData(java.util.Map extraData)
```

---

(continued from last page)

---

**addVideoExtraData**

```
public void addVideoExtraData(java.util.Map extraData)
```

---

---

**addDataExtraData**

```
public void addDataExtraData(java.util.Map extraData)
```

---

---

**getPublishBitrateVideo**

```
public int getPublishBitrateVideo()
```

---

---

**getPublishBitrateAudio**

```
public int getPublishBitrateAudio()
```

---

---

**getPublishBitrateVideo**

```
public int getPublishBitrateVideo(int source)
```

---

---

**getPublishBitrateAudio**

```
public int getPublishBitrateAudio(int source)
```

---

---

**getPublishFramerateVideo**

```
public double getPublishFramerateVideo()
```

---

---

**getPublishKeyFrameIntervalsVideo**

```
public int[] getPublishKeyFrameIntervalsVideo()
```

---

---

**getPublishFramerateVideo**

```
public double getPublishFramerateVideo(int source)
```

---

(continued from last page)

**getPublishFrameCounts**

```
public long getPublishFrameCounts(long[] counts)
```

---

**getPublishFrameCountVideo**

```
public long getPublishFrameCountVideo()
```

---

**getPublishFrameCountVideoKey**

```
public long getPublishFrameCountVideoKey()
```

---

**getPublishFrameCountAudio**

```
public long getPublishFrameCountAudio()
```

---

**getPublishFrameCountData**

```
public long getPublishFrameCountData()
```

---

---

Package

**com.wowza.wms.stream.livedvr**

## com.wowza.wms.stream.livedvr Interface IDvrStreamManagerActionNotify

All Subinterfaces:

[IDvrStreamManagerActionNotify2](#)

public interface **IDvrStreamManagerActionNotify**  
extends

IDvrStreamManagerActionNotify notify interface for dvr stores. See  
IApplicationInstance.addDvrStreamManagerListener(IDvrStreamManagerActionNotify listener)

### Method Summary

void	<a href="#">onDvrStreamManagerCreate</a> ( <a href="#">IDvrStreamManager</a> dvrMgr ) Called when DVR stream manager created but before it is initialized.
void	<a href="#">onDvrStreamManagerDestroy</a> ( <a href="#">IDvrStreamManager</a> dvrMgr ) Called when DVR stream manager destroyed.
void	<a href="#">onDvrStreamManagerInit</a> ( <a href="#">IDvrStreamManager</a> dvrMgr ) Called when DVR stream manager initialized.

### Methods

#### onDvrStreamManagerCreate

public void **onDvrStreamManagerCreate**([IDvrStreamManager](#) dvrMgr )

Called when DVR stream manager created but before it is initialized.

**Parameters:**

dvrMgr - DVR stream manager

#### onDvrStreamManagerInit

public void **onDvrStreamManagerInit**([IDvrStreamManager](#) dvrMgr )

Called when DVR stream manager initialized.

**Parameters:**

dvrMgr - DVR stream manager

#### onDvrStreamManagerDestroy

public void **onDvrStreamManagerDestroy**([IDvrStreamManager](#) dvrMgr )

Called when DVR stream manager destroyed.

**Parameters:**

dvrMgr - DVR stream manager

## com.wowza.wms.stream.livedvr Interface IDvrStreamManagerActionNotify2

All Superinterfaces:

[IDvrStreamManagerActionNotify](#)

public interface **IDvrStreamManagerActionNotify2**

extends [IDvrStreamManagerActionNotify](#)

IDvrStreamManagerActionNotify notify interface for dvr stores. See  
IApplicationInstance.addDvrStreamManagerListener(IDvrStreamManagerActionNotify listener)

### Method Summary

void	<a href="#">onDvrStreamManagerCreate</a> ( <a href="#">IDvrStreamManager</a> dvrMgr) Called when DVR stream manager created but before it is initialized.
void	<a href="#">onDvrStreamManagerDestroy</a> ( <a href="#">IDvrStreamManager</a> dvrMgr) Called when DVR stream manager destroyed.
void	<a href="#">onDvrStreamManagerInit</a> ( <a href="#">IDvrStreamManager</a> dvrMgr) Called when DVR stream manager initialized.
void	<a href="#">onDvrStreamManagerInitStreamName</a> ( <a href="#">IDvrStreamManager</a> dvrManager, String streamName)

Methods inherited from interface [com.wowza.wms.stream.livedvr.IDvrStreamManagerActionNotify](#)

[onDvrStreamManagerCreate](#), [onDvrStreamManagerDestroy](#), [onDvrStreamManagerInit](#)

### Methods

#### onDvrStreamManagerCreate

public void **onDvrStreamManagerCreate**([IDvrStreamManager](#) dvrMgr)

Called when DVR stream manager created but before it is initialized.

**Parameters:**

dvrMgr - DVR stream manager

#### onDvrStreamManagerInit

public void **onDvrStreamManagerInit**([IDvrStreamManager](#) dvrMgr)

Called when DVR stream manager initialized.

**Parameters:**

dvrMgr - DVR stream manager

(continued from last page)

## onDvrStreamManagerDestroy

```
public void onDvrStreamManagerDestroy(IDvrStreamManager dvrMgr)
```

Called when DVR stream manager destroyed.

### Parameters:

dvrMgr - DVR stream manager

---

## onDvrStreamManagerInitStreamName

```
public void onDvrStreamManagerInitStreamName(IDvrStreamManager dvrManager,  
String streamName)
```

## com.wowza.wms.stream.livedvr Interface **ILiveStreamDvrRecorder**

public interface **ILiveStreamDvrRecorder**  
extends

ILiveStreamDvrRecorder: DVR Recorder interface.

### Method Summary

boolean	<a href="#"><u>canRecordAudio()</u></a> True if audio is being recorded
boolean	<a href="#"><u>canRecordData()</u></a> True if data is being recorded
boolean	<a href="#"><u>canRecordVideo()</u></a> True if video is being recorded
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getAndSetStartStream()</u></a> ( <a href="#"><u>IMediaStream</u></a> stream)
<a href="#"><u>IApplicationInstance</u></a>	<a href="#"><u>getAppInstance()</u></a> Get associated applicationInstance.
<a href="#"><u>IDvrStreamManager</u></a>	<a href="#"><u>getDvrManager()</u></a> Get DVR recorder's associated DVR stream manager
int	<a href="#"><u>getDvrRecorderId()</u></a> Get the DVR recorder id
LicenseHolder	<a href="#"><u>getLicenseHolder()</u></a>
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get properties
String	<a href="#"><u>getRecordingName()</u></a>
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getStream()</u></a> Get the current stream that is being recorded
void	<a href="#"><u>handlePacket()</u></a> ( <a href="#"><u>IMediaStream</u></a> stream, <a href="#"><u>AMFPacket</u></a> packet) Called to handle an incoming packet
void	<a href="#"><u>init()</u></a> (String streamName, String recorderName, <a href="#"><u>IApplicationInstance</u></a> appInstance, <a href="#"><u>DvrRecorderItem</u></a> dvrRecorderItem) Initialize DVR recorder.
boolean	<a href="#"><u>isActive()</u></a> Is the DVR recorder active
boolean	<a href="#"><u>isRecording()</u></a> Is this stream currently recording.

boolean	<a href="#"><u>isRecordingPaused()</u></a> Is this stream currently paused from recording.
boolean	<a href="#"><u>pauseRecording()</u></a> Request that stream recording pause.
void	<a href="#"><u>resetStream()</u></a> ( <a href="#"><u>IMediaStream</u></a> stream) Called when something happens that forces the stream to reset
boolean	<a href="#"><u>resumeRecording()</u></a> Request that stream recording resume.
void	<a href="#"><u>setDvrRecorderId()</u></a> (int liveStreamId) Set the DVR recorder id
void	<a href="#"><u>setRecordAudio()</u></a> (boolean recordAudio) Set to true to record audio
void	<a href="#"><u>setRecordData()</u></a> (boolean recordVideo) Set to true to record data
void	<a href="#"><u>setRecordingName()</u></a> (String name)
void	<a href="#"><u>setRecordVideo()</u></a> (boolean recordVideo) Set to true to record video
void	<a href="#"><u>setStartRecordingOnStartup()</u></a> (boolean shouldStartRecordingOnStartup) Set recording behavior of DVR Manager on startup.
boolean	<a href="#"><u>shouldStartRecordingOnStartup()</u></a> Should DVR start recording when packets start flowing.
void	<a href="#"><u>shutdown()</u></a> Called to shutdown the DVR recorder
<a href="#"><u>IDvrStreamManager</u></a>	<a href="#"><u>startRecording()</u></a> Request that stream recording start.
void	<a href="#"><u>startStream()</u></a> ( <a href="#"><u>IMediaStream</u></a> stream) Called when the stream starts
boolean	<a href="#"><u>stopRecording()</u></a> Request that stream recording stop.
void	<a href="#"><u>touch()</u></a> (long timecode) Touch the stream to keep it active

## Methods

### init

```
public void init(String streamName,
    String recorderName,
    IApplicationInstance appInstance,
    DvrRecorderItem dvrRecorderItem)
```

Initialize DVR recorder.

(continued from last page)

**Parameters:**

streamName - stream name  
recorderName - DVR recorder name  
appInstance - application instance  
dvrRecorderItem - DVR recorder

---

**shutdown**

```
public void shutdown()
```

Called to shutdown the DVR recorder

---

**getStream**

```
public IMediaStream getStream()
```

Get the current stream that is being recorded

**Returns:**

stream

---

**getAppInstance**

```
public IApplicationInstance getAppInstance()
```

Get associated applicationInstance.

**Returns:**

application Instance

---

**handlePacket**

```
public void handlePacket(IMediaStream stream,  
    AMFPacket packet)
```

Called to handle an incoming packet

**Parameters:**

stream - stream  
packet - packet

---

**startStream**

```
public void startStream(IMediaStream stream)
```

Called when the stream starts

**Parameters:**

stream - stream

---

**resetStream**

```
public void resetStream(IMediaStream stream)
```

Called when something happens that forces the stream to reset

**Parameters:**

stream - stream

## touch

```
public void touch(long timecode)
```

Touch the stream to keep it active

**Parameters:**

timecode - timecode of touch in milliseconds

---

## isActive

```
public boolean isActive()
```

Is the DVR recorder active

**Returns:**

true if active

---

## getProperties

```
public WMSProperties getProperties()
```

Get properties

**Returns:**

properties

---

## getDvrRecorderId

```
public int getDvrRecorderId()
```

Get the DVR recorder id

**Returns:**

DVR recorder id

---

## setDvrRecorderId

```
public void setDvrRecorderId(int liveStreamId)
```

Set the DVR recorder id

**Parameters:**

liveStreamId

---

## getDvrManager

```
public IDvrStreamManager getDvrManager()
```

Get DVR recorder's associated DVR stream manager

**Returns:**

DVR manager

---

## canRecordAudio

```
public boolean canRecordAudio()
```

---

(continued from last page)

True if audio is being recorded

**Returns:**

True if audio is being recorded

---

## setRecordAudio

```
public void setRecordAudio(boolean recordAudio)
```

Set to true to record audio

**Parameters:**

recordAudio - true to record audio

---

## canRecordVideo

```
public boolean canRecordVideo( )
```

True if video is being recorded

**Returns:**

True if video is being recorded

---

## setRecordVideo

```
public void setRecordVideo(boolean recordVideo)
```

Set to true to record video

**Parameters:**

recordVideo - true to record video

---

## canRecordData

```
public boolean canRecordData( )
```

True if data is being recorded

**Returns:**

True if data is being recorded

---

## setRecordData

```
public void setRecordData(boolean recordVideo)
```

Set to true to record data

**Parameters:**

recordVideo - true to record data

---

## startRecording

```
public IDvrStreamManager startRecording( )
```

Request that stream recording start.

**Returns:**

stream manager if successful. null otherwise.

## isRecording

```
public boolean isRecording()
```

Is this stream currently recording. If this stream is not recordable, the method returns false.

**Returns:**

true if has a recording stream and it is recording.

---

## isRecordingPaused

```
public boolean isRecordingPaused()
```

Is this stream currently paused from recording. If this stream is not recording and not paused, the method returns false.

**Returns:**

true if has a recording is paused.

---

## stopRecording

```
public boolean stopRecording()
```

Request that stream recording stop. Note that this call places the DVR stream in the *not* recording state.

A successful stop will result in registered [IDvrRecordingListeners](#) to have their [IDvrRecordingListener.recordingStopped\(IDvrStreamStore\)](#) method called.

Success only occurs if the stream is already in the recording state [IDvrStreamStore.isRecording\(\)](#).

**Returns:**

store if successful. null otherwise.

---

## pauseRecording

```
public boolean pauseRecording()
```

Request that stream recording pause. The stream does not have to be actively recording to be paused. For example, it could be paused before packets start flowing.

A successful pause will result in registered [IDvrRecordingListeners](#) to have their [IDvrRecordingListener.recordingPaused\(IDvrStreamStore\)](#) method called.

**Returns:**

store if successful. null otherwise.

---

## resumeRecording

```
public boolean resumeRecording()
```

Request that stream recording resume. The stream does not have to be actively recording to be resumed. For example, it could have been paused before the stream started, and this call would move it out of the paused state.

A successful resume will result in registered [IDvrRecordingListeners](#) to have their [IDvrRecordingListener.recordingResumed\(IDvrStreamStore\)](#) method called.

**Returns:**

store if successful. null otherwise.

---

(continued from last page)

---

## setRecordingName

```
public void setRecordingName(String name)
```

---

## getRecordingName

```
public String getRecordingName()
```

---

## shouldStartRecordingOnStartup

```
public boolean shouldStartRecordingOnStartup()
```

Should DVR start recording when packets start flowing.

**Returns:**

true if should start recording initially, false otherwise

---

## setStartRecordingOnStartup

```
public void setStartRecordingOnStartup(boolean shouldStartRecordingOnStartup)
```

Set recording behavior of DVR Manager on startup.

**Parameters:**

shouldStartRecordingOnStartup - should recording start when DVR manager starts.

---

## getLicenseHolder

```
public LicenseHolder getLicenseHolder()
```

---

## getAndSetStartStream

```
public IMediaStream getAndSetStartStream(IMediaStream stream)
```

---

## com.wowza.wms.stream.livedvr Interface **ILiveStreamDvrRecorderActionNotify**

public interface **ILiveStreamDvrRecorderActionNotify**  
extends

ILiveStreamDvrRecorderActionNotify: notify interface for dvr recorders.

See Also:

[IApplicationInstance.addDvrRecorderListener\(ILiveStreamDvrRecorderActionNotify\)](#),

### Method Summary

void	<a href="#">onLiveStreamDvrRecorderCreate</a> ( <a href="#">ILiveStreamDvrRecorder</a> recorder, String streamName) Called when recorder created
void	<a href="#">onLiveStreamDvrRecorderDestroy</a> ( <a href="#">ILiveStreamDvrRecorder</a> recorder) Called when recorder destroyed
void	<a href="#">onLiveStreamDvrRecorderInit</a> ( <a href="#">ILiveStreamDvrRecorder</a> recorder, String streamName) Called after recorder is initialized

### Methods

#### **onLiveStreamDvrRecorderCreate**

```
public void onLiveStreamDvrRecorderCreate(ILiveStreamDvrRecorder recorder,  
String streamName)
```

Called when recorder created

**Parameters:**

recorder - recorder  
streamName - stream name

#### **onLiveStreamDvrRecorderInit**

```
public void onLiveStreamDvrRecorderInit(ILiveStreamDvrRecorder recorder,  
String streamName)
```

Called after recorder is initialized

**Parameters:**

recorder - recorder  
streamName - stream name

#### **onLiveStreamDvrRecorderDestroy**

```
public void onLiveStreamDvrRecorderDestroy(ILiveStreamDvrRecorder recorder)
```

Called when recorder destroyed

(continued from last page)

**Parameters:**

recorder - recorder

com.wowza.wms.stream.livedvr

# Interface ILiveStreamDvrRecorderControl

public interface **ILiveStreamDvrRecorderControl**  
extends

ILiveStreamDvrRecorderControl: interface to control which recorders are run for which streams.  
**See Also:**  
[IApplicationInstance.setLiveStreamDvrRecorderControl\(ILiveStreamDvrRecorderControl\)](#)

Method Summary	
boolean	<a href="#">shouldDvrRecord</a> (String recorderName, <a href="#">IMediaStream</a> stream) Returns true if given string should be recorded.;

## Methods

### shouldDvrRecord

public boolean **shouldDvrRecord**(String recorderName, [IMediaStream](#) stream)

Returns true if given string should be recorded.;

**Parameters:**

- recorderName - recorder name
- stream - stream

**Returns:**

true to record

---

Package

**com.wowza.wms.stream.livepacketizer**

## com.wowza.wms.stream.livepacketizer

### Interface ILiveStreamPacketizer

All Subinterfaces:

[IDvrStreamManager](#)

public interface **ILiveStreamPacketizer**  
extends

ILiveStreamPacketizer: live stream packetizer interface.

#### Method Summary

<a href="#">IMediaStream</a>	<a href="#">getAndSetStartStream</a> ( <a href="#">IMediaStream</a> stream) Get the current stream that is being packetized
<a href="#">IApplicationInstance</a>	<a href="#">getApplicationInstance</a> () Get the application instance associated with this live stream packetizer.
int	<a href="#">getLiveStreamPacketizerId</a> () Get the live stream packetizer id
<a href="#">WMSProperties</a>	<a href="#">getProperties</a> () Get properties
long	<a href="#">getRepeaterLastSequence</a> () Get the sequence number of the last added repeater item
void	<a href="#">handlePacket</a> ( <a href="#">IMediaStream</a> stream, <a href="#">AMFPacket</a> packet) Called to handle an incoming packet
void	<a href="#">init</a> (String streamName, String packetizerName, <a href="#">IApplicationInstance</a> appInstance, LiveStreamPacketizerItem liveStreamPacketizerItem) Initialize live stream packetizer
boolean	<a href="#">isActive</a> () Is the live stream packetizer active
boolean	<a href="#">isPacketizeAudio</a> () True if audio is being packetized
boolean	<a href="#">isPacketizeData</a> () True if data is being packetized
boolean	<a href="#">isPacketizeVideo</a> () True if video is being packetized
boolean	<a href="#">isRepeaterEdge</a> () Is this packetizer a live repeater edge
void	<a href="#">resetStream</a> ( <a href="#">IMediaStream</a> stream) Called when something happens that forces the stream to reset
void	<a href="#">setLiveStreamPacketizerId</a> (int id) Set the live stream packetizer id

void	<a href="#">setPacketizeAudio</a> (boolean packetizeAudio) Set to true to packetize audio
void	<a href="#">setPacketizeData</a> (boolean packetizeVideo) Set to true to packetize data
void	<a href="#">setPacketizeVideo</a> (boolean packetizeVideo) Set to true to packetize video
void	<a href="#">setRepeaterEdge</a> (boolean isRepeaterEdge) Set is live repeater edge
void	<a href="#">shutdown</a> ( ) Called to shutdown the live stream packetizer
void	<a href="#">startStream</a> ( <a href="#">IMediaStream</a> stream) Called when the stream starts
void	<a href="#">touch</a> (long timecode) Touch the stream to keep it active

## Methods

### init

```
public void init(String streamName,  
                String packetizerName,  
                IApplicationInstance appInstance,  
                LiveStreamPacketizerItem liveStreamPacketizerItem)
```

Initialize live stream packetizer

#### Parameters:

streamName - stream name  
packetizerName - packetizer name  
appInstance - application instance  
liveStreamPacketizerItem - live stream packetizer

### shutdown

```
public void shutdown( )
```

Called to shutdown the live stream packetizer

### isActive

```
public boolean isActive( )
```

Is the live stream packetizer active

#### Returns:

true if active

### getProperties

```
public WMSProperties getProperties( )
```

(continued from last page)

Get properties

**Returns:**  
properties

---

## getRepeaterLastSequence

```
public long getRepeaterLastSequence()
```

Get the sequence number of the last added repeater item

**Returns:**  
sequence number

---

## getLiveStreamPacketizerId

```
public int getLiveStreamPacketizerId()
```

Get the live stream packetizer id

**Returns:**  
live stream packetizer id

---

## setLiveStreamPacketizerId

```
public void setLiveStreamPacketizerId(int id)
```

Set the live stream packetizer id

**Parameters:**  
id

---

## handlePacket

```
public void handlePacket(IMediaStream stream,  
    AMFPacket packet)
```

Called to handle an incoming packet

**Parameters:**  
stream - stream  
packet - packet

---

## startStream

```
public void startStream(IMediaStream stream)
```

Called when the stream starts

**Parameters:**  
stream - stream

---

## resetStream

```
public void resetStream(IMediaStream stream)
```

Called when something happens that forces the stream to reset

**Parameters:**

(continued from last page)

stream - stream

---

## touch

```
public void touch(long timecode)
```

Touch the stream to keep it active

**Parameters:**

timecode - timecode of touch in milliseconds

---

## isRepeaterEdge

```
public boolean isRepeaterEdge()
```

Is this packetizer a live repeater edge

**Returns:**

true if live repeater edge

---

## setRepeaterEdge

```
public void setRepeaterEdge(boolean isRepeaterEdge)
```

Set is live repeater edge

**Parameters:**

isRepeaterEdge - is live repeater edge

---

## isPacketizeAudio

```
public boolean isPacketizeAudio()
```

True if audio is being packetized

**Returns:**

True if audio is being packetized

---

## setPacketizeAudio

```
public void setPacketizeAudio(boolean packetizeAudio)
```

Set to true to packetize audio

**Parameters:**

packetizeAudio - true to packetize audio

---

## isPacketizeVideo

```
public boolean isPacketizeVideo()
```

True if video is being packetized

**Returns:**

True if video is being packetized

---

(continued from last page)

## setPacketizeVideo

```
public void setPacketizeVideo(boolean packetizeVideo)
```

Set to true to packetize video

**Parameters:**

packetizeVideo - true to packetize video

---

## isPacketizeData

```
public boolean isPacketizeData()
```

True if data is being packetized

**Returns:**

True if data is being packetized

---

## setPacketizeData

```
public void setPacketizeData(boolean packetizeVideo)
```

Set to true to packetize data

**Parameters:**

packetizeVideo - true to packetize data

---

## getAndSetStartStream

```
public IMediaStream getAndSetStartStream(IMediaStream stream)
```

Get the current stream that is being packetized

**Returns:**

stream

---

## getApplicationInstance

```
public IApplicationInstance getApplicationInstance()
```

Get the application instance associated with this live stream packetizer.

**Returns:**

application instance

---

## com.wowza.wms.stream.livepacketizer Interface **ILiveStreamPacketizerActionNotify**

public interface **ILiveStreamPacketizerActionNotify**  
extends

ILiveStreamPacketizerActionNotify: notify interface for live stream packetizers. See  
IApplicationInstance.addLiveStreamPacketizerListener(ILiveStreamPacketizerActionNotify liveStreamPacketizerListener)

### Method Summary

void	<a href="#">onLiveStreamPacketizerCreate</a> ( <a href="#">ILiveStreamPacketizer</a> liveStreamPacketizer, String streamName) Called when packetizer created
void	<a href="#">onLiveStreamPacketizerDestroy</a> ( <a href="#">ILiveStreamPacketizer</a> liveStreamPacketizer) Called when packetizer destroyed
void	<a href="#">onLiveStreamPacketizerInit</a> ( <a href="#">ILiveStreamPacketizer</a> liveStreamPacketizer, String streamName) Called after packetizer is initialized

### Methods

#### **onLiveStreamPacketizerCreate**

```
public void onLiveStreamPacketizerCreate(ILiveStreamPacketizer liveStreamPacketizer,  
String streamName)
```

Called when packetizer created

**Parameters:**

liveStreamPacketizer - packetizer  
streamName - stream name

#### **onLiveStreamPacketizerDestroy**

```
public void onLiveStreamPacketizerDestroy(ILiveStreamPacketizer liveStreamPacketizer)
```

Called when packetizer destroyed

**Parameters:**

liveStreamPacketizer - packetizer

#### **onLiveStreamPacketizerInit**

```
public void onLiveStreamPacketizerInit(ILiveStreamPacketizer liveStreamPacketizer,  
String streamName)
```

Called after packetizer is initialized

**Parameters:**

(continued from last page)

liveStreamPacketizer - packetizer  
streamName - stream name

# com.wowza.wms.stream.livepacketizer

## Interface ILiveStreamPacketizerControl

public interface **ILiveStreamPacketizerControl**  
extends

ILiveStreamPacketizerControl: interface to control which packetizers are run for which streams. See:  
IApplicationInstance.setLiveStreamPacketizerControl(ILiveStreamPacketizerControl liveStreamPacketizerControl)

Method Summary	
boolean	<a href="#">isLiveStreamPacketize</a> (String packetizer, <a href="#">IMediaStream</a> stream) Return true to packetize stream

## Methods

### isLiveStreamPacketize

public boolean **isLiveStreamPacketize**(String packetizer, [IMediaStream](#) stream)

Return true to packetize stream

**Parameters:**

- packetizer - packetizer name
- stream - stream

**Returns:**

true to packetize

---

Package

**com.wowza.wms.stream.livetranscoder**

## com.wowza.wms.stream.livetranscoder Interface **ILiveStreamTranscoder**

public interface **ILiveStreamTranscoder**  
extends

ILiveStreamTranscoder: Interface to live stream transcoder.

### Field Summary

public static final	<a href="#">TRANSCODERTYPE_LIVE</a> Value: <b>1</b>
public static final	<a href="#">TRANSCODERTYPE_VOD</a> Value: <b>2</b>

### Method Summary

void	<a href="#">close</a> ( <a href="#">IMediaStream</a> stream) Called when live stream transcoder is stream is closed
<a href="#">IApplicationInstance</a>	<a href="#">getAppInstance</a> () Get the application instance associated with this live stream transcoder.
String	<a href="#">getContextStr</a> () Get the streaming context for this live stream transcoder.
LicenseHolder	<a href="#">getLicenseHolder</a> () Get license holder.
LiveStreamTranscoderItem	<a href="#">getLiveStreamTranscoderItem</a> () Get the definition for live stream transcoder.
<a href="#">WMSProperties</a>	<a href="#">getProperties</a> () Get the user properties
java.util.List	<a href="#">getPublisherNames</a> () Get a list of publisher stream names for this transcoder (resultant streams)
java.util.List	<a href="#">getPublishers</a> () Get a list of publishers for this transcoder (resultant streams)
String	<a href="#">getStreamName</a> () Get the stream name of the source stream.
String	<a href="#">getTranscoderName</a> () Get the live stream transcoder name
int	<a href="#">getTranscoderType</a> () Get the live stream transcoder type.

void	<a href="#"><code>handleOnMetadata(IMediaStream stream, AMFPacket packet, long timecode, boolean isSetDataFrame)</code></a> Called for each new onMetaData packet
void	<a href="#"><code>handlePacket(IMediaStream stream, AMFPacket packet)</code></a> Called for each new source packet
void	<a href="#"><code>init(String streamName, IMediaStream stream, String transcoderName, IApplicationInstance appInstance, LiveStreamTranscoderItem liveStreamTranscoderItem)</code></a> Called when live stream transcoder interface is initialized.
boolean	<a href="#"><code>isEncoder()</code></a> Is this transcoder an encoder session (capture)
boolean	<a href="#"><code>isTemplateLoaded()</code></a> Is the transcoder template loaded.
boolean	<a href="#"><code>isTranscoderActive(long currTime)</code></a> Returns true if the transcoder is actively receiving packets
void	<a href="#"><code>resetStream(IMediaStream stream)</code></a> Called when source stream changes.
void	<a href="#"><code>setAppInstance(IApplicationInstance appInstance)</code></a> Set the application instance associated with this live stream transcoder.
void	<a href="#"><code>setLiveStreamTranscoderItem(LiveStreamTranscoderItem liveStreamTranscoderItem)</code></a> Set the definition for live stream transcoder.
void	<a href="#"><code>setStreamName(String streamName)</code></a> Set source stream name.
void	<a href="#"><code>setTranscoderName(String transcoderName)</code></a> Get the live stream transcoder name
void	<a href="#"><code>setTranscoderType(int transcoderType)</code></a> Set the live stream transcoder type.
void	<a href="#"><code>shutdown(IMediaStream stream)</code></a> Called when live stream transcoder is shutdown

## Fields

### TRANSCODERTYPE\_LIVE

```
public static final int TRANSCODERTYPE_LIVE
```

Constant value: **1**

### TRANSCODERTYPE\_VOD

```
public static final int TRANSCODERTYPE_VOD
```

Constant value: **2**

## Methods

### init

```
public void init(String streamName,  
    IMediaStream stream,  
    String transcoderName,  
    IApplicationInstance appInstance,  
    LiveStreamTranscoderItem liveStreamTranscoderItem)
```

Called when live stream transcoder interface is initialized.

#### Parameters:

streamName - stream name  
transcoderName - transcoder name  
appInstance - application instance  
liveStreamTranscoderItem - live stream transcoder config item

### handlePacket

```
public void handlePacket(IMediaStream stream,  
    AMFPacket packet)
```

Called for each new source packet

#### Parameters:

stream - stream  
packet - packet

### handleOnMetadata

```
public void handleOnMetadata(IMediaStream stream,  
    AMFPacket packet,  
    long timecode,  
    boolean isSetDataFrame)
```

Called for each new onMetaData packet

#### Parameters:

stream - stream  
packet - packet  
timecode - timecode (milliseconds)  
isSetDataFrame - is SetDataFrame call

### resetStream

```
public void resetStream(IMediaStream stream)
```

Called when source stream changes.

#### Parameters:

stream - stream interface

### close

```
public void close(IMediaStream stream)
```

Called when live stream transcoder is stream is closed

(continued from last page)

**Parameters:**

stream - stream interface

---

**shutdown**

```
public void shutdown(IMediaStream stream)
```

Called when live stream transcoder is shutdown

**Parameters:**

stream - stream interface

---

**getStreamName**

```
public String getStreamName()
```

Get the stream name of the source stream.

**Returns:**

stream name of the source stream

---

**setStreamName**

```
public void setStreamName(String streamName)
```

Set source stream name.

**Parameters:**

streamName - source stream name

---

**getTranscoderName**

```
public String getTranscoderName()
```

Get the live stream transcoder name

**Returns:**

live stream transcoder name

---

**setTranscoderName**

```
public void setTranscoderName(String transcoderName)
```

Get the live stream transcoder name

**Parameters:**

transcoderName - live stream transcoder name

---

**getAppInstance**

```
public IApplicationInstance getAppInstance()
```

Get the application instance associated with this live stream transcoder.

**Returns:**

application instance associated with this live stream transcoder

(continued from last page)

## setAppInstance

```
public void setAppInstance(IApplicationInstance appInstance)
```

Set the application instance associated with this live stream transcoder.

**Parameters:**

appInstance - application instance associated with this live stream transcoder

---

## getLiveStreamTranscoderItem

```
public LiveStreamTranscoderItem getLiveStreamTranscoderItem()
```

Get the definition for live stream transcoder.

**Returns:**

definition for live stream transcoder

---

## setLiveStreamTranscoderItem

```
public void setLiveStreamTranscoderItem(LiveStreamTranscoderItem  
liveStreamTranscoderItem)
```

Set the definition for live stream transcoder.

**Parameters:**

liveStreamTranscoderItem - definition for live stream transcoder

---

## getProperties

```
public WMSProperties getProperties()
```

Get the user properties

**Returns:**

user properties

---

## getLicenseHolder

```
public LicenseHolder getLicenseHolder()
```

Get license holder.

**Returns:**

license holder

---

## isTranscoderActive

```
public boolean isTranscoderActive(long currTime)
```

Returns true if the transcoder is actively receiving packets

**Parameters:**

currTime - current timecode in milliseconds

**Returns:**

true if the transcoder is actively receiving packets

## isTemplateLoaded

```
public boolean isTemplateLoaded()
```

Is the transcoder template loaded.

**Returns:**

true if transcoder template is loaded.

---

## getContextStr

```
public String getContextStr()
```

Get the streaming context for this live stream transcoder.

**Returns:**

streaming context for this live stream transcoder

---

## getTranscoderType

```
public int getTranscoderType()
```

Get the live stream transcoder type. See `ILiveStreamTranscoder.TRANSCODERTYPE_*`

**Returns:**

live stream transcoder type

---

## setTranscoderType

```
public void setTranscoderType(int transcoderType)
```

Set the live stream transcoder type. See `ILiveStreamTranscoder.TRANSCODERTYPE_*`

**Parameters:**

transcoderType - live stream transcoder type

---

## getPublishers

```
public java.util.List getPublishers()
```

Get a list of publishers for this transcoder (resultant streams)

**Returns:**

list of publishers for this transcoder

---

## getPublisherNames

```
public java.util.List getPublisherNames()
```

Get a list of publisher stream names for this transcoder (resultant streams)

**Returns:**

list of publishers names

---

## isEncoder

```
public boolean isEncoder()
```

(continued from last page)

Is this transcoder an encoder session (capture)

**Returns:**

true if this live transcoder is an encoder session

## com.wowza.wms.stream.livetranscoder Interface **ILiveStreamTranscoderControl**

public interface **ILiveStreamTranscoderControl**  
extends

Interface used to control if stream is transcoded. See  
`IApplicationInstance.setLiveStreamTranscoderControl(ILiveStreamTranscoderControl)`

### Method Summary

boolean	<a href="#">isLiveStreamTranscode</a> (String transcoder, <a href="#">IMediaStream</a> stream) Called each time a new publishing stream is started.
---------	--

### Methods

#### **isLiveStreamTranscode**

```
public boolean isLiveStreamTranscode(String transcoder,  
    IMediaStream stream)
```

Called each time a new publishing stream is started. Return true if you wish stream to be transcoded. See  
`IApplicationInstance.setLiveStreamTranscoderControl(ILiveStreamTranscoderControl)`

**Parameters:**

transcoder - name of transcoder  
stream - stream interface

**Returns:**

true if wish stream to be transcoded

## com.wowza.wms.stream.livetranscoder Interface `ILiveStreamTranscoderNotify`

public interface `ILiveStreamTranscoderNotify`  
extends

`ILiveStreamTranscoderNotify`: Listener interface for listening for new live stream transcoders. See `IApplicationInstance.addLiveStreamTranscoderListener(ILiveStreamTranscoderNotify)`

### Method Summary

void	<a href="#"><code>onLiveStreamTranscoderCreate</code></a> ( <a href="#"><code>ILiveStreamTranscoder</code></a> liveStreamTranscoder, <a href="#"><code>IMediaStream</code></a> stream) Triggered when live stream transcoder is created.
void	<a href="#"><code>onLiveStreamTranscoderDestroy</code></a> ( <a href="#"><code>ILiveStreamTranscoder</code></a> liveStreamTranscoder, <a href="#"><code>IMediaStream</code></a> stream) Triggered when live stream transcoder is destroyed.
void	<a href="#"><code>onLiveStreamTranscoderInit</code></a> ( <a href="#"><code>ILiveStreamTranscoder</code></a> liveStreamTranscoder, <a href="#"><code>IMediaStream</code></a> stream) Triggered after live stream transcoder is initialized.

### Methods

#### `onLiveStreamTranscoderCreate`

```
public void onLiveStreamTranscoderCreate(ILiveStreamTranscoder liveStreamTranscoder,  
    IMediaStream stream)
```

Triggered when live stream transcoder is created.

**Parameters:**

liveStreamTranscoder - live stream transcoder  
stream - source stream

#### `onLiveStreamTranscoderDestroy`

```
public void onLiveStreamTranscoderDestroy(ILiveStreamTranscoder liveStreamTranscoder,  
    IMediaStream stream)
```

Triggered when live stream transcoder is destroyed.

**Parameters:**

liveStreamTranscoder - live stream transcoder  
stream - source stream

#### `onLiveStreamTranscoderInit`

```
public void onLiveStreamTranscoderInit(ILiveStreamTranscoder liveStreamTranscoder,  
    IMediaStream stream)
```

Triggered after live stream transcoder is initialized.

(continued from last page)

**Parameters:**

liveStreamTranscoder - live stream transcoder  
stream - source stream

---

Package

**com.wowza.wms.stream.publish**

## com.wowza.wms.stream.publish Interface IPublishingProvider

All Known Implementing Classes:

[PublishingProviderMediaReader](#), [PublishingProviderLive](#)

public interface **IPublishingProvider**  
extends

IPublishingProvider: publishing provider interface.

### Method Summary

void	<a href="#">close()</a> Invoked on stream close
boolean	<a href="#">isSendOnMetadata()</a> Get to send onMetadata event when stream starts
boolean	<a href="#">play(Publisher publisher)</a> Invoked on play
boolean	<a href="#">seek(long timecode)</a> Invoked on seek
boolean	<a href="#">seek(long timecode, int seekType)</a> Invoked on seek
void	<a href="#">setDuration(long duration)</a> Set target duration for playback (milliseconds)
void	<a href="#">setRealTimeStartTime(long realTimeStartTime)</a> Set real start time (milliseconds)
void	<a href="#">setSendOnMetadata(boolean sendOnMetadata)</a> Set to send onMetadata event when stream starts

### Methods

#### play

public boolean **play**([Publisher](#) publisher)

Invoked on play

**Parameters:**

publisher - publisher

**Returns:**

true if successful

(continued from last page)

## close

```
public void close()
```

Invoked on stream close

---

## seek

```
public boolean seek(long timecode,  
                    int seekType)
```

Invoked on seek

### Parameters:

timecode - target timecode

seekType - seek type, see IMediaReader.SEEKTARGET\_\*

### Returns:

true, if seek successful

---

## seek

```
public boolean seek(long timecode)
```

Invoked on seek

### Parameters:

timecode - target timecode

### Returns:

true, if seek successful

---

## setDuration

```
public void setDuration(long duration)
```

Set target duration for playback (milliseconds)

### Parameters:

duration - duration for playback (milliseconds)

---

## setRealTimeStartTime

```
public void setRealTimeStartTime(long realTimeStartTime)
```

Set real start time (milliseconds)

### Parameters:

realTimeStartTime - real start time (milliseconds)

---

## setSendOnMetadata

```
public void setSendOnMetadata(boolean sendOnMetadata)
```

Set to send onMetadata event when stream starts

### Parameters:

sendOnMetadata - true to send onMetadata event

---

---

## isSendOnMetadata

```
public boolean isSendOnMetadata()
```

Get to send onMetadata event when stream starts

**Returns:**

true to send onMetadata event

## com.wowza.wms.stream.publish Interface IStreamActionNotify

public interface **IStreamActionNotify**  
extends

IStreamActionNotify: listener interface to Stream class for playlist items. See Stream.addListener(IStreamActionNotify listener)

### Method Summary

void	<a href="#">onPlaylistItemStart</a> ( <a href="#">Stream</a> stream, <a href="#">PlaylistItem</a> playlistItem) Invoked when playlist item playback is started
void	<a href="#">onPlaylistItemStop</a> ( <a href="#">Stream</a> stream, <a href="#">PlaylistItem</a> playlistItem) Invoked when playlist item playback has ended

### Methods

#### onPlaylistItemStart

```
public void onPlaylistItemStart(Stream stream,  
    PlaylistItem playlistItem)
```

Invoked when playlist item playback is started

**Parameters:**

stream - stream

playlistItem - playlist item

#### onPlaylistItemStop

```
public void onPlaylistItemStop(Stream stream,  
    PlaylistItem playlistItem)
```

Invoked when playlist item playback has ended

**Parameters:**

stream - stream

playlistItem - playlist item

## com.wowza.wms.stream.publish Class Playlist

java.lang.Object

└─com.wowza.wms.stream.publish.Playlist

public class **Playlist**  
extends Object

### Constructor Summary

public	<a href="#">Playlist</a> (String sName) Class constructor - A simple structure that maintains a list of playlist items.
--------	--

### Method Summary

void	<a href="#">addItem</a> (String sName, int start, int length) Appends an item to this playlist
java.util.List	<a href="#">getItems</a> () Get the items in the playlist (returns a copy of the list)
String	<a href="#">getName</a> () Returns the name of this playlist as defined in the XML definition file
boolean	<a href="#">getRepeat</a> ()
boolean	<a href="#">open</a> ( <a href="#">Stream</a> s) Opens this playlist on the given stream...
void	<a href="#">removeItem</a> (int index) Remove an item from the list
void	<a href="#">setRepeat</a> (boolean repeat)

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### Playlist

public **Playlist**(String sName)

Class constructor - A simple structure that maintains a list of playlist items.

#### Parameters:

sName -- name of playlist - as defined in the XML definition file

## Methods

### getItems

```
public java.util.List getItems()
```

Get the items in the playlist (returns a copy of the list)

**Returns:**

items in the playlist (returns a copy of the list)

### getRepeat

```
public boolean getRepeat()
```

### setRepeat

```
public void setRepeat(boolean repeat)
```

### addItem

```
public void addItem(String sName,  
                    int start,  
                    int length)
```

Appends an item to this playlist

**Parameters:**

sName -- item name

start -- start seconds

length -- playlength seconds

### removeItem

```
public void removeItem(int index)
```

Remove an item from the list

**Parameters:**

index - index of item to remove

### open

```
public boolean open(Stream s)
```

Opens this playlist on the given stream... stopping anything currently playing on that stream and switching over.

**Parameters:**

s -- stream to play on

**Returns:**

- true if successful

## getName

```
public String getName()
```

Returns the name of this playlist as defined in the XML definition file

**Returns:**

name of this playlist

## com.wowza.wms.stream.publish Class PlaylistItem

java.lang.Object

└─com.wowza.wms.stream.publish.PlaylistItem

public class **PlaylistItem**  
extends Object

### Constructor Summary

public	<a href="#">PlaylistItem</a> (String name, int start, int length, int index) Class constructor - A simple structure to define parameters associated with a playlist item
--------	---

### Method Summary

int	<a href="#">getIndex()</a>
int	<a href="#">getLength()</a> Number of seconds of track to play
String	<a href="#">getName()</a> Name of playlist stream
int	<a href="#">getStart()</a> Number of seconds into track to start from
void	<a href="#">setIndex</a> (int index)
String	<a href="#">toString()</a>

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### PlaylistItem

```
public PlaylistItem(String name,
                    int start,
                    int length,
                    int index)
```

Class constructor - A simple structure to define parameters associated with a playlist item

#### Parameters:

name - - name of the playlist stream

start - - number of seconds into the track to start from (-2 means live stream)

(continued from last page)

length -- number of seconds of track to play

index -- index in the playlist

## Methods

### getName

```
public String getName()
```

Name of playlist stream

**Returns:**

- name of stream

---

### getStart

```
public int getStart()
```

Number of seconds into track to start from

**Returns:**

- number of seconds

---

### getLength

```
public int getLength()
```

Number of seconds of track to play

**Returns:**

- number of seconds

---

### getIndex

```
public int getIndex()
```

---

### setIndex

```
public void setIndex(int index)
```

---

### toString

```
public String toString()
```

## com.wowza.wms.stream.publish Class Publisher

java.lang.Object

└─com.wowza.wms.stream.publish.Publisher

---

```
public class Publisher  
extends Object
```

Publisher: clientless stream publisher. This class can be used to publish raw video, audio and metadata packets to the Wowza Pro server. Here is a quick snippet of code that illustrates how to use it.

This code below will publish data the stream named "myStream". It will be streamed to the default virtual host and available at the rtmp address rtmp://[server-ip-address]/streamtest.

```
IVHost vhost = VHostSingleton.getInstance(VHost.VHOST_DEFAULT);
Publisher publisher = Publisher.createInstance(vhost, "streamtest");

publisher.setFileExtension("flv");
publisher.setStreamType("live");

publisher.publish("myStream", "live");

// sit in a loop adding data
boolean done = false;
while(true)
{
    AMFPacket amfPacket;

    // read packet from audio, video, data source
    // amfPacket = readPacketFromSomewhere();

    switch (amfPacket.getType())
    {
        case IVHost.CONTENTTYPE_AUDIO:
            publisher.addAudioData(amfPacket.getData(), amfPacket.getSize(),
amfPacket.getTimecode());
            break;
        case IVHost.CONTENTTYPE_VIDEO:
            publisher.addVideoData(amfPacket.getData(), amfPacket.getSize(),
amfPacket.getTimecode());
            break;
        case IVHost.CONTENTTYPE_DATA:
            publisher.addDataData(amfPacket.getData(), amfPacket.getSize(),
amfPacket.getTimecode());
            break;
    }
    if (done)
        break;
}

publisher.unpublish();
publisher.close();
```

Basic packet format:

Audio:

AAC

[1-byte header]

[1-byte codec config indicator (1 - audio data, 0 - codec config packet)]

[n-bytes audio content or codec config data]

All others

[1-byte header]

[n-bytes audio content]

Below is the bit

layout of the header byte of data (table goes from least significant bit to most significant bit):

1 bit Number of channels:

- 0 mono
- 1 stereo

1 bit Sample size:

- 0 8 bits per sample
- 1 16 bits per sample

2 bits Sample rate:

- 0 special or 8KHz
- 1 11KHz
- 2 22KHz
- 3 44KHz

4 bits Audio type:

- 0 PCM (big endian)
- 1 PCM (swf - ADPCM)
- 2 MP3
- 3 PCM (little endian)
- 4 Nelly Moser ASAO 16KHz Mono
- 5 Nelly Moser ASAO 8KHz Mono
- 6 Nelly Moser ASAO
- 7 G.711 ALaw
- 8 G.711 MULaw
- 9 Reserved
- a AAC
- b Speex
- f MP3 8Khz

Note: For AAC the codec config data is generally a two byte packet that describes the stream. It must

be published first. Here is the basic code to fill in the codec config data.

```
AACFrame frame = new AACFrame();
```

```
int sampleRate = 22100;
int channels = 2;
frame.setSampleRate(sampleRate);
frame.setRateIndex(AACUtils.sampleRateToIndex(sampleRate));
frame.setChannels(channels);
frame.setChannelIndex(AACUtils.channelCountToIndex(sampleRate));
byte[] codecConfig = new byte[2];
AACUtils.encodeAACCodecConfig(frame, codecConfig, 0);
```

Note: For AAC the header byte is always 0xaf

Note: For Speex the audio data must be encoded as 16000Hz wide band

Video:

H.264

```
[1-byte header]
[1-byte codec config indicator (1 - video data, 0 - codec config packet)]
[3-byte time difference between dts and pts in milliseconds]
[n-bytes video content or codec config data]
```

All others

```
[1-byte header]
[n-bytes audio content]
```

Below is the bit layout of the header byte of data (table goes from least significant bit to most significant bit):

4 bits Video type:

- |   |                        |
|---|------------------------|
| 2 | Sorenson Spark (H.263) |
| 3 | Screen                 |
| 4 | On2 VP6                |
| 5 | On2 VP6A               |
| 6 | Screen2                |
| 7 | H.264                  |

2 bit Frame type:

- |   |                     |
|---|---------------------|
| 1 | K frame (key frame) |
| 2 | P frame             |
| 3 | B frame             |

Note: H.264 codec config data is the same as the AVCc packet in a QuickTime container.

Note: All timecode data is in milliseconds

## Method Summary

void	<a href="#">addAudioData</a> (byte[] data, int offset, int len, long timecode)
------	--

void	<a href="#">addAudioData</a> (byte[] data, int offset, int len, long timecode, java.util.Map extraData) Add audio data

void	<a href="#">unpublish()</a>
------	-----------------------------

Methods inherited from class `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Methods

### createInstance

```
public static Publisher createInstance(IVHost vhost,  
    String applicationName)
```

### createInstance

```
public static Publisher createInstance(IVHost vhost,  
    String applicationName,  
    String appInstanceName)
```

### createInstance

```
public static Publisher createInstance(IApplicationInstance appInstance)
```

### getStream

```
public IMediaStream getStream()
```

Get the media stream object

**Returns:**

media stream object

### getStreamType

```
public String getStreamType()
```

### setStreamType

```
public void setStreamType(String streamType)
```

Set the stream type (default live)

**Parameters:**

streamType - stream type

(continued from last page)

## publish

```
public void publish(String streamName)
```

Publish a stream (null to stop publishing)

**Parameters:**

streamName - stream name

---

## getFileExtension

```
public String getFileExtension()
```

Get the file extension (default flv)

**Returns:**

file extension

---

## setFileExtension

```
public void setFileExtension(String fileExtension)
```

Set the file extension

**Parameters:**

fileExtension - file extension

---

## getAppInstance

```
public IApplicationInstance getAppInstance()
```

---

## unpublish

```
public void unpublish()
```

---

## createStream

```
public void createStream()
```

Create underlying IMediaStream object if not already created

---

## publish

```
public void publish(String streamName,  
String howToPublish)
```

Start publishing a stream (streamName = null to stop). Valid howToPublish values are (live, record, append)

**Parameters:**

streamName - stream name

howToPublish - publish method (live, record, append)

---

(continued from last page)

## addVideoData

```
public void addVideoData(byte[] data,  
    long timecode)
```

Add video data

### Parameters:

data - data  
timecode - absolute timecode (milliseconds)

---

## addVideoData

```
public void addVideoData(byte[] data,  
    int len,  
    long timecode)
```

Add video data

### Parameters:

data - data  
len - data length  
timecode - absolute timecode (milliseconds)

---

## addVideoData

```
public void addVideoData(byte[] data,  
    int offset,  
    int len,  
    long timecode)
```

Add video data

### Parameters:

data - data  
offset - offset  
len - data length  
timecode - absolute timecode (milliseconds)

---

## addVideoData

```
public void addVideoData(byte[] data,  
    int offset,  
    int len,  
    long timecode,  
    java.util.Map extraData)
```

Add video data

### Parameters:

data - data  
offset - offset  
len - data length  
timecode - absolute timecode (milliseconds)  
extraData - extra data

---

## startVideoData

```
public void startVideoData(int len,  
    long timecode)
```

(continued from last page)

---

## startVideoData

```
public void startVideoData(int len,  
    long timecode,  
    java.util.Map extraData)
```

---

## addVideoDataInc

```
public void addVideoDataInc(byte[] data,  
    int offset,  
    int len)
```

---

## startAudioData

```
public void startAudioData(int len,  
    long timecode)
```

---

## startAudioData

```
public void startAudioData(int len,  
    long timecode,  
    java.util.Map extraData)
```

---

## addAudioDataInc

```
public void addAudioDataInc(byte[] data,  
    int offset,  
    int len)
```

---

## addAudioData

```
public void addAudioData(byte[] data,  
    long timecode)
```

Add audio data

### Parameters:

data - data

timecode - absolute timecode (milliseconds)

---

## addAudioData

```
public void addAudioData(byte[] data,  
    int len,  
    long timecode)
```

Add audio data

(continued from last page)

**Parameters:**

data - data  
len - data length  
timecode - absolute timecode (milliseconds)

---

**addAudioData**

```
public void addAudioData(byte[] data,  
    int offset,  
    int len,  
    long timecode)
```

---

**addAudioData**

```
public void addAudioData(byte[] data,  
    int offset,  
    int len,  
    long timecode,  
    java.util.Map extraData)
```

Add audio data

**Parameters:**

data - data  
len - data length  
offset - offset  
timecode - absolute timecode (milliseconds)

---

**addDataData**

```
public void addDataData(byte[] data,  
    long timecode)
```

Add metadata

**Parameters:**

data - data  
timecode - absolute timecode (milliseconds)

---

**addDataData**

```
public void addDataData(byte[] data,  
    int len,  
    long timecode)
```

Add metadata

**Parameters:**

data - data  
len - data length  
timecode - absolute timecode (milliseconds)

---

**addDataData**

```
public void addDataData(byte[] data,  
    int offset,  
    int len,  
    long timecode)
```

(continued from last page)

---

## addDataData

```
public void addDataData(byte[] data,  
    int offset,  
    int len,  
    long timecode,  
    java.util.Map extraData)
```

Add metadata

### Parameters:

data - data  
offset - offset  
len - data length  
timecode - absolute timecode (milliseconds)

---

## startDataData

```
public void startDataData(int len,  
    long timecode)
```

---

## startDataData

```
public void startDataData(int len,  
    long timecode,  
    java.util.Map extraData)
```

---

## addDataDataInc

```
public void addDataDataInc(byte[] data,  
    int offset,  
    int len)
```

---

## flush

```
public void flush()
```

Flush the packets from the input buffer to the output buffer

---

## close

```
public void close()
```

Close the publisher

---

## getMaxTimecode

```
public long getMaxTimecode()
```

Highest timecode written through this publisher (milliseconds).

---

(continued from last page)

**Returns:**

highest timecode written through this publisher (milliseconds)

---

**getLastAudioTimecode**

```
public long getLastAudioTimecode()
```

Get last audio timecode written through this publisher (milliseconds).

**Returns:**

last audio timecode written through this publisher (milliseconds).

---

**getLastGapAudioTimecode**

```
public long getLastGapAudioTimecode()
```

Get gap time from last audio timecode.

**Returns:**

gap time from audio timecode written through this publisher (milliseconds).

---

**getLastVideoTimecode**

```
public long getLastVideoTimecode()
```

Get last video timecode written through this publisher (milliseconds).

**Returns:**

last video timecode written through this publisher (milliseconds).

---

**getLastGapVideoTimecode**

```
public long getLastGapVideoTimecode()
```

Get gap time from last video timecode.

**Returns:**

gap time from video timecode written through this publisher (milliseconds).

---

**getLastDataTimecode**

```
public long getLastDataTimecode()
```

Get last data timecode written through this publisher (milliseconds).

**Returns:**

last data timecode written through this publisher (milliseconds).

---

**isPublishDataEvents**

```
public boolean isPublishDataEvents()
```

---

**setPublishDataEvents**

```
public void setPublishDataEvents(boolean publishDataEvents)
```

(continued from last page)

## com.wowza.wms.stream.publish Class PublishingProviderBase

java.lang.Object

└-com.wowza.wms.stream.publish.PublishingProviderBase

Direct Known Subclasses:

[PublishingProviderMediaReader](#), [PublishingProviderLive](#)

```
public class PublishingProviderBase
extends Object
```

PublishingProviderBase: Base class for publishing providers.

### Field Summary

protected	<a href="#">sendOnMetadata</a>
-----------	--------------------------------

### Constructor Summary

public	<a href="#">PublishingProviderBase()</a>
--------	--

### Method Summary

boolean	<a href="#">isSendOnMetadata()</a> True to send onMetadata event on stream start
void	<a href="#">setSendOnMetadata</a> (boolean sendOnMetadata) True to send onMetadata event on stream start

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Fields

#### sendOnMetadata

protected boolean **sendOnMetadata**

### Constructors

#### PublishingProviderBase

```
public PublishingProviderBase()
```

(continued from last page)

## Methods

### isSendOnMetadata

```
public boolean isSendOnMetadata()
```

True to send onMetadata event on stream start

**Returns:**

True to send onMetadata event on stream start

---

### setSendOnMetadata

```
public void setSendOnMetadata(boolean sendOnMetadata)
```

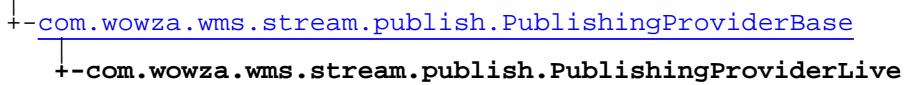

True to send onMetadata event on stream start

**Parameters:**

sendOnMetadata - True to send onMetadata event on stream start

## com.wowza.wms.stream.publish Class PublishingProviderLive

## Constructors

### PublishingProviderLive

```
public PublishingProviderLive(Publisher publisher,
                             long timeoffset,
                             String streamName)
```

## Methods

### close

```
public void close()
```

### play

```
public boolean play(Publisher publisher)
```

### seek

```
public boolean seek(long timecode)
```

### seek

```
public boolean seek(long timecode,
                    int seekType)
```

---

### **getDuration**

```
public long getDuration()
```

---

### **setDuration**

```
public void setDuration(long duration)
```

---

### **setRealTimeStartTime**

```
public void setRealTimeStartTime(long realTimeStartTime)
```

---

### **isStartOnPreviousKeyFrame**

```
public boolean isStartOnPreviousKeyFrame()
```

---

### **setStartOnPreviousKeyFrame**

```
public void setStartOnPreviousKeyFrame(boolean startOnPreviousKeyFrame)
```

---

### **getStartOnPreviousBufferTime**

```
public long getStartOnPreviousBufferTime()
```

---

### **setStartOnPreviousBufferTime**

```
public void setStartOnPreviousBufferTime(long startOnPreviousBufferTime)
```

---

### **isStopIfStreamMissing**

```
public boolean isStopIfStreamMissing()
```

---

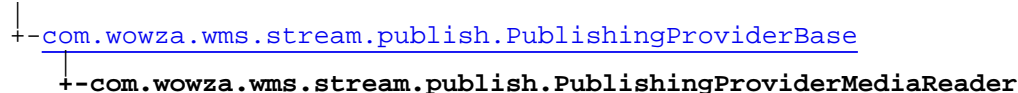

### **setStopIfStreamMissing**

```
public void setStopIfStreamMissing(boolean stopIfStreamMissing)
```

---

## com.wowza.wms.stream.publish Class PublishingProviderMediaReader

java.lang.Object

All Implemented Interfaces:

[IPublishingProvider](#)

public class **PublishingProviderMediaReader**

extends [PublishingProviderBase](#)

implements [IPublishingProvider](#)

PublishingProviderMediaReader: Publishing provider for media reader based stream (vod).

### Field Summary

public static final	<a href="#">ONMETADATA_FILTER_DURATION</a> Value: <b>1</b>
public static final	<a href="#">ONMETADATA_FILTER_NONE</a> Value: <b>0</b>

Fields inherited from class [com.wowza.wms.stream.publish.PublishingProviderBase](#)

[sendOnMetadata](#)

### Constructor Summary

## Fields

### ONMETADATA\_FILTER\_NONE

public static final long **ONMETADATA\_FILTER\_NONE**

Constant value: **0**

### ONMETADATA\_FILTER\_DURATION

public static final long **ONMETADATA\_FILTER\_DURATION**

Constant value: **1**

## Constructors

### PublishingProviderMediaReader

```
public PublishingProviderMediaReader(Publisher publisher,
                                     long timeoffset,
                                     String streamName)
```

Constructor

#### Parameters:

`publisher` - publisher  
`timeoffset` - timeoffset (milliseconds)  
`streamName` - stream name

## Methods

### getTimeTextedReader

```
public void getTimeTextedReader(IMediaReader mediaReader,
                                 IApplicationInstance appInstance,
                                 String mediaName,
                                 String mediaExtension,
                                 String queryStr,
                                 IMediaStream stream)
```

### seek

```
public boolean seek(long timecode)
```

(continued from last page)

## seek

```
public boolean seek(long timecode,  
                    int seekType)
```

---

## filterMetadata

```
public byte[] filterMetadata(byte[] dataDataBytes)
```

---

## play

```
public boolean play(Publisher publisher)
```

---

## close

```
public void close()
```

---

## getDuration

```
public long getDuration()
```

Get the target playback duration (milliseconds)

**Returns:**

playback duration (milliseconds)

---

## setDuration

```
public void setDuration(long duration)
```

---

## setRealTimeStartTime

```
public void setRealTimeStartTime(long realTimeStartTime)
```

---

## getSpeed

```
public double getSpeed()
```

---

## setSpeed

```
public void setSpeed(double speed)
```

---

---

## getOnMetadataFilter

```
public long getOnMetadataFilter()
```

Filter that control what metadata items are removed from onMetaData event. Default is ONMETADATA\_FILTER\_DURATION. Value is a bit mask of ONMETADATA\_FILTER\_\* value.

### Returns:

control what metadata items are removed from onMetaData event

---

## setOnMetadataFilter

```
public void setOnMetadataFilter(long onMetadataFilter)
```

Filter that control what metadata items are removed from onMetaData event. Default is ONMETADATA\_FILTER\_DURATION. Value is a bit mask of ONMETADATA\_FILTER\_\* value.

### Parameters:

onMetadataFilter - control what metadata items are removed from onMetaData event

---

## getCaptionLanguageQueryParameter

```
public String getCaptionLanguageQueryParameter()
```

---

## setCaptionLanguageQueryParameter

```
public void setCaptionLanguageQueryParameter(String captionLanguageQueryParameter)
```

---

## getCaptionFilenameQueryParameter

```
public String getCaptionFilenameQueryParameter()
```

---

## setCaptionFilenameQueryParameter

```
public void setCaptionFilenameQueryParameter(String captionFilenameQueryParameter)
```

---

## getCaptionLanguageStr

```
public String getCaptionLanguageStr()
```

---

## setCaptionLanguageStr

```
public void setCaptionLanguageStr(String captionLanguageStr)
```

---

(continued from last page)

**getCaptionFilenameStr**

```
public String getCaptionFilenameStr()
```

---

**setCaptionFilenameStr**

```
public void setCaptionFilenameStr(String captionFilenameStr)
```

---

**getTimedTextEventName**

```
public String getTimedTextEventName()
```

---

**setTimedTextEventName**

```
public void setTimedTextEventName(String timedTextEventName)
```

---

**isTimedTextEnabled**

```
public boolean isTimedTextEnabled()
```

---

**setTimedTextEnabled**

```
public void setTimedTextEnabled(boolean timedTextEnabled)
```

---

## com.wowza.wms.stream.publish Class Stream

java.lang.Object

└─com.wowza.wms.stream.publish.Stream

All Implemented Interfaces:

Runnable

public class **Stream**  
extends Object  
implements Runnable

### Constructor Summary

public	<a href="#">Stream()</a>
--------	--------------------------

### Method Summary

void	<a href="#">addListener(IStreamActionNotify listener)</a> Add a listener
boolean	<a href="#">addToPlaylist(int index, String name, int start, int length)</a> Inserts a media source item to this playlist at a particular index, without interruption.
boolean	<a href="#">addToPlaylist(String existing, String name, int start, int length)</a> Insert item into playlist just after the first item in the playlist with a given name.
void	<a href="#">close()</a> Call this method when you have finished with the playlist object.
void	<a href="#">closeAndWait()</a> Call this method when you have finished with the playlist object.
static <a href="#">Stream</a>	<a href="#">createInstance(IApplicationInstance appInstance, String sName)</a> Use this to create a named Stream on an application instance.
static <a href="#">Stream</a>	<a href="#">createInstance(IVHost vhost, String applicationName, String sName)</a> Use this to create a named Stream on the default instance (_definst_) of an application on a particular VHost.
static <a href="#">Stream</a>	<a href="#">createInstance(IVHost vhost, String applicationName, String appInstanceName, String sName)</a> Use this to create a named Stream on the non-default instance of an application on a particular VHost.
static <a href="#">Stream</a>	<a href="#">createInstance(IVHost vhost, String applicationName, String appInstanceName, String sName, String streamType)</a> Use this to create a named Stream on the non-default instance of an application on a particular VHost.
<a href="#">PlaylistItem</a>	<a href="#">getCurrentItem()</a> Get the currently playing playlist item

Object	<a href="#"><u>getLock()</u></a> Get the synchronization lock for this interface.
String	<a href="#"><u>getName()</u></a> Returns the name of the playlist stream - the client would play this stream by this name.
java.util.List	<a href="#"><u>getPlaylist()</u></a> Get the current playlist
int	<a href="#"><u>getPollingInterval()</u></a> Get the polling interval (milliseconds)
<a href="#"><u>Publisher</u></a>	<a href="#"><u>getPublisher()</u></a>
boolean	<a href="#"><u>getRepeat()</u></a> Use this to determine if the playlist is auto-repeating
long	<a href="#"><u>getStartLiveOnPreviousBufferTime()</u></a> Get time in milliseconds to go back in live stream buffer to get previous key frame
String	<a href="#"><u>getStreamType()</u></a>
int	<a href="#"><u>getTimeOffsetBetweenItems()</u></a> Get time in milliseconds to add to stream time between playlist items (default is zero)
double	<a href="#"><u>getVODSpeed()</u></a>
boolean	<a href="#"><u>isMoveToNextIfLiveStreamMissing()</u></a> If true, will move to next playlist item if live stream is missing or is unpublished.
boolean	<a href="#"><u>isSendOnMetadata()</u></a> True if sending onMetadata events
boolean	<a href="#"><u>isStartLiveOnPreviousKeyFrame()</u></a> Set to true to start live streams on most recent key frame (smoother switching)
boolean	<a href="#"><u>isSwitchLog()</u></a> Log when a playlist switch occurs
boolean	<a href="#"><u>isTimesInMilliseconds()</u></a> If true start time and duration and are milliseconds.
boolean	<a href="#"><u>isUnpublishOnEnd()</u></a> If true, stop publishing if end of playlist and repeat is false
void	<a href="#"><u>next()</u></a>
void	<a href="#"><u>next(int n)</u></a>
void	<a href="#"><u>play(int n)</u></a>
boolean	<a href="#"><u>play(String sPlaylist)</u></a> Add a media item to the playlist as defined by an XML file ..
boolean	<a href="#"><u>play(String name, int start, int length, boolean reset)</u></a> Adds a media source item to this playlist -

void	<a href="#"><u>previous()</u></a>
void	<a href="#"><u>previous(int n)</u></a>
boolean	<a href="#"><u>removeFromPlaylist(int index)</u></a> Remove item from playlist based on index.
boolean	<a href="#"><u>removeFromPlaylist(String name)</u></a> Remove all items matching the given stream name from the playlist.
void	<a href="#"><u>removeListener(IStreamActionNotify listener)</u></a> Remove a listener
void	<a href="#"><u>run()</u></a> Overridden from class Runnable ....
void	<a href="#"><u>setMoveToNextIfLiveStreamMissing(boolean moveToNextIfLiveStreamMissing)</u></a> If true, will move to next playlist item if live stream is missing or is unpublished.
void	<a href="#"><u>setPollingInterval(int pollingInterval)</u></a> Set the polling interval (milliseconds)
void	<a href="#"><u>setRepeat(boolean repeat)</u></a> Use this to make the playlist repeat or not...
void	<a href="#"><u>setSendOnMetadata(boolean sendOnMetadata)</u></a> True if sending onMetadata events
void	<a href="#"><u>setStartLiveOnPreviousBufferTime(long startLiveOnPreviousBufferTime)</u></a> Set time in milliseconds to go back in live stream buffer to get previous key frame
void	<a href="#"><u>setStartLiveOnPreviousKeyFrame(boolean startLiveOnPreviousKeyFrame)</u></a> Set to true to start live streams on most recent key frame (smoother switching)
void	<a href="#"><u>setSwitchLog(boolean switchLog)</u></a> Log when a playlist switch occurs
void	<a href="#"><u>setTimeOffsetBetweenItems(int timeOffsetBetweenItems)</u></a> Set time in milliseconds to add to stream time between playlist items (default is zero)
void	<a href="#"><u>setTimesInMilliseconds(boolean timesInMilliseconds)</u></a> If true start time and duration and are milliseconds.
void	<a href="#"><u>setUnpublishOnEnd(boolean stopOnEnd)</u></a> If true, stop publishing if end of playlist and repeat is false
void	<a href="#"><u>setVODSpeed(double vodSpeed)</u></a>

**Methods inherited from class java.lang.Object**

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

**Methods inherited from interface java.lang.Runnable**

run

## Constructors

### Stream

```
public Stream()
```

## Methods

### createInstance

```
public static Stream createInstance(IVHost vhost,  
    String applicationName,  
    String sName)
```

Use this to create a named Stream on the default instance (\_definst\_) of an application on a particular VHost.

**Parameters:**

vhost -- Virtual Host  
applicationName -- Application name  
sName -- Name of Stream

**Returns:**

stream interface

### createInstance

```
public static Stream createInstance(IVHost vhost,  
    String applicationName,  
    String appInstanceName,  
    String sName)
```

Use this to create a named Stream on the non-default instance of an application on a particular VHost.

**Parameters:**

vhost -- Virtual Host  
applicationName -- Application name  
appInstanceName -- Instance name  
sName -- Name of Stream

**Returns:**

stream interface

### createInstance

```
public static Stream createInstance(IVHost vhost,  
    String applicationName,  
    String appInstanceName,  
    String sName,  
    String streamType)
```

Use this to create a named Stream on the non-default instance of an application on a particular VHost.

**Parameters:**

vhost -- Virtual Host  
applicationName -- Application name  
appInstanceName -- Instance name

(continued from last page)

sName -- Name of Stream  
streamType -- Stream type

**Returns:**

stream interface

---

## getLock

```
public Object getLock()
```

Get the synchronization lock for this interface.

**Returns:**

synchronization lock for this interface

---

## createInstance

```
public static Stream createInstance(IApplicationInstance appInstance,  
String sName)
```

Use this to create a named Stream on an application instance.

**Parameters:**

appInstance -- Application instance  
sName -- Name of Stream

**Returns:**

stream interface

---

## run

```
public void run()
```

Overridden from class Runnable .... do NOT call this directly. This method handles switching between media sources in the playlist.

---

## getPlaylist

```
public java.util.List getPlaylist()
```

Get the current playlist

**Returns:**

current playlist

---

## getCurrentItem

```
public PlaylistItem getCurrentItem()
```

Get the currently playing playlist item

**Returns:**

currently playing playlist item

(continued from last page)

## play

```
public boolean play(String name,  
    int start,  
    int length,  
    boolean reset)
```

Adds a media source item to this playlist -

### Parameters:

name - - name of media item  
start - - where to start playing the item. (-2 implies play a live stream)  
length - - how much of the item to play (-1 implies play the entire file or live stream)  
reset - - if true, will begin a new playlist, otherwise items are appended

### Returns:

- returns true if item was added successfully ...otherwise false.

---

## addToPlaylist

```
public boolean addToPlaylist(int index,  
    String name,  
    int start,  
    int length)
```

Inserts a media source item to this playlist at a particular index, without interruption.

### Parameters:

index - - insertion index  
name - - name of media item being inserted  
start - - where to start playing the item. (-2 implies play a live stream)  
length - - how much of the item to play (-1 implies play the entire file or live stream)

### Returns:

- returns true if item was inserted successfully ...otherwise false. this should not interrupt anything that might be currently playing.... will do nothing if existing item does not exist.. if existing == "" insert at head of list

---

## addToPlaylist

```
public boolean addToPlaylist(String existing,  
    String name,  
    int start,  
    int length)
```

Insert item into playlist just after the first item in the playlist with a given name.

### Parameters:

existing - name of playlist item in which to insert the item after  
name - name of new item  
start - where to start playing the item. (-2 implies play a live stream)  
length - how much of the item to play (-1 implies play the entire file or live stream)

### Returns:

true if item inserted

---

## removeFromPlaylist

```
public boolean removeFromPlaylist(int index)
```

Remove item from playlist based on index.

(continued from last page)

**Parameters:**

index - item index

**Returns:**

true if at least one item from removed

---

**removeFromPlaylist**

```
public boolean removeFromPlaylist(String name)
```

Remove all items matching the given stream name from the playlist. If the item is currently being played, it is not removed.

**Parameters:**

name - stream name

**Returns:**

true if at least one item from removed

---

**play**

```
public boolean play(String sPlaylist)
```

Add a media item to the playlist as defined by an XML file ..

**Parameters:**

sPlaylist -- the playlist XML definition file

**Returns:**

- returns true if item was added successfully ...otherwise false.

---

**close**

```
public void close()
```

Call this method when you have finished with the playlist object. It will terminate the playlist thread. The playlist object cannot be used after this call.

---

**closeAndWait**

```
public void closeAndWait()
```

Call this method when you have finished with the playlist object. It will terminate the playlist thread. The playlist object cannot be used after this call. This method will wait for the thread to exit.

---

**getName**

```
public String getName()
```

Returns the name of the playlist stream - the client would play this stream by this name.

**Returns:**

- the name of the playlist stream

---

**getRepeat**

```
public boolean getRepeat()
```

Use this to determine if the playlist is auto-repeating

(continued from last page)

**Returns:**

- true if repeating otherwise false.

---

**setRepeat**

```
public void setRepeat(boolean repeat)
```

Use this to make the playlist repeat or not...

**Parameters:**

repeat -- true to repeat otherwise false

---

**play**

```
public void play(int n)
```

---

**next**

```
public void next(int n)
```

---

**next**

```
public void next()
```

---

**previous**

```
public void previous()
```

---

**previous**

```
public void previous(int n)
```

---

**getPollingInterval**

```
public int getPollingInterval()
```

Get the polling interval (milliseconds)

**Returns:**

polling interval (milliseconds)

---

**setPollingInterval**

```
public void setPollingInterval(int pollingInterval)
```

Set the polling interval (milliseconds)

(continued from last page)

**Parameters:**

pollingInterval - polling interval (milliseconds)

---

**getPublisher**

```
public Publisher getPublisher()
```

---

**addListener**

```
public void addListener(IStreamActionNotify listener)
```

Add a listener

**Parameters:**

listener - listener

---

**removeListener**

```
public void removeListener(IStreamActionNotify listener)
```

Remove a listener

**Parameters:**

listener - listener

---

**isSwitchLog**

```
public boolean isSwitchLog()
```

Log when a playlist switch occurs

**Returns:**

log when a playlist switch occurs

---

**setSwitchLog**

```
public void setSwitchLog(boolean switchLog)
```

Log when a playlist switch occurs

**Parameters:**

switchLog - log when a playlist switch occurs

---

**isSendOnMetadata**

```
public boolean isSendOnMetadata()
```

True if sending onMetadata events

**Returns:**

True if sending onMetadata events

---

**setSendOnMetadata**

```
public void setSendOnMetadata(boolean sendOnMetadata)
```

(continued from last page)

True if sending onMetadata events

**Parameters:**

sendOnMetadata - True if sending onMetadata events

---

## isTimesInMilliseconds

```
public boolean isTimesInMilliseconds()
```

If true start time and duration and are milliseconds. If false startTime and duration are in seconds.

**Returns:**

true start time and duration and are milliseconds

---

## setTimesInMilliseconds

```
public void setTimesInMilliseconds(boolean timesInMilliseconds)
```

If true start time and duration and are milliseconds. If false startTime and duration are in seconds.

**Parameters:**

timesInMilliseconds - true start time and duration and are milliseconds

---

## isStartLiveOnPreviousKeyFrame

```
public boolean isStartLiveOnPreviousKeyFrame()
```

Set to true to start live streams on most recent key frame (smoother switching)

**Returns:**

true to start live streams on most recent key frame

---

## setStartLiveOnPreviousKeyFrame

```
public void setStartLiveOnPreviousKeyFrame(boolean startLiveOnPreviousKeyFrame)
```

Set to true to start live streams on most recent key frame (smoother switching)

**Parameters:**

startLiveOnPreviousKeyFrame - true to start live streams on most recent key frame

---

## getStartLiveOnPreviousBufferTime

```
public long getStartLiveOnPreviousBufferTime()
```

Get time in milliseconds to go back in live stream buffer to get previous key frame

**Returns:**

time in milliseconds to go back in live stream buffer to get previous key frame

---

## setStartLiveOnPreviousBufferTime

```
public void setStartLiveOnPreviousBufferTime(long startLiveOnPreviousBufferTime)
```

Set time in milliseconds to go back in live stream buffer to get previous key frame

**Parameters:**

startLiveOnPreviousBufferTime - time in milliseconds to go back in live stream buffer to get previous key frame

---

## getTimeOffsetBetweenItems

```
public int getTimeOffsetBetweenItems()
```

Get time in milliseconds to add to stream time between playlist items (default is zero)

**Returns:**

time in milliseconds to add to stream time between playlist items

---

## setTimeOffsetBetweenItems

```
public void setTimeOffsetBetweenItems(int timeOffsetBetweenItems)
```

Set time in milliseconds to add to stream time between playlist items (default is zero)

**Parameters:**

timeOffsetBetweenItems - time in milliseconds to add to stream time between playlist items

---

## isMoveToNextIfLiveStreamMissing

```
public boolean isMoveToNextIfLiveStreamMissing()
```

If true, will move to next playlist item if live stream is missing or is unpublished.

**Returns:**

move to next playlist item if live stream is missing or is unpublished

---

## setMoveToNextIfLiveStreamMissing

```
public void setMoveToNextIfLiveStreamMissing(boolean moveToNextIfLiveStreamMissing)
```

If true, will move to next playlist item if live stream is missing or is unpublished.

**Parameters:**

moveToNextIfLiveStreamMissing - move to next playlist item if live stream is missing or is unpublished

---

## isUnpublishOnEnd

```
public boolean isUnpublishOnEnd()
```

If true, stop publishing if end of playlist and repeat is false

**Returns:**

stop publishing if end of playlist and repeat is false

---

## setUnpublishOnEnd

```
public void setUnpublishOnEnd(boolean stopOnEnd)
```

If true, stop publishing if end of playlist and repeat is false

**Parameters:**

stopOnEnd - stop publishing if end of playlist and repeat is false

---

## getVODSpeed

```
public double getVODSpeed()
```

---

(continued from last page)

---

## setVODSpeed

```
public void setVODSpeed(double vodSpeed)
```

---

## getStreamType

```
public String getStreamType()
```

## com.wowza.wms.stream.publish Class VODTimedTextDelegatePublisher

java.lang.Object

```

    |
    +--com.wowza.wms.timedtext.vod.model.VODTimedTextDelegateBase

## Method Summary

void	<a href="#">init</a> ( <a href="#">IMediaReader</a> reader, com.wowza.wms.timedtext.vod.model.TimedTextMediaReaderContext ctx, Class inf)
void	<a href="#">initializeTimedTextProviders</a> ()
boolean	<a href="#">shouldCreateTimedTextProvider</a> (String providerName, VODTimedTextProviderItem item)

### Methods inherited from class com.wowza.wms.timedtext.vod.model.VODTimedTextDelegateBase

determineCaptionLanguages, findAvailableProviders, findProvidersByExtension, findProvidersThatSupportInterface, getContext, getTimedTextProviders, getTimedTextProviders, getVODTimedTextProviders, indexTimedText, init, initializeTimedTextProviders, narrowAndOrderProviders, setTimedTextProviders, shouldCreateTimedTextProvider

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Methods inherited from interface com.wowza.wms.timedtext.model.IVODTimedTextDelegate

```
determineCaptionLanguages, getTimedTextProviders, getTimedTextProviders,  
getVODTimedTextProviders, indexTimedText, init, initializeTimedTextProviders,  
setTimedTextProviders
```

Methods inherited from interface `com.wowza.wms.timedtext.model.IVODTimedTextDelegate`

```
determineCaptionLanguages, getTimedTextProviders, getTimedTextProviders,  
getVODTimedTextProviders, indexTimedText, init, initializeTimedTextProviders,  
setTimedTextProviders
```

---

## Constructors

### VODTimedTextDelegatePublisher

```
public VODTimedTextDelegatePublisher()
```

## Methods

### init

```
public void init(IMediaReader reader,  
                 com.wowza.wms.timedtext.vod.model.TimedTextMediaReaderContext ctx,  
                 Class inf)
```

---

### initializeTimedTextProviders

```
public void initializeTimedTextProviders()
```

---

### shouldCreateTimedTextProvider

```
protected boolean shouldCreateTimedTextProvider(String providerName,  
                                                  VODTimedTextProviderItem item)
```

---

Package

**com.wowza.wms.timedtext.cea608**

## com.wowza.wms.timedtext.cea608

### Class ClosedCaptionCEA608Utils

```

---

**UTF8\_CENTS**

```
public static final char UTF8_CENTS
```

Constant value: **162**

---

## UTF8\_TRADEMARK

public static final char **UTF8\_TRADEMARK**

Constant value: **8482**

---

## UTF8\_REVERSE\_QUERY

public static final char **UTF8\_REVERSE\_QUERY**

Constant value: **191**

---

## UTF8\_ONE\_HALF

public static final char **UTF8\_ONE\_HALF**

Constant value: **189**

---

## CEA608\_MUSICAL\_NOTE

public static byte **CEA608\_MUSICAL\_NOTE**

---

## CEA608\_SOLID\_BLOCK

public static byte **CEA608\_SOLID\_BLOCK**

---

## UTF8MAP\_INDEX\_OFFSET

public static final int **UTF8MAP\_INDEX\_OFFSET**

Constant value: **32**

---

## UTF8MAP

public static final byte **UTF8MAP**

---

## CEA608\_EXTENDED\_NA\_MAP

public static final char **CEA608\_EXTENDED\_NA\_MAP**

---

## CEA608\_EXTENDED\_FR\_SP\_MAP

public static final char **CEA608\_EXTENDED\_FR\_SP\_MAP**

---

---

## CEA608\_EXTENDED\_PORT\_GERMAN\_DANISH\_MAP

```
public static final char CEA608_EXTENDED_PORT_GERMAN_DANISH_MAP
```

## Constructors

### ClosedCaptionCEA608Utils

```
public ClosedCaptionCEA608Utils()
```

## Methods

### charUTF8ToCAE608

```
public static byte[] charUTF8ToCAE608(CEACaptionConversionContext ceaContext,  
    String text,  
    int pos,  
    String characterSet,  
    int channel)
```

---

### charUTF8ToCAE608

```
public static byte[] charUTF8ToCAE608(String text,  
    int pos,  
    String characterSet,  
    int channel)
```

---

### cea608CharToCharUTF8

```
public static char cea608CharToCharUTF8(short b)
```

---

### calcParity

```
public static byte calcParity(byte inByte)
```

---

### calcParity

```
public static short calcParity(short inShort)
```

---

### checkParity

```
public static boolean checkParity(byte inByte)
```

---

## **checkParity**

```
public static boolean checkParity(short inShort)
```

---

## **cea608ExtendedCharacterToUTF8**

```
public static Character cea608ExtendedCharacterToUTF8(short command)
```

---

Package

**com.wowza.wms.timedtext.model**

## com.wowza.wms.timedtext.model Interface ITimedTextConstants

public interface **ITimedTextConstants**  
extends **ITimedTextPrivateConstants**

### Field Summary

public static final	<a href="#">AMF_TEXTTYPE_ON_TEXT_DATA</a> Value: <b>onTextData</b>
public static final	<a href="#">CEA608</a> Value: <b>CEA608</b>
public static final	<a href="#">DEFAULT_AMF_CONVERTER_TEXT_TYPE</a> Value: <b>onTextData</b>
public static final	<a href="#">DEFAULT_AMF_CONVERTER_TRACK_INDEX</a> Value: <b>99</b>
public static final	<a href="#">DEFAULT_CAPTION_CHARACTER_SET</a> Default value for Timed Text Property "captionCharacterSet". Value: <b>UTF-8</b>
public static final	<a href="#">DEFAULT_MAXIMUM_CAPTION_DURATION</a> Default value for Timed Text Property "maximumCaptionDuration". Value: <b>5000</b>
public static final	<a href="#">DEFAULT_PROPERTY_CAPTION_LANGUAGES</a> Value: <b>*</b>
public static final	<a href="#">DEFAULT_PROPERTY_CAPTION_FILE_NAMING_RULE</a> Default value for Timed Text Property "captionFileNamingRule". Value: <b>\${SourceStreamName}.\${FileExtension}</b>
public static final	<a href="#">DEFAULT_PROPERTY_CAPTION_LANGUAGES</a> Default value for Timed Text Property "captionLanguages". Value: <b>*</b>
public static final	<a href="#">DEFAULT_PROPERTY_CAPTION_PATH_NAMING_RULE</a> Default value for Timed Text Property "captionFileNamingRule". Value: <b>\${SourceBasePath}</b>
public static final	<a href="#">LANGUAGE_ID_ENGLISH</a> Value: <b>eng</b>
public static final	<a href="#">LANGUAGE_LOCALE</a> Value: <b>locale</b>

public static final	<a href="#">ON_CAPTION</a> Value: <b>onCaption</b>
public static final	<a href="#">ON_CAPTION_INFO</a> Value: <b>onCaptionInfo</b>
public static final	<a href="#">ON_TEXT_DATA</a> Value: <b>onTextData</b>
public static final	<a href="#">OUTPUT_TYPE_AMF</a> Value: <b>AMF</b>
public static final	<a href="#">OUTPUT_TYPE_CEA608</a> Value: <b>CEA608</b>
public static final	<a href="#">OUTPUT_TYPE_TTML</a> Value: <b>TTML</b>
public static final	<a href="#">PROP_3GPP_CAPTION_CHARACTER_SET</a> Timed Text Property "reader3GPPCaptionCharacterSet": used to determine character set when ingesting TTML captions Overrides general property "captionCharacterSet" Value: <b>reader3GPPCaptionCharacterSet</b>
public static final	<a href="#">PROP_AMF_CONVERTER_INSERT_ERASES_IN_GAPS</a> Timed Text Property "amfCaptionConverterInsertErases": insert erase captions if gaps between captions are greater than PROP_MAXIMUM_CAPTION_DURATION Value: <b>amfCaptionConverterInsertErases</b>
public static final	<a href="#">PROP_AMF_CONVERTER_TEXT_TYPE</a> Timed Text Property "amfCaptionConverterTextType": AMF text type used in conversion Value: <b>amfCaptionConverterTextType</b>
public static final	<a href="#">PROP_AMF_CONVERTER_TRACK_INDEX</a> Timed Text Property "amfCaptionConverterTrackIndex": track index used for captions Value: <b>amfCaptionConverterTrackIndex</b>
public static final	<a href="#">PROP_CAPTION_CHARACTER_SET</a> Timed Text Property "captionCharacterSet": used to determine character set when ingesting captions Value: <b>captionCharacterSet</b>
public static final	<a href="#">PROP_CAPTION_FILE_NAMING_RULE</a> Timed Text Property "captionFileNamingRule": to change logic determining the caption companion file naming scheme Value: <b>captionFileNamingRule</b>
public static final	<a href="#">PROP_CAPTION_FILENAME_QUERY_PARAMETER</a> HTTP Streamer Property "captionFilenameQueryParameter": used for changing query string param used for caption file selection. Value: <b>captionFilenameQueryParameter</b>

public static final	<a href="#">PROP_CAPTION_LANGUAGE_QUERY_PARAMETER</a> HTTP Streamer Property "captionLanguageQueryParameter": used for changing query string param used for caption language selection. Value: <b>captionLanguageQueryParameter</b>
public static final	<a href="#">PROP_CAPTION_LANGUAGES</a> Timed Text Property "captionLanguages": used to select presented caption Language. Value: <b>captionLanguages</b>
public static final	<a href="#">PROP_CAPTION_PATH_NAMING_RULE</a> Timed Text Property "captionPathNamingRule": to change logic determining the caption companion path Value: <b>captionPathNamingRule</b>
public static final	<a href="#">PROP_CEA608_CONVERTER_CHARACTER_SET</a> Timed Text Property "cea608CaptionConverterCharacterSet": character set in default CEA caption converter. Value: <b>cea608CaptionConverterCharacterSet</b>
public static final	<a href="#">PROP_CEA608_CONVERTER_CHARS_PER_LINE</a> Timed Text Property "cea608CaptionConverterCharsPerLine": max number characters per line in default CEA caption converter. Value: <b>cea608CaptionConverterCharsPerLine</b>
public static final	<a href="#">PROP_CEA608_CONVERTER_COLOR</a> Timed Text Property "cea608CaptionConverterColor": color of text in default CEA caption converter. Value: <b>cea608CaptionConverterColor</b>
public static final	<a href="#">PROP_CUPERTINO_CAPTION_LANGUAGES</a> Timed Text Property "cupertinoCaptionLanguages": to enabled captionLanguage selection for Cupertino streaming. Value: <b>cupertinoCaptionLanguages</b>
public static final	<a href="#">PROP_CUPERTINO_LIVE_USE_WEBVTT</a> Timed Text Property "cupertinoLiveCaptionsUseWebVTT" Value: <b>cupertinoLiveCaptionsUseWebVTT</b>
public static final	<a href="#">PROP_CUPERTINO_LIVE_WEBVTT_ADD_SPECIAL_EMPTY_CAPTION</a> Timed Text Property "cupertinoLiveWebVTTAddSpecialEmptyCaption" Value: <b>cupertinoLiveWebVTTAddSpecialEmptyCaption</b>
public static final	<a href="#">PROP_CUPERTINO_VOD_CAPTIONS_ENABLED</a> Timed Text Property "cupertinoVODCaptionsEnabled": to enabled VOD captions for Cupertino streaming. Value: <b>cupertinoVODCaptionsEnabled</b>
public static final	<a href="#">PROP_CUPERTINO_VOD_REMOVE_EXISTING_CEA608</a> Timed Text Property "cupertinoVODCaptionsRemoveExistingCEA608": if existing VOD has 608, remove them Value: <b>cupertinoVODCaptionsRemoveExistingCEA608</b>
public static final	<a href="#">PROP_CUPERTINO_VOD_USE_WEBVTT</a> Timed Text Property "cupertinoVODCaptionsUseWebVTT" Value: <b>cupertinoVODCaptionsUseWebVTT</b>

public static final	<a href="#"><u>PROP_DEBUG_3GPP_CAPTION_PARSER</u></a> Timed Text Property "debug3GPPCaptionParser": adds info level logging regarding the 3GPP parser Value: <b>debug3GPPCaptionParser</b>
public static final	<a href="#"><u>PROP_DEBUG_3GPP_CAPTION_PARSER_TIME</u></a> Timed Text Property "debug3GPPCaptionParserTime": adds info level logging regarding how long it took parser to index Value: <b>debug3GPPCaptionParserTime</b>
public static final	<a href="#"><u>PROP_DEBUG_CUPERTINO_VOD_CAPTION_LANGUAGE_SELECTION</u></a> Timed Text Property "cupertinoDebugVODCaptionLanguageSelection": adds info level logging regarding language selection for Cupertino Streaming Value: <b>cupertinoDebugVODCaptionLanguageSelection</b>
public static final	<a href="#"><u>PROP_DEBUG_CUPERTINO_VOD_CAPTION_PROVIDER_DETERMINATION</u></a> Timed Text Property "cupertinoDebugVODCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset for Cupertino Streaming. Value: <b>cupertinoDebugVODCaptionProviderDetermination</b>
public static final	<a href="#"><u>PROP_DEBUG_LIVE_CAPTION_INGEST</u></a> Timed Text Property "debugCaptionLiveIngest" Value: <b>debugCaptionLiveIngest</b>
public static final	<a href="#"><u>PROP_DEBUG_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_LOG_AS_RAW</u></a> Timed Text Property "debugCaptionLiveIngestOnCaptionCEA608LogAsRaw" : Adds additional logging of decoding AMF onCaption events of type "708" (CEA-608) such that they are logged in a raw binary state Value: <b>debugCaptionLiveIngestOnCaptionCEA608LogAsRaw</b>
public static final	<a href="#"><u>PROP_DEBUG_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_LOG_AS_SCC</u></a> Timed Text Property "debugCaptionLiveIngestOnCaptionCEA608LogAsSCC" : Adds additional logging of decoding AMF onCaption events of type "708" (CEA-608) such that they are logged in SCC format Value: <b>debugCaptionLiveIngestOnCaptionCEA608LogAsSCC</b>
public static final	<a href="#"><u>PROP_DEBUG_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_VERBOSE</u></a> Timed Text Property "debugCaptionLiveIngestOnCaptionCEA608Verbose" : Adds verbose logging to AMF onCaption events of type "708" (CEA-608) Value: <b>debugCaptionLiveIngestOnCaptionCEA608Verbose</b>
public static final	<a href="#"><u>PROP_DEBUG_LIVE_CAPTION_ONCAPTION_INGEST</u></a> Timed Text Property "debugCaptionLiveOnCaptionIngest" Value: <b>debugCaptionLiveOnCaptionIngest</b>
public static final	<a href="#"><u>PROP_DEBUG_LIVE_CAPTION_ONTEXTDATA_INGEST</u></a> Timed Text Property "debugCaptionLiveOnTextDataIngest" Value: <b>debugCaptionLiveOnTextDataIngest</b>
public static final	<a href="#"><u>PROP_DEBUG_MPEGDASH_VOD_CAPTION_LANGUAGE_SELECTION</u></a> Timed Text Property "mpegdashDebugVODCaptionLanguageSelection": adds info level logging regarding language selection for Cupertino Streaming Value: <b>mpegdashDebugVODCaptionLanguageSelection</b>

public static final	<a href="#">PROP_DEBUG_MPEGDASH_VOD_CAPTION_PROVIDER_DETERMINATION</a> Timed Text Property "mpegdashDebugVODCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset for MPEGDash Streaming. Value: <b><code>mpegdashDebugVODCaptionProviderDetermination</code></b>
public static final	<a href="#">PROP_DEBUG_RTMP_VOD_CAPTION_LANGUAGE_SELECTION</a> Timed Text Property "rtmpDebugVODCaptionLanguageSelection": adds info level logging regarding language selection for RTMP Streaming Value: <b><code>rtmpDebugVODCaptionLanguageSelection</code></b>
public static final	<a href="#">PROP_DEBUG_RTMP_VOD_CAPTION_PROVIDER_DETERMINATION</a> Timed Text Property "rtmpDebugVODCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset for RTMP Streaming. Value: <b><code>rtmpDebugVODCaptionProviderDetermination</code></b>
public static final	<a href="#">PROP_DEBUG_SANJOSE_VOD_CAPTION_LANGUAGE_SELECTION</a> Timed Text Property "sanJoseDebugVODCaptionLanguageSelection": adds info level logging regarding language selection for San Jose Streaming Value: <b><code>sanJoseDebugVODCaptionLanguageSelection</code></b>
public static final	<a href="#">PROP_DEBUG_SANJOSE_VOD_CAPTION_PROVIDER_DETERMINATION</a> Timed Text Property "sanJoseVODDebugCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset for San Jose Streaming. Value: <b><code>sanJoseVODDebugCaptionProviderDetermination</code></b>
public static final	<a href="#">PROP_DEBUG_SCC_CAPTION_PARSER</a> Timed Text Property "debugSCCCaptionParser": adds info level logging regarding the SCC caption parser Value: <b><code>debugSCCCaptionParser</code></b>
public static final	<a href="#">PROP_DEBUG_SCC_CAPTION_PARSER_TIME</a> Timed Text Property "debugSCCCaptionParserTime": adds info level logging regarding how long it took parser to index Value: <b><code>debugSCCCaptionParserTime</code></b>
public static final	<a href="#">PROP_DEBUG_SCC_VOD_CAPTION_COMPANION_FILES</a> Timed Text Property "debugSCCVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset for SCC provider Value: <b><code>debugSCCVODCaptionFileDetermination</code></b>
public static final	<a href="#">PROP_DEBUG_SRT_CAPTION_PARSER</a> Timed Text Property "debugSRTCaptionParser": adds info level logging regarding the SRT caption parser Value: <b><code>debugSRTCaptionParser</code></b>
public static final	<a href="#">PROP_DEBUG_SRT_CAPTION_PARSER_TIME</a> Timed Text Property "debugSRTCaptionParserTime": adds info level logging regarding how long it took parser to index Value: <b><code>debugSRTCaptionParserTime</code></b>
public static final	<a href="#">PROP_DEBUG_SRT_VOD_CAPTION_COMPANION_FILES</a> Timed Text Property "debugSRTVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset for SRT provider Value: <b><code>debugSRTVODCaptionFileDetermination</code></b>

public static final	<a href="#"><u>PROP_DEBUG_TTML_CAPTION_PARSER</u></a> Timed Text Property "debugTTMLCaptionParser": adds info level logging regarding the TTML caption parser Value: <b>debugTTMLCaptionParser</b>
public static final	<a href="#"><u>PROP_DEBUG_TTML_CAPTION_PARSER_TIME</u></a> Timed Text Property "debugTTMLCaptionParserTime": adds info level logging regarding how long it took parser to index Value: <b>debugTTMLCaptionParserTime</b>
public static final	<a href="#"><u>PROP_DEBUG_TTML_VOD_CAPTION_COMPANION_FILES</u></a> Timed Text Property "debugTTMLVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset for TTML Streaming. Value: <b>debugTTMLVODCaptionFileDetermination</b>
public static final	<a href="#"><u>PROP_DEBUG_VOD_CAPTION_COMPANION_FILES</u></a> Timed Text Property "debugVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset Value: <b>debugVODCaptionFileDetermination</b>
public static final	<a href="#"><u>PROP_DEBUG_VOD_CAPTION_LANGUAGE_SELECTION</u></a> Timed Text Property "debugVODCaptionLanguageSelection": adds info level logging regarding language selection Value: <b>debugVODCaptionLanguageSelection</b>
public static final	<a href="#"><u>PROP_DEBUG_VOD_CAPTION_PROVIDER_DETERMINATION</u></a> Timed Text Property "debugVODCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset Value: <b>debugVODCaptionProviderDetermination</b>
public static final	<a href="#"><u>PROP_DEBUG_WEBVTT_CAPTION_PARSER</u></a> Timed Text Property "debugWebVTTCaptionParser": adds info level logging regarding the WebVTT caption parser Value: <b>debugWebVTTCaptionParser</b>
public static final	<a href="#"><u>PROP_DEBUG_WEBVTT_CAPTION_PARSER_TIME</u></a> Timed Text Property "debugWebVTTCaptionParserTime": adds info level logging regarding how long it took parser to index Value: <b>debugWebVTTCaptionParserTime</b>
public static final	<a href="#"><u>PROP_DEBUG_WEBVTT_VOD_CAPTION_COMPANION_FILES</u></a> Timed Text Property "debugWebVTTVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset for WebVTT provider Value: <b>debugWebVTTVODCaptionFileDetermination</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_DEFAULT_LANGUAGES</u></a> Timed Text Property "captionLiveIngestLanguages": comma separated ISO-639 language codes determining what languages are expected in the live stream Value: <b>captionLiveIngestLanguages</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_AMF_ID_STRING</u></a> Timed Text Property "captionLiveIngestAMFIDString": to change AMF identifier from default "onTextData" to something else Value: <b>captionLiveIngestAMFIDString</b>

public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_ENABLE_FIELD1</u></a> Timed Text Property "captionLiveIngestOnCaptionCEA608EnableField1": When ingesting AMF onCaption 708 data events (actually CEA-608), controls whether CEA-608 field 1 is enabled for decoding Value: <b>captionLiveIngestOnCaptionCEA608EnableField1</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_ENABLE_FIELD2</u></a> Timed Text Property "captionLiveIngestOnCaptionCEA608EnableField2": When ingesting AMF onCaption 708 data events (actually CEA-608), controls whether CEA-608 field 2 is enabled for decoding Value: <b>captionLiveIngestOnCaptionCEA608EnableField2</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_IDLE_TIME_TO_FLUSH_DECODER</u></a> Timed Text Property "captionLiveIngestOnCaptionCEA608IdleTimeToFlushDecoder" Controls allowed amount of idle time when parsing CEA-608 captions when ingested from AMF 708 data events Value: <b>captionLiveIngestOnCaptionCEA608IdleTimeToFlushDecoder</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_LANGUAGE_ID</u></a> Timed Text Property "captionLiveIngestOnCaptionCEA608LanguageID": When ingesting AMF onCaption 708 data events (actually CEA-608), controls the language ID used to add captions as onTextData Value: <b>captionLiveIngestOnCaptionCEA608LanguageID</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_MAX_WARN_MESSAGES</u></a> Timed Text Property "captionLiveIngestOnCaptionCEA608MaxWarnMessages": When ingesting AMF onCaption 708 data events (actually CEA-608), controls the maximum number of warning messages that are logged by the decoder Value: <b>captionLiveIngestOnCaptionCEA608MaxWarnMessages</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_TRACK_NUMBER</u></a> Timed Text Property "captionLiveIngestOnCaptionCEA608TrackNumber": When ingesting AMF onCaption 708 data events (actually CEA-608), controls the track number used to add captions as onTextData Value: <b>captionLiveIngestOnCaptionCEA608TrackNumber</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_ON_CAPTION_INFO_STRING</u></a> Timed Text Property "captionLiveIngestOnCaptionInfoString": to change AMF identifier from default "onCaptionInfo" to something else Value: <b>captionLiveIngestOnCaptionInfoString</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_ON_CAPTION_STRING</u></a> Timed Text Property "captionLiveIngestOnCaptionString": to change AMF identifier from default "onCaption" to something else Value: <b>captionLiveIngestOnCaptionString</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_INGEST_TYPE</u></a> Timed Text Property "captionLiveIngestType": type of live caption ingestion. Value: <b>captionLiveIngestType</b>
public static final	<a href="#"><u>PROP_LIVE_CAPTION_USE_STREAM_NAME_GROUPS</u></a> Timed Text Property "captionLiveIngestUseStreamNameGroups": to enable use of smil files to determine available languages and ingest type Value: <b>captionLiveIngestUseStreamNameGroups</b>
public static final	<a href="#"><u>PROP_MAXIMUM_CAPTION_DURATION</u></a> Timed Text Property "maximumCaptionDuration": used to determine maximum caption duration Value: <b>maximumCaptionDuration</b>

public static final	<a href="#"><u>PROP_MPEGDASH_CAPTION_LANGUAGES</u></a> Timed Text Property "mpegdashCaptionLanguages": to enabled captionLanguage selection for Cupertino streaming. Value: <b>mpegdashCaptionLanguages</b>
public static final	<a href="#"><u>PROP_MPEGDASH_VOD_CAPTIONS_ENABLED</u></a> Timed Text Property "mpegdashVODCaptionsEnabled": to enabled VOD captions for Cupertino streaming. Value: <b>mpegdashVODCaptionsEnabled</b>
public static final	<a href="#"><u>PROP_RTMP_CAPTION_LANGUAGES</u></a> Timed Text Property "rtmpCaptionLanguages": to enabled captionLanguage selection for RTMP Type String. Value: <b>rtmpCaptionLanguages</b>
public static final	<a href="#"><u>PROP_RTMP_VOD_CAPTIONS_ENABLED</u></a> Timed Text Property "rtmpVODCaptionsEnabled": to enabled VOD captions for RTMP streaming. Value: <b>rtmpVODCaptionsEnabled</b>
public static final	<a href="#"><u>PROP_SANJOSE_CAPTION_LANGUAGES</u></a> Timed Text Property "sanJoseCaptionLanguages": to enabled captionLanguage selection for San Jose streaming. Value: <b>sanJoseCaptionLanguages</b>
public static final	<a href="#"><u>PROP_SANJOSE_VOD_CAPTIONS_ENABLED</u></a> Timed Text Property "sanJoseVODCaptionsEnabled": to enabled VOD captions for San Jose streaming. Value: <b>sanJoseVODCaptionsEnabled</b>
public static final	<a href="#"><u>PROP_SRT_CAPTION_CHARACTER_SET</u></a> Timed Text Property "srtReaderCaptionCharacterSet": used to determine character set when ingesting SRT captions Overrides general property "captionCharacterSet" Value: <b>srtReaderCaptionCharacterSet</b>
public static final	<a href="#"><u>PROP_TTML_CAPTION_CHARACTER_SET</u></a> Timed Text Property "ttmlReaderCaptionCharacterSet": used to determine character set when ingesting TTML captions Overrides general property "captionCharacterSet" Value: <b>ttmlReaderCaptionCharacterSet</b>
public static final	<a href="#"><u>PROP_TTML_INLINE_TAGS_IN_TEXT</u></a> Timed Text Property "ttmlInlineTagsInText": TTML parser includes in-line styling and line-break tags in the sample text Value: <b>ttmlInlineTagsInText</b>
public static final	<a href="#"><u>PROP_UNDEFINED_LANG_CODE</u></a> Timed Text Property "captionUndefinedLanguageId": if incoming caption language is undefined, use this language ID. Value: <b>captionUndefinedLanguageId</b>
public static final	<a href="#"><u>PROP_VOD_CAPTIONS_ENABLED</u></a> Timed Text Property "vodCaptionsEnabled": to enabled VOD captions for all supported protocols Value: <b>vodCaptionsEnabled</b>
public static final	<a href="#"><u>PROP_WEBVTT_CONVERTER_INSERT_ERASES_IN_GAPS</u></a> Timed Text Property "webVTTCaptionConverterInsertErases": insert erase captions if gaps between captions are greater than PROP_MAXIMUM_CAPTION_DURATION Value: <b>webVTTCaptionConverterInsertErases</b>

public static final	<a href="#"><u>QUERYSTR_CAPTION_FILENAME</u></a> Query string used for choosing caption languages. Value: <b>wowzacaptionfile</b>
public static final	<a href="#"><u>QUERYSTR_CAPTIONLANGUAGES</u></a> Query string used for choosing caption languages. Value: <b>wowzacaptionlanguages</b>
public static final	<a href="#"><u>SMIL_PARAM_IS_WOWZA_CAPTION_STREAM</u></a> Value: <b>iswowzacaptionstream</b>
public static final	<a href="#"><u>SMIL_PARAM_WOWZA_CAPTION_INGEST_TYPE</u></a> Value: <b>wowzacaptioningesttype</b>
public static final	<a href="#"><u>SOURCE_TYPE_3GPP</u></a> Value: <b>3GPP</b>
public static final	<a href="#"><u>SOURCE_TYPE_AMF</u></a> Value: <b>AMF</b>
public static final	<a href="#"><u>SOURCE_TYPE_SCC</u></a> Value: <b>SCC</b>
public static final	<a href="#"><u>SOURCE_TYPE_SRT</u></a> Value: <b>SRT</b>
public static final	<a href="#"><u>SOURCE_TYPE_TTML</u></a> Value: <b>TTML</b>
public static final	<a href="#"><u>SOURCE_TYPE_WEBVTT</u></a> Value: <b>WebVTT</b>
public static final	<a href="#"><u>TIMED_TEXT_TYPE_CAPTION</u></a> Value: <b>Caption</b>

public static final java.lang.String PROP_VOD_CAPTIONS_ENABLED
```

Timed Text Property "vodCaptionsEnabled": to enabled VOD captions for all supported protocols

Type boolean. The default is true.

Add the property to Application/TimedText/Properties in Application.xml

VOD Captions can be enabled on a per protocol basis using [PROP\\_CUPERTINO\\_VOD\\_CAPTIONS\\_ENABLED](#), [PROP\\_RTMP\\_VOD\\_CAPTIONS\\_ENABLED](#), [PROP\\_SANJOSE\\_VOD\\_CAPTIONS\\_ENABLED](#).

Constant value: **vodCaptionsEnabled**

See Also:

[PROP\\_CUPERTINO\\_VOD\\_CAPTIONS\\_ENABLED](#)

[PROP\\_RTMP\\_VOD\\_CAPTIONS\\_ENABLED](#)

[PROP\\_SANJOSE\\_VOD\\_CAPTIONS\\_ENABLED](#)

---

## PROP\_CUPERTINO\_VOD\_CAPTIONS\_ENABLED

```
public static final java.lang.String PROP_CUPERTINO_VOD_CAPTIONS_ENABLED
```

Timed Text Property "cupertinoVODCaptionsEnabled": to enabled VOD captions for Cupertino streaming.

Type boolean. The default is true.

Add the property to Application/TimedText/Properties in Application.xml

VOD Captions can be enabled for all protocols using [PROP\\_VOD\\_CAPTIONS\\_ENABLED](#).

Constant value: **cupertinoVODCaptionsEnabled**

See Also:

[PROP\\_VOD\\_CAPTIONS\\_ENABLED](#)

---

## PROP\_MPEGDASH\_VOD\_CAPTIONS\_ENABLED

```
public static final java.lang.String PROP_MPEGDASH_VOD_CAPTIONS_ENABLED
```

Timed Text Property "mpegdashVODCaptionsEnabled": to enabled VOD captions for Cupertino streaming.

Type boolean. The default is true.

Add the property to Application/TimedText/Properties in Application.xml

VOD Captions can be enabled for all protocols using [PROP\\_VOD\\_CAPTIONS\\_ENABLED](#).

Constant value: **mpegdashVODCaptionsEnabled**

See Also:

[PROP\\_VOD\\_CAPTIONS\\_ENABLED](#)

---

## PROP\_RTMP\_VOD\_CAPTIONS\_ENABLED

```
public static final java.lang.String PROP_RTMP_VOD_CAPTIONS_ENABLED
```

---

(continued from last page)

Timed Text Property "rtmpVODCaptionsEnabled": to enabled VOD captions for RTMP streaming.

Type boolean. The default is true.

Add the property to Application/TimedText/Properties in Application.xml

VOD Captions can be enabled for all protocols using [PROP\\_VOD\\_CAPTIONS\\_ENABLED](#).

Constant value: **rtmpVODCaptionsEnabled**

See Also:

[PROP\\_VOD\\_CAPTIONS\\_ENABLED](#)

## PROP\_SANJOSE\_VOD\_CAPTIONS\_ENABLED

```
public static final java.lang.String PROP_SANJOSE_VOD_CAPTIONS_ENABLED
```

Timed Text Property "sanJoseVODCaptionsEnabled": to enabled VOD captions for San Jose streaming.

Type boolean. The default is true.

Add the property to Application/TimedText/Properties in Application.xml

VOD Captions can be enabled for all protocols using [PROP\\_VOD\\_CAPTIONS\\_ENABLED](#).

Constant value: **sanJoseVODCaptionsEnabled**

See Also:

[PROP\\_VOD\\_CAPTIONS\\_ENABLED](#)

## PROP\_CAPTION\_LANGUAGES

```
public static final java.lang.String PROP_CAPTION_LANGUAGES
```

Timed Text Property "captionLanguages": used to select presented caption Language.

Type String. The default is [DEFAULT\\_PROPERTY\\_CAPTION\\_LANGUAGES](#)

Add the property to Application/TimedText/Properties in Application.xml

VOD Caption languages can be specified on a per protocol basis using [PROP\\_CUPERTINO\\_CAPTION\\_LANGUAGES](#), [PROP\\_RTMP\\_CAPTION\\_LANGUAGES](#), [PROP\\_SANJOSE\\_CAPTION\\_LANGUAGES](#).

Constant value: **captionLanguages**

See Also:

[PROP\\_CUPERTINO\\_CAPTION\\_LANGUAGES](#)

[PROP\\_RTMP\\_CAPTION\\_LANGUAGES](#)

[PROP\\_SANJOSE\\_CAPTION\\_LANGUAGES](#)

## DEFAULT\_PROPERTY\_CAPTION\_LANGUAGES

```
public static final java.lang.String DEFAULT_PROPERTY_CAPTION_LANGUAGES
```

Default value for Timed Text Property "captionLanguages".

Default value is "\*", meaning present all found languages.

Constant value: **\***

See Also:

[PROP\\_CAPTION\\_LANGUAGES](#)

## DEFAULT\_PROPERTY\_CAPION\_LANGUAGES

```
public static final java.lang.String DEFAULT_PROPERTY_CAPION_LANGUAGES
```

(continued from last page)

Constant value: \*

---

## PROP\_CUPERTINO\_CAPTION\_LANGUAGES

```
public static final java.lang.String PROP_CUPERTINO_CAPTION_LANGUAGES
```

Timed Text Property "cupertinoCaptionLanguages": to enabled captionLanguage selection for Cupertino streaming.

Type String. The default is [DEFAULT\\_PROPERTY\\_CAPTION\\_LANGUAGES](#)

Add the property to Application/TimedText/Properties in Application.xml

VOD Captions can be enabled for all protocols using [PROP\\_CAPTION\\_LANGUAGES](#).

Constant value: **cupertinoCaptionLanguages**

See Also:

[PROP\\_CAPTION\\_LANGUAGES](#)

---

## PROP\_MPEGDASH\_CAPTION\_LANGUAGES

```
public static final java.lang.String PROP_MPEGDASH_CAPTION_LANGUAGES
```

Timed Text Property "mpegdashCaptionLanguages": to enabled captionLanguage selection for Cupertino streaming.

Type String. The default is [DEFAULT\\_PROPERTY\\_CAPTION\\_LANGUAGES](#)

Add the property to Application/TimedText/Properties in Application.xml

VOD Captions can be enabled for all protocols using [PROP\\_CAPTION\\_LANGUAGES](#).

Constant value: **mpegdashCaptionLanguages**

See Also:

[PROP\\_CAPTION\\_LANGUAGES](#)

---

## PROP\_RTMP\_CAPTION\_LANGUAGES

```
public static final java.lang.String PROP_RTMP_CAPTION_LANGUAGES
```

Timed Text Property "rtmpCaptionLanguages": to enabled captionLanguage selection for RTMP Type String. The default is [DEFAULT\\_PROPERTY\\_CAPTION\\_LANGUAGES](#)

Add the property to Application/TimedText/Properties in Application.xml

VOD Captions can be enabled for all protocols using [PROP\\_CAPTION\\_LANGUAGES](#).

Constant value: **rtmpCaptionLanguages**

See Also:

[PROP\\_CAPTION\\_LANGUAGES](#)

---

## PROP\_SANJOSE\_CAPTION\_LANGUAGES

```
public static final java.lang.String PROP_SANJOSE_CAPTION_LANGUAGES
```

Timed Text Property "sanJoseCaptionLanguages": to enabled captionLanguage selection for San Jose streaming.

Type String. The default is [DEFAULT\\_PROPERTY\\_CAPTION\\_LANGUAGES](#)

Add the property to Application/TimedText/Properties in Application.xml

VOD Captions can be enabled for all protocols using [PROP\\_CAPTION\\_LANGUAGES](#).

Constant value: **sanJoseCaptionLanguages**

(continued from last page)

**See Also:**[PROP\\_CAPTION\\_LANGUAGES](#)

---

## PROP\_DEBUG\_VOD\_CAPTION\_LANGUAGE\_SELECTION

```
public static final java.lang.String PROP_DEBUG_VOD_CAPTION_LANGUAGE_SELECTION
```

Timed Text Property "debugVODCaptionLanguageSelection": adds info level logging regarding language selection

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Can be enabled on a per protocol basis using [PROP\\_DEBUG\\_CUPERTINO\\_VOD\\_CAPTION\\_LANGUAGE\\_SELECTION](#), [PROP\\_DEBUG\\_RTMP\\_VOD\\_CAPTION\\_LANGUAGE\\_SELECTION](#), [PROP\\_DEBUG\\_SANJOSE\\_VOD\\_CAPTION\\_LANGUAGE\\_SELECTION](#).

Constant value: **debugVODCaptionLanguageSelection**

---

## PROP\_DEBUG\_CUPERTINO\_VOD\_CAPTION\_LANGUAGE\_SELECTION

```
public static final java.lang.String  
PROP_DEBUG_CUPERTINO_VOD_CAPTION_LANGUAGE_SELECTION
```

Timed Text Property "cupertinoDebugVODCaptionLanguageSelection": adds info level logging regarding language selection for Cupertino Streaming

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **cupertinoDebugVODCaptionLanguageSelection**

**See Also:**[PROP\\_DEBUG\\_VOD\\_CAPTION\\_LANGUAGE\\_SELECTION](#)

---

## PROP\_DEBUG\_MPEGDASH\_VOD\_CAPTION\_LANGUAGE\_SELECTION

```
public static final java.lang.String  
PROP_DEBUG_MPEGDASH_VOD_CAPTION_LANGUAGE_SELECTION
```

Timed Text Property "mpegdashDebugVODCaptionLanguageSelection": adds info level logging regarding language selection for Cupertino Streaming

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **mpegdashDebugVODCaptionLanguageSelection**

**See Also:**[PROP\\_DEBUG\\_VOD\\_CAPTION\\_LANGUAGE\\_SELECTION](#)

---

## PROP\_DEBUG\_RTMP\_VOD\_CAPTION\_LANGUAGE\_SELECTION

```
public static final java.lang.String PROP_DEBUG_RTMP_VOD_CAPTION_LANGUAGE_SELECTION
```

---

(continued from last page)

Timed Text Property "rtmpDebugVODCaptionLanguageSelection": adds info level logging regarding language selection for RTMP Streaming

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **rtmpDebugVODCaptionLanguageSelection**

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_LANGUAGE\\_SELECTION](#)

---

## PROP\_DEBUG\_SANJOSE\_VOD\_CAPTION\_LANGUAGE\_SELECTION

```
public static final java.lang.String PROP_DEBUG_SANJOSE_VOD_CAPTION_LANGUAGE_SELECTION
```

Timed Text Property "sanJoseDebugVODCaptionLanguageSelection": adds info level logging regarding language selection for San Jose Streaming

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **sanJoseDebugVODCaptionLanguageSelection**

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_LANGUAGE\\_SELECTION](#)

---

## PROP\_DEBUG\_VOD\_CAPTION\_PROVIDER\_DETERMINATION

```
public static final java.lang.String PROP_DEBUG_VOD_CAPTION_PROVIDER_DETERMINATION
```

Timed Text Property "debugVODCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Can be enabled on a per protocol basis using [PROP\\_DEBUG\\_CUPERTINO\\_VOD\\_CAPTION\\_PROVIDER\\_DETERMINATION](#), [PROP\\_DEBUG\\_RTMP\\_VOD\\_CAPTION\\_PROVIDER\\_DETERMINATION](#), [PROP\\_DEBUG\\_SANJOSE\\_VOD\\_CAPTION\\_PROVIDER\\_DETERMINATION](#).

Constant value: **debugVODCaptionProviderDetermination**

---

## PROP\_DEBUG\_CUPERTINO\_VOD\_CAPTION\_PROVIDER\_DETERMINATION

```
public static final java.lang.String  
PROP_DEBUG_CUPERTINO_VOD_CAPTION_PROVIDER_DETERMINATION
```

Timed Text Property "cupertinoDebugVODCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset for Cupertino Streaming.

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **cupertinoDebugVODCaptionProviderDetermination**

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_PROVIDER\\_DETERMINATION](#)

---

---

## PROP\_DEBUG\_MPEGDASH\_VOD\_CAPTION\_PROVIDER\_DETERMINATION

```
public static final java.lang.String  
PROP_DEBUG_MPEGDASH_VOD_CAPTION_PROVIDER_DETERMINATION
```

Timed Text Property "mpegdashDebugVODCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset for MPEGDash Streaming.

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **mpegdashDebugVODCaptionProviderDetermination**

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_PROVIDER\\_DETERMINATION](#)

---

## PROP\_DEBUG\_RTMP\_VOD\_CAPTION\_PROVIDER\_DETERMINATION

```
public static final java.lang.String  
PROP_DEBUG_RTMP_VOD_CAPTION_PROVIDER_DETERMINATION
```

Timed Text Property "rtmpDebugVODCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset for RTMP Streaming.

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **rtmpDebugVODCaptionProviderDetermination**

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_PROVIDER\\_DETERMINATION](#)

---

## PROP\_DEBUG\_SANJOSE\_VOD\_CAPTION\_PROVIDER\_DETERMINATION

```
public static final java.lang.String  
PROP_DEBUG_SANJOSE_VOD_CAPTION_PROVIDER_DETERMINATION
```

Timed Text Property "sanJoseVODDebugCaptionProviderDetermination": adds info level logging regarding caption provider determination for a given VOD asset for San Jose Streaming.

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **sanJoseVODDebugCaptionProviderDetermination**

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_PROVIDER\\_DETERMINATION](#)

---

## PROP\_DEBUG\_VOD\_CAPTION\_COMPANION\_FILES

```
public static final java.lang.String PROP_DEBUG_VOD_CAPTION_COMPANION_FILES
```

(continued from last page)

Timed Text Property "debugVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Can be enabled on a per provider basis as well using [PROP\\_DEBUG\\_TTML\\_VOD\\_CAPTION\\_COMPANION\\_FILES](#)  
Constant value: **debugVODCaptionFileDetermination**

## PROP\_UNDEFINED\_LANG\_CODE

```
public static final java.lang.String PROP_UNDEFINED_LANG_CODE
```

Timed Text Property "captionUndefinedLanguageId": if incoming caption language is undefined, use this language ID.

Type String. If not defined, the Locale's 3 character language code is used. See `Locale.getDefault().getISO3Language()`

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionUndefinedLanguageId**

## PROP\_CAPTION\_FILE\_NAMING\_RULE

```
public static final java.lang.String PROP_CAPTION_FILE_NAMING_RULE
```

Timed Text Property "captionFileNamingRule": to change logic determining the caption companion file naming scheme

Type String. The default value is [DEFAULT\\_PROPERTY\\_CAPTION\\_FILE\\_NAMING\\_RULE](#).

This string is used to find the caption file for a given VOD asset. It is used in conjunction with [PROP\\_CAPTION\\_PATH\\_NAMING\\_RULE](#), which determines the file location.

It is comprised of variables preceded by a dollar sign and enclosed in squiggly brackets. For example: "\${var1}.\${var2}"

Valid variables include these:

- `${SourceStreamName}` : The baseName of the VOD file
- `${SourceBasePath}` : The base path of the VOD asset
- `${FileExtension}` : Registered file extensions with the Timed Text Provider

and these standard ones:

- `${com.wowza.wms.context.VHost}`
- `${com.wowza.wms.context.VHostConfigHome, appInstance.getVHost().getHomePath()};`
- `${com.wowza.wms.context.Application, appInstance.getApplication().getName()};`
- `${com.wowza.wms.context.ApplicationInstance, appInstance.getName()};`

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionFileNamingRule**

See Also:

[DEFAULT\\_PROPERTY\\_CAPTION\\_FILE\\_NAMING\\_RULE](#)

## DEFAULT\_PROPERTY\_CAPTION\_FILE\_NAMING\_RULE

```
public static final java.lang.String DEFAULT_PROPERTY_CAPTION_FILE_NAMING_RULE
```

Default value for Timed Text Property "captionFileNamingRule".

Default value is `"${SourceStreamName}.${FileExtension}"`

Constant value: **`${SourceStreamName}.${FileExtension}`**

(continued from last page)

**See Also:**[PROP\\_CAPTION\\_FILE\\_NAMING\\_RULE](#)

---

## PROP\_CAPTION\_PATH\_NAMING\_RULE

```
public static final java.lang.String PROP_CAPTION_PATH_NAMING_RULE
```

Timed Text Property "captionPathNamingRule": to change logic determining the caption companion path

Type String. The default value is [DEFAULT\\_PROPERTY\\_CAPTION\\_PATH\\_NAMING\\_RULE](#).

This string is used to find the caption file location for a given VOD asset. It is used in conjunction with [PROP\\_CAPTION\\_FILE\\_NAMING\\_RULE](#), which determines the file name.

It is comprised of variables preceded by a dollar sign and enclosed in squiggly brackets. For example: "\${var1}.{var2}"

Valid variables include these:

- \${SourceStreamName} : The baseName of the VOD file
- \${SourceBasePath} : The base path of the VOD asset
- \${FileExtension} : Registered file extensions with the Timed Text Provider

and these standard ones:

- \${com.wowza.wms.context.VHost}
- \${com.wowza.wms.context.VHostConfigHome", appInstance.getVHost().getHomePath()};
- \${com.wowza.wms.context.Application", appInstance.getApplication().getName()};
- \${com.wowza.wms.context.ApplicationInstance", appInstance.getName()};

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionPathNamingRule**

**See Also:**[DEFAULT\\_PROPERTY\\_CAPTION\\_PATH\\_NAMING\\_RULE](#)

---

## DEFAULT\_PROPERTY\_CAPTION\_PATH\_NAMING\_RULE

```
public static final java.lang.String DEFAULT_PROPERTY_CAPTION_PATH_NAMING_RULE
```

Default value for Timed Text Property "captionFileNamingRule". Default value is "\${SourceBasePath}"

Constant value: **\${SourceBasePath}**

**See Also:**[PROP\\_CAPTION\\_PATH\\_NAMING\\_RULE](#)

---

## PROP\_MAXIMUM\_CAPTION\_DURATION

```
public static final java.lang.String PROP_MAXIMUM_CAPTION_DURATION
```

Timed Text Property "maximumCaptionDuration": used to determine maximum caption duration

Type Integer. In ms. The default is [DEFAULT\\_MAXIMUM\\_CAPTION\\_DURATION](#)

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **maximumCaptionDuration**

---

(continued from last page)

---

## DEFAULT\_MAXIMUM\_CAPTION\_DURATION

```
public static final int DEFAULT_MAXIMUM_CAPTION_DURATION
```

Default value for Timed Text Property "maximumCaptionDuration".

Default value is 10000.  
Constant value: **5000**

See Also:

[PROP\\_MAXIMUM\\_CAPTION\\_DURATION](#)

---

## PROP\_CAPTION\_CHARACTER\_SET

```
public static final java.lang.String PROP_CAPTION_CHARACTER_SET
```

Timed Text Property "captionCharacterSet": used to determine character set when ingesting captions

Type String. The default is [DEFAULT\\_CAPTION\\_CHARACTER\\_SET](#)

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionCharacterSet**

---

## DEFAULT\_CAPTION\_CHARACTER\_SET

```
public static final java.lang.String DEFAULT_CAPTION_CHARACTER_SET
```

Default value for Timed Text Property "captionCharacterSet".

Default value is "UTF-8"  
Constant value: **UTF-8**

See Also:

[PROP\\_CAPTION\\_CHARACTER\\_SET](#)

---

## PROP\_SRT\_CAPTION\_CHARACTER\_SET

```
public static final java.lang.String PROP_SRT_CAPTION_CHARACTER_SET
```

Timed Text Property "srtReaderCaptionCharacterSet": used to determine character set when ingesting SRT captions  
Overrides general property "captionCharacterSet"

Type String. The default is [DEFAULT\\_CAPTION\\_CHARACTER\\_SET](#)  
Constant value: **srtReaderCaptionCharacterSet**

See Also:

Add the property to Application/TimedText/Properties in Application.xml

---

## PROP\_TTML\_CAPTION\_CHARACTER\_SET

```
public static final java.lang.String PROP_TTML_CAPTION_CHARACTER_SET
```

Timed Text Property "ttmlReaderCaptionCharacterSet": used to determine character set when ingesting TTML captions  
Overrides general property "captionCharacterSet"

Type String. The default is [DEFAULT\\_CAPTION\\_CHARACTER\\_SET](#)

---

(continued from last page)

Constant value: **ttmlReaderCaptionCharacterSet**

**See Also:**

Add the property to Application/TimedText/Properties in Application.xml

---

## PROP\_3GPP\_CAPTION\_CHARACTER\_SET

```
public static final java.lang.String PROP_3GPP_CAPTION_CHARACTER_SET
```

Timed Text Property "reader3GPPCaptionCharacterSet": used to determine character set when ingesting TTML captions Overrides general property "captionCharacterSet"

Type String. The default is [DEFAULT\\_CAPTION\\_CHARACTER\\_SET](#)

Constant value: **reader3GPPCaptionCharacterSet**

**See Also:**

Add the property to Application/TimedText/Properties in Application.xml

---

## PROP\_CEA608\_CONVERTER\_COLOR

```
public static final java.lang.String PROP_CEA608_CONVERTER_COLOR
```

Timed Text Property "cea608CaptionConverterColor": color of text in default CEA caption converter.

Type Integer. Default is [ClosedCaptionCEA608Utils.COL0\\_WHITE](#)

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **cea608CaptionConverterColor**

**See Also:**

[ClosedCaptionCEA608Utils.COL0\\_WHITE](#)

[ClosedCaptionCEA608Utils.COL0\\_GREEN](#)

[ClosedCaptionCEA608Utils.COL0\\_BLUE](#)

[ClosedCaptionCEA608Utils.COL0\\_CYAN](#)

[ClosedCaptionCEA608Utils.COL0\\_RED](#)

[ClosedCaptionCEA608Utils.COL0\\_YELLOW](#)

[ClosedCaptionCEA608Utils.COL0\\_MAGENTA](#)

---

## PROP\_CEA608\_CONVERTER\_CHARS\_PER\_LINE

```
public static final java.lang.String PROP_CEA608_CONVERTER_CHARS_PER_LINE
```

Timed Text Property "cea608CaptionConverterCharsPerLine": max number characters per line in default CEA caption converter.

Type Integer. Default is [ClosedCaptionCEA608Utils.COUNT\\_COLS](#)

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **cea608CaptionConverterCharsPerLine**

---

## PROP\_CEA608\_CONVERTER\_CHARACTER\_SET

```
public static final java.lang.String PROP_CEA608_CONVERTER_CHARACTER_SET
```

(continued from last page)

Timed Text Property "cea608CaptionConverterCharacterSet": character set in default CEA caption converter.

Type String. Default is "UTF-8"

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **cea608CaptionConverterCharacterSet**

## PROP\_CUPERTINO\_VOD\_REMOVE\_EXISTING\_CEA608

```
public static final java.lang.String PROP_CUPERTINO_VOD_REMOVE_EXISTING_CEA608
```

Timed Text Property "cupertinoVODCaptionsRemoveExistingCEA608": if existing VOD has 608, remove them

Type Boolean. Default is false.

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **cupertinoVODCaptionsRemoveExistingCEA608**

## PROP\_CUPERTINO\_VOD\_USE\_WEBVTT

```
public static final java.lang.String PROP_CUPERTINO_VOD_USE_WEBVTT
```

Timed Text Property "cupertinoVODCaptionsUseWebVTT"

Type Boolean. Default is false.

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **cupertinoVODCaptionsUseWebVTT**

## PROP\_CUPERTINO\_LIVE\_USE\_WEBVTT

```
public static final java.lang.String PROP_CUPERTINO_LIVE_USE_WEBVTT
```

Timed Text Property "cupertinoLiveCaptionsUseWebVTT"

Type Boolean. Default is false.

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **cupertinoLiveCaptionsUseWebVTT**

## PROP\_CUPERTINO\_LIVE\_WEBVTT\_ADD\_SPECIAL\_EMPTY\_CAPTION

```
public static final java.lang.String  
PROP_CUPERTINO_LIVE_WEBVTT_ADD_SPECIAL_EMPTY_CAPTION
```

Timed Text Property "cupertinoLiveWebVTTAddSpecialEmptyCaption"

Type Boolean. Default is true.

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **cupertinoLiveWebVTTAddSpecialEmptyCaption**

## PROP\_AMF\_CONVERTER\_TEXT\_TYPE

```
public static final java.lang.String PROP_AMF_CONVERTER_TEXT_TYPE
```

Timed Text Property "amfCaptionConverterTextType": AMF text type used in conversion

Type String. Default is [AMF\\_TEXTTYPE\\_ON\\_TEXT\\_DATA](#)

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **amfCaptionConverterTextType**

(continued from last page)

---

## DEFAULT\_AMF\_CONVERTER\_TEXT\_TYPE

```
public static final java.lang.String DEFAULT_AMF_CONVERTER_TEXT_TYPE
```

Constant value: **onTextData**

---

## PROP\_AMF\_CONVERTER\_TRACK\_INDEX

```
public static final java.lang.String PROP_AMF_CONVERTER_TRACK_INDEX
```

Timed Text Property "amfCaptionConverterTrackIndex": track index used for captions

Type Integer.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **amfCaptionConverterTrackIndex**

---

## DEFAULT\_AMF\_CONVERTER\_TRACK\_INDEX

```
public static final int DEFAULT_AMF_CONVERTER_TRACK_INDEX
```

Constant value: **99**

---

## PROP\_AMF\_CONVERTER\_INSERT\_ERASES\_IN\_GAPS

```
public static final java.lang.String PROP_AMF_CONVERTER_INSERT_ERASES_IN_GAPS
```

Timed Text Property "amfCaptionConverterInsertErases": insert erase captions if gaps between captions are greater than PROP\_MAXIMUM\_CAPTION\_DURATION

Type boolean. The default is true.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **amfCaptionConverterInsertErases**

---

## PROP\_WEBVTT\_CONVERTER\_INSERT\_ERASES\_IN\_GAPS

```
public static final java.lang.String PROP_WEBVTT_CONVERTER_INSERT_ERASES_IN_GAPS
```

Timed Text Property "webVTTCaptionConverterInsertErases": insert erase captions if gaps between captions are greater than PROP\_MAXIMUM\_CAPTION\_DURATION

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **webVTTCaptionConverterInsertErases**

---

## PROP\_DEBUG\_TTML\_VOD\_CAPTION\_COMPANION\_FILES

```
public static final java.lang.String PROP_DEBUG_TTML_VOD_CAPTION_COMPANION_FILES
```

(continued from last page)

Timed Text Property "debugTTMLVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset for TTML Streaming.

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugTTMLVODCaptionFileDetermination**

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_COMPANION\\_FILES](#)

## PROP\_DEBUG\_TTML\_CAPTION\_PARSER

```
public static final java.lang.String PROP_DEBUG_TTML_CAPTION_PARSER
```

Timed Text Property "debugTTMLCaptionParser": adds info level logging regarding the TTML caption parser

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugTTMLCaptionParser**

## PROP\_DEBUG\_TTML\_CAPTION\_PARSER\_TIME

```
public static final java.lang.String PROP_DEBUG_TTML_CAPTION_PARSER_TIME
```

Timed Text Property "debugTTMLCaptionParserTime": adds info level logging regarding how long it took parser to index

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugTTMLCaptionParserTime**

## PROP\_TTML\_INLINE\_TAGS\_IN\_TEXT

```
public static final java.lang.String PROP_TTML_INLINE_TAGS_IN_TEXT
```

Timed Text Property "ttmlInlineTagsInText": TTML parser includes in-line styling and line-break tags in the sample text

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Example sample: "

I can linebreak

or change fontWeight to bold in the middle of a sample." If ttmlInlineTagsInText=true then the parser provides the sample text as: "I can linebreak

or change fontWeight to bold in the middle of a sample." If ttmlInlineTagsInText=false then the parser provides the sample text as: "I can linebreak or change fontWeight to bold in the middle of a sample."

Constant value: **ttmlInlineTagsInText**

## PROP\_DEBUG\_SRT\_VOD\_CAPTION\_COMPANION\_FILES

```
public static final java.lang.String PROP_DEBUG_SRT_VOD_CAPTION_COMPANION_FILES
```

---

(continued from last page)

Timed Text Property "debugSRTVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset for SRT provider

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugSRTVODCaptionFileDetermination**

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_COMPANION\\_FILES](#)

---

## PROP\_DEBUG\_SRT\_CAPTION\_PARSER

```
public static final java.lang.String PROP_DEBUG_SRT_CAPTION_PARSER
```

Timed Text Property "debugSRTCaptionParser": adds info level logging regarding the SRT caption parser

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugSRTCaptionParser**

---

## PROP\_DEBUG\_SRT\_CAPTION\_PARSER\_TIME

```
public static final java.lang.String PROP_DEBUG_SRT_CAPTION_PARSER_TIME
```

Timed Text Property "debugSRTCaptionParserTime": adds info level logging regarding how long it took parser to index

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugSRTCaptionParserTime**

---

## PROP\_DEBUG\_WEBVTT\_VOD\_CAPTION\_COMPANION\_FILES

```
public static final java.lang.String PROP_DEBUG_WEBVTT_VOD_CAPTION_COMPANION_FILES
```

Timed Text Property "debugWebVTTVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset for WebVTT provider

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugWebVTTVODCaptionFileDetermination**

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_COMPANION\\_FILES](#)

---

## PROP\_DEBUG\_WEBVTT\_CAPTION\_PARSER

```
public static final java.lang.String PROP_DEBUG_WEBVTT_CAPTION_PARSER
```

---

(continued from last page)

Timed Text Property "debugWebVTTCaptionParser": adds info level logging regarding the WebVTT caption parser

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugWebVTTCaptionParser**

---

## PROP\_DEBUG\_WEBVTT\_CAPTION\_PARSER\_TIME

```
public static final java.lang.String PROP_DEBUG_WEBVTT_CAPTION_PARSER_TIME
```

Timed Text Property "debugWebVTTCaptionParserTime": adds info level logging regarding how long it took parser to index

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugWebVTTCaptionParserTime**

---

## PROP\_DEBUG\_SCC\_VOD\_CAPTION\_COMPANION\_FILES

```
public static final java.lang.String PROP_DEBUG_SCC_VOD_CAPTION_COMPANION_FILES
```

Timed Text Property "debugSCCVODCaptionFileDetermination": adds info level logging regarding caption companion file determination for a given VOD asset for SCC provider

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugSCCVODCaptionFileDetermination**

---

See Also:

[PROP\\_DEBUG\\_VOD\\_CAPTION\\_COMPANION\\_FILES](#)

---

## PROP\_DEBUG\_SCC\_CAPTION\_PARSER

```
public static final java.lang.String PROP_DEBUG_SCC_CAPTION_PARSER
```

Timed Text Property "debugSCCCaptionParser": adds info level logging regarding the SCC caption parser

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugSCCCaptionParser**

---

## PROP\_DEBUG\_SCC\_CAPTION\_PARSER\_TIME

```
public static final java.lang.String PROP_DEBUG_SCC_CAPTION_PARSER_TIME
```

Timed Text Property "debugSCCCaptionParserTime": adds info level logging regarding how long it took parser to index

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

(continued from last page)

Constant value: **debugSCCCaptionParserTime**

---

## PROP\_DEBUG\_3GPP\_CAPTION\_PARSER

```
public static final java.lang.String PROP_DEBUG_3GPP_CAPTION_PARSER
```

Timed Text Property "debug3GPPCaptionParser": adds info level logging regarding the 3GPP parser

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debug3GPPCaptionParser**

---

## PROP\_DEBUG\_3GPP\_CAPTION\_PARSER\_TIME

```
public static final java.lang.String PROP_DEBUG_3GPP_CAPTION_PARSER_TIME
```

Timed Text Property "debug3GPPCaptionParserTime": adds info level logging regarding how long it took parser to index

Type boolean. The default is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debug3GPPCaptionParserTime**

---

## QUERYSTR\_CAPTIONLANGUAGES

```
public static final java.lang.String QUERYSTR_CAPTIONLANGUAGES
```

Query string used for choosing caption languages. Language must be presented using ISO 3 letter language codes.

Constant value: **wowzacaptionlanguages**

---

## PROP\_CAPTION\_LANGUAGE\_QUERY\_PARAMETER

```
public static final java.lang.String PROP_CAPTION_LANGUAGE_QUERY_PARAMETER
```

HTTP Streamer Property "captionLanguageQueryParameter": used for changing query string param used for caption language selection. Note: Must go into HTTPStreamers.xml under Properties for each streamer type

Type String. The default is "wowzacaptionlanguages"

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLanguageQueryParameter**

---

## QUERYSTR\_CAPTION\_FILENAME

```
public static final java.lang.String QUERYSTR_CAPTION_FILENAME
```

Query string used for choosing caption languages. Language must be presented using ISO 3 letter language codes.

Constant value: **wowzacaptionfile**

---

## PROP\_CAPTION\_FILENAME\_QUERY\_PARAMETER

```
public static final java.lang.String PROP_CAPTION_FILENAME_QUERY_PARAMETER
```

(continued from last page)

HTTP Streamer Property "captionFilenameQueryParameter": used for changing query string param used for caption file selection. Note: Must go into HTTPStreamers.xml under Properties for each streamer type

Type String. The default is "wowzacaptionfile"

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionFilenameQueryParameter**

## PROP\_LIVE\_CAPTION\_INGEST\_AMF\_ID\_STRING

```
public static final java.lang.String PROP_LIVE_CAPTION_INGEST_AMF_ID_STRING
```

Timed Text Property "captionLiveIngestAMFIDString": to change AMF identifier from default "onTextData" to something else

Type String. The default value is "onTextData".

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestAMFIDString**

## PROP\_LIVE\_CAPTION\_USE\_STREAM\_NAME\_GROUPS

```
public static final java.lang.String PROP_LIVE_CAPTION_USE_STREAM_NAME_GROUPS
```

Timed Text Property "captionLiveIngestUseStreamNameGroups": to enable use of smil files to determine available languages and ingest type

Type Boolean. The default value is true. Only affects streams started with .smil files using StartupStreams or stream manager.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestUseStreamNameGroups**

## PROP\_LIVE\_CAPTION\_DEFAULT\_LANGUAGES

```
public static final java.lang.String PROP_LIVE_CAPTION_DEFAULT_LANGUAGES
```

Timed Text Property "captionLiveIngestLanguages": comma separated ISO-639 language codes determining what languages are expected in the live stream

Type String. The default value is the language returned by Locale.getDefault().getISO3Language().

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestLanguages**

## PROP\_LIVE\_CAPTION\_INGEST\_TYPE

```
public static final java.lang.String PROP_LIVE_CAPTION_INGEST_TYPE
```

Timed Text Property "captionLiveIngestType": type of live caption ingestion.

This corresponds to LiveIngestTypes in TimedTextProviders.

Type String. The default value is "onTextData". "onCaption" is also a valid value. "CEA608" is a valid value since 4.0.4

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestType**

## PROP\_DEBUG\_LIVE\_CAPTION\_INGEST

```
public static final java.lang.String PROP_DEBUG_LIVE_CAPTION_INGEST
```

(continued from last page)

Timed Text Property "debugCaptionLiveIngest "

Type Boolean. The default value is false.

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **debugCaptionLiveIngest**

---

## PROP\_DEBUG\_LIVE\_CAPTION\_ONTEXTDATA\_INGEST

```
public static final java.lang.String PROP_DEBUG_LIVE_CAPTION_ONTEXTDATA_INGEST
```

Timed Text Property "debugCaptionLiveOnTextDataIngest "

Type Boolean. The default value is false. Overrides [PROP\\_LIVE\\_CAPTION\\_DEFAULT\\_LANGUAGES](#)

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **debugCaptionLiveOnTextDataIngest**

---

## PROP\_DEBUG\_LIVE\_CAPTION\_ONCAPTION\_INGEST

```
public static final java.lang.String PROP_DEBUG_LIVE_CAPTION_ONCAPTION_INGEST
```

Timed Text Property "debugCaptionLiveOnCaptionIngest "

Type Boolean. The default value is false. Overrides [PROP\\_LIVE\\_CAPTION\\_DEFAULT\\_LANGUAGES](#)

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **debugCaptionLiveOnCaptionIngest**

---

## PROP\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_STRING

```
public static final java.lang.String PROP_LIVE_CAPTION_INGEST_ON_CAPTION_STRING
```

Timed Text Property "captionLiveIngestOnCaptionString": to change AMF identifier from default "onCaption" to something else

Type String. The default value is "onCaption".

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **captionLiveIngestOnCaptionString**

---

## PROP\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_INFO\_STRING

```
public static final java.lang.String PROP_LIVE_CAPTION_INGEST_ON_CAPTION_INFO_STRING
```

Timed Text Property "captionLiveIngestOnCaptionInfoString": to change AMF identifier from default "onCaptionInfo" to something else

Type String. The default value is "onCaptionInfo".

Add the property to Application/TimedText/Properties in Application.xml  
Constant value: **captionLiveIngestOnCaptionInfoString**

---

## PROP\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_CEA608\_IDLE\_TIME\_TO\_FLUSH\_DECODER

```
public static final java.lang.String  
PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_IDLE_TIME_TO_FLUSH_DECODER
```

---

(continued from last page)

Timed Text Property "captionLiveIngestOnCaptionCEA608IdleTimeToFlushDecoder" Controls allowed amount of idle time when parsing CEA-608 captions when ingested from AMF 708 data events

Type Integer. The default value is 250 ms.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestOnCaptionCEA608IdleTimeToFlushDecoder**

---

## PROP\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_CEA608\_ENABLE\_FIELD1

```
public static final java.lang.String
```

```
PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_ENABLE_FIELD1
```

Timed Text Property "captionLiveIngestOnCaptionCEA608EnableField2": When ingesting AMF onCaption 708 data events (actually CEA-608), controls whether CEA-608 field 1 is enabled for decoding

Type Boolean. Default is true;

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestOnCaptionCEA608EnableField1**

---

## PROP\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_CEA608\_ENABLE\_FIELD2

```
public static final java.lang.String
```

```
PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_ENABLE_FIELD2
```

Timed Text Property "captionLiveIngestOnCaptionCEA608EnableField2": When ingesting AMF onCaption 708 data events (actually CEA-608), controls whether CEA-608 field 2 is enabled for decoding

Type Boolean. Default is false;

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestOnCaptionCEA608EnableField2**

---

## PROP\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_CEA608\_MAX\_WARN\_MESSAGES

```
public static final java.lang.String
```

```
PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_MAX_WARN_MESSAGES
```

Timed Text Property "captionLiveIngestOnCaptionCEA608MaxWarnMessages": When ingesting AMF onCaption 708 data events (actually CEA-608), controls the maximum number of warning messages that are logged by the decoder

Type Integer. Default is 25.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestOnCaptionCEA608MaxWarnMessages**

---

## PROP\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_CEA608\_TRACK\_NUMBER

```
public static final java.lang.String
```

```
PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_TRACK_NUMBER
```

Timed Text Property "captionLiveIngestOnCaptionCEA608TrackNumber": When ingesting AMF onCaption 708 data events (actually CEA-608), controls the track number used to add captions as onTextData

Type Integer. Default is 99.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestOnCaptionCEA608TrackNumber**

---

## PROP\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_CEA608\_LANGUAGE\_ID

```
public static final java.lang.String
```

```
PROP_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_LANGUAGE_ID
```

(continued from last page)

Timed Text Property "captionLiveIngestOnCaptionCEA608LanguageID": When ingesting AMF onCaption 708 data events (actually CEA-608), controls the language ID used to add captions as onTextData

Type String. Default is language code of Java's locale.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **captionLiveIngestOnCaptionCEA608LanguageID**

---

## PROP\_DEBUG\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_CEA608\_VERBOSE

```
public static final java.lang.String
```

```
PROP_DEBUG_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_VERBOSE
```

Timed Text Property "debugCaptionLiveIngestOnCaptionCEA608Verbose" : Adds verbose logging to AMF onCaption events of type "708" (CEA-608)

Type Boolean. The default value is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugCaptionLiveIngestOnCaptionCEA608Verbose**

---

## PROP\_DEBUG\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_CEA608\_LOG\_AS\_SCC

```
public static final java.lang.String
```

```
PROP_DEBUG_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_LOG_AS_SCC
```

Timed Text Property "debugCaptionLiveIngestOnCaptionCEA608LogAsSCC" : Adds additional logging of decoding AMF onCaption events of type "708" (CEA-608) such that they are logged in SCC format

Type Boolean. The default value is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugCaptionLiveIngestOnCaptionCEA608LogAsSCC**

---

## PROP\_DEBUG\_LIVE\_CAPTION\_INGEST\_ON\_CAPTION\_CEA608\_LOG\_AS\_RAW

```
public static final java.lang.String
```

```
PROP_DEBUG_LIVE_CAPTION_INGEST_ON_CAPTION_CEA608_LOG_AS_RAW
```

Timed Text Property "debugCaptionLiveIngestOnCaptionCEA608LogAsRaw" : Adds additional logging of decoding AMF onCaption events of type "708" (CEA-608) such that they are logged in a raw binary state

Type Boolean. The default value is false.

Add the property to Application/TimedText/Properties in Application.xml

Constant value: **debugCaptionLiveIngestOnCaptionCEA608LogAsRaw**

---

## ON\_TEXT\_DATA

```
public static final java.lang.String ON_TEXT_DATA
```

Constant value: **onTextData**

---

## ON\_CAPTION\_INFO

```
public static final java.lang.String ON_CAPTION_INFO
```

Constant value: **onCaptionInfo**

(continued from last page)

---

## ON\_CAPTION

```
public static final java.lang.String ON_CAPTION
```

Constant value: **onCaption**

---

## CEA608

```
public static final java.lang.String CEA608
```

Constant value: **CEA608**

---

## SMIL\_PARAM\_WOWZA\_CAPTION\_INGEST\_TYPE

```
public static final java.lang.String SMIL_PARAM_WOWZA_CAPTION_INGEST_TYPE
```

Constant value: **wowzacaptioningesttype**

---

## SMIL\_PARAM\_IS\_WOWZA\_CAPTION\_STREAM

```
public static final java.lang.String SMIL_PARAM_IS_WOWZA_CAPTION_STREAM
```

Constant value: **iswowzacaptionstream**

---

---

Package

**com.wowza.wms.transcoder.model**

## com.wowza.wms.transcoder.model Interface ILiveStreamTranscoderActionNotify

All Known Implementing Classes:

[LiveStreamTranscoderActionNotifyBase](#)

public interface **ILiveStreamTranscoderActionNotify**  
extends

ILiveStreamTranscoderActionNotify: listener interface for live stream transcoder events.

### Method Summary

void	<a href="#">onCalculateSourceAudioBitrate</a> (LiveStreamTranscoder liveStreamTranscoder, long bitrate) Called when the bitrate of the source audio stream is calculated
void	<a href="#">onCalculateSourceVideoBitrate</a> (LiveStreamTranscoder liveStreamTranscoder, long bitrate) Called when the bitrate of the source video stream is calculated
void	<a href="#">onInitAfterLoadTemplate</a> (LiveStreamTranscoder liveStreamTranscoder) Called just after transcoder template is loaded.
void	<a href="#">onInitBeforeLoadTemplate</a> (LiveStreamTranscoder liveStreamTranscoder) Called just before transcoder template is loaded
void	<a href="#">onInitStart</a> (LiveStreamTranscoder liveStreamTranscoder, String streamName, String transcoderName, <a href="#">IApplicationInstance</a> appInstance, LiveStreamTranscoderItem liveStreamTranscoderItem) Call when live stream transcoder is first created
void	<a href="#">onInitStop</a> (LiveStreamTranscoder liveStreamTranscoder) At the end of the initialization process
void	<a href="#">onRegisterStreamNameGroup</a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderStreamNameGroup streamNameGroup) Called after a stream name group is resolved and registered with MediaStreamMap
void	<a href="#">onResetStream</a> (LiveStreamTranscoder liveStreamTranscoder) Called when the stream feeding the live stream transcoder switches.
void	<a href="#">onSessionAudioDecodeCodecInfo</a> (LiveStreamTranscoder liveStreamTranscoder, com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio) Called when audio decoding information is available.
void	<a href="#">onSessionAudioEncodeCodecInfo</a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionAudioEncode sessionAudioEncode, com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio) Called when audio encoding information is available.
void	<a href="#">onSessionAudioEncodeCreate</a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionAudioEncode sessionAudioEncode) Called when audio encoder session is created.

void	<a href="#"><u>onSessionAudioEncodeInit</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionAudioEncode sessionAudioEncode) Called after audio session is initialized.
void	<a href="#"><u>onSessionAudioEncodeSetup</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionAudioEncode sessionAudioEncode) Called after native audio encoder is created and initialized.
void	<a href="#"><u>onSessionDataEncodeCreate</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionDataEncode sessionDataEncode) Called when data encoder session is created.
void	<a href="#"><u>onSessionDataEncodeInit</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionDataEncode sessionDataEncode) Called after data session is initialized.
void	<a href="#"><u>onSessionDestinationCreate</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionDestination sessionDestination) Called when transcoding destination is created
void	<a href="#"><u>onSessionVideoDecodeCodecInfo</u></a> (LiveStreamTranscoder liveStreamTranscoder, com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo) Called when video decoding information is available.
void	<a href="#"><u>onSessionVideoEncodeCodecInfo</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionVideoEncode sessionVideoEncode, com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo) Called when video encoding information is available.
void	<a href="#"><u>onSessionVideoEncodeCreate</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionVideoEncode sessionVideoEncode) Called when video encoder session is created.
void	<a href="#"><u>onSessionVideoEncodeInit</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionVideoEncode sessionVideoEncode) Called after video session is initialized.
void	<a href="#"><u>onSessionVideoEncodeSetup</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderSessionVideoEncode sessionVideoEncode) Called after native video encoder is created and initialized.
void	<a href="#"><u>onShutdownStart</u></a> (LiveStreamTranscoder liveStreamTranscoder) Called when the live stream transcoder starts to shutdown.
void	<a href="#"><u>onShutdownStop</u></a> (LiveStreamTranscoder liveStreamTranscoder) Called when the live stream transcoder is shutdown.
void	<a href="#"><u>onUnregisterStreamNameGroup</u></a> (LiveStreamTranscoder liveStreamTranscoder, TranscoderStreamNameGroup streamNameGroup) Called after a stream name group is unregistered with MediaStreamMap

## Methods

### onInitStart

```
public void onInitStart(LiveStreamTranscoder liveStreamTranscoder,
    String streamName,
    String transcoderName,
    IApplicationInstance appInstance,
    LiveStreamTranscoderItem liveStreamTranscoderItem)
```

(continued from last page)

Call when live stream transcoder is first created

**Parameters:**

liveStreamTranscoder - live stream transcoder  
streamName - stream name  
transcoderName - transcoder name  
appInstance - application instance  
liveStreamTranscoderItem - live stream transcoder definition

---

## onInitBeforeLoadTemplate

```
public void onInitBeforeLoadTemplate(LiveStreamTranscoder liveStreamTranscoder)
```

Called just before transcoder template is loaded

**Parameters:**

liveStreamTranscoder - live stream transcoder

---

## onInitAfterLoadTemplate

```
public void onInitAfterLoadTemplate(LiveStreamTranscoder liveStreamTranscoder)
```

Called just after transcoder template is loaded. Good place to modify values loaded from template.

**Parameters:**

liveStreamTranscoder - live stream transcoder

---

## onInitStop

```
public void onInitStop(LiveStreamTranscoder liveStreamTranscoder)
```

At the end of the initialization process

**Parameters:**

liveStreamTranscoder - live stream transcoder

---

## onCalculateSourceVideoBitrate

```
public void onCalculateSourceVideoBitrate(LiveStreamTranscoder liveStreamTranscoder,  
long bitrate)
```

Called when the bitrate of the source video stream is calculated

**Parameters:**

liveStreamTranscoder - live stream transcoder  
bitrate - source bitrate (bytes per second)

---

## onCalculateSourceAudioBitrate

```
public void onCalculateSourceAudioBitrate(LiveStreamTranscoder liveStreamTranscoder,  
long bitrate)
```

Called when the bitrate of the source audio stream is calculated

**Parameters:**

liveStreamTranscoder - live stream transcoder  
bitrate - source bitrate (bytes per second)

## onSessionDestinationCreate

```
public void onSessionDestinationCreate(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionDestination sessionDestination)
```

Called when transcoding destination is created

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionDestination - destination

---

## onSessionVideoEncodeCreate

```
public void onSessionVideoEncodeCreate(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionVideoEncode sessionVideoEncode)
```

Called when video encoder session is created.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionVideoEncode - video session

---

## onSessionAudioEncodeCreate

```
public void onSessionAudioEncodeCreate(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionAudioEncode sessionAudioEncode)
```

Called when audio encoder session is created.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionAudioEncode - audio session

---

## onSessionDataEncodeCreate

```
public void onSessionDataEncodeCreate(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionDataEncode sessionDataEncode)
```

Called when data encoder session is created.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionDataEncode - data session

---

## onSessionVideoEncodeInit

```
public void onSessionVideoEncodeInit(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionVideoEncode sessionVideoEncode)
```

Called after video session is initialized.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionVideoEncode - video session

---

(continued from last page)

---

## onSessionAudioEncodeInit

```
public void onSessionAudioEncodeInit(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionAudioEncode sessionAudioEncode)
```

Called after audio session is initialized.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionAudioEncode - audio session

---

## onSessionDataEncodeInit

```
public void onSessionDataEncodeInit(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionDataEncode sessionDataEncode)
```

Called after data session is initialized.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionDataEncode - data session

---

## onSessionVideoEncodeSetup

```
public void onSessionVideoEncodeSetup(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionVideoEncode sessionVideoEncode)
```

Called after native video encoder is created and initialized.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionVideoEncode - video session

---

## onSessionAudioEncodeSetup

```
public void onSessionAudioEncodeSetup(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionAudioEncode sessionAudioEncode)
```

Called after native audio encoder is created and initialized.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionAudioEncode - audio session

---

## onSessionVideoEncodeCodecInfo

```
public void onSessionVideoEncodeCodecInfo(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionVideoEncode sessionVideoEncode,  
    com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo)
```

Called when video encoding information is available.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionVideoEncode - video session  
codecInfoVideo - encoding info

---

(continued from last page)

---

## onSessionAudioEncodeCodecInfo

```
public void onSessionAudioEncodeCodecInfo(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionAudioEncode sessionAudioEncode,  
    com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio)
```

Called when audio encoding information is available.

### Parameters:

liveStreamTranscoder - live stream transcoder  
sessionAudioEncode - audio session  
codecInfoAudio - encoding info

---

## onSessionVideoDecodeCodecInfo

```
public void onSessionVideoDecodeCodecInfo(LiveStreamTranscoder liveStreamTranscoder,  
    com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo)
```

Called when video decoding information is available.

### Parameters:

liveStreamTranscoder - live stream transcoder  
codecInfoVideo - video info

---

## onSessionAudioDecodeCodecInfo

```
public void onSessionAudioDecodeCodecInfo(LiveStreamTranscoder liveStreamTranscoder,  
    com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio)
```

Called when audio decoding information is available.

### Parameters:

liveStreamTranscoder - live stream transcoder  
codecInfoAudio - audio info

---

## onRegisterStreamNameGroup

```
public void onRegisterStreamNameGroup(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderStreamNameGroup streamNameGroup)
```

Called after a stream name group is resolved and registered with MediaStreamMap

### Parameters:

liveStreamTranscoder - live stream transcoder  
streamNameGroup - stream name group

---

## onUnregisterStreamNameGroup

```
public void onUnregisterStreamNameGroup(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderStreamNameGroup streamNameGroup)
```

Called after a stream name group is unregistered with MediaStreamMap

### Parameters:

liveStreamTranscoder - live stream transcoder  
streamNameGroup - stream name group

---

(continued from last page)

## onShutdownStart

```
public void onShutdownStart(LiveStreamTranscoder liveStreamTranscoder)
```

Called when the live stream transcoder starts to shutdown.

**Parameters:**

liveStreamTranscoder - live stream transcoder

---

## onShutdownStop

```
public void onShutdownStop(LiveStreamTranscoder liveStreamTranscoder)
```

Called when the live stream transcoder is shutdown.

**Parameters:**

liveStreamTranscoder - live stream transcoder

---

## onResetStream

```
public void onResetStream(LiveStreamTranscoder liveStreamTranscoder)
```

Called when the stream feeding the live stream transcoder switches.

**Parameters:**

liveStreamTranscoder - live stream transcoder

com.wowza.wms.transcoder.model

# Interface ITranscoderAudioFrameNotify

public interface ITranscoderAudioFrameNotify  
extends

Method Summary	
void	<a href="#">onAudioFrame</a> (TranscoderSessionAudio transcoderSessionAudio, TranscoderNativeAudioFrame nativeAudioFrame)

## Methods

### onAudioFrame

```
public void onAudioFrame(TranscoderSessionAudio transcoderSessionAudio,
    TranscoderNativeAudioFrame nativeAudioFrame)
```

## com.wowza.wms.transcoder.model Interface ITranscoderFrameGrabProvider

public interface **ITranscoderFrameGrabProvider**  
extends

ITranscoderFrameGrabProvider: interface used to grab frames from the live stream transcoder.

### Method Summary

java.util.List	<a href="#"><code>getAndClearPendingFrameGrabs()</code></a> Returns a list of all grab frame requests that are pending and clears the pending list.
void	<a href="#"><code>grabFrame(ITranscoderFrameGrabResult grabResult)</code></a> Call to grab a frame.
void	<a href="#"><code>grabFrame(ITranscoderFrameGrabResult grabResult, int width, int height)</code></a> Call to grab a frame.

### Methods

#### grabFrame

public void **grabFrame**([`ITranscoderFrameGrabResult`](#) grabResult)

Call to grab a frame. The size of the frame will be the full size of the video frame.

**Parameters:**

grabResult - the class that will be called back when frame is available

#### grabFrame

public void **grabFrame**([`ITranscoderFrameGrabResult`](#) grabResult,  
int width,  
int height)

Call to grab a frame. The size of the frame is controlled by width and height.

**Parameters:**

grabResult - the class that will be called back when frame is available

width - frame width

height - frame height

#### getAndClearPendingFrameGrabs

public java.util.List **getAndClearPendingFrameGrabs**()

Returns a list of all grab frame requests that are pending and clears the pending list.

**Returns:**

list of pending grab frames

# com.wowza.wms.transcoder.model Interface ITranscoderFrameGrabResult

public interface **ITranscoderFrameGrabResult**  
extends

ITranscoderFrameGrabResult: Implement this interface when using frame grabber interface to grab transcoder video frames.

Method Summary	
void	<a href="#">onGrabFrame</a> ( <a href="#">TranscoderNativeVideoFrame</a> nativeFrame) Trigger when frame is available.

## Methods

### onGrabFrame

public void **onGrabFrame**([TranscoderNativeVideoFrame](#) nativeFrame)

Trigger when frame is available.

**Parameters:**

nativeFrame - native video frame.

com.wowza.wms.transcoder.model  
Interface ITranscoderOverlayImages

public interface ITranscoderOverlayImages  
extends

Method Summary	
void	<a href="#">addOverlayImage</a> (int index, <a href="#">TranscoderVideoOverlayFrame</a> overlay)
java.util.Map	<a href="#">getOverlayImages</a> ()

Methods

addOverlayImage

```
public void addOverlayImage(int index,  
    TranscoderVideoOverlayFrame overlay)
```

getOverlayImages

```
public java.util.Map getOverlayImages()
```

## com.wowza.wms.transcoder.model Interface ITranscoderOverlayProvider

public interface **ITranscoderOverlayProvider**  
extends

ITranscoderOverlayProvider: interface to add and remove video overlays.

### Method Summary

void	<a href="#"><code>addOverlay</code></a> (int index, <a href="#"><code>TranscoderVideoOverlayFrame</code></a> overlay) Add an overlay to a video stream.
void	<a href="#"><code>clearOverlay</code></a> (int index) Clear video overlay
java.util.Map	<a href="#"><code>getAndClearPendingOverlays</code></a> () Get a list of pending overlay requests and clear the pending overlay queue.
boolean	<a href="#"><code>isOverlayAvailable</code></a> () Returns true if there is a pending overlay request.

### Methods

#### addOverlay

```
public void addOverlay(int index,  
    TranscoderVideoOverlayFrame overlay)
```

Add an overlay to a video stream.

**Parameters:**

index - over lay index (zero is bottom in z-order)  
overlay - overlay object

#### clearOverlay

```
public void clearOverlay(int index)
```

Clear video overlay

**Parameters:**

index - over lay index (zero is bottom in z-order)

#### isOverlayAvailable

```
public boolean isOverlayAvailable()
```

Returns true if there is a pending overlay request.

**Returns:**

true if there is a pending overlay request

---

## getAndClearPendingOverlays

```
public java.util.Map getAndClearPendingOverlays()
```

Get a list of pending overlay requests and clear the pending overlay queue.

**Returns:**

list of pending overlay requests

## com.wowza.wms.transcoder.model Interface ITranscoderSessionNative

public interface **ITranscoderSessionNative**  
extends

## Fields

### CLASS

public static final java.lang.Class **CLASS**

### CLASSNAME

public static final java.lang.String **CLASSNAME**

Constant value: **ITranscoderSessionNative**

---

## AAC\_SAMPLEBUFFER\_SIZE

```
public static final long AAC_SAMPLEBUFFER_SIZE
```

Constant value: **1024**

---

## MP3\_SAMPLEBUFFER\_SIZE

```
public static final long MP3_SAMPLEBUFFER_SIZE
```

Constant value: **5760**

---

## G711\_SAMPLEBUFFER\_SIZE

```
public static final long G711_SAMPLEBUFFER_SIZE
```

Constant value: **2048**

---

## SPEEX\_SAMPLEBUFFER\_SIZE

```
public static final long SPEEX_SAMPLEBUFFER_SIZE
```

Constant value: **2048**

---

## AC3\_SAMPLEBUFFER\_SIZE

```
public static final long AC3_SAMPLEBUFFER_SIZE
```

Constant value: **2048**

---

## VORBIS\_SAMPLEBUFFER\_SIZE

```
public static final long VORBIS_SAMPLEBUFFER_SIZE
```

Constant value: **2048**

---

## OPUS\_SAMPLEBUFFER\_SIZE

```
public static final long OPUS_SAMPLEBUFFER_SIZE
```

Constant value: **5760**

---

## CODEC\_IMPL\_DEFAULT

```
public static final long CODEC_IMPL_DEFAULT
```

Constant value: **0**

---

(continued from last page)

---

## VIDEO\_DECODER\_TYPE\_COMPRESSED

```
public static final long VIDEO_DECODER_TYPE_COMPRESSED
```

Constant value: **0**

---

## VIDEO\_DECODER\_TYPE\_CAPTURE

```
public static final long VIDEO_DECODER_TYPE_CAPTURE
```

Constant value: **1**

---

## AUDIO\_DECODER\_TYPE\_COMPRESSED

```
public static final long AUDIO_DECODER_TYPE_COMPRESSED
```

Constant value: **0**

---

## AUDIO\_DECODER\_TYPE\_CAPTURE

```
public static final long AUDIO_DECODER_TYPE_CAPTURE
```

Constant value: **1**

---

## DECODERESULT\_FRAMEDONE

```
public static final long DECODERESULT_FRAMEDONE
```

Constant value: **1**

---

## DECODERESULT\_FRAMEREADY

```
public static final long DECODERESULT_FRAMEREADY
```

Constant value: **2**

---

## DECODERESULT\_FRAMEVALID

```
public static final long DECODERESULT_FRAMEVALID
```

Constant value: **4**

---

## DECODERESULT\_FRAMESKIP

```
public static final long DECODERESULT_FRAMESKIP
```

Constant value: **8**

---

## DECODERESULT\_FRAMEERROR

```
public static final long DECODERESULT_FRAMEERROR
```

---

(continued from last page)

Constant value: **16**

---

## DECODERESULT\_SEQHEADER

```
public static final long DECODERESULT_SEQHEADER
```

Constant value: **32**

---

## DECODERESULT\_ERROR

```
public static final long DECODERESULT_ERROR
```

Constant value: **64**

---

## H264\_BASELINE

```
public static final long H264_BASELINE
```

Constant value: **0**

---

## H264\_CIF

```
public static final long H264_CIF
```

Constant value: **1**

---

## H264\_MAIN

```
public static final long H264_MAIN
```

Constant value: **2**

---

## H264\_SVCD

```
public static final long H264_SVCD
```

Constant value: **3**

---

## H264\_D1

```
public static final long H264_D1
```

Constant value: **4**

---

## H264\_HIGH

```
public static final long H264_HIGH
```

Constant value: **5**

---

## H264\_DVD

public static final long **H264\_DVD**

Constant value: **6**

---

## H264\_HD\_DVD

public static final long **H264\_HD\_DVD**

Constant value: **7**

---

## H264\_BD

public static final long **H264\_BD**

Constant value: **8**

---

## H264\_BD\_HDMV

public static final long **H264\_BD\_HDMV**

Constant value: **9**

---

## H264\_PSP

public static final long **H264\_PSP**

Constant value: **10**

---

## H264\_HDTV\_720p

public static final long **H264\_HDTV\_720p**

Constant value: **11**

---

## H264\_HDTV\_1080i

public static final long **H264\_HDTV\_1080i**

Constant value: **12**

---

## H264\_iPOD

public static final long **H264\_iPOD**

Constant value: **13**

---

(continued from last page)

---

## H264\_AVCHD

```
public static final long H264_AVCHD
```

Constant value: **14**

---

## H264\_iPOD\_640x480

```
public static final long H264_iPOD_640x480
```

Constant value: **15**

---

## H264\_1SEG

```
public static final long H264_1SEG
```

Constant value: **16**

---

## H264\_INTRA\_HIGH\_10

```
public static final long H264_INTRA_HIGH_10
```

Constant value: **17**

---

## H264\_INTRA\_CLASS\_50

```
public static final long H264_INTRA_CLASS_50
```

Constant value: **18**

---

## H264\_INTRA\_CLASS\_100

```
public static final long H264_INTRA_CLASS_100
```

Constant value: **19**

---

## H264\_PSP\_480x270

```
public static final long H264_PSP_480x270
```

Constant value: **20**

---

## H264\_PSP\_640x480

```
public static final long H264_PSP_640x480
```

Constant value: **21**

---

## H264\_DIVX

```
public static final long H264_DIVX
```

---

(continued from last page)

Constant value: **22**

---

## H264\_FLASH\_LOWRES

```
public static final long H264_FLASH_LOWRES
```

Constant value: **23**

---

## H264\_FLASH\_HIGHRES

```
public static final long H264_FLASH_HIGHRES
```

Constant value: **24**

---

## H264\_3GP

```
public static final long H264_3GP
```

Constant value: **25**

---

## H264\_SILVERLIGHT

```
public static final long H264_SILVERLIGHT
```

Constant value: **26**

---

## H264\_LAST\_H264\_TYPE

```
public static final long H264_LAST_H264_TYPE
```

Constant value: **27**

---

## H264\_HD\_DVD\_BD\_MV

```
public static final long H264_HD_DVD_BD_MV
```

Constant value: **64**

---

## NATIVELIBPATH\_BASEPATH

```
public static final int NATIVELIBPATH_BASEPATH
```

Constant value: **0**

---

## NATIVELIBPATH\_QUICKSYNCPATH

```
public static final int NATIVELIBPATH_QUICKSYNCPATH

public static final int **CAPTUREDEVICE\_RENDITIONIDS\_BLACKMAGIC\_BMDMODEUNKNOWN**

Constant value: **1769303659**

## Methods

### setNativeLibPath

public long **setNativeLibPath**(long pathIndex,  
String pathStr)

---

### getHardwareInfoJSON

public long **getHardwareInfoJSON**(TranscoderStringByReference jsonStr)

---

### nativeInitialize

public long **nativeInitialize**()

---

### nativeShutdown

public long **nativeShutdown**()

---

### captureManagerInit

public long **captureManagerInit**()

---

### captureManagerSetPath

public long **captureManagerSetPath**(long pathIndex,  
String pathStr)

---

(continued from last page)

---

## captureManagerInspectHardware

```
public long captureManagerInspectHardware()
```

---

## captureManagerGetHardwareInfoJSON

```
public long captureManagerGetHardwareInfoJSON(TranscoderStringByReference jsonStr)
```

---

## captureManagerGetDeviceIds

```
public long captureManagerGetDeviceIds(TranscoderNativeArrayLong ids)
```

---

## captureManagerShutdown

```
public long captureManagerShutdown()
```

---

## captureDeviceGetInfo

```
public long captureDeviceGetInfo(long deviceId,  
    long flags,  
    com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceInfo  
captureDeviceInfo)
```

---

## captureDeviceGetSessionInfo

```
public long captureDeviceGetSessionInfo(long deviceId,  
    com.wowza.wms.transcoder.capture.TranscoderCaptureSessionInfo  
captureSessionInfo)
```

---

## captureDeviceSetActiveState

```
public long captureDeviceSetActiveState(long deviceId,  
    com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceStateInfo  
captureDeviceStateInfo)
```

---

## captureDeviceResetTimecodeSyncToWallClock

```
public long captureDeviceResetTimecodeSyncToWallClock(long deviceId)
```

---

## captureDeviceStartSessionParameterValues

```
public long captureDeviceStartSessionParameterValues(long deviceId,  
    TranscoderLongByReference sessionIdObj)
```

---

(continued from last page)

---

### captureDeviceEndSessionParameterValues

```
public long captureDeviceEndSessionParameterValues(long deviceId,  
    long sessionId)
```

---

### captureDeviceSetParameterValues

```
public long captureDeviceSetParameterValues(long deviceId,  
    long sessionId,  
    TranscoderNativeParameterValue[] values)
```

---

### captureDeviceGetParameterValues

```
public long captureDeviceGetParameterValues(long deviceId,  
    long sessionId,  
    TranscoderNativeParameterValue[] values)
```

---

### captureDeviceSaveParameterValues

```
public long captureDeviceSaveParameterValues(long deviceId,  
    long sessionId)
```

---

### captureDeviceSetVideoCaptureParams

```
public long captureDeviceSetVideoCaptureParams(long deviceId,  
    com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceCaptureParamsVideo  
    videoCaptureParams)
```

---

### captureDeviceGetVideoFrame

```
public long captureDeviceGetVideoFrame(long deviceId,  
    TranscoderNativeVideoFrame nativeVideoFrame)
```

---

### captureDeviceSetVideoCaptureInput

```
public long captureDeviceSetVideoCaptureInput(long deviceId,  
    com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceCaptureInputVideo  
    videoCaptureInput)
```

---

(continued from last page)

---

### captureDeviceGetVideoCaptureInput

```
public long captureDeviceGetVideoCaptureInput(long deviceId,  
        com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceCaptureInputVideo  
        videoCaptureInput)
```

---

### captureDeviceSetVideoCaptureTarget

```
public long captureDeviceSetVideoCaptureTarget(long deviceId,  
        com.wowza.wms.transcoder.capture.TranscoderCaptureTargetVideo  
        captureTargetVideo)
```

---

### captureDeviceSetAudioCaptureParams

```
public long captureDeviceSetAudioCaptureParams(long deviceId,  
        com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceCaptureParamsAudio  
        audioCaptureParams)
```

---

### captureDeviceSetAudioLevelParams

```
public long captureDeviceSetAudioLevelParams(long deviceId,  
        com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceAudioLevelParams  
        audioLevelParams)
```

---

### captureDeviceGetAudioLevelData

```
public long captureDeviceGetAudioLevelData(long deviceId,  
        com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceAudioLevelData  
        audioLevelData)
```

---

### captureDeviceGetAudioLevelDataLast

```
public long captureDeviceGetAudioLevelDataLast(long deviceId,  
        com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceAudioLevelDataSingle  
        audioLevelDataSingle)
```

---

### captureDeviceSetAudioVolume

```
public long captureDeviceSetAudioVolume(long deviceId,  
        com.wowza.wms.transcoder.capture.TranscoderCaptureDeviceAudioVolume  
        audioVolume)
```

---

### createInstance

```
public long createInstance()
```

---

## destroyInstance

```
public long destroyInstance(long classPtr)
```

---

---

## getLicenseChallenge

```
public long getLicenseChallenge(long classPtr,  
    TranscoderLongByReference challenge)
```

---

---

## setLicenseResponse

```
public long setLicenseResponse(long classPtr,  
    long response)
```

---

---

## initInstance

```
public long initInstance(long classPtr)
```

---

---

## vodTranscoderTranscodeFrames

```
public long vodTranscoderTranscodeFrames(long classPtr,  
    TranscoderNativeVODTranscoderSettings settings,  
    TranscoderPacket[] decodedFrames,  
    java.util.List encodedFrames)
```

---

---

## vodTranscoderGetCodecConfig

```
public long vodTranscoderGetCodecConfig(long classPtr,  
    TranscoderNativeVODTranscoderSettings settings,  
    TranscoderPacket codecConfigFrame)
```

---

---

## thumbnailerGetVideoFrame

```
public long thumbnailerGetVideoFrame(long classPtr,  
    com.wowza.wms.transcoder.thumbnailer.ThumbnailerRequest request,  
    com.wowza.wms.transcoder.thumbnailer.ThumbnailerResponse response)
```

---

---

## vodEncoderRun

```
public long vodEncoderRun(long classPtr)
```

---

(continued from last page)

---

## videoPipelineCreate

```
public long videoPipelineCreate(long classPtr,  
                                long implementation)
```

---

## videoPipelineSetGPUID

```
public long videoPipelineSetGPUID(long classPtr,  
                                   long GPUID)
```

---

## videoPipelineSetParameterValues

```
public long videoPipelineSetParameterValues(long classPtr,  
                                              TranscoderNativeParameterValue[] values)
```

---

## videoPipelineGetParameterValues

```
public long videoPipelineGetParameterValues(long classPtr,  
                                              TranscoderNativeParameterValue[] values)
```

---

## videoPipelineApplyParameters

```
public long videoPipelineApplyParameters(long classPtr)
```

---

## videoPipelineInitialize

```
public long videoPipelineInitialize(long classPtr)
```

---

## videoScalerCreate

```
public long videoScalerCreate(long classPtr)
```

---

## videoScalerSetImplementation

```
public long videoScalerSetImplementation(long classPtr,  
                                           long implementation,  
                                           long gpuid)
```

---

## videoScalerInitialize

```
public long videoScalerInitialize(long classPtr)
```

---

## videoDecoderCreate

```
public long videoDecoderCreate(long classPtr,  
    long decoderType,  
    long codec,

## com.wowza.wms.transcoder.model Interface ITranscoderVideoDecoderNotify

public interface **ITranscoderVideoDecoderNotify**  
extends

### Method Summary

void	<a href="#"><code>onAfterDecodeFrame</code></a> (TranscoderSessionVideo sessionVideo, TranscoderStreamSourceVideo sourceVideo, long frameCount)
void	<a href="#"><code>onAfterScaleFrame</code></a> (TranscoderSessionVideo sessionVideo, TranscoderStreamSourceVideo sourceVideo, long frameCount)
void	<a href="#"><code>onBeforeDecodeFrame</code></a> (TranscoderSessionVideo sessionVideo, TranscoderStreamSourceVideo sourceVideo, long frameCount)
void	<a href="#"><code>onBeforeScaleFrame</code></a> (TranscoderSessionVideo sessionVideo, TranscoderStreamSourceVideo sourceVideo, long frameCount)

### Methods

#### **onBeforeDecodeFrame**

```
public void onBeforeDecodeFrame(TranscoderSessionVideo sessionVideo,  
    TranscoderStreamSourceVideo sourceVideo,  
    long frameCount)
```

#### **onAfterDecodeFrame**

```
public void onAfterDecodeFrame(TranscoderSessionVideo sessionVideo,  
    TranscoderStreamSourceVideo sourceVideo,  
    long frameCount)
```

#### **onBeforeScaleFrame**

```
public void onBeforeScaleFrame(TranscoderSessionVideo sessionVideo,  
    TranscoderStreamSourceVideo sourceVideo,  
    long frameCount)
```

#### **onAfterScaleFrame**

```
public void onAfterScaleFrame(TranscoderSessionVideo sessionVideo,  
    TranscoderStreamSourceVideo sourceVideo,  
    long frameCount)
```

(continued from last page)

---

## com.wowza.wms.transcoder.model Interface ITranscoderVideoEncoderNotify

---

public interface **ITranscoderVideoEncoderNotify**  
extends

---

### Method Summary

void	<a href="#"><u>onAfterEncodeFrame</u></a> (TranscoderSessionVideoEncode sessionVideoEncode, TranscoderStreamDestinationVideo destinationVideo, long frameCount)
void	<a href="#"><u>onBeforeEncodeFrame</u></a> (TranscoderSessionVideoEncode sessionVideoEncode, TranscoderStreamDestinationVideo destinationVideo, long frameCount)

---

### Methods

#### **onBeforeEncodeFrame**

```
public void onBeforeEncodeFrame(TranscoderSessionVideoEncode sessionVideoEncode,  
    TranscoderStreamDestinationVideo destinationVideo,  
    long frameCount)
```

---

#### **onAfterEncodeFrame**

```
public void onAfterEncodeFrame(TranscoderSessionVideoEncode sessionVideoEncode,  
    TranscoderStreamDestinationVideo destinationVideo,  
    long frameCount)
```

com.wowza.wms.transcoder.model

Interface ITranscoderVideoEncoderNotify2

public interface ITranscoderVideoEncoderNotify2

extends

Method Summary	
void	<a href="#">onAfterEncodeFrame</a> (TranscoderSessionVideoEncode sessionVideoEncode, TranscoderStreamDestinationVideo destinationVideo, TranscoderVideoEncodeFrameContext frameContext)
void	<a href="#">onBeforeEncodeFrame</a> (TranscoderSessionVideoEncode sessionVideoEncode, TranscoderStreamDestinationVideo destinationVideo, TranscoderVideoEncodeFrameContext frameContext)

Methods

onBeforeEncodeFrame

```
public void onBeforeEncodeFrame(TranscoderSessionVideoEncode sessionVideoEncode,
                                TranscoderStreamDestinationVideo destinationVideo,
                                TranscoderVideoEncodeFrameContext frameContext)
```

onAfterEncodeFrame

```
public void onAfterEncodeFrame(TranscoderSessionVideoEncode sessionVideoEncode,
                                TranscoderStreamDestinationVideo destinationVideo,
                                TranscoderVideoEncodeFrameContext frameContext)
```

## com.wowza.wms.transcoder.model Interface ITranscoderVideoLoadBalancer

public interface **ITranscoderVideoLoadBalancer**  
extends

### Method Summary

void	<a href="#"><code>init</code></a> ( <a href="#"><code>IServer</code></a> server, <code>TranscoderContextServer</code> transcoderContextServer)
void	<a href="#"><code>onHardwareInspection</code></a> ( <code>TranscoderContextServer</code> transcoderContextServer)
void	<a href="#"><code>onTranscoderSessionCreate</code></a> ( <code>LiveStreamTranscoder</code> liveStreamTranscoder)
void	<a href="#"><code>onTranscoderSessionDestroy</code></a> ( <code>LiveStreamTranscoder</code> liveStreamTranscoder)
void	<a href="#"><code>onTranscoderSessionInit</code></a> ( <code>LiveStreamTranscoder</code> liveStreamTranscoder)
void	<a href="#"><code>onTranscoderSessionLoadBalance</code></a> ( <code>LiveStreamTranscoder</code> liveStreamTranscoder)
void	<a href="#"><code>onTranscoderSessionVODEncodeStart</code></a> ( <code>LiveStreamTranscoder</code> liveStreamTranscoder, <code>TranscoderNativeVODTranscoderSettings</code> videoEncodeSettings)
void	<a href="#"><code>onTranscoderSessionVODEncodeStop</code></a> ( <code>LiveStreamTranscoder</code> liveStreamTranscoder)

### Methods

#### **init**

```
public void init(IServer server,  
                 TranscoderContextServer transcoderContextServer)
```

#### **onHardwareInspection**

```
public void onHardwareInspection(TranscoderContextServer transcoderContextServer)
```

#### **onTranscoderSessionCreate**

```
public void onTranscoderSessionCreate(LiveStreamTranscoder liveStreamTranscoder)
```

---

### **onTranscoderSessionInit**

```
public void onTranscoderSessionInit(LiveStreamTranscoder liveStreamTranscoder)
```

---

### **onTranscoderSessionDestroy**

```
public void onTranscoderSessionDestroy(LiveStreamTranscoder liveStreamTranscoder)
```

---

### **onTranscoderSessionLoadBalance**

```
public void onTranscoderSessionLoadBalance(LiveStreamTranscoder liveStreamTranscoder)
```

---

### **onTranscoderSessionVODEncodeStart**

```
public void onTranscoderSessionVODEncodeStart(LiveStreamTranscoder  
liveStreamTranscoder,  
        TranscoderNativeVODTranscoderSettings videoEncodeSettings)
```

---

### **onTranscoderSessionVODEncodeStop**

```
public void onTranscoderSessionVODEncodeStop(LiveStreamTranscoder  
liveStreamTranscoder)
```

---

## com.wowza.wms.transcoder.model Interface ITranscoderWorker

public interface **ITranscoderWorker**  
extends

For internal use.

### Method Summary

void	<a href="#"><code>destroy()</code></a>
String	<a href="#"><code>getContextStr()</code></a>
long	<a href="#"><code>getFrameCount()</code></a>
boolean	<a href="#"><code>isEncoderInUse()</code></a>
boolean	<a href="#"><code>isRunning()</code></a> Returns true if transcoder worker is running (internal use)
void	<a href="#"><code>setFrameCount(long frameCount)</code></a>

### Methods

#### **isRunning**

public boolean **isRunning()**

Returns true if transcoder worker is running (internal use)

**Returns:**

true if transcoder worker is running (internal use)

#### **getFrameCount**

public long **getFrameCount()**

#### **setFrameCount**

public void **setFrameCount(long frameCount)**

#### **isEncoderInUse**

public boolean **isEncoderInUse()**

(continued from last page)

---

## **getContextStr**

```
public String getContextStr()
```

---

## **destroy**

```
public void destroy()
```

com.wowza.wms.transcoder.model

# Interface ITranscoderWorkerSorterSender

public interface **ITranscoderWorkerSorterSender**  
extends

For internal use.

Method Summary	
void	<a href="#">addSorterPacket</a> (TranscoderPacketSorterHolder sorterHolder) For internal use.

## Methods

### addSorterPacket

public void **addSorterPacket**(TranscoderPacketSorterHolder sorterHolder)

For internal use.

**Parameters:**  
sorterHolder - sorter holder

## com.wowza.wms.transcoder.model Class LiveStreamTranscoderActionNotifyBase

java.lang.Object

## Constructors

### LiveStreamTranscoderActionNotifyBase

```
public LiveStreamTranscoderActionNotifyBase()
```

## Methods

### onInitStart

```
public void onInitStart(LiveStreamTranscoder liveStreamTranscoder,  
    String streamName,  
    String transcoderName,  
    IApplicationInstance appInstance,  
    LiveStreamTranscoderItem liveStreamTranscoderItem)
```

### onInitBeforeLoadTemplate

```
public void onInitBeforeLoadTemplate(LiveStreamTranscoder liveStreamTranscoder)
```

### onInitAfterLoadTemplate

```
public void onInitAfterLoadTemplate(LiveStreamTranscoder liveStreamTranscoder)
```

### onInitStop

```
public void onInitStop(LiveStreamTranscoder liveStreamTranscoder)
```

### onCalculateSourceVideoBitrate

```
public void onCalculateSourceVideoBitrate(LiveStreamTranscoder liveStreamTranscoder,  
    long bitrate)
```

### onCalculateSourceAudioBitrate

```
public void onCalculateSourceAudioBitrate(LiveStreamTranscoder liveStreamTranscoder,  
    long bitrate)
```

### onSessionDestinationCreate

```
public void onSessionDestinationCreate(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionDestination sessionDestination)
```

(continued from last page)

---

### onSessionVideoEncodeCreate

```
public void onSessionVideoEncodeCreate(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionVideoEncode sessionVideoEncode)
```

---

### onSessionAudioEncodeCreate

```
public void onSessionAudioEncodeCreate(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionAudioEncode sessionAudioEncode)
```

---

### onSessionDataEncodeCreate

```
public void onSessionDataEncodeCreate(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionDataEncode sessionDataEncode)
```

---

### onSessionVideoEncodeInit

```
public void onSessionVideoEncodeInit(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionVideoEncode sessionVideoEncode)
```

---

### onSessionAudioEncodeInit

```
public void onSessionAudioEncodeInit(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionAudioEncode sessionAudioEncode)
```

---

### onSessionDataEncodeInit

```
public void onSessionDataEncodeInit(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionDataEncode sessionDataEncode)
```

---

### onSessionVideoEncodeSetup

```
public void onSessionVideoEncodeSetup(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionVideoEncode sessionVideoEncode)
```

---

### onSessionAudioEncodeSetup

```
public void onSessionAudioEncodeSetup(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionAudioEncode sessionAudioEncode)
```

---

(continued from last page)

---

## onSessionVideoEncodeCodecInfo

```
public void onSessionVideoEncodeCodecInfo(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionVideoEncode sessionVideoEncode,  
    com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo)
```

---

## onSessionAudioEncodeCodecInfo

```
public void onSessionAudioEncodeCodecInfo(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderSessionAudioEncode sessionAudioEncode,  
    com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio)
```

---

## onSessionVideoDecodeCodecInfo

```
public void onSessionVideoDecodeCodecInfo(LiveStreamTranscoder liveStreamTranscoder,  
    com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo)
```

---

## onSessionAudioDecodeCodecInfo

```
public void onSessionAudioDecodeCodecInfo(LiveStreamTranscoder liveStreamTranscoder,  
    com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio)
```

---

## onShutdownStart

```
public void onShutdownStart(LiveStreamTranscoder liveStreamTranscoder)
```

---

## onShutdownStop

```
public void onShutdownStop(LiveStreamTranscoder liveStreamTranscoder)
```

---

## onResetStream

```
public void onResetStream(LiveStreamTranscoder liveStreamTranscoder)
```

---

## onRegisterStreamNameGroup

```
public void onRegisterStreamNameGroup(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderStreamNameGroup streamNameGroup)
```

---

## onUnregisterStreamNameGroup

```
public void onUnregisterStreamNameGroup(LiveStreamTranscoder liveStreamTranscoder,  
    TranscoderStreamNameGroup streamNameGroup)
```

## com.wowza.wms.transcoder.model Class TranscoderNativeVideoFrame

java.lang.Object

└-com.wowza.wms.transcoder.model.TranscoderNativeVideoFrame

public class **TranscoderNativeVideoFrame**  
extends Object

Native video frame.

### Field Summary

public	<a href="#">bytes</a>
public static final	<a href="#">DESTINATION_ALIGN_BOTTOM</a> Value: <b>64</b>
public static final	<a href="#">DESTINATION_ALIGN_HCENTER</a> Value: <b>2</b>
public static final	<a href="#">DESTINATION_ALIGN_LEFT</a> Value: <b>1</b>
public static final	<a href="#">DESTINATION_ALIGN_RIGHT</a> Value: <b>4</b>
public static final	<a href="#">DESTINATION_ALIGN_TOP</a> Value: <b>16</b>
public static final	<a href="#">DESTINATION_ALIGN_VCENTER</a> Value: <b>32</b>
public	<a href="#">dstAlign</a>
public	<a href="#">dstHeight</a>
public	<a href="#">dstWidth</a>
public	<a href="#">dstX</a>
public	<a href="#">dstY</a>
public	<a href="#">fourcc</a>
public	<a href="#">frameStartOffset</a>

public	<a href="#">height</a>
public	<a href="#">stride</a>
public	<a href="#">timecode</a>
public	<a href="#">width</a>

## Constructor Summary

public	<a href="#">TranscoderNativeVideoFrame()</a>
--------	--

## Method Summary

static int	<a href="#">deserialize</a> ( <a href="#">TranscoderNativeVideoFrame</a> obj, byte[] buffer, int pos, boolean includeByteArray)
byte[]	<a href="#">getBytes()</a> Get the raw image bytes.
int	<a href="#">getDstAlign()</a> Get destination origin align (see DESTINATION_ALIGN_*)
int	<a href="#">getDstHeight()</a> Get destination height
int	<a href="#">getDstWidth()</a> Get destination width
int	<a href="#">getDstX()</a> Get the destination x offset
int	<a href="#">getDstY()</a> Get the destination y offset
long	<a href="#">getFourcc()</a> Get the FOURCC format for this image (always BGRA)
long	<a href="#">getFrameStartOffset()</a> Get the offset to first image row byte.
int	<a href="#">getHeight()</a> Get image height
int	<a href="#">getSerializationSize</a> (boolean includeByteArray)
long	<a href="#">getStride()</a> Get the number of bytes in each image row.
long	<a href="#">getTimecode()</a> Get timecode (milliseconds) of this frame if it is a frame grab.
int	<a href="#">getWidth()</a> Get image width

int	<a href="#"><code>serialize</code></a> (byte[] buffer, int pos, boolean includeByteArray)
void	<a href="#"><code>setBytes</code></a> (byte[] bytes) Set raw image bytes.
void	<a href="#"><code>setDstAlign</code></a> (int dstAlign) Set destination origin align (see DESTINATION_ALIGN_*)
void	<a href="#"><code>setDstHeight</code></a> (int dstHeight) Set destination height
void	<a href="#"><code>setDstWidth</code></a> (int dstWidth) Set destination width
void	<a href="#"><code>setDstX</code></a> (int dstX) Set the destination x offset
void	<a href="#"><code>setDstY</code></a> (int dstY) Set the destination y offset
void	<a href="#"><code>setFourcc</code></a> (long fourcc) Set the FOURCC format for this image (always BGRA)
void	<a href="#"><code>setFrameStartOffset</code></a> (long frameStartOffset) Set the offset to first image row byte.
void	<a href="#"><code>setHeight</code></a> (int height) Set image height
void	<a href="#"><code>setStride</code></a> (long stride) Set the number of bytes in each image row.
void	<a href="#"><code>setTimecode</code></a> (long timecode) Set timecode (milliseconds) of this frame if it is a frame grab.
void	<a href="#"><code>setWidth</code></a> (int width) Set image width

#### Methods inherited from class java.lang.Object

## Fields

### DESTINATION\_ALIGN\_LEFT

```
public static final int DESTINATION_ALIGN_LEFT
```

Constant value: **1**

### DESTINATION\_ALIGN\_HCENTER

```
public static final int DESTINATION_ALIGN_HCENTER
```

(continued from last page)

Constant value: **2**

---

## DESTINATION\_ALIGN\_RIGHT

```
public static final int DESTINATION_ALIGN_RIGHT
```

Constant value: **4**

---

## DESTINATION\_ALIGN\_TOP

```
public static final int DESTINATION_ALIGN_TOP
```

Constant value: **16**

---

## DESTINATION\_ALIGN\_VCENTER

```
public static final int DESTINATION_ALIGN_VCENTER
```

Constant value: **32**

---

## DESTINATION\_ALIGN\_BOTTOM

```
public static final int DESTINATION_ALIGN_BOTTOM
```

Constant value: **64**

---

## fourcc

```
public long fourcc
```

---

## bytes

```
public byte bytes
```

---

## stride

```
public long stride
```

---

## frameStartOffset

```
public long frameStartOffset
```

---

## width

```
public int width
```

---

### height

```
public int height
```

---

### timecode

```
public long timecode
```

---

### dstX

```
public int dstX
```

---

### dstY

```
public int dstY
```

---

### dstWidth

```
public int dstWidth
```

---

### dstHeight

```
public int dstHeight
```

---

### dstAlign

```
public int dstAlign
```

---

## Constructors

### TranscoderNativeVideoFrame

```
public TranscoderNativeVideoFrame()
```

## Methods

### getSerializationSize

```
public int getSerializationSize(boolean includeByteArray)
```

---

## serialize

```
public int serialize(byte[] buffer,
                    int pos,
                    boolean includeByteArray)
```

---

## deserialize

```
public static int deserialize(TranscoderNativeVideoFrame obj,
                             byte[] buffer,
                             int pos,
                             boolean includeByteArray)
```

---

## getFourcc

```
public long getFourcc()
```

Get the FOURCC format for this image (always BGRA)

**Returns:**

FOURCC format

---

## setFourcc

```
public void setFourcc(long fourcc)
```

Set the FOURCC format for this image (always BGRA)

**Parameters:**

fourcc - FOURCC format

---

## getBytes

```
public byte[] getBytes()
```

Get the raw image bytes.

**Returns:**

raw image bytes

---

## setBytes

```
public void setBytes(byte[] bytes)
```

Set raw image bytes.

**Parameters:**

bytes - raw image bytes

---

## getStride

```
public long getStride()
```

Get the number of bytes in each image row.

---

---

(continued from last page)

**Returns:**

number of bytes in each image row

---

**setStride**

```
public void setStride(long stride)
```

Set the number of bytes in each image row.

**Parameters:**

stride - number of bytes in each image row

---

**getFrameStartOffset**

```
public long getFrameStartOffset()
```

Get the offset to first image row byte.

**Returns:**

offset to first image row byte

---

**setFrameStartOffset**

```
public void setFrameStartOffset(long frameStartOffset)
```

Set the offset to first image row byte.

**Parameters:**

frameStartOffset - offset to first image row byte

---

**getWidth**

```
public int getWidth()
```

Get image width

**Returns:**

image width

---

**setWidth**

```
public void setWidth(int width)
```

Set image width

**Parameters:**

width - image width

---

**getHeight**

```
public int getHeight()
```

Get image height

**Returns:**

image height

---

## setHeight

```
public void setHeight(int height)
```

Set image height

**Parameters:**

height - image height

---

## getDstX

```
public int getDstX()
```

Get the destination x offset

**Returns:**

destination x offset

---

## setDstX

```
public void setDstX(int dstX)
```

Set the destination x offset

**Parameters:**

dstX - destination x offset

---

## getDstY

```
public int getDstY()
```

Get the destination y offset

**Returns:**

destination y offset

---

## setDstY

```
public void setDstY(int dstY)
```

Set the destination y offset

**Parameters:**

dstY - destination y offset

---

## getDstWidth

```
public int getDstWidth()
```

Get destination width

**Returns:**

destination width

---

## setDstWidth

```
public void setDstWidth(int dstWidth)
```

---

(continued from last page)

Set destination width

**Parameters:**

dstWidth - destination width

---

## getDstHeight

```
public int getDstHeight()
```

Get destination height

**Returns:**

destination height

---

## setDstHeight

```
public void setDstHeight(int dstHeight)
```

Set destination height

**Parameters:**

dstHeight - destination height

---

## getDstAlign

```
public int getDstAlign()
```

Get destination origin align (see DESTINATION\_ALIGN\_\*)

**Returns:**

destination origin align

---

## setDstAlign

```
public void setDstAlign(int dstAlign)
```

Set destination origin align (see DESTINATION\_ALIGN\_\*)

**Parameters:**

dstAlign - destination origin align

---

## getTimecode

```
public long getTimecode()
```

Get timecode (milliseconds) of this frame if it is a frame grab.

**Returns:**

timecode (milliseconds)

---

## setTimecode

```
public void setTimecode(long timecode)
```

Set timecode (milliseconds) of this frame if it is a frame grab.

**Parameters:**

timecode - timecode (milliseconds)

## com.wowza.wms.transcoder.model Class TranscoderVideoOverlayFrame

java.lang.Object

└-com.wowza.wms.transcoder.model.TranscoderVideoOverlayFrame

public class **TranscoderVideoOverlayFrame**  
extends Object

TranscoderVideoOverlayFrame: Video overlay frame.

### Field Summary

public	<a href="#">enabled</a>
public	<a href="#">imagePath</a>
public	<a href="#">index</a>
public	<a href="#">lastModDate</a>
public static final	<a href="#">LOADSTATE_FAILURE</a> Value: <b>2</b>
public static final	<a href="#">LOADSTATE_INIT</a> Value: <b>0</b>
public static final	<a href="#">LOADSTATE_SUCCESS</a> Value: <b>1</b>
public	<a href="#">opacity</a>
public	<a href="#">videoFrame</a>

### Constructor Summary

public	<a href="#">TranscoderVideoOverlayFrame()</a>
public	<a href="#">TranscoderVideoOverlayFrame</a> (String imagePath)
public	<a href="#">TranscoderVideoOverlayFrame</a> (String imagePath, int opacity)
public	<a href="#">TranscoderVideoOverlayFrame</a> (int width, int height, byte[] buffer)

### Method Summary

int	<a href="#"><u>getDstAlign()</u></a>
int	<a href="#"><u>getDstHeight()</u></a>
int	<a href="#"><u>getDstWidth()</u></a>
int	<a href="#"><u>getDstX()</u></a>
int	<a href="#"><u>getDstY()</u></a>
String	<a href="#"><u>getImagePath()</u></a> Get the path to the overlay image.
int	<a href="#"><u>getIndex()</u></a> Get overlay index (z-order)
long	<a href="#"><u>getLastModDate()</u></a>
int	<a href="#"><u>getOpacity()</u></a>
<a href="#"><u>TranscoderNativeVideoFrame</u></a>	<a href="#"><u>getVideoFrame()</u></a> Get the video frame.
boolean	<a href="#"><u>isCheckForUpdates()</u></a>
boolean	<a href="#"><u>isEnabled()</u></a> Is this overlay enabled.
boolean	<a href="#"><u>isGood()</u></a>
boolean	<a href="#"><u>isImageFileUpdated()</u></a> <a href="#"><u>IApplicationInstance</u></a> appInstance)
boolean	<a href="#"><u>isTransparent()</u></a>
boolean	<a href="#"><u>loadImage()</u></a> <a href="#"><u>IApplicationInstance</u></a> appInstance, boolean reload) If you set a path to an image file (JPG, PNG, BMP...) this will load the image into this object.
void	<a href="#"><u>setCheckForUpdates()</u></a> (boolean checkForUpdates)
void	<a href="#"><u>setDstAlign()</u></a> (int align)
void	<a href="#"><u>setDstHeight()</u></a> (int height)
void	<a href="#"><u>setDstWidth()</u></a> (int width)
void	<a href="#"><u>setDstX()</u></a> (int x)
void	<a href="#"><u>setDstY()</u></a> (int y)
void	<a href="#"><u>setEnabled()</u></a> (boolean enabled) Set is this overlay enabled.

void	<a href="#">setImagePath</a> (String imagePath) Set the path to the overlay image.
void	<a href="#">setIndex</a> (int index) Set overlay index (z-order)
void	<a href="#">setLastModDate</a> (long lastModDate)
void	<a href="#">setOpacity</a> (int opacity)

Methods inherited from class `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Fields

### LOADSTATE\_INIT

```
public static final int LOADSTATE_INIT
```

Constant value: **0**

### LOADSTATE\_SUCCESS

```
public static final int LOADSTATE_SUCCESS
```

Constant value: **1**

### LOADSTATE\_FAILURE

```
public static final int LOADSTATE_FAILURE
```

Constant value: **2**

### videoFrame

```
public com.wowza.wms.transcoder.model.TranscoderNativeVideoFrame videoFrame
```

### enabled

```
public boolean enabled
```

### index

```
public int index
```

---

## imagePath

```
public java.lang.String imagePath
```

---

## opacity

```
public int opacity
```

---

## lastModDate

```
public long lastModDate
```

---

## Constructors

### TranscoderVideoOverlayFrame

```
public TranscoderVideoOverlayFrame()
```

---

### TranscoderVideoOverlayFrame

```
public TranscoderVideoOverlayFrame(String imagePath)
```

---

### TranscoderVideoOverlayFrame

```
public TranscoderVideoOverlayFrame(String imagePath,  
                                     int opacity)
```

---

### TranscoderVideoOverlayFrame

```
public TranscoderVideoOverlayFrame(int width,  
                                     int height,  
                                     byte[] buffer)
```

---

## Methods

### isGood

```
public boolean isGood()
```

---

(continued from last page)

---

## isImageFileUpdated

```
public boolean isImageFileUpdated(IApplicationInstance appInstance)
```

---

## loadImage

```
public boolean loadImage(IApplicationInstance appInstance,  
    boolean reload)
```

If you set a path to an image file (JPG, PNG, BMP...) this will load the image into this object.

**Parameters:**

appInstance - application instance  
reload - is it an image reload

**Returns:**

true if successful

---

## isEnabled

```
public boolean isEnabled()
```

Is this overlay enabled.

**Returns:**

overlay enabled

---

## setEnabled

```
public void setEnabled(boolean enabled)
```

Set is this overlay enabled.

**Parameters:**

enabled - overlay enabled

---

## getVideoFrame

```
public TranscoderNativeVideoFrame getVideoFrame()
```

Get the video frame.

**Returns:**

video frame

---

## getIndex

```
public int getIndex()
```

Get overlay index (z-order)

**Returns:**

overlay index (z-order)

---

(continued from last page)

---

## setIndex

```
public void setIndex(int index)
```

Set overlay index (z-order)

### Parameters:

index - overlay index (z-order)

---

## getImagePath

```
public String getImagePath()
```

Get the path to the overlay image.

### Returns:

path to the overlay image

---

## setImagePath

```
public void setImagePath(String imagePath)
```

Set the path to the overlay image.

### Parameters:

imagePath - path to the overlay image

---

## getOpacity

```
public int getOpacity()
```

---

## setOpacity

```
public void setOpacity(int opacity)
```

---

## getDstX

```
public int getDstX()
```

---

## setDstX

```
public void setDstX(int x)
```

---

## getDstY

```
public int getDstY()
```

---

(continued from last page)

---

**setDstY**

```
public void setDstY(int y)
```

---

---

**getDstWidth**

```
public int getDstWidth()
```

---

---

**setDstWidth**

```
public void setDstWidth(int width)
```

---

---

**getDstHeight**

```
public int getDstHeight()
```

---

---

**setDstHeight**

```
public void setDstHeight(int height)
```

---

---

**getDstAlign**

```
public int getDstAlign()
```

---

---

**setDstAlign**

```
public void setDstAlign(int align)
```

---

---

**getLastModDate**

```
public long getLastModDate()
```

---

---

**setLastModDate**

```
public void setLastModDate(long lastModDate)
```

---

---

**isCheckForUpdates**

```
public boolean isCheckForUpdates()
```

---

(continued from last page)

---

## **setCheckForUpdates**

```
public void setCheckForUpdates(boolean checkForUpdates)
```

---

## **isTransparent**

```
public boolean isTransparent()
```

---

Package

**com.wowza.wms.transport.media**

## com.wowza.wms.transport.media Interface IMediaTransport

public interface **IMediaTransport**  
extends

MediaTransport sub system. It manages transport providers and how objects are passed to each provider.

### Method Summary

void	<a href="#"><u>addTransportDataObject</u></a> ( <a href="#"><u>IMediaTransportDataObject</u></a> transportDataObject) Adds a data object to the MediaTransport system which is then pushed to the transport providers configured.
void	<a href="#"><u>addTransportListener</u></a> ( <a href="#"><u>IMediaTransportListener</u></a> listener) This adds a transport listener which has the following calls onTransportProviderAdd onTransportProviderRemove These are triggered when a transport provider is added or removed.
boolean	<a href="#"><u>addTransportProvider</u></a> ( <a href="#"><u>IMediaTransportProvider</u></a> transportProvider) This adds a transport provider to the list of providers to use for any data objects passed into the MediaTransport system.
boolean	<a href="#"><u>getDebug</u></a> ( ) Get the state of the debugging flag.
java.util.List	<a href="#"><u>getTransportListeners</u></a> ( ) Returns a list of transport listeners available to the MediaTransport system.
java.util.List	<a href="#"><u>getTransportProviders</u></a> ( ) Returns a list of transport providers available to the MediaTransport system.
void	<a href="#"><u>init</u></a> ( ) Initialises the MediaTransport sub system.
boolean	<a href="#"><u>isReady</u></a> ( ) Return if the MediaTransport system is ready.
boolean	<a href="#"><u>removeTransportProvider</u></a> ( <a href="#"><u>IMediaTransportProvider</u></a> transportProvider) This removes a transport provider from the list of providers in use.
void	<a href="#"><u>removeTransportProviderListener</u></a> ( <a href="#"><u>IMediaTransportListener</u></a> listener) This removes a transport listener.
void	<a href="#"><u>setDebug</u></a> (boolean debug) Set the debug flag, by default it should be false.
void	<a href="#"><u>setIsReady</u></a> (boolean ready) This should be set to true if the MediaTransport object initialised correctly.

### Methods

(continued from last page)

## init

```
public void init()
```

Initialises the MediaTransport sub system. This should be called prior immediately and instantiation.

---

## setDebug

```
public void setDebug(boolean debug)
```

Set the debug flag, by default it should be false.

**Parameters:**

debug - boolean

---

## getDebug

```
public boolean getDebug()
```

Get the state of the debugging flag.

**Returns:**

boolean

---

## isReady

```
public boolean isReady()
```

Return if the MediaTransport system is ready. It should only return true if at least one(1) transport provider has been added and it initialised correctly.

**Returns:**

boolean

---

## setIsReady

```
public void setIsReady(boolean ready)
```

This should be set to true if the MediaTransport object initialised correctly. Even when this is set to true isReady() should only return true if at least one(1) transport provider has been added.

**Parameters:**

ready

---

## addTransportProvider

```
public boolean addTransportProvider(IMediaTransportProvider transportProvider)
```

This adds a transport provider to the list of providers to use for any data objects passed into the MediaTransport system. The transport provider should be fully configured and initialised before being added. If the MediaTransport system allows the provider to be added it returns true. You can not add the same MediaTransport provider more than once, if you want to send objects to similar type destinations you MUST create two providers. When adding a provider it can ONLY return true if the MediaTransport object has been initialised.

**Parameters:**

transportProvider

**Returns:**

---

## removeTransportProvider

```
public boolean removeTransportProvider(IMediaTransportProvider transportProvider)
```

This removes a transport provider from the list of providers in use. If the transport provider specified is not found as active then false is returned, otherwise it is true. Removing a transport provider should not interrupt any transport in progress.

**Parameters:**

transportProvider

**Returns:**

---

## getTransportProviders

```
public java.util.List getTransportProviders()
```

Returns a list of transport providers available to the MediaTransport system.

**Returns:**

List

---

## addTransportListener

```
public void addTransportListener(IMediaTransportListener listener)
```

This adds a transport listener which has the following calls onTransportProviderAdd onTransportProviderRemove These are triggered when a transport provider is added or removed.

**Parameters:**

IMediaTransportListener

---

## removeTransportProviderListener

```
public void removeTransportProviderListener(IMediaTransportListener listener)
```

This removes a transport listener.

**Parameters:**

IMediaTransportListener

---

## getTransportListeners

```
public java.util.List getTransportListeners()
```

Returns a list of transport listeners available to the MediaTransport system.

**Returns:**

List

---

## addTransportDataObject

```
public void addTransportDataObject(IMediaTransportDataObject transportDataObject)
```

Adds a data object to the MediaTransport system which is then pushed to the transport providers configured.

**Parameters:**

IMediaTransportDataObject

## com.wowza.wms.transport.media Interface IMediaTransportDataObject

public interface **IMediaTransportDataObject**  
extends

IMediaTransportDataObject This object is used by the MediaTransport sub system and should contain a command ( used by the appropriate transport provider ), content-type, path and a byte[] array of the data to transport.

### Method Summary

String	<a href="#"><u>getCommand()</u></a> Get the command set
String	<a href="#"><u>getContentType()</u></a> Get the content type set.
byte[]	<a href="#"><u>getData()</u></a> Get the data body set
String	<a href="#"><u>getHeader</u></a> (String name)
java.util.HashMap	<a href="#"><u>getHeaders()</u></a>
String	<a href="#"><u>getOption</u></a> (String name) Get an option for this object.
java.util.HashMap	<a href="#"><u>getOptions()</u></a> Get the map of options set for this object.
String	<a href="#"><u>getPath()</u></a> Get the path set
String	<a href="#"><u>getUUID()</u></a> Return the UUID created when the object was initialised.
void	<a href="#"><u>init()</u></a> This initialises the object.
void	<a href="#"><u>setCommand</u></a> (String command) This is the command the object needs to use to execute transport within the transport provider.
void	<a href="#"><u>setContentType</u></a> (String contentType) Set the content type of the object.
void	<a href="#"><u>setData</u></a> (byte[] data) This sets the data body of the object and must be a byte array.
void	<a href="#"><u>setHeader</u></a> (String name, String value)
void	<a href="#"><u>setOption</u></a> (String name, String value) Set an option for this object.

void

[setPath](#)(String path)

This sets the destination path of the object.

## Methods

### init

```
public void init()
```

This initialises the object. IT MUST create a UUID for the object upon initialisation and MUST be a string. It is up to the individual implementation to determine the format however MUST have a low chance of conflict for the period of use of the specific object.

### getUUID

```
public String getUUID()
```

Return the UUID created when the object was initialised.

**Returns:**

String

### setContentType

```
public void setContentType(String contentType)
```

Set the content type of the object. This should be a known MIME type that can be understood by the destination for the transport provider being used.

**Parameters:**

String

### setCommand

```
public void setCommand(String command)
```

This is the command the object needs to use to execute transport within the transport provider. A default provider available is a HTTP provider so common commands would be GET, PUT, POST, DELETE This is implementation independent so can be anything the provider can understand.

**Parameters:**

String

### setData

```
public void setData(byte[] data)
```

This sets the data body of the object and must be a byte array.

**Parameters:**

byte[]

### setPath

```
public void setPath(String path)
```

(continued from last page)

This sets the destination path of the object. This will be used by the transport provider. A common path could be /sample.mp4 which would indicate the data set should be stored as sample.mp4 in the root of the transport provider destination.

**Parameters:**String

---

**getData**

```
public byte[] getData()
```

Get the data body set

**Returns:**byte[]

---

**getPath**

```
public String getPath()
```

Get the path set

**Returns:**String

---

**getContentType**

```
public String getContentType()
```

Get the content type set.

**Returns:**String

---

**getCommand**

```
public String getCommand()
```

Get the command set

**Returns:**String

---

**setOption**

```
public void setOption(String name,  
    String value)
```

Set an option for this object. The option name set would be used by a transport provider when transporting this object.

**Parameters:**

String

String

---

**getOption**

```
public String getOption(String name)
```

Get an option for this object. If the option named does not exist it should return null.

(continued from last page)

**Parameters:**

String

**Returns:**String

---

## getOptions

```
public java.util.HashMap getOptions()
```

Get the map of options set for this object.

**Returns:**HashMap

---

## setHeader

```
public void setHeader(String name,  
                      String value)
```

## getHeader

```
public String getHeader(String name)
```

---

## getHeaders

```
public java.util.HashMap getHeaders()
```

# com.wowza.wms.transport.media Interface IMediaTransportListener

public interface **IMediaTransportListener**  
extends

IMediaTransportListener provides call backs when a transport provider is added or removed from the MediaTransport system.

Method Summary	
void	<a href="#">onTransportProviderAdd</a> ( <a href="#">IMediaTransportProvider</a> thisProvider) When a transport provider is added this call back is triggered.
void	<a href="#">onTransportProviderRemove</a> ( <a href="#">IMediaTransportProvider</a> thisProvider) When a transport provider is removed this call back is triggered.

## Methods

### onTransportProviderAdd

public void **onTransportProviderAdd**([IMediaTransportProvider](#) thisProvider)

When a transport provider is added this call back is triggered.

**Parameters:**  
[IMediaTransportProvider](#)

### onTransportProviderRemove

public void **onTransportProviderRemove**([IMediaTransportProvider](#) thisProvider)

When a transport provider is removed this call back is triggered.

**Parameters:**  
[IMediaTransportProvider](#)

## com.wowza.wms.transport.media Interface IMediaTransportObject

public interface **IMediaTransportObject**  
extends

IMediaTransportObject This object is used by a transport provider to manage data delivery. This is used by the MediaTransportProviderBase class and is an internal object only.

### Method Summary

<a href="#">IMediaTransportDataObject</a>	<a href="#">getDataObject()</a> Gets the IMediaTransportDataObject from this transport object.
int	<a href="#">getMaxAttempts()</a> Gets the max attempts for this object.
long	<a href="#">getRetryTime()</a> Gets the retry time for this object.
void	<a href="#">setDataObject(IMediaTransportDataObject dataObject)</a> Sets the IMediaTransportDataObject object for this transport object
void	<a href="#">setMaxAttempts(int attempts)</a> Sets the max attempts for this object.
void	<a href="#">setRetryTime(long retrytime)</a> Sets the retry time for this object.

### Methods

#### setDataObject

public void **setDataObject**([IMediaTransportDataObject](#) dataObject)

Sets the IMediaTransportDataObject object for this transport object

**Parameters:**

[IMediaTransportDataObject](#)

#### getDataObject

public [IMediaTransportDataObject](#) **getDataObject**()

Gets the IMediaTransportDataObject from this transport object.

**Returns:**

[IMediaTransportDataObject](#)

#### setRetryTime

public void **setRetryTime**(long retrytime)

(continued from last page)

Sets the retry time for this object.

**Parameters:**

long

---

## getRetryTime

```
public long getRetryTime()
```

Gets the retry time for this object.

**Returns:**

long

---

## setMaxAttempts

```
public void setMaxAttempts(int attempts)
```

Sets the max attempts for this object.

**Parameters:**

int

---

## getMaxAttempts

```
public int getMaxAttempts()
```

Gets the max attempts for this object.

**Returns:**

int

---

## com.wowza.wms.transport.media Interface IMediaTransportProvider

public interface **IMediaTransportProvider**  
extends

IMediaTransportProvider enables data objects to be transported to the defined destination.

### Field Summary

public static final	<a href="#"><u>TRANSPORT_PROVIDER_DEFAULT_PROCESS</u></a> Value: <b>2</b>
public static final	<a href="#"><u>TRANSPORT_PROVIDER_PROCESS_ASYNC</u></a> Value: <b>2</b>
public static final	<a href="#"><u>TRANSPORT_PROVIDER_PROCESS_SYNC</u></a> Value: <b>1</b>

### Method Summary

void	<a href="#"><u>addProviderListener</u></a> ( <a href="#"><u>IMediaTransportProviderListener</u></a> providerlistener) This adds a transport provider listener which has the following calls onTransportObjectStatus This is triggered when a transport provider attempts to transport an object.
boolean	<a href="#"><u>addTransportObject</u></a> ( <a href="#"><u>IMediaTransportDataObject</u></a> transportDataObject) This method gets called by the IMediaTransport object when a data object is added for transport.
boolean	<a href="#"><u>getDebug</u></a> ( ) Get the debug flag set.
int	<a href="#"><u>getTransportProcessType</u></a> ( ) Get the transport type used by this provider.
<a href="#"><u>IMediaTransportProviderConfiguration</u></a>	<a href="#"><u>getTransportProviderConfiguration</u></a> ( ) Get the configuration for this transport provider
String	<a href="#"><u>getTransportProviderName</u></a> ( ) Get the transport provider name.
void	<a href="#"><u>init</u></a> ( ) Initialise this transport provider.
boolean	<a href="#"><u>isReady</u></a> ( ) This should return true if the transport provider is ready to use.
void	<a href="#"><u>removeProviderListener</u></a> ( <a href="#"><u>IMediaTransportProviderListener</u></a> providerlistener) This removes a transport provider listener.
void	<a href="#"><u>setDebug</u></a> (boolean debug) Set the debug flag.

void	<a href="#"><code>setIsReady</code></a> (boolean ready) Set the state of the transport provider.
void	<a href="#"><code>setThreadPoolSize</code></a> (int threadpoolsize) If you have configured the transport provider to use ASYNC processing then you should also define a thread pool size.
void	<a href="#"><code>setTransportProcessType</code></a> (int type) Set the processing type for this provider.
void	<a href="#"><code>setTransportProviderConfiguration</code></a> ( <a href="#"><code>IMediaTransportProviderConfiguration</code></a> configuration) Set the configuration for this transport provider
void	<a href="#"><code>setTransportProviderName</code></a> (String methodName) Set the name of this transport provider.
<a href="#"><code>IMediaTransportResponse</code></a>	<a href="#"><code>transportObject</code></a> ( <a href="#"><code>IMediaTransportObject</code></a> transportObject) This is called when the provider attempts to transport the object.

## Fields

### TRANSPORT\_PROVIDER\_PROCESS\_SYNC

public static final int **TRANSPORT\_PROVIDER\_PROCESS\_SYNC**

Constant value: **1**

### TRANSPORT\_PROVIDER\_PROCESS\_ASYNC

public static final int **TRANSPORT\_PROVIDER\_PROCESS\_ASYNC**

Constant value: **2**

### TRANSPORT\_PROVIDER\_DEFAULT\_PROCESS

public static final int **TRANSPORT\_PROVIDER\_DEFAULT\_PROCESS**

Constant value: **2**

## Methods

### setTransportProviderConfiguration

public void **setTransportProviderConfiguration**([`IMediaTransportProviderConfiguration`](#) configuration)

Set the configuration for this transport provider

#### Parameters:

`IMediaTransportProviderConfiguration`

(continued from last page)

## getTransportProviderConfiguration

```
public IMediaTransportProviderConfiguration getTransportProviderConfiguration()
```

Get the configuration for this transport provider

**Returns:**

IMediaTransportProviderConfiguration

---

## init

```
public void init()
```

Initialise this transport provider. This should ONLY be called AFTER the configuration has been added so to allow any custom initialisation from the configuration provided.

---

## setDebug

```
public void setDebug(boolean debug)
```

Set the debug flag. By default it should be false

**Parameters:**

boolean

---

## getDebug

```
public boolean getDebug()
```

Get the debug flag set.

**Returns:**

boolean

---

## setTransportProcessType

```
public void setTransportProcessType(int type)
```

Set the processing type for this provider. It should be set as MediaTransportProviderBase.TRANSPORT\_PROVIDER\_PROCESS\_SYNC or MediaTransportProviderBase.TRANSPORT\_PROVIDER\_PROCESS\_ASYNC The provider MUST provide both synchronous and asynchronous delivery types.

**Parameters:**

type

---

## getTransportProcessType

```
public int getTransportProcessType()
```

Get the transport type used by this provider.

**Returns:**

int

---

## setTransportProviderName

```
public void setTransportProviderName(String methodName)
```

(continued from last page)

Set the name of this transport provider. This name is passed to the IMediaTransportProviderListener if implemented when objects have been processed.

**Parameters:**String

---

## getTransportProviderName

```
public String getTransportProviderName()
```

Get the transport provider name.

**Returns:**String

---

## setThreadPoolSize

```
public void setThreadPoolSize(int threadpoolsize)
```

If you have configured the transport provider to use ASYNC processing then you should also define a thread pool size.

**Parameters:**int

---

## addTransportObject

```
public boolean addTransportObject(IMediaTransportDataObject transportDataObject)
```

This method gets called by the IMediaTransport object when a data object is added for transport. If this transport provider does not want to handle this object it should return false. If you have configured the transport provider to use ASYNC processing then you need to add this to your pool of executors to process.

**Parameters:**[IMediaTransportDataObject](#)**Returns:**boolean

---

## transportObject

```
public IMediaTransportResponse transportObject(IMediaTransportObject transportObject)
```

This is called when the provider attempts to transport the object. It MUST return an IMediaTransportResponse object.

**Parameters:**[IMediaTransportObject](#)**Returns:**[IMediaTransportResponse](#)

---

## addProviderListener

```
public void addProviderListener(IMediaTransportProviderListener providerlistener)
```

This adds a transport provider listener which has the following calls onTransportObjectStatus. This is triggered when a transport provider attempts to transport an object.

**Parameters:**[IMediaTransportProviderListener](#)

---

---

## removeProviderListener

```
public void removeProviderListener(IMediaTransportProviderListener providerlistener)
```

This removes a transport provider listener.

**Parameters:**

[IMediaTransportProviderListener](#)

---

## isReady

```
public boolean isReady()
```

This should return true if the transport provider is ready to use.

**Returns:**

---

## setIsReady

```
public void setIsReady(boolean ready)
```

Set the state of the transport provider.

**Parameters:**

ready

## com.wowza.wms.transport.media Interface IMediaTransportProviderConfiguration

public interface **IMediaTransportProviderConfiguration**  
extends

IMediaTransportProviderConfiguration This object provides a mechanism to configure a media transport provider. \*

### Method Summary

void	<a href="#"><u>addCustomHeader</u></a> (String name, String value) Add a custom output header for this configuration item.
boolean	<a href="#"><u>getAttributeBoolean</u></a> (String name) Attempt to get a boolean attribute with the name specified.
int	<a href="#"><u>getAttributeInt</u></a> (String name) Attempt to get an int attribute with the name specified.
long	<a href="#"><u>getAttributeLong</u></a> (String name) Attempt to get a long attribute with the name specified.
java.util.Set	<a href="#"><u>getAttributeNames</u></a> ( ) Get a list of all the attribute names set.
String	<a href="#"><u>getAttributeString</u></a> (String name) Attempt to get a string attribute with the name specified.
String	<a href="#"><u>getConfigurationName</u></a> ( ) Get the name of this configuration item.
java.util.HashMap	<a href="#"><u>getCustomHeaders</u></a> ( ) Get all the custom headers set.
boolean	<a href="#"><u>getDebug</u></a> ( ) Get the debug flag for this configuration object.
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties</u></a> ( ) Get the WMSProperties holder.
java.util.HashMap	<a href="#"><u>getTransportHeaderOutput</u></a> ( java.util.HashMap dynamictransportinformation, <a href="#"><u>IMediaTransportObject</u></a> transportObject ) This should be called by the transport provider using this configuration item.
void	<a href="#"><u>init</u></a> ( ) Initialise the provider configuration.
boolean	<a href="#"><u>isReady</u></a> ( ) Get the ready flag for this configuration object.
void	<a href="#"><u>removeCustomHeader</u></a> (String name) Remove a custom output header
void	<a href="#"><u>setAttributeBoolean</u></a> (String name, boolean value) Set an attribute with a boolean type

void	<a href="#"><code>setAttributeInt</code></a> (String name, int value) Set an attribute with an int type
void	<a href="#"><code>setAttributeLong</code></a> (String name, long value) Set an attribute with a long type
void	<a href="#"><code>setAttributeString</code></a> (String name, String value) Set an attribute with a string type
void	<a href="#"><code>setConfigurationName</code></a> (String name) Set the name of this configuration object.
void	<a href="#"><code>setDebug</code></a> (boolean debug) Set the debug flag for this configuration object.
void	<a href="#"><code>setIsReady</code></a> (boolean ready) Set if this configuration object is ready.
void	<a href="#"><code>setProperties</code></a> ( <a href="#"><code>WMSProperties</code></a> props) When the object is created a WMSProperties holder is created.

## Methods

### **init**

```
public void init()
```

Initialise the provider configuration. This should only be called when all appropriate attributes have been set.

### **setConfigurationName**

```
public void setConfigurationName(String name)
```

Set the name of this configuration object.

**Parameters:**

String

### **getConfigurationName**

```
public String getConfigurationName()
```

Get the name of this configuration item.

**Returns:**

String

### **addCustomHeader**

```
public void addCustomHeader(String name,  
                             String value)
```

Add a custom output header for this configuration item. This is more geared towards HTTP transport providers but can be used by any transport provider.

**Parameters:**

String

(continued from last page)

String

---

## removeCustomHeader

```
public void removeCustomHeader(String name)
```

Remove a custom output header

**Parameters:**

String

---

## getCustomHeaders

```
public java.util.HashMap getCustomHeaders()
```

Get all the custom headers set.

**Returns:**

HashMap

---

## setAttributeString

```
public void setAttributeString(String name,  
                                String value)
```

Set an attribute with a string type

**Parameters:**

name

value

---

## setAttributeBoolean

```
public void setAttributeBoolean(String name,  
                                  boolean value)
```

Set an attribute with a boolean type

**Parameters:**

name

boolean

---

## setAttributeLong

```
public void setAttributeLong(String name,  
                               long value)
```

Set an attribute with a long type

**Parameters:**

name

long

---

## setAttributeInt

```
public void setAttributeInt(String name,  
                              int value)
```

Set an attribute with an int type

---

(continued from last page)

**Parameters:**name  
int

---

**getAttributeString**

```
public String getAttributeString(String name)
```

Attempt to get a string attribute with the name specified. If the attribute is not found a null should be returned.

**Parameters:**

name

**Returns:**String

---

**getAttributeBoolean**

```
public boolean getAttributeBoolean(String name)
```

Attempt to get a boolean attribute with the name specified. If the attribute is not found false should be returned.

**Parameters:**

name

**Returns:**boolean

---

**getAttributeLong**

```
public long getAttributeLong(String name)
```

Attempt to get a long attribute with the name specified. If the attribute is not found -1 should be returned.

**Parameters:**

name

**Returns:**long

---

**getAttributeInt**

```
public int getAttributeInt(String name)
```

Attempt to get an int attribute with the name specified. If the attribute is not found -1 should be returned.

**Parameters:**

name

**Returns:**int

---

**getAttributeNames**

```
public java.util.Set getAttributeNames()
```

Get a list of all the attribute names set.

---

(continued from last page)

**Returns:**  
Set

---

## getTransportHeaderOutput

```
public java.util.HashMap getTransportHeaderOutput( java.util.HashMap  
dynamictransportinformation,  
IMediaTransportObject transportObject)
```

This should be called by the transport provider using this configuration item. You can pass in two objects, one is a HashMap and the other is a IMediaTransportObject The result should be a HashMap that the transport provider can then use to process the data block being transported.

**Parameters:**  
HashMap  
IMediaTransportObject

**Returns:**  
HashMap

---

## setProperties

```
public void setProperties(WMSPProperties props)
```

When the object is created a WMSPProperties holder is created. This can be changed by setting it with this call. All attributes should be stored within a WMSPProperties object

**Parameters:**  
[WMSPProperties](#)

---

## getProperties

```
public WMSPProperties getProperties()
```

Get the WMSPProperties holder.

**Returns:**  
[WMSPProperties](#)

---

## setIsReady

```
public void setIsReady(boolean ready)
```

Set if this configuration object is ready. It should be set after init() is called and therefore after any attributes have been set.

**Parameters:**  
boolean

---

## isReady

```
public boolean isReady()
```

Get the ready flag for this configuration object.

**Returns:**  
boolean

(continued from last page)

## setDebug

```
public void setDebug(boolean debug)
```

Set the debug flag for this configuration object.

**Parameters:**

boolean

---

## getDebug

```
public boolean getDebug()
```

Get the debug flag for this configuration object.

**Returns:**

boolean

## com.wowza.wms.transport.media Interface IMediaTransportProviderListener

public interface **IMediaTransportProviderListener**  
extends

IMediaTransportProviderListener This listener provides a callback for the status of the transport object status

### Method Summary

void	<a href="#">onTransportObjectStatus</a> (int count, <a href="#">IMediaTransportResponse</a> responseObject, String transportProviderName) This is called when an object has been attempted to be transported by a transport provider.
------	--

### Methods

#### onTransportObjectStatus

```
public void onTransportObjectStatus(int count,  
    IMediaTransportResponse responseObject,  
    String transportProviderName)
```

This is called when an object has been attempted to be transported by a transport provider. The attempt number is provided  
The responseObject should contain the status of the transport attempt The transport provider used for this attempt

**Parameters:**

int  
IMediaTransportResponse  
String

## com.wowza.wms.transport.media Interface IMediaTransportResponse

public interface **IMediaTransportResponse**  
extends

IMediaTransportResponse This object is provided as part of the IMediaTransportProviderListener callback. This is an internal object/class.

### Field Summary

public static final	<a href="#"><u>RESPONSE_DATA</u></a> Value: <b>responseData</b>
public static final	<a href="#"><u>RESPONSE_HEADERS</u></a> Value: <b>responseHeaders</b>
public static final	<a href="#"><u>RESPONSE_INDICATOR</u></a> Value: <b>responseIndicator</b>

### Method Summary

void	<a href="#"><u>addSuccessData</u></a> (String key, byte[] data) In order to provide as much flexibility as possible it is possible to add 'success' data to the response object in the form of a key and a byte array.
String	<a href="#"><u>getBasicMessage</u></a> () Get the basic message for the response object.
String	<a href="#"><u>getCommand</u></a> () Get the command for the response object.
String	<a href="#"><u>getContentType</u></a> () Get the content type for the response object.
String	<a href="#"><u>getPath</u></a> () Get the path for the response object.
boolean	<a href="#"><u>getSuccess</u></a> () Get the success flag from the response object.
byte[]	<a href="#"><u>getSuccessData</u></a> (String key) Get the success data available
java.util.List	<a href="#"><u>getSuccessKeyList</u></a> () Get the list of keys that the success data contains.
String	<a href="#"><u>getUUID</u></a> () Get the UUID of the object.
void	<a href="#"><u>setbasicMessage</u></a> (String basicMessage) Set a basic message for the response object.

void	<a href="#"><code>setCommand</code></a> (String command) Set the command type for the response object.
void	<a href="#"><code>setContentType</code></a> (String contenttype) Set the content type for the response object.
void	<a href="#"><code>setPath</code></a> (String path) Set the path for the response object.
void	<a href="#"><code>setSuccess</code></a> (boolean success) Set the success flag for the response object.
void	<a href="#"><code>setUUID</code></a> (String id) Sets the UUID of the response object.

## Fields

### RESPONSE\_HEADERS

```
public static final java.lang.String RESPONSE_HEADERS
```

Constant value: **responseHeaders**

### RESPONSE\_INDICATOR

```
public static final java.lang.String RESPONSE_INDICATOR
```

Constant value: **responseIndicator**

### RESPONSE\_DATA

```
public static final java.lang.String RESPONSE_DATA
```

Constant value: **responseData**

## Methods

### setUUID

```
public void setUUID(String id)
```

Sets the UUID of the response object. This should match the IMediaTransportDataObject UUID created when it was initialised.

**Parameters:**  
String

### getUUID

```
public String getUUID()
```

Get the UUID of the object.

**Returns:**

(continued from last page)

String

---

## setPath

```
public void setPath(String path)
```

Set the path for the response object. This should match the IMediaTransportDataObject path setting.

**Parameters:**

String

---

## getPath

```
public String getPath()
```

Get the path for the response object.

**Returns:**

String

---

## setContentType

```
public void setContentType(String contenttype)
```

Set the content type for the response object. This should match the IMediaTransportDataObject content type setting.

**Parameters:**

String

---

## getContentType

```
public String getContentType()
```

Get the content type for the response object.

**Returns:**

String

---

## setCommand

```
public void setCommand(String command)
```

Set the command type for the response object. This should match the IMediaTransportDataObject command setting.

**Parameters:**

String

---

## getCommand

```
public String getCommand()
```

Get the command for the response object.

**Returns:**

String

(continued from last page)

## setbasicMessage

```
public void setbasicMessage(String basicMessage)
```

Set a basic message for the response object. This allows basic string messages for state to be available in the IMediaTransportProviderListener callback. A common message would be SUCCESS or FAILED.

**Parameters:**

String

---

## getBasicMessage

```
public String getBasicMessage()
```

Get the basic message for the response object.

**Returns:**

String

---

## setSuccess

```
public void setSuccess(boolean success)
```

Set the success flag for the response object. If the transport was successful then it should be set to true.

**Parameters:**

boolean

---

## getSuccess

```
public boolean getSuccess()
```

Get the success flag from the response object.

**Returns:**

boolean

---

## addSuccessData

```
public void addSuccessData(String key,  
    byte[] data)
```

In order to provide as much flexibility as possible it is possible to add 'success' data to the response object in the form of a key and a byte array. An example would be as follows `MediaTransportConfiguration.HTTP.RESPONSE_INDICATOR, String.valueOf("200").getBytes());` This is done within the `MediaTransportProviderHTTP` and allows the response code 200 to be added into the success data. There are 3 defined responses, although you can add any you wish

- `IMediaTransportProviderConfiguration.RESPONSE_INDICATOR`
- `IMediaTransportProviderConfiguration.RESPONSE_HEADERS`
- `IMediaTransportProviderConfiguration.RESPONSE_DATA`

**Parameters:**

key

data

---

## getSuccessData

```
public byte[] getSuccessData(String key)
```

Get the success data available

(continued from last page)

**Parameters:**

String

**Returns:**byte[]

---

**getSuccessKeyList**

```
public java.util.List getSuccessKeyList()
```

Get the list of keys that the success data contains.

**Returns:**

List

## com.wowza.wms.transport.media

### Class MediaTransportConfigurationAmazonS3

java.lang.Object

└-com.wowza.wms.transport.media.MediaTransportConfigurationBase

└-com.wowza.wms.transport.media.MediaTransportConfigurationAmazonS3

All Implemented Interfaces:

[IMediaTransportProviderConfiguration](#)

---

```
public class MediaTransportConfigurationAmazonS3  
extends MediaTransportConfigurationBase
```

This is a base configuration object for AmazonS3 for the MediaTransport System //Example use

```
//Create a main transport object

MediaTransport transport = new MediaTransport();

//Create an Amazon Transport Provider
MediaTransportProviderAmazonS3 amazonTransport = new MediaTransportProviderAmazonS3();

//Create an Amazon Configuration Object
MediaTransportConfigurationAmazonS3 amazonConfig = new MediaTransportConfigurationAmazonS3();

//Configure the Amazon object with the required parameters
amazonConfig.setAttributeString(MediaTransportConfigurationAmazonS3.AMZ_CONFIG_BUCKET,
"mybucketName");
amazonConfig.setAttributeString(MediaTransportConfigurationAmazonS3.AMZ_CONFIG_REGION,
"bucketRegionName");
amazonConfig.setAttributeBoolean(MediaTransportConfigurationAmazonS3.AMZ_CONFIG_REGION_ENABLED, true);
amazonConfig.setAttributeString(MediaTransportConfigurationAmazonS3.AMZ_CONFIG_ACCESSID,
"myAmazonAccessKey");
amazonConfig.setAttributeString(MediaTransportConfigurationAmazonS3.AMZ_CONFIG_SECRETACCESSKEY, "myAmazonSecretKey");

//Add the configuration item to the provider
amazonTransport.setTransportProviderConfiguration(amazonConfig);

//Set the type of processing to occur, the default is ASYNC, set to SYNC
//Async will use a thread pool to handle transports, SYNC will block and do them in the order
//they are provided
amazonTransport.setTransportProcessType(IMediaTransportProvider.TRANSPORT_PROVIDER_PROCESS_SYNC);

//Initialize the provider
amazonTransport.init();

//Add the transport provided to the media transport system
transport.addTransportProvider(amazonTransport);

//You can add multiple transport providers

//To push a data block into the transport system the following example should be followed

//Lets assume you have a byte array, say from loading a file into this array.
byte[] fileBytes = getBytesFromFile(uploadFile);

//Create a data object and set up various settings.
MediaTransportDataObject transportDataObject = new MediaTransportDataObject();
transportDataObject.setPath("/"+filename);
transportDataObject.setContentType("video/mp4");
transportDataObject.setData(fileBytes);
transportDataObject.setCommand("PUT");
```

```
//Put the object into the transport system
transport.addTransportDataObject(transportDataObject);

// There are several listeners you can use to determine if the transport provider was added
// and the return status of the object presented to the system.
```

## Field Summary

public static final	<a href="#">AMZ_CONFIG_ACCESSID</a> Value: <b>accessID</b>
public static final	<a href="#">AMZ_CONFIG_BUCKET</a> Value: <b>bucketName</b>
public static final	<a href="#">AMZ_CONFIG_DOMAIN_SUFFIX</a> Value: <b>domainSuffix</b>
public static final	<a href="#">AMZ_CONFIG_FULLPATH</a> Value: <b>fullPathURI</b>
public static final	<a href="#">AMZ_CONFIG_PREFIX</a> Value: <b>prefixType</b>
public static final	<a href="#">AMZ_CONFIG_REGION</a> Value: <b>region</b>
public static final	<a href="#">AMZ_CONFIG_REGION_ENABLED</a> Value: <b>regionEnabled</b>
public static final	<a href="#">AMZ_CONFIG_REQUEST_TYPE</a> Value: <b>requestType</b>
public static final	<a href="#">AMZ_CONFIG_SECRETACCESSKEY</a> Value: <b>secretAccessKey</b>

## Fields

(continued from last page)

---

## AMZ\_OBJECT\_HEADER\_STORAGE\_CLASS

```
public static final java.lang.String AMZ_OBJECT_HEADER_STORAGE_CLASS
```

Constant value: **x-amz-storage-class**

---

## AMZ\_OBJECT\_HEADER\_ACCESS\_LIST

```
public static final java.lang.String AMZ_OBJECT_HEADER_ACCESS_LIST
```

Constant value: **x-amz-acl**

---

## AMZ\_OBJECT\_HEADER\_SECURITY\_TOKEN

```
public static final java.lang.String AMZ_OBJECT_HEADER_SECURITY_TOKEN
```

Constant value: **x-amz-security-token**

---

## AMZ\_OBJECT\_HEADER\_COPY\_SOURCE

```
public static final java.lang.String AMZ_OBJECT_HEADER_COPY_SOURCE
```

Constant value: **x-amz-copy-source**

---

## AMZ\_OBJECT\_HEADER\_META\_DIRECTIVE

```
public static final java.lang.String AMZ_OBJECT_HEADER_META_DIRECTIVE
```

Constant value: **x-amz-metadata-directive**

---

## AMZ\_OBJECT\_HEADER\_COPY\_SOURCE\_IF\_MATCH

```
public static final java.lang.String AMZ_OBJECT_HEADER_COPY_SOURCE_IF_MATCH
```

Constant value: **x-amz-copy-source-if-match**

---

## AMZ\_OBJECT\_HEADER\_COPY\_SOURCE\_IF\_NONE\_MATCH

```
public static final java.lang.String AMZ_OBJECT_HEADER_COPY_SOURCE_IF_NONE_MATCH
```

Constant value: **x-amz-copy-source-if-none-match**

---

## AMZ\_OBJECT\_HEADER\_COPY\_SOURCE\_IF\_UNMODIFIED\_SINCE

```
public static final java.lang.String AMZ_OBJECT_HEADER_COPY_SOURCE_IF_UNMODIFIED_SINCE
```

Constant value: **x-amz-copy-source-if-unmodified-since**

---

(continued from last page)

---

## AMZ\_OBJECT\_HEADER\_COPY\_SOURCE\_IF\_MODIFIED\_SINCE

```
public static final java.lang.String AMZ_OBJECT_HEADER_COPY_SOURCE_IF_MODIFIED_SINCE
```

Constant value: **x-amz-copy-source-if-modified-since**

---

## AMZ\_OBJECT\_HEADER\_GRANT\_READ

```
public static final java.lang.String AMZ_OBJECT_HEADER_GRANT_READ
```

Constant value: **x-amz-grant-read**

---

## AMZ\_OBJECT\_HEADER\_GRANT\_WRITE

```
public static final java.lang.String AMZ_OBJECT_HEADER_GRANT_WRITE
```

Constant value: **x-amz-grant-write**

---

## AMZ\_OBJECT\_HEADER\_GRANT\_READ\_ACP

```
public static final java.lang.String AMZ_OBJECT_HEADER_GRANT_READ_ACP
```

Constant value: **x-amz-grant-read-acp**

---

## AMZ\_OBJECT\_HEADER\_GRANT\_WRITE\_ACP

```
public static final java.lang.String AMZ_OBJECT_HEADER_GRANT_WRITE_ACP
```

Constant value: **x-amz-grant-write-acp**

---

## AMZ\_OBJECT\_HEADER\_GRANT\_FULL\_CONTROL

```
public static final java.lang.String AMZ_OBJECT_HEADER_GRANT_FULL_CONTROL
```

Constant value: **x-amz-grant-full-control**

---

## AMZ\_OBJECT\_HEADER\_SERVER\_ENCRYPT

```
public static final java.lang.String AMZ_OBJECT_HEADER_SERVER_ENCRYPT
```

Constant value: **x-amz-server-side-encryption**

---

## AMZ\_OBJECT\_HEADER\_SERVER\_ENCRYPT\_KEY\_ID

```
public static final java.lang.String AMZ_OBJECT_HEADER_SERVER_ENCRYPT_KEY_ID
```

Constant value: **x-amz-server-side-encryption-aws-kms-key-id**

---

## AMZ\_OBJECT\_HEADER\_SERVER\_ENCRYPT\_CONTEXT

```
public static final java.lang.String AMZ_OBJECT_HEADER_SERVER_ENCRYPT_CONTEXT
```

(continued from last page)

---

Constant value: **x-amz-server-side-encryption-context**

---

## AMZ\_OBJECT\_OPTION\_BUCKET

```
public static final java.lang.String AMZ_OBJECT_OPTION_BUCKET
```

Constant value: **bucketName**

---

## AMZ\_OBJECT\_OPTION\_REGION

```
public static final java.lang.String AMZ_OBJECT_OPTION_REGION
```

Constant value: **region**

---

## AMZ\_OBJECT\_OPTION\_REGION\_ENABLED

```
public static final java.lang.String AMZ_OBJECT_OPTION_REGION_ENABLED
```

Constant value: **regionEnabled**

---

## AMZ\_CONFIG\_FULLPATH

```
public static final java.lang.String AMZ_CONFIG_FULLPATH
```

Constant value: **fullPathURI**

---

## AMZ\_CONFIG\_BUCKET

```
public static final java.lang.String AMZ_CONFIG_BUCKET
```

Constant value: **bucketName**

---

## AMZ\_CONFIG\_REGION

```
public static final java.lang.String AMZ_CONFIG_REGION
```

Constant value: **region**

---

## AMZ\_CONFIG\_REGION\_ENABLED

```
public static final java.lang.String AMZ_CONFIG_REGION_ENABLED
```

Constant value: **regionEnabled**

---

## AMZ\_CONFIG\_SECRETACCESSKEY

```
public static final java.lang.String AMZ_CONFIG_SECRETACCESSKEY
```

Constant value: **secretAccessKey**

---

---

## AMZ\_CONFIG\_ACCESSID

```
public static final java.lang.String AMZ_CONFIG_ACCESSID
```

Constant value: **accessID**

---

## AMZ\_CONFIG\_SERVICETYPE

```
public static final java.lang.String AMZ_CONFIG_SERVICETYPE
```

Constant value: **serviceType**

---

## AMZ\_CONFIG\_DOMAIN\_SUFFIX

```
public static final java.lang.String AMZ_CONFIG_DOMAIN_SUFFIX
```

Constant value: **domainSuffix**

---

## AMZ\_CONFIG\_REQUEST\_TYPE

```
public static final java.lang.String AMZ_CONFIG_REQUEST_TYPE
```

Constant value: **requestType**

---

## AMZ\_CONFIG\_PREFIX

```
public static final java.lang.String AMZ_CONFIG_PREFIX
```

Constant value: **prefixType**

---

## AMZ\_SIGNATURE\_EXPIRE\_TIME

```
public static long AMZ_SIGNATURE_EXPIRE_TIME
```

---

## Constructors

### MediaTransportConfigurationAmazonS3

```
public MediaTransportConfigurationAmazonS3()
```

---

## Methods

### init

```
public void init()
```

---

(continued from last page)

## getTransportHeaderOutput

```
public java.util.HashMap getTransportHeaderOutput( java.util.HashMap  
dynamictransportinformation,  
IMediaTransportObject transportObject)
```

## com.wowza.wms.transport.media

### Class MediaTransportConfigurationGoogleCloud

java.lang.Object

└-com.wowza.wms.transport.media.MediaTransportConfigurationBase

└-com.wowza.wms.transport.media.MediaTransportConfigurationGoogleCloud

All Implemented Interfaces:

[IMediaTransportProviderConfiguration](#)

---

```
public class MediaTransportConfigurationGoogleCloud  
extends MediaTransportConfigurationBase
```

This is a base configuration object for Google Cloud Storage for the MediaTransport System //Example use

```
//Create a main transport object

MediaTransport transport = new MediaTransport();

//Create an Amazon Transport Provider
MediaTransportProviderGoogleCloud googleTransport = new MediaTransportProviderGoogleCloud();

//Create an Amazon Configuration Object
MediaTransportConfigurationGoogleCloud googleConfig = new
MediaTransportConfigurationGoogleCloud();

//Configure the Amazon object with the required parameters
googleConfig.setAttributeString(MediaTransportConfigurationGoogleCloud.GC_CONFIG_BUCKET,
this.bucketName);
googleConfig.setAttributeString(MediaTransportConfigurationGoogleCloud.GC_CONFIG_SECRETACCESS
KEY, this.secretKey);
googleConfig.setAttributeString(MediaTransportConfigurationGoogleCloud.GC_CONFIG_SERVICEID,
this.serviceID);
googleConfig.setAttributeString(MediaTransportConfigurationGoogleCloud.GC_CONFIG_PROJECT_ID,
this.projectID);

//Add the configuration item to the provider
googleTransport.setTransportProviderConfiguration(googleConfig);

//Set the type of processing to occur, the default is ASYNC, set to SYNC
//Async will use a thread pool to handle transports, SYNC will block and do them in the order
//they are provided
googleTransport.setTransportProcessType(IMediaTransportProvider.TRANSPORT_PROVIDER_PROCESS_SY
NC);

//Initialize the provider
googleTransport.init();

//Add the transport provided to the media transport system
transport.addTransportProvider(googleTransport);

//You can add multiple transport providers

//To push a data block into the transport system the following example should be followed

//Lets assume you have a byte array, say from loading a file into this array.
byte[] fileBytes = getBytesFromFile(uploadFile);

//Create a data object and set up various settings.
MediaTransportDataObject transportDataObject = new MediaTransportDataObject();
transportDataObject.setPath("/"+filename);
transportDataObject.setContentType("video/mp4");
transportDataObject.setData(fileBytes);
transportDataObject.setCommand("PUT");
```

```
//Put the object into the transport system
transport.addTransportDataObject(transportDataObject);

// There are several listeners you can use to determine if the transport provider was added
// and the return status of the object presented to the system.
```

## Fields

### **profile**

```
public int profile
```

---

### **level**

```
public int level
```

---

### **hasExtendedData**

```
public boolean hasExtendedData
```

---

### **channelServiceFlag**

```
public boolean channelServiceFlag
```

---

### **mainIdFlag**

```
public boolean mainIdFlag
```

---

### **ascvFlag**

```
public boolean ascvFlag
```

---

### **languageFlag**

```
public boolean languageFlag
```

---

### **componentNameFlag**

```
public boolean componentNameFlag
```

---

### **aacExtensionFlag**

```
public boolean aacExtensionFlag
```

---

---

**mixInfoExists**

```
public boolean mixInfoExists
```

---

**channelConfig**

```
public int channelConfig
```

---

**aacServiceType**

```
public int aacServiceType
```

---

**receiverMixRequired**

```
public boolean receiverMixRequired
```

---

**mainId**

```
public int mainId
```

---

**asvc**

```
public int asvc
```

---

**language**

```
public byte language
```

---

**componentNameTextChars**

```
public char componentNameTextChars
```

---

**aacExtensionDataConfig**

```
public byte aacExtensionDataConfig
```

---

**PROFILE\_LC\_ADTS**

```
public static final int PROFILE_LC_ADTS
```

---

(continued from last page)

Constant value: **0**

---

## PROFILE\_HE\_ADTS

```
public static final int PROFILE_HE_ADTS
```

Constant value: **1**

---

## PROFILE\_HE\_V2

```
public static final int PROFILE_HE_V2
```

Constant value: **2**

## Constructors

### AACSCTEDescriptor

```
public AACSCTEDescriptor()
```

Instantiates a new AAC descriptor.

---

### AACSCTEDescriptor

```
public AACSCTEDescriptor(java.nio.ByteBuffer descriptorData)
```

Instantiates a new AAC descriptor.

**Parameters:**

descriptorData - the descriptor data

## Methods

### decodeDescriptorData

```
public void decodeDescriptorData(java.nio.ByteBuffer descriptorData)
```

Decode descriptor data.

---

### toString

```
public String toString()
```

--------	--

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### discontinuity

public boolean **discontinuity**

The discontinuity.

### randomAccess

public boolean **randomAccess**

The random access.

### streamPriority

public boolean **streamPriority**

The stream priority.

---

## pcrFlag

public boolean **pcrFlag**

The PCR flag.

---

## opcrFlag

public boolean **opcrFlag**

The OPCR flag.

---

## splicingPoint

public boolean **splicingPoint**

The splicing point.

---

## privateDataFlag

public boolean **privateDataFlag**

The private data flag.

---

## extension

public boolean **extension**

The extension.

---

## pcrClock90

public long **pcrClock90**

The PCR clock90.

---

## pcrClock27

public long **pcrClock27**

The PCR clock27.

---

## opcrClock90

public long **opcrClock90**

The OPCR clock90.

---

## opcrClock27

public long **opcrClock27**

The OPCR clock27.

---

## splicCountdown

public int **splicCountdown**

---

(continued from last page)

The splic countdown.

---

## privateDataLength

public int **privateDataLength**

The private data length.

---

## privateData

public byte **privateData**

The private data.

---

## ltwFlag

public boolean **ltwFlag**

The ltw flag.

---

## piecewiseRateFlag

public boolean **piecewiseRateFlag**

The piecewise rate flag.

---

## seemlessSpliceFlag

public boolean **seemlessSpliceFlag**

The seamless splice flag.

---

## ltwValidFlag

public boolean **ltwValidFlag**

The ltw valid flag.

---

## ltwOffset

public int **ltwOffset**

The ltw offset.

---

## piecewiseRate

public int **piecewiseRate**

The piecewise rate.

---

## spliceType

public int **spliceType**

The splice type.

(continued from last page)

**dtsNextAU**

public long **dtsNextAU**

The DTS next au.

## com.wowza.wms.transport.mpeg2 Class CUEIdentifierDescriptor

java.lang.Object

```
public class CUEIdentifierDescriptor
extends Descriptor
```

The Class CUEIdentifierDescriptor. The cue\_identifier\_descriptor may be used in the PMT to label PIDs that carry splice commands so that they can be differentiated as to the type or level of splice commands they carry. The cue\_identifier\_descriptor, when present, shall be located in the elementary descriptor loop. If the cue\_identifier\_descriptor is not utilized, the stream may carry any valid command in this specification.

### Field Summary

public static final	<a href="#">CUE_STREAM_TYPE_ALL_COMMANDS</a> The Constant CUE_STREAM_TYPE_ALL_COMMANDS. Value: <b>1</b>
public static final	<a href="#">CUE_STREAM_TYPE_INSERT_NULL_SCHEDULE</a> The Constant CUE_STREAM_TYPE_INSERT_NULL_SCHEDULE. Value: <b>0</b>
public static final	<a href="#">CUE_STREAM_TYPE_SEGMENTATION</a> The Constant CUE_STREAM_TYPE_SEGMENTATION. Value: <b>2</b>
public static final	<a href="#">CUE_STREAM_TYPE_TIERED_SEGMENTATION</a> The Constant CUE_STREAM_TYPE_TIERED_SEGMENTATION. Value: <b>4</b>
public static final	<a href="#">CUE_STREAM_TYPE_TIERED_SPLICING</a> The Constant CUE_STREAM_TYPE_TIERED_SPLICING. Value: <b>3</b>
public	<a href="#">cueStreamType</a> The CUE stream type.

## Constructor Summary

public	<a href="#">CUEIdentifierDescriptor()</a> Instantiates a new CUE identifier descriptor
public	<a href="#">CUEIdentifierDescriptor</a> (java.nio.ByteBuffer descriptorData) Instantiates a new CUE identifier descriptor.

## Method Summary

int	<a href="#">binarySize()</a> How big is the descriptor in binary
void	<a href="#">decodeDescriptorData</a> (java.nio.ByteBuffer descriptorData)
void	<a href="#">toBin</a> (java.nio.ByteBuffer buffer) Encodes the descriptor into binary format for us in transport
String	<a href="#">toString()</a>

### Methods inherited from class [com.wowza.wms.transport.mpeg2.Descriptor](#)

[binarySize](#), [decodeDescriptor](#), [decodeDescriptorData](#), [getDataAsBase64](#),  
[getDescriptorName](#), [getShortClassName](#), [serializeAMF](#), [toBin](#), [toDebugString](#), [toString](#)

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait,  
wait

## Fields

### CUE\_STREAM\_TYPE\_INSERT\_NULL\_SCHEDULE

public static final int **CUE\_STREAM\_TYPE\_INSERT\_NULL\_SCHEDULE**

The Constant CUE\_STREAM\_TYPE\_INSERT\_NULL\_SCHEDULE.  
Constant value: 0

---

## CUE\_STREAM\_TYPE\_ALL\_COMMANDS

```
public static final int CUE_STREAM_TYPE_ALL_COMMANDS
```

The Constant CUE\_STREAM\_TYPE\_ALL\_COMMANDS.  
Constant value: **1**

---

## CUE\_STREAM\_TYPE\_SEGMENTATION

```
public static final int CUE_STREAM_TYPE_SEGMENTATION
```

The Constant CUE\_STREAM\_TYPE\_SEGMENTATION.  
Constant value: **2**

---

## CUE\_STREAM\_TYPE\_TIERED\_SPLICING

```
public static final int CUE_STREAM_TYPE_TIERED_SPLICING
```

The Constant CUE\_STREAM\_TYPE\_TIERED\_SPLICING.  
Constant value: **3**

---

## CUE\_STREAM\_TYPE\_TIERED\_SEGMENTATION

```
public static final int CUE_STREAM_TYPE_TIERED_SEGMENTATION
```

The Constant CUE\_STREAM\_TYPE\_TIERED\_SEGMENTATION.  
Constant value: **4**

---

## cueStreamType

```
public int cueStreamType
```

The CUE stream type.

## Constructors

### CUEIdentifierDescriptor

```
public CUEIdentifierDescriptor()
```

Instantiates a new CUE identifier descriptor

---

### CUEIdentifierDescriptor

```
public CUEIdentifierDescriptor(java.nio.ByteBuffer descriptorData)
```

Instantiates a new CUE identifier descriptor.

#### Parameters:

descriptorData - the descriptor data

## Methods

### decodeDescriptorData

```
public void decodeDescriptorData(java.nio.ByteBuffer descriptorData)
```

Decode descriptor data.

---

---

## toBin

```
public void toBin(java.nio.ByteBuffer buffer)
```

Encodes the descriptor into binary format for us in transport

### Parameters:

buffer - a ByteBuffer to put the descriptor binary data into

---

## binarySize

```
public int binarySize()
```

How big is the descriptor in binary

---

## toString

```
public String toString()
```

## com.wowza.wms.transport.mpeg2 Class Descriptor

java.lang.Object

└─com.wowza.wms.transport.mpeg2.Descriptor

### Direct Known Subclasses:

[SpliceSegmentationDescriptor](#), [SpliceDTMFDescriptor](#), [SpliceAvailDescriptor](#), [VideoStreamDescriptor](#), [StreamIdentifierDescriptor](#), [RegistrationDescriptor](#), [MetadataSTDDescriptor](#), [MetadataDescriptor](#), [MetaDataPointerDescriptor](#), [MP4AudioExtensionLOAS](#), [MP4AudioDescriptor](#), [LanguageDescriptor](#), [ExtensionDVBDescriptor](#), [CUEIdentifierDescriptor](#), [AncillaryDataDescriptor](#), [AC3Descriptor](#), [AACSCTEDescriptor](#), [AACDVBDescriptor](#)

public class **Descriptor**  
extends Object

The Class Descriptor.

### Field Summary

public	<a href="#">data</a> The data.
public static final	<a href="#">DESCRIPTOR_TAG_AAC_DVB</a> The Constant DESCRIPTOR_TAG_AAC_DVB Value: <b>124</b>
public static final	<a href="#">DESCRIPTOR_TAG_AAC_SCTE</a> The Constant DESCRIPTOR_TAG_AAC_SCTE. Value: <b>234</b>
public static final	<a href="#">DESCRIPTOR_TAG_AC3</a> The Constant DESCRIPTOR_TAG_AC3. Value: <b>106</b>
public static final	<a href="#">DESCRIPTOR_TAG_ANCILLARY</a> The Constant DESCRIPTOR_TAG_ANCILLARY Value: <b>107</b>
public static final	<a href="#">DESCRIPTOR_TAG_AUDIO</a> The Constant DESCRIPTOR_TAG_AUDIO. Value: <b>3</b>
public static final	<a href="#">DESCRIPTOR_TAG_CA</a> The Constant DESCRIPTOR_TAG_CA. Value: <b>9</b>
public static final	<a href="#">DESCRIPTOR_TAG_COPYRIGHT</a> The Constant DESCRIPTOR_TAG_COPYRIGHT. Value: <b>13</b>
public static final	<a href="#">DESCRIPTOR_TAG_CUE_IDENTIFIER</a> The Constant DESCRIPTOR_TAG_CUE_IDENTIFIER. Value: <b>138</b>

public static final	<a href="#"><u>DESCRIPTOR_TAG_DATA_STREAM_ALIGN</u></a> The Constant DESCRIPTOR_TAG_DATA_STREAM_ALIGN. Value: <b>6</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_DVBTELETEXT</u></a> The Constant DESCRIPTOR_TAG_DVBTELETEXT. Value: <b>86</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_ENHANCED_AC3</u></a> The Constant DESCRIPTOR_TAG_ENHANCED_AC3. Value: <b>122</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_EXT_ES_ID</u></a> The Constant DESCRIPTOR_TAG_EXT_ES_ID. Value: <b>32</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_EXTENSION_DVB</u></a> The Constant DESCRIPTOR_TAG_EXTENSION_DVB Value: <b>127</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_EXTENSION_MP4_LOAS</u></a> The Constant DESCRIPTOR_TAG_MP4_LOAS Value: <b>46</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_FLEX_MUX_TIMING</u></a> The Constant DESCRIPTOR_TAG_FLEX_MUX_TIMING. Value: <b>36</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_FMC</u></a> The Constant DESCRIPTOR_TAG_FMC. Value: <b>31</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_FMX_BUFSIZE</u></a> The Constant DESCRIPTOR_TAG_FMX_BUFSIZE. Value: <b>34</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_HIERARCHY</u></a> The Constant DESCRIPTOR_TAG_HIERARCHY. Value: <b>4</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_IBP</u></a> The Constant DESCRIPTOR_TAG_IBP. Value: <b>18</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_IOD</u></a> The Constant DESCRIPTOR_TAG_IOD. Value: <b>29</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_ISO_639_LANG</u></a> The Constant DESCRIPTOR_TAG_ISO_639_LANG. Value: <b>10</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_MAX_BITRATE</u></a> The Constant DESCRIPTOR_TAG_MAX_BITRATE. Value: <b>14</b>

public static final	<a href="#"><u>DESCRIPTOR_TAG_METADATA</u></a> The Constant DESCRIPTOR_TAG_METADATA. Value: <b>38</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_METADATA_POINTER</u></a> The Constant DESCRIPTOR_TAG_METADATA_POINTER_DESCRIPTOR. Value: <b>37</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_METADATA_STD</u></a> The Constant DESCRIPTOR_TAG_METADATA_STD. Value: <b>39</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_MP4_AUDIO</u></a> The Constant DESCRIPTOR_TAG_MP4_AUDIO. Value: <b>28</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_MP4_VIDEO</u></a> The Constant DESCRIPTOR_TAG_MP4_VIDEO. Value: <b>27</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_MULTIPLE_BUF</u></a> The Constant DESCRIPTOR_TAG_MULTIPLE_BUF. Value: <b>35</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_MULTIPLEX_BUF_UTIL</u></a> The Constant DESCRIPTOR_TAG_MULTIPLEX_BUF_UTIL. Value: <b>12</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_MUXCODE</u></a> The Constant DESCRIPTOR_TAG_MUXCODE. Value: <b>33</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_PRIVATE_DATA</u></a> The Constant DESCRIPTOR_TAG_PRIVATE_DATA. Value: <b>15</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_REGISTRATION</u></a> The Constant DESCRIPTOR_TAG_REGISTRATION. Value: <b>5</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_SL</u></a> The Constant DESCRIPTOR_TAG_SL. Value: <b>30</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_SMOOTHING_BUF</u></a> The Constant DESCRIPTOR_TAG_SMOOTHING_BUF. Value: <b>16</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_STD</u></a> The Constant DESCRIPTOR_TAG_STD. Value: <b>17</b>
public static final	<a href="#"><u>DESCRIPTOR_TAG_STREAM_IDENTIFIER</u></a> The Constant DESCRIPTOR_TAG_STREAM_IDENTIFIER. Value: <b>82</b>

public static final	<a href="#">DESCRIPTOR_TAG_SYSTEM_CLOCK</a> The Constant DESCRIPTOR_TAG_SYSTEM_CLOCK. Value: <b>11</b>
public static final	<a href="#">DESCRIPTOR_TAG_TGT_BACKGRD_GRID</a> The Constant DESCRIPTOR_TAG_TGT_BACKGRD_GRID. Value: <b>7</b>
public static final	<a href="#">DESCRIPTOR_TAG_VIDEO</a> The Constant DESCRIPTOR_TAG_VIDEO. Value: <b>2</b>
public static final	<a href="#">DESCRIPTOR_TAG_VIDEO_WINDOWS</a> The Constant DESCRIPTOR_TAG_VIDEO_WINDOWS. Value: <b>8</b>
public	<a href="#">length</a> The length.
public	<a href="#">tag</a> The tag.

## Constructor Summary

public	<a href="#">Descriptor</a> ( ) Instantiates a new descriptor.
public	<a href="#">Descriptor</a> ( java.nio.ByteBuffer descriptorData ) Instantiates a new descriptor.

## Method Summary

int	<a href="#">binarySize</a> ( ) How big is the descriptor in binary.
static <a href="#">Descriptor</a>	<a href="#">decodeDescriptor</a> ( java.nio.ByteBuffer descriptorData ) Decode descriptor.
void	<a href="#">decodeDescriptorData</a> ( java.nio.ByteBuffer descriptorData ) Decode descriptor data.
String	<a href="#">getDataAsBase64</a> ( )
static String	<a href="#">getDescriptorName</a> (int tag)
String	<a href="#">getShortClassName</a> ( ) getShortClassName returns just the class name instead of the com.wms.xxx.xx.className
<a href="#">AMFDataObj</a>	<a href="#">serializeAMF</a> ( <a href="#">SpliceInformationTableSerializeAMFContext</a> context)
void	<a href="#">toBin</a> ( java.nio.ByteBuffer buffer ) Encodes the descriptor into binary format for use in a transport
String	<a href="#">toDebugString</a> ( )

String	<a href="#">toString()</a>
--------	----------------------------

Methods inherited from class `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Fields

### DESCRIPTOR\_TAG\_VIDEO

```
public static final int DESCRIPTOR_TAG_VIDEO
```

The Constant `DESCRIPTOR_TAG_VIDEO`.  
Constant value: **2**

### DESCRIPTOR\_TAG\_AUDIO

```
public static final int DESCRIPTOR_TAG_AUDIO
```

The Constant `DESCRIPTOR_TAG_AUDIO`.  
Constant value: **3**

### DESCRIPTOR\_TAG\_HIERARCHY

```
public static final int DESCRIPTOR_TAG_HIERARCHY
```

The Constant `DESCRIPTOR_TAG_HIERARCHY`.  
Constant value: **4**

### DESCRIPTOR\_TAG\_REGISTRATION

```
public static final int DESCRIPTOR_TAG_REGISTRATION
```

The Constant `DESCRIPTOR_TAG_REGISTRATION`.  
Constant value: **5**

### DESCRIPTOR\_TAG\_DATA\_STREAM\_ALIGN

```
public static final int DESCRIPTOR_TAG_DATA_STREAM_ALIGN
```

The Constant `DESCRIPTOR_TAG_DATA_STREAM_ALIGN`.  
Constant value: **6**

### DESCRIPTOR\_TAG\_TGT\_BACKGRD\_GRID

```
public static final int DESCRIPTOR_TAG_TGT_BACKGRD_GRID
```

The Constant `DESCRIPTOR_TAG_TGT_BACKGRD_GRID`.  
Constant value: **7**

### DESCRIPTOR\_TAG\_VIDEO\_WINDOWS

```
public static final int DESCRIPTOR_TAG_VIDEO_WINDOWS
```

The Constant `DESCRIPTOR_TAG_VIDEO_WINDOWS`.

(continued from last page)

Constant value: **8**

---

## DESCRIPTOR\_TAG\_CA

```
public static final int DESCRIPTOR_TAG_CA
```

The Constant DESCRIPTOR\_TAG\_CA.  
Constant value: **9**

---

## DESCRIPTOR\_TAG\_ISO\_639\_LANG

```
public static final int DESCRIPTOR_TAG_ISO_639_LANG
```

The Constant DESCRIPTOR\_TAG\_ISO\_639\_LANG.  
Constant value: **10**

---

## DESCRIPTOR\_TAG\_SYSTEM\_CLOCK

```
public static final int DESCRIPTOR_TAG_SYSTEM_CLOCK
```

The Constant DESCRIPTOR\_TAG\_SYSTEM\_CLOCK.  
Constant value: **11**

---

## DESCRIPTOR\_TAG\_MULTIPLEX\_BUF\_UTIL

```
public static final int DESCRIPTOR_TAG_MULTIPLEX_BUF_UTIL
```

The Constant DESCRIPTOR\_TAG\_MULTIPLEX\_BUF\_UTIL.  
Constant value: **12**

---

## DESCRIPTOR\_TAG\_COPYRIGHT

```
public static final int DESCRIPTOR_TAG_COPYRIGHT
```

The Constant DESCRIPTOR\_TAG\_COPYRIGHT.  
Constant value: **13**

---

## DESCRIPTOR\_TAG\_MAX\_BITRATE

```
public static final int DESCRIPTOR_TAG_MAX_BITRATE
```

The Constant DESCRIPTOR\_TAG\_MAX\_BITRATE.  
Constant value: **14**

---

## DESCRIPTOR\_TAG\_PRIVATE\_DATA

```
public static final int DESCRIPTOR_TAG_PRIVATE_DATA
```

The Constant DESCRIPTOR\_TAG\_PRIVATE\_DATA.  
Constant value: **15**

---

## DESCRIPTOR\_TAG\_SMOOTHING\_BUF

```
public static final int DESCRIPTOR_TAG_SMOOTHING_BUF
```

The Constant DESCRIPTOR\_TAG\_SMOOTHING\_BUF.  
Constant value: **16**

---

(continued from last page)

---

## DESCRIPTOR\_TAG\_STD

```
public static final int DESCRIPTOR_TAG_STD
```

The Constant DESCRIPTOR\_TAG\_STD.  
Constant value: **17**

---

## DESCRIPTOR\_TAG\_IBP

```
public static final int DESCRIPTOR_TAG_IBP
```

The Constant DESCRIPTOR\_TAG\_IBP.  
Constant value: **18**

---

## DESCRIPTOR\_TAG\_MP4\_VIDEO

```
public static final int DESCRIPTOR_TAG_MP4_VIDEO
```

The Constant DESCRIPTOR\_TAG\_MP4\_VIDEO.  
Constant value: **27**

---

## DESCRIPTOR\_TAG\_MP4\_AUDIO

```
public static final int DESCRIPTOR_TAG_MP4_AUDIO
```

The Constant DESCRIPTOR\_TAG\_MP4\_AUDIO.  
Constant value: **28**

---

## DESCRIPTOR\_TAG\_IOD

```
public static final int DESCRIPTOR_TAG_IOD
```

The Constant DESCRIPTOR\_TAG\_IOD.  
Constant value: **29**

---

## DESCRIPTOR\_TAG\_SL

```
public static final int DESCRIPTOR_TAG_SL
```

The Constant DESCRIPTOR\_TAG\_SL.  
Constant value: **30**

---

## DESCRIPTOR\_TAG\_FMC

```
public static final int DESCRIPTOR_TAG_FMC
```

The Constant DESCRIPTOR\_TAG\_FMC.  
Constant value: **31**

---

## DESCRIPTOR\_TAG\_EXT\_ES\_ID

```
public static final int DESCRIPTOR_TAG_EXT_ES_ID
```

The Constant DESCRIPTOR\_TAG\_EXT\_ES\_ID.  
Constant value: **32**

---

## DESCRIPTOR\_TAG\_MUXCODE

```
public static final int DESCRIPTOR_TAG_MUXCODE
```

---

(continued from last page)

The Constant `DESCRIPTOR_TAG_MUXCODE`.  
Constant value: **33**

---

## DESCRIPTOR\_TAG\_FMX\_BUFSIZE

`public static final int DESCRIPTOR_TAG_FMX_BUFSIZE`

The Constant `DESCRIPTOR_TAG_FMX_BUFSIZE`.  
Constant value: **34**

---

## DESCRIPTOR\_TAG\_MULTIPLE\_BUF

`public static final int DESCRIPTOR_TAG_MULTIPLE_BUF`

The Constant `DESCRIPTOR_TAG_MULTIPLE_BUF`.  
Constant value: **35**

---

## DESCRIPTOR\_TAG\_FLEX\_MUX\_TIMING

`public static final int DESCRIPTOR_TAG_FLEX_MUX_TIMING`

The Constant `DESCRIPTOR_TAG_FLEX_MUX_TIMING`.  
Constant value: **36**

---

## DESCRIPTOR\_TAG\_METADATA\_POINTER

`public static final int DESCRIPTOR_TAG_METADATA_POINTER`

The Constant `DESCRIPTOR_TAG_METADATA_POINTER_DESCRIPTOR`.  
Constant value: **37**

---

## DESCRIPTOR\_TAG\_METADATA

`public static final int DESCRIPTOR_TAG_METADATA`

The Constant `DESCRIPTOR_TAG_METADATA`.  
Constant value: **38**

---

## DESCRIPTOR\_TAG\_METADATA\_STD

`public static final int DESCRIPTOR_TAG_METADATA_STD`

The Constant `DESCRIPTOR_TAG_METADATA_STD`.  
Constant value: **39**

---

## DESCRIPTOR\_TAG\_EXTENSION\_MP4\_LOAS

`public static final int DESCRIPTOR_TAG_EXTENSION_MP4_LOAS`

The Constant `DESCRIPTOR_TAG_MP4_LOAS`.  
Constant value: **46**

---

## DESCRIPTOR\_TAG\_STREAM\_IDENTIFIER

`public static final int DESCRIPTOR_TAG_STREAM_IDENTIFIER`

The Constant `DESCRIPTOR_TAG_STREAM_IDENTIFIER`.  
Constant value: **82**

---

## DESCRIPTOR\_TAG\_DVBTELETEXT

public static final int **DESCRIPTOR\_TAG\_DVBTELETEXT**

The Constant DESCRIPTOR\_TAG\_DVBTELETEXT.  
Constant value: **86**

---

## DESCRIPTOR\_TAG\_AC3

public static final int **DESCRIPTOR\_TAG\_AC3**

The Constant DESCRIPTOR\_TAG\_AC3.  
Constant value: **106**

---

## DESCRIPTOR\_TAG Ancillary

public static final int **DESCRIPTOR\_TAG\_Ancillary**

The Constant DESCRIPTOR\_TAG\_Ancillary  
Constant value: **107**

---

## DESCRIPTOR\_TAG\_ENHANCED\_AC3

public static final int **DESCRIPTOR\_TAG\_ENHANCED\_AC3**

The Constant DESCRIPTOR\_TAG\_ENHANCED\_AC3.  
Constant value: **122**

---

## DESCRIPTOR\_TAG\_AAC\_DVB

public static final int **DESCRIPTOR\_TAG\_AAC\_DVB**

The Constant DESCRIPTOR\_TAG\_AAC\_DVB  
Constant value: **124**

---

## DESCRIPTOR\_TAG\_EXTENSION\_DVB

public static final int **DESCRIPTOR\_TAG\_EXTENSION\_DVB**

The Constant DESCRIPTOR\_TAG\_EXTENSION\_DVB  
Constant value: **127**

---

## DESCRIPTOR\_TAG\_CUE\_IDENTIFIER

public static final int **DESCRIPTOR\_TAG\_CUE\_IDENTIFIER**

The Constant DESCRIPTOR\_TAG\_CUE\_IDENTIFIER.  
Constant value: **138**

---

## DESCRIPTOR\_TAG\_AAC\_SCTE

public static final int **DESCRIPTOR\_TAG\_AAC\_SCTE**

The Constant DESCRIPTOR\_TAG\_AAC\_SCTE.  
Constant value: **234**

---

(continued from last page)

**tag**

```
public int tag
```

The tag.

**length**

```
public int length
```

The length.

**data**

```
public byte data
```

The data.

## Constructors

**Descriptor**

```
public Descriptor()
```

Instantiates a new descriptor.

**Descriptor**

```
public Descriptor(java.nio.ByteBuffer descriptorData)
```

Instantiates a new descriptor.

**Parameters:**

descriptorData - the descriptor data

## Methods

**decodeDescriptorData**

```
public void decodeDescriptorData(java.nio.ByteBuffer descriptorData)
```

Decode descriptor data.

**Parameters:**

descriptorData - the descriptor data

**toBin**

```
public void toBin(java.nio.ByteBuffer buffer)
```

Encodes the descriptor into binary format for use in a transport

**Parameters:**

buffer - a ByteBuffer to put the descriptor binary data into

(continued from last page)

## binarySize

```
public int binarySize()
```

How big is the descriptor in binary.

**Returns:**

the total size of the descriptor in binary form, includes tag and length fields

---

## decodeDescriptor

```
public static Descriptor decodeDescriptor( java.nio.ByteBuffer descriptorData)
```

Decode descriptor.

**Parameters:**

descriptorData - the descriptor data

**Returns:**

the descriptor

---

## getShortClassName

```
public String getShortClassName()
```

getShortClassName returns just the class name instead of the com.wms.xxx.xx.className

---

## getDescriptorName

```
public static String getDescriptorName(int tag)
```

---

## serializeAMF

```
public AMFDataObj serializeAMF(SpliceInformationTableSerializeAMFContext context)
```

---

## getDataAsBase64

```
public String getDataAsBase64()
```

---

## toDebugString

```
public String toDebugString()
```

---

## toString

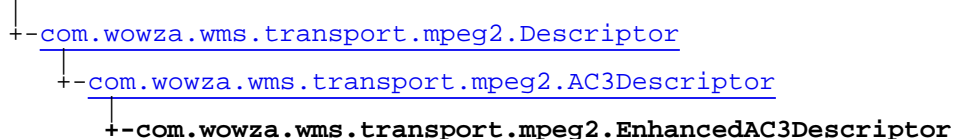

```
public String toString()
```

---

## com.wowza.wms.transport.mpeg2

## com.wowza.wms.transport.mpeg2 Interface IMPEG2PacketProcessor

All Known Implementing Classes:

[MPEG2SectionAssembler](#), [MPEG2RawPacketProcessor](#), [MPEG2RawAssembler](#), [MPEG2PESPacketProcessor](#)

public interface **IMPEG2PacketProcessor**  
extends

The Interface Impeg2PacketProcessor.

### Method Summary

void	<a href="#">notifyAdaptationHeaders</a> (boolean notify) Notify adaptation headers.
void	<a href="#">processMpeg2Buffer</a> (int pid, byte[] bytes, int offset, int count) Process mpeg2 raw buffer.
void	<a href="#">processMpeg2Packet</a> ( <a href="#">MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet</a> packet) Process mpeg2 packet.

### Methods

#### notifyAdaptationHeaders

public void **notifyAdaptationHeaders**(boolean notify)

Notify adaptation headers.

**Parameters:**

notify - the notify

#### processMpeg2Packet

public void **processMpeg2Packet**([MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet](#) packet)  
throws java.io.IOException

Process mpeg2 packet.

**Parameters:**

packet - the packet

**Throws:**

IOException - Signals that an I/O exception has occurred.

#### processMpeg2Buffer

public void **processMpeg2Buffer**(int pid,  
byte[] bytes,  
int offset,  
int count)

(continued from last page)

Process mpeg2 raw buffer.

**Parameters:**

bytes  
offset  
count

com.wowza.wms.transport.mpeg2  
Interface IMPEG2PESListener

All Known Implementing Classes:  
[PESAssembler](#)

public interface IMPEG2PESListener  
extends

Method Summary	
void	<a href="#">pesDataAvailable(MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet</a> packet, int length, <a href="#">MPEG2PESPacket.PESHeader</a> header)

Methods

**pesDataAvailable**  
public void **pesDataAvailable**([MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet](#) packet, int length, [MPEG2PESPacket.PESHeader](#) header)

## com.wowza.wms.transport.mpeg2 Interface IMPEG2RawListener

All Known Implementing Classes:

[RawAssembler](#)

public interface **IMPEG2RawListener**  
extends

### Method Summary

void	<a href="#">processMpeg2Buffer</a> (int pid, byte[] bytes, int offset, int count)
------	---

### Methods

#### processMpeg2Buffer

```
public void processMpeg2Buffer(int pid,  
    byte[] bytes,  
    int offset,  
    int count)
```

## com.wowza.wms.transport.mpeg2 Interface IMPEG2SectionListener

All Known Implementing Classes:

[SectionAssembler](#), [SITAssembler](#), [MPEG2TableAssembler](#)

public interface **IMPEG2SectionListener**  
extends

The listener interface for receiving mpeg2Section events. The class that is interested in processing a mpeg2Section event implements this interface, and the object created with that class is registered with a component using the component's addImpeg2SectionListener method. When the mpeg2Section event occurs, that object's appropriate method is invoked.

**See Also:**

[Impeg2SectionEvent](#)

void	<a href="#">sectionNotify</a> ( <a href="#">MPEG2Section</a> section, boolean continuityError) Section notify.

### Fields

(continued from last page)

## INVALID

```
public static final int INVALID
```

The Constant INVALID.  
Constant value: **-1**

## Methods

### adaptationHeader

```
public void adaptationHeader(AdaptationField field)
```

Adaptation header.

**Parameters:**

field - the field

### headerNotify

```
public boolean headerNotify(MPEG2Section section)
```

Header notify.

**Parameters:**

section - the section

**Returns:**

true, if successful

### sectionNotify

```
public void sectionNotify(MPEG2Section section,  
    boolean continuityError)
```

Section notify.

**Parameters:**

section - the section

continuityError - the continuity error

### logThrottleDoLog

```
public boolean logThrottleDoLog()
```

### logFatal

```
public void logFatal(String comment)
```

### logError

```
public void logError(String comment)
```

---

## logError

```
public void logError(String comment,  
                    Exception e)
```

---

## logWarn

public void logDebug(String comment)
```

---

## com.wowza.wms.transport.mpeg2 Interface IMPEG2StreamListener

public interface **IMPEG2StreamListener**  
extends

The listener interface for receiving impeg2Stream events. The class that is interested in processing a impeg2Stream event implements this interface, and the object created with that class is registered with a component using the component's addImpeg2StreamListener method. When the impeg2Stream event occurs, that object's appropriate method is invoked.

**See Also:**

IMPEG2StreamEvent

### Method Summary

void	<a href="#">adaptationFieldAvailable</a> ( <a href="#">AdaptationField</a> newAdapationField) Adaptation field available.
void	<a href="#">audioAvailable</a> ( <a href="#">MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet</a> packet, int length, <a href="#">MPEG2PESPacket.PESHeader</a> header) Audio available.
void	<a href="#">logDebug</a> (String comment)
void	<a href="#">logError</a> (String comment)
void	<a href="#">logError</a> (String comment, Exception e)
void	<a href="#">logFatal</a> (String comment)
void	<a href="#">logInfo</a> (String comment)
boolean	<a href="#">logThrottleDoLog</a> ( )
void	<a href="#">logWarn</a> (String comment)
void	<a href="#">patAvailable</a> ( <a href="#">ProgramAssociationTable</a> newPAT) PAT available.
void	<a href="#">pmtAvailable</a> ( <a href="#">ProgramMapTable</a> newPMT) PMT available.
void	<a href="#">sitAvailable</a> ( <a href="#">SpliceInformationTable</a> newSIT) SIT available.
void	<a href="#">videoAvailable</a> ( <a href="#">MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet</a> packet, int length, <a href="#">MPEG2PESPacket.PESHeader</a> header) Video available.

### Methods

(continued from last page)

## patAvailable

```
public void patAvailable(ProgramAssociationTable newPAT)
```

PAT available.

**Parameters:**

newPAT - the new pat

---

## pmtAvailable

```
public void pmtAvailable(ProgramMapTable newPMT)
```

PMT available.

**Parameters:**

newPMT - the new pmt

---

## sitAvailable

```
public void sitAvailable(SpliceInformationTable newSIT)
```

SIT available.

**Parameters:**

newSIT - the new sit

---

## adaptationFieldAvailable

```
public void adaptationFieldAvailable(AdaptationField newAdapationField)
```

Adaptation field available.

**Parameters:**

newAdapationField - the new adapation field

---

## videoAvailable

```
public void videoAvailable(MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet packet,  
    int length,  
    MPEG2PESPacket.PESHeader header)
```

Video available.

**Parameters:**

packet - the packet  
length - the length  
header - the header

---

## audioAvailable

```
public void audioAvailable(MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet packet,  
    int length,  
    MPEG2PESPacket.PESHeader header)
```

Audio available.

**Parameters:**

(continued from last page)

packet - the packet  
length - the length  
header - the header

---

## logThrottleDoLog

```
public boolean logThrottleDoLog()
```

---

## logFatal

```
public void logFatal(String comment)
```

---

## logError

```
public void logError(String comment)
```

---

## logError

```
public void logError(String comment,  
                     Exception e)
```

---

## logWarn

```
public void logWarn(String comment)
```

---

## logInfo

```
public void logInfo(String comment)
```

[getDescriptorName](#), [getShortClassName](#), [serializeAMF](#), [toBin](#), [toDebugString](#), [toString](#)

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait,  
wait

## Fields

### codes

```
public java.util.Map codes
```

The codes.

## Constructors

### LanguageDescriptor

```
public LanguageDescriptor()
```

Instantiates a new language descriptor.

### LanguageDescriptor

```
public LanguageDescriptor(java.nio.ByteBuffer descriptorData)
```

Instantiates a new language descriptor.

#### Parameters:

descriptorData - the descriptor data

## Methods

### decodeDescriptorData

```
public void decodeDescriptorData(java.nio.ByteBuffer descriptorData)
```

Decode descriptor data.

### toBin

```
public void toBin(java.nio.ByteBuffer buffer)
```

(continued from last page)

Encodes the Language descriptor into binary form for use in transport

**Parameters:**

buffer - ByteBuffer to put the binary data

---

## binarySize

```
public int binarySize()
```

How big is the language descriptor in binary.

**Returns:**

the total size of the language descriptor in binary form, includes tag and length fields

---

## toString

```
public String toString()
```

## com.wowza.wms.transport.mpeg2 Class LanguageDescriptor.LanguageCode

java.lang.Object

└─com.wowza.wms.transport.mpeg2.LanguageDescriptor.LanguageCode

public class **LanguageDescriptor.LanguageCode**  
extends Object

The Class LanguageCode.

### Field Summary

public	<a href="#">code</a> ISO-639~language-code - Identifies the language or languages used by the associated program element.
public	<a href="#">type</a> The audio type specifies the associated stream using the table below 0x00 Undefined 0x01 Clean Effects 0x02 Hearing Impaired 0x03 Visual Impaired commentary 0x04 - 0xFF reserved

### Constructor Summary

public	<a href="#">LanguageDescriptor.LanguageCode()</a>
--------	---

### Method Summary

int	<a href="#">binarySize()</a> How big is the language code in binary.
void	<a href="#">toBin()</a> (java.nio.ByteBuffer buffer) Encodes the Language code into binary form for use in transport
String	<a href="#">toString()</a>

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Fields

#### code

public java.lang.String **code**

ISO-639~language-code - Identifies the language or languages used by the associated program element. The ISO-639-language-code contains a 3-character code as specified by ISO 639, Part 2. Each character is coded into 8 bits according to ISO 8859-1 and inserted in order into this 24-bit field. In the case of multilingual audio streams the sequence of ISO-639-language-code fields shall reflect the content of the audio stream.

## type

```
public int type
```

The audio type specifies the associated stream using the table below 0x00 Undefined 0x01 Clean Effects 0x02 Hearing Impaired 0x03 Visual Impaired commentary 0x04 - 0xFF reserved

## Constructors

### LanguageDescriptor.LanguageCode

```
public LanguageDescriptor.LanguageCode()
```

## Methods

### binarySize

```
public int binarySize()
```

How big is the language code in binary.

**Returns:**

the total size of the language code in binary form

---

### toBin

```
public void toBin(java.nio.ByteBuffer buffer)
```

Encodes the Language code into binary form for use in transport

**Parameters:**

buffer - ByteBuffer to put the binary data

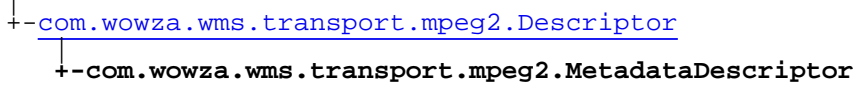

---

### toString

```
public String toString()
```

### Constructors

#### MPEG2AudioPacketProcessor

```

public MPEG2AudioPacketProcessor(int PID,
                                IMPEG2StreamListener listener)
  
```

Instantiates a new MPEG2 audio packet processor.

(continued from last page)

**Parameters:**

PID - the pid

listener - the listener

## Methods

**handlePESData**

```
public void handlePESData(int length,  
    MPEG2PESPacket.PESHeader header)
```

Handle pes data.

## com.wowza.wms.transport.mpeg2

### Class MPEG2MPTS

java.lang.Object

└─com.wowza.wms.transport.mpeg2.MPEG2MPTS

public class **MPEG2MPTS**  
extends Object

The Class mpeg2MPTS.

#### Nested Class Summary

class	<a href="#">MPEG2MPTS.MPEG2MPTSBuffer</a> MPEG2MPTS.MPEG2MPTSBuffer
-------	--

#### Field Summary

public static final	<a href="#">INVALID</a> The Constant INVALID. Value: <b>-1</b>
public	<a href="#">packetCount</a> The packet count.
public static final	<a href="#">PID_DATATYPE_PES</a> Value: <b>1</b>
public static final	<a href="#">PID_DATATYPE_RAW</a> Value: <b>3</b>
public static final	<a href="#">PID_DATATYPE_SECTION</a> Value: <b>2</b>
public static final	<a href="#">PID_DATATYPE_UNKNOWN</a> Value: <b>0</b>
public static final	<a href="#">TS_PACKETLEN</a> The Constant TS_PACKETLEN. Value: <b>188</b>
public static final	<a href="#">TS_SYNCBYTE</a> The Constant TS_SYNCBYTE. Value: <b>71</b>

#### Constructor Summary

public	<a href="#">MPEG2MPTS()</a>
--------	-----------------------------

## Method Summary

boolean	<a href="#"><u>getHasM2TSTimeCodes</u></a> ( )
int	<a href="#"><u>getPCRPid</u></a> ( ) Gets the pCR pid.
String	<a href="#"><u>getShortClassName</u></a> ( ) getShortClassName returns just the class name instead of the com.wms.xxx.xx.className
void	<a href="#"><u>listen</u></a> ( <a href="#"><u>IMPEG2StreamListener</u></a> who) Listen.
void	<a href="#"><u>processNewBuffer</u></a> (byte[] bytes, int offset, int count) Process new buffer.
void	<a href="#"><u>setHasM2TSTimeCodes</u></a> (boolean hasM2TSTimeCodes)
void	<a href="#"><u>setPCRPid</u></a> (int PID) Sets the pcr pid.
void	<a href="#"><u>startStream</u></a> (int PID, <a href="#"><u>IMPEG2PacketProcessor</u></a> parser) Start stream.
void	<a href="#"><u>startStreamAudio</u></a> (int PID, int codec) Start stream audio.
void	<a href="#"><u>startStreamPAT</u></a> ( ) Start stream pat.
void	<a href="#"><u>startStreamPMT</u></a> ( <a href="#"><u>ProgramAssociationTable.ProgramEntry</u></a> program) Start stream pmt.
void	<a href="#"><u>startStreamSCTE</u></a> (int PID) Start stream scte.
void	<a href="#"><u>startStreamVideo</u></a> (int PID, int codec) Start stream video.
void	<a href="#"><u>startUserMonitorPES</u></a> (int PID, <a href="#"><u>IMPEG2UserMonitorPESNotify</u></a> monitor)
void	<a href="#"><u>startUserMonitorRaw</u></a> (int PID, <a href="#"><u>IMPEG2UserMonitorRawNotify</u></a> monitor)
void	<a href="#"><u>startUserMonitorSection</u></a> (int PID, <a href="#"><u>IMPEG2UserMonitorSectionNotify</u></a> monitor)
void	<a href="#"><u>stopStream</u></a> (int PID) Stop stream.
void	<a href="#"><u>stopStreamPMT</u></a> ( <a href="#"><u>ProgramAssociationTable.ProgramEntry</u></a> program) Stop stream pmt.
void	<a href="#"><u>stopStreamSCTE</u></a> (int PID) Stop stream scte.

Methods inherited from class `java.lang.Object`

```
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait
```

## Fields

### PID\_DATATYPE\_UNKNOWN

```
public static final int PID_DATATYPE_UNKNOWN
```

Constant value: **0**

### PID\_DATATYPE\_PES

```
public static final int PID_DATATYPE_PES
```

Constant value: **1**

### PID\_DATATYPE\_SECTION

```
public static final int PID_DATATYPE_SECTION
```

Constant value: **2**

### PID\_DATATYPE\_RAW

```
public static final int PID_DATATYPE_RAW
```

Constant value: **3**

### INVALID

```
public static final int INVALID
```

The Constant INVALID.  
Constant value: **-1**

### TS\_PACKETLEN

```
public static final int TS_PACKETLEN
```

The Constant TS\_PACKETLEN.  
Constant value: **188**

### TS\_SYNCBYTE

```
public static final byte TS_SYNCBYTE
```

The Constant TS\_SYNCBYTE.  
Constant value: **71**

(continued from last page)

## packetCount

```
public long packetCount
```

The packet count.

## Constructors

### MPEG2MPTS

```
public MPEG2MPTS()
```

## Methods

### getHasM2TSTimeCodes

```
public boolean getHasM2TSTimeCodes()
```

### setHasM2TSTimeCodes

```
public void setHasM2TSTimeCodes(boolean hasM2TSTimeCodes)
```

### listen

```
public void listen(IMPEG2StreamListener who)
```

Listen.

**Parameters:**

who - the who

### startStreamPAT

```
public void startStreamPAT()
```

Start stream pat.

### startStreamPMT

```
public void startStreamPMT(ProgramAssociationTable.ProgramEntry program)
```

Start stream pmt.

**Parameters:**

program - the program

### stopStreamPMT

```
public void stopStreamPMT(ProgramAssociationTable.ProgramEntry program)
```

Stop stream pmt.

---

(continued from last page)

**Parameters:**

program - the program

---

**startStreamVideo**

```
public void startStreamVideo(int PID,  
                             int codec)
```

Start stream video.

**Parameters:**

PID - the pid

---

**startStreamAudio**

```
public void startStreamAudio(int PID,  
                             int codec)
```

Start stream audio.

**Parameters:**

PID - the pid

---

**setPCRPid**

```
public void setPCRPid(int PID)
```

Sets the pcr pid.

**Parameters:**

PID - the pid

---

**getPCRPid**

```
public int getPCRPid()
```

Gets the pCR pid.

**Returns:**

the pCR pid

---

**startStreamSCTE**

```
public void startStreamSCTE(int PID)
```

Start stream scte.

**Parameters:**

PID - the pid

---

**startUserMonitorPES**

```
public void startUserMonitorPES(int PID,  
                                IMPEG2UserMonitorPESNotify monitor)
```

---

(continued from last page)

---

## startUserMonitorRaw

```
public void startUserMonitorRaw(int PID,  
    IMPEG2UserMonitorRawNotify monitor)
```

---

## startUserMonitorSection

```
public void startUserMonitorSection(int PID,  
    IMPEG2UserMonitorSectionNotify monitor)
```

---

## stopStreamSCTE

```
public void stopStreamSCTE(int PID)
```

Stop stream scte.

**Parameters:**

PID - the pid

---

## startStream

```
public void startStream(int PID,  
    IMPEG2PacketProcessor parser)
```

Start stream.

**Parameters:**

PID - the pid

parser - the parser

---

## stopStream

```
public void stopStream(int PID)
```

Stop stream.

**Parameters:**

PID - the pid

---

## processNewBuffer

```
public void processNewBuffer(byte[] bytes,  
    int offset,  
    int count)  
    throws java.io.IOException
```

Process new buffer.

**Parameters:**

bytes - the bytes

offset - the offset

count - the count

**Throws:**

IOException - Signals that an I/O exception has occurred.

---

## getShortClassName

```
public String getShortClassName()
```

getShortClassName returns just the class name instead of the com.wms.xxx.xx.className

## com.wowza.wms.transport.mpeg2 Class MPEG2MPTS.MPEG2MPTSBuffer

java.lang.Object

└─com.wowza.wms.transport.mpeg2.MPEG2MPTS.MPEG2MPTSBuffer

public class **MPEG2MPTS.MPEG2MPTSBuffer**  
extends Object

The Class MPEG2MPTSBuffer.

### Nested Class Summary

class	<a href="#">MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet</a> MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet
-------	--

### Constructor Summary

public	<a href="#">MPEG2MPTS.MPEG2MPTSBuffer</a> (byte[] buf, int offset, int length) Instantiates a new MPEG2 mpts buffer.
--------	---

### Method Summary

<a href="#">MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet</a>	<a href="#">readPacket()</a> Read packet.
---	--

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### MPEG2MPTS.MPEG2MPTSBuffer

```
public MPEG2MPTS.MPEG2MPTSBuffer(byte[] buf,  
                                   int offset,  
                                   int length)
```

Instantiates a new MPEG2 mpts buffer.

##### Parameters:

buf - the buf  
offset - the offset  
length - the length

### Methods

(continued from last page)

## readPacket

```
public MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet readPacket()  
    throws IllegalArgumentException
```

Read packet.

**Returns:**

the MPEG2 packet

**Throws:**

[IllegalArgumentException](#) - the illegal argument exception

## com.wowza.wms.transport.mpeg2

### Class MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet

java.lang.Object

└─com.wowza.wms.transport.mpeg2.MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet

public class **MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet**  
extends Object

The Class MPEG2Packet.

#### Field Summary

public static final	<a href="#">ADAPTATION_CONTROL_ADAPATION_ONLY</a> The Constant ADAPTATION_CONTROL_ADAPATION_ONLY. Value: <b>2</b>

boolean	<a href="#">payloadSkip</a> (int count) Payload skip.
String	<a href="#">toString()</a>
String	<a href="#">toString</a> (int count) To string.
String	<a href="#">toString</a> (int count, String contextStr)
String	<a href="#">toString</a> (String contextStr)

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

(continued from last page)

## Fields

### ADAPTATION\_CONTROL\_PAYLOAD\_ONLY

```
public static final byte ADAPTATION_CONTROL_PAYLOAD_ONLY
```

The Constant ADAPTATION\_CONTROL\_PAYLOAD\_ONLY.  
Constant value: **1**

### ADAPTATION\_CONTROL\_ADAPATION\_ONLY

```
public static final byte ADAPTATION_CONTROL_ADAPATION_ONLY
```

The Constant ADAPTATION\_CONTROL\_ADAPATION\_ONLY.  
Constant value: **2**

### ADAPTATION\_CONTROL\_BOTH

```
public static final byte ADAPTATION_CONTROL_BOTH
```

The Constant ADAPTATION\_CONTROL\_BOTH.  
Constant value: **3**

### ADAPTATION\_FIELD\_PRESENT\_MASK

```
public static final byte ADAPTATION_FIELD_PRESENT_MASK
```

The Constant ADAPTATION\_FIELD\_PRESENT\_MASK.  
Constant value: **2**

### PAYLOAD\_PRESENT\_MASK

```
public static final byte PAYLOAD_PRESENT_MASK
```

The Constant PAYLOAD\_PRESENT\_MASK.  
Constant value: **1**

### transportError

```
public boolean transportError
```

The transport error.

### PUSI

```
public boolean PUSI
```

The pusi.

### transportPriority

```
public boolean transportPriority
```

The transport priority.

### PID

```
public int PID
```

(continued from last page)

The pid.

---

## transportScrambling

public byte **transportScrambling**

The transport scrambling.

---

## adaptationFieldControl

public byte **adaptationFieldControl**

The adaptation field control.

---

## continuityCounter

public byte **continuityCounter**

The continuity counter.

## Constructors

### MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet

public **MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet**( )

## Methods

### clear

public void **clear**( )

Clear.

---

### LoadPacketData

public boolean **LoadPacketData**( )  
throws *IllegalArgumentException*

Load packet data.

**Returns:**

true, if successful

**Throws:**

*IllegalArgumentException* - the illegal argument exception

---

### adaptationFieldRead

public [AdaptationField](#) **adaptationFieldRead**( )

Adaptation field read.

**Returns:**

the adaptation field

## payloadRead

```
public int payloadRead()
```

Payload read.

**Returns:**  
the int

---

## payloadRead

```
public boolean payloadRead(byte[] bytes,  
    int offset,  
    int length)
```

Payload read.

**Parameters:**  
bytes - the bytes  
offset - the offset  
length - the length

**Returns:**  
the int

---

## payloadReadFragment

```
public PacketFragment payloadReadFragment(int length)
```

## payloadReadInt

```
public int payloadReadInt(int count,  
    int mask)
```

Payload read int.

**Parameters:**  
count - the count  
mask - the mask

**Returns:**  
the int

---

## payloadSkip

```
public boolean payloadSkip(int count)
```

Payload skip.

**Parameters:**  
count - the count

**Returns:**  
the int

---

(continued from last page)

---

## payloadAvailable

```
public int payloadAvailable()
```

Payload available.

**Returns:**

the int

---

## payloadMark

```
public void payloadMark()
```

Payload mark.

---

## payloadReset

```
public void payloadReset()
```

Payload reset.

---

## toString

```
public String toString()
```

---

## toString

```
public String toString(String contextStr)
```

---

## toString

```
public String toString(int count)
```

To string.

**Parameters:**

count - the count

**Returns:**

the string

---

## toString

```
public String toString(int count,  
    String contextStr)
```

---

## dumpPacket

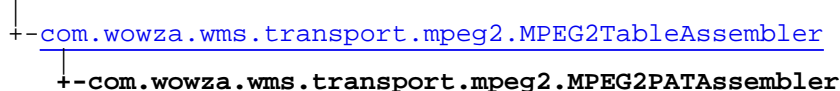

```
public String dumpPacket(String contextStr)
```

Dump packet.

---

## Fields

### PAT\_PID

```
public static final int PAT_PID
```

The Constant PAT\_PID.  
Constant value: **0**

### PAT

```
public com.wowza.wms.transport.mpeg2.ProgramAssociationTable PAT
```

(continued from last page)

The pat.

---

## listeners

```
public java.util.List listeners
```

The listeners.

---

## deliverSection

```
protected boolean deliverSection
```

The deliver section.

---

## Constructors

### MPEG2PATAssembler

```
public MPEG2PATAssembler()
```

---

## Methods

### adaptationHeader

```
public void adaptationHeader(AdaptationField field)
```

---

### headerNotify

```
public boolean headerNotify(MPEG2Section section)
```

---

### tableExist

```
public boolean tableExist()
```

Table exist.

---

### tableVersion

```
public int tableVersion()
```

Table version.

---

### buildTable

```
public void buildTable()
```

Builds the table.

---

### monitorStart

```
public void monitorStart(IMPEG2StreamListener listener,  
    MPEG2MPTS stream)
```

(continued from last page)

Monitor start.

**Parameters:**

listener - the listener  
stream - the stream

---

## monitorStop

```
public void monitorStop(IMPEG2StreamListener listener)
```

Monitor stop.

**Parameters:**

listener - the listener

---

## logThrottleDoLog

```
public boolean logThrottleDoLog()
```

---

## logFatal

```
public void logFatal(String comment)
```

---

## logError

```
public void logError(String comment)
```

---

## logError

```
public void logError(String comment,  
    Exception e)
```

---

## logWarn

```
public void logWarn(String comment)
```

---

## logInfo

```
public void logInfo(String comment)
```

---

## logDebug

```
public void logDebug(String comment)
```

public	<a href="#">MPEG2PESPacket.PESHeader(java.nio.ByteBuffer buffer)</a>

Methods inherited from class java.lang.Object
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### PES\_PICTURE\_START

public static final int **PES\_PICTURE\_START**

The Constant PES\_PICTURE\_START.  
Constant value: **0**

### PES\_USER\_DATA

public static final int **PES\_USER\_DATA**

The Constant PES\_USER\_DATA.  
Constant value: **178**

### PES\_SEQUENCE\_HEADER

public static final int **PES\_SEQUENCE\_HEADER**

(continued from last page)

The Constant PES\_SEQUENCE\_HEADER.  
Constant value: **179**

---

## PES\_SEQUENCE\_ERROR

public static final int **PES\_SEQUENCE\_ERROR**

The Constant PES\_SEQUENCE\_ERROR.  
Constant value: **180**

---

## PES\_EXTENSION

public static final int **PES\_EXTENSION**

The Constant PES\_EXTENSION.  
Constant value: **181**

---

## PES\_SEQUENCE\_END

public static final int **PES\_SEQUENCE\_END**

The Constant PES\_SEQUENCE\_END.  
Constant value: **183**

---

## PES\_GROUP

public static final int **PES\_GROUP**

The Constant PES\_GROUP.  
Constant value: **184**

---

## PES\_PROGRAM\_MAP

public static final int **PES\_PROGRAM\_MAP**

The Constant PES\_PROGRAM\_MAP.  
Constant value: **188**

---

## PES\_PRIVATE\_STREAM\_1

public static final int **PES\_PRIVATE\_STREAM\_1**

The Constant PES\_PRIVATE\_STREAM\_1.  
Constant value: **189**

---

## PES\_PADDING\_STREAM

public static final int **PES\_PADDING\_STREAM**

The Constant PES\_PADDING\_STREAM.  
Constant value: **190**

---

## PES\_PRIVATE\_STREAM\_2

public static final int **PES\_PRIVATE\_STREAM\_2**

The Constant PES\_PRIVATE\_STREAM\_2.  
Constant value: **191**

---

(continued from last page)

---

## PES\_ECM\_STREAM

```
public static final int PES_ECM_STREAM
```

The Constant PES\_ECM\_STREAM.  
Constant value: **240**

---

## PES\_EMM\_STREAM

```
public static final int PES_EMM_STREAM
```

The Constant PES\_EMM\_STREAM.  
Constant value: **241**

---

## PES\_DSMCC\_STREAM

```
public static final int PES_DSMCC_STREAM
```

The Constant PES\_DSMCC\_STREAM.  
Constant value: **242**

---

## PES\_H222\_TYPE\_A

```
public static final int PES_H222_TYPE_A
```

The Constant PES\_H222\_TYPE\_A.  
Constant value: **244**

---

## PES\_H222\_TYPE\_B

```
public static final int PES_H222_TYPE_B
```

The Constant PES\_H222\_TYPE\_B.  
Constant value: **245**

---

## PES\_H222\_TYPE\_C

```
public static final int PES_H222_TYPE_C
```

The Constant PES\_H222\_TYPE\_C.  
Constant value: **246**

---

## PES\_H222\_TYPE\_D

```
public static final int PES_H222_TYPE_D
```

The Constant PES\_H222\_TYPE\_D.  
Constant value: **247**

---

## PES\_H222\_TYPE\_E

```
public static final int PES_H222_TYPE_E
```

The Constant PES\_H222\_TYPE\_E.  
Constant value: **248**

---

## PES\_PROGRAM\_STREAM\_DIRECTORY

```
public static final int PES_PROGRAM_STREAM_DIRECTORY
```

---

(continued from last page)

The Constant PES\_PROGRAM\_STREAM\_DIRECTORY.  
Constant value: **255**

---

## **startCodePrefix**

```
public int startCodePrefix
```

The pes start code.

---

## **streamId**

```
public int streamId
```

The pes stream id.

---

## **length**

```
public int length
```

The pes packet len.

---

## **scramblingControl**

```
public int scramblingControl
```

The pes scrambling control.

---

## **priority**

```
public boolean priority
```

The pes priority.

---

## **dataAlignment**

```
public boolean dataAlignment
```

The pes data alignment.

---

## **copyright**

```
public boolean copyright
```

The pes copyright.

---

## **originalOrCopy**

```
public boolean originalOrCopy
```

The pes original or copy.

---

## **PTSDTSFlags**

```
public int PTSDTSFlags
```

The pes ptsdts flags.

---

(continued from last page)

---

## ESCRFlag

public boolean **ESCRFlag**

The pes escr flag.

---

## ESRateFlag

public boolean **ESRateFlag**

The pes es rate flag.

---

## DSMTrickMode

public boolean **DSMTrickMode**

The pes dsm trick mode.

---

## additionalCopyInfoFlag

public boolean **additionalCopyInfoFlag**

The pes additional copy info flag.

---

## CRCFlag

public boolean **CRCFlag**

The pes pescrc flag.

---

## extFlag

public boolean **extFlag**

The pes pes ext flag.

---

## PTS

public long **PTS**

The pes pts.

---

## DTS

public long **DTS**

The pes dts.

---

## ESCRBase

public int **ESCRBase**

The pes escr base.

---

## ESCRExt

public int **ESCRExt**

---

(continued from last page)

The pes escr ext.

---

## escrBuf

public byte **escrBuf**

The escr buf.

---

## ESRate

public int **ESRate**

The pes es rate.

---

## previousPacketCRC

public int **previousPacketCRC**

The previous packet crc.

---

## privateDataFlag

public boolean **privateDataFlag**

The pes private data flag.

---

## packHeaderFieldFlag

public boolean **packHeaderFieldFlag**

The pes pack header field flag.

---

## programPacketSeqCounterFlag

public boolean **programPacketSeqCounterFlag**

The pes program packet seq counter flag.

---

## originalStuffLen

public int **originalStuffLen**

---

## PSTDBufferFlag

public boolean **PSTDBufferFlag**

The pes pstd buffer flag.

---

## PES2ExtFlag

public boolean **PES2ExtFlag**

The pes pe s2 ext flag.

(continued from last page)

**privateData**

public byte **privateData**

The pes private data.

**packetHeaderBytes**

public byte **packetHeaderBytes**

**programPacketSequenceCounter**

public int **programPacketSequenceCounter**

The pes program packet sequence counter.

**PSTDBufferSize**

public int **PSTDBufferSize**

The PSTD buffer size.

**PESExt2Data**

public byte **PESExt2Data**

The pes pes ext2 data.

**packetDataBytes**

public byte **packetDataBytes**

The pes packet data byte.

Constructors

**MPEG2PESPacket.PESHeader**

public **MPEG2PESPacket.PESHeader**( )

**MPEG2PESPacket.PESHeader**

public **MPEG2PESPacket.PESHeader**( java.nio.ByteBuffer buffer )

## com.wowza.wms.transport.mpeg2 Class MPEG2PESPacketProcessor

java.lang.Object

└─com.wowza.wms.transport.mpeg2.MPEG2PESPacketProcessor

All Implemented Interfaces:

[IMPEG2PacketProcessor](#)

Direct Known Subclasses:

[MPEG2VideoPacketProcessor](#), [MPEG2PESAssembler](#), [MPEG2AudioPacketProcessor](#)

public abstract class **MPEG2PESPacketProcessor**

extends Object

implements [IMPEG2PacketProcessor](#)

The Class mpeg2PESPacketProcessor.

### Field Summary

public	<a href="#">continuityCounter</a> The continuity counter.
public	<a href="#">continuityError</a> The continuity error.
protected	<a href="#">currentPacket</a> The current packet.
public static final	<a href="#">INVALID</a> The Constant INVALID. Value: <b>-1</b>
protected	<a href="#">listener</a> The listener.
protected	<a href="#">pesPacket</a>
public	<a href="#">PID</a> The pid.

### Constructor Summary

public	<a href="#">MPEG2PESPacketProcessor</a> ( )
--------	---

### Method Summary

void	<a href="#">checkContinuity</a> ( ) Check continuity.
int	<a href="#">findPESHeader</a> ( ) Find pes header.

int	<a href="#"><code>getCodec()</code></a>
abstract void	<a href="#"><code>handlePESData</code></a> (int length, <a href="#"><code>MPEG2PESPacket.PESHeader</code></a> header) Handle pes data.
void	<a href="#"><code>notifyAdaptationHeaders</code></a> (boolean deliver)
void	<a href="#"><code>processMpeg2Buffer</code></a> (int pid, byte[] bytes, int offset, int count)
void	<a href="#"><code>processMpeg2Packet</code></a> ( <a href="#"><code>MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet</code></a> packet)
<a href="#"><code>MPEG2PESPacket.PESHeader</code></a>	<a href="#"><code>processPESHeader</code></a> () Process pes header.
void	<a href="#"><code>setCodec</code></a> (int codec)

## Fields

### INVALID

public static final int **INVALID**

The Constant INVALID.

Constant value: **-1**

### PID

public int **PID**

The pid.

### continuityCounter

public int **continuityCounter**

The continuity counter.

### continuityError

public boolean **continuityError**

The continuity error.

(continued from last page)

---

## listener

protected com.wowza.wms.transport.mpeg2.IMPEG2StreamListener **listener**

The listener.

---

## pesPacket

protected com.wowza.wms.transport.mpeg2.MPEG2PESPacket **pesPacket**

---

## currentPacket

protected com.wowza.wms.transport.mpeg2.MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet  
**currentPacket**

The current packet.

## Constructors

### MPEG2PESPacketProcessor

public **MPEG2PESPacketProcessor**()

## Methods

### notifyAdaptationHeaders

public void **notifyAdaptationHeaders**(boolean deliver)

---

### setCodec

public void **setCodec**(int codec)

---

### getCodec

public int **getCodec**()

---

### handlePESData

public abstract void **handlePESData**(int length,  
[MPEG2PESPacket.PESHeader](#) header)

Handle pes data.

**Parameters:**

length - the length  
header - the header

---

## checkContinuity

```
public void checkContinuity()
```

Check continuity.

---

## findPESHeader

```
public int findPESHeader()
```

Find pes header.

**Returns:**

the int

---

## processMpeg2Buffer

```
public void processMpeg2Buffer(int pid,  
    byte[] bytes,  
    int offset,  
    int count)
```

---

## processMpeg2Packet

```
public final void processMpeg2Packet(MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet packet)  
    throws java.io.IOException
```

---

## processPESHeader

```
public MPEG2PESPacket.PESHeader processPESHeader()
```

Process pes header.

**Returns:**

the pES header

---

## com.wowza.wms.transport.mpeg2 Class MPEG2PMTAssembler

java.lang.Object

## Fields

### PMT

public com.wowza.wms.transport.mpeg2.ProgramMapTable **PMT**

The pmt.

### PID

public int **PID**

(continued from last page)

The pid.

---

## programNo

```
public int programNo
```

The program no.

---

## listener

```
public com.wowza.wms.transport.mpeg2.IMPEG2StreamListener listener
```

The listener.

---

## deliverSection

```
protected boolean deliverSection
```

The deliver section.

---

## Constructors

### MPEG2PMTAssembler

```
public MPEG2PMTAssembler()
```

---

## Methods

### adaptationHeader

```
public void adaptationHeader(AdaptationField field)
```

---

### tableExist

```
public boolean tableExist()
```

Table exist.

---

### tableVersion

```
public int tableVersion()
```

Table version.

---

### headerNotify

```
public boolean headerNotify(MPEG2Section section)
```

---

### buildTable

```
public void buildTable()
```

(continued from last page)

Builds the table.

---

## monitorStart

```
public void monitorStart(ProgramAssociationTable.ProgramEntry program,  
    IMPEG2StreamListener listener,  
    MPEG2MPTS stream)
```

Monitor start.

### Parameters:

program - the program  
listener - the listener  
stream - the stream

---

## monitorStop

```
public void monitorStop()
```

Monitor stop.

---

## logThrottleDoLog

```
public boolean logThrottleDoLog()
```

---

## logFatal

```
public void logFatal(String comment)
```

---

## logError

```
public void logError(String comment)
```

---

## logError

```
public void logError(String comment,  
    Exception e)
```

---

## logWarn

```
public void logWarn(String comment)
```

---

## logInfo

```
public void logInfo(String comment)
```

---

(continued from last page)

## logDebug

```
public void logDebug(String comment)
```

## Constructor Summary

public	<a href="#">MPEG2Section</a> ( )
--------	----------------------------------

## Method Summary

int	<a href="#">bytesWritten</a> ( ) Bytes written.
boolean	<a href="#">CRCIsValid</a> ( ) CRC is valid.
String	<a href="#">dumpSection</a> (String contextStr) Dump section.
int	<a href="#">getAvailableData</a> ( ) Gets the available data.
int	<a href="#">getLastSectionNo</a> ( ) Gets the last section no.
int	<a href="#">getSectionLength</a> ( ) Gets the section length.
int	<a href="#">getSectionNo</a> ( ) Gets the section no.
int	<a href="#">getTableID</a> ( ) Gets the table id.
int	<a href="#">getTableIDExtension</a> ( ) Gets the table id extension.
int	<a href="#">getVersion</a> ( ) Gets the version.
boolean	<a href="#">isCurrent</a> ( ) Checks if is current.
int	<a href="#">read</a> ( ) Read.
int	<a href="#">readBytes</a> (byte[] buf, int offset, int count) Read bytes.
int	<a href="#">readInt</a> ( )
int	<a href="#">readInt</a> (int count, int mask) Read int.

void	<a href="#">rewind()</a> Rewind.
void	<a href="#">skip(int count)</a> Skip.
String	<a href="#">toString()</a>
int	<a href="#">write(byte[] bytes)</a> Write.

**Methods inherited from class java.lang.Object**

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### continuityCounter

protected int **continuityCounter**

The continuity counter.

### LENGTH\_OFFSET

protected static final int **LENGTH\_OFFSET**

The Constant LENGTH\_OFFSET.  
Constant value: **1**

### LENGTH\_SIZE

protected static final int **LENGTH\_SIZE**

The Constant LENGTH\_SIZE.  
Constant value: **2**

### LENGHT\_HIGH\_BYTE\_MASK

protected static final byte **LENGHT\_HIGH\_BYTE\_MASK**

The Constant LENGHT\_HIGH\_BYTE\_MASK.  
Constant value: **3**

### TABLE\_ID\_EXT\_OFFSET

protected static final int **TABLE\_ID\_EXT\_OFFSET**

The Constant TABLE\_ID\_EXT\_OFFSET.  
Constant value: **3**

### TABLE\_ID\_EXT LENGHT

protected static final int **TABLE\_ID\_EXT LENGHT**

(continued from last page)

The Constant `TABLE_ID_EXT_LENGTH`.  
Constant value: **2**

---

## VERSION\_OFFSET

protected static final int **VERSION\_OFFSET**

The Constant `VERSION_OFFSET`.  
Constant value: **5**

---

## VERSION\_MASK

protected static final byte **VERSION\_MASK**

The Constant `VERSION_MASK`.  
Constant value: **62**

---

## CURNEXT\_OFFSET

protected static final int **CURNEXT\_OFFSET**

The Constant `CURNEXT_OFFSET`.  
Constant value: **5**

---

## CURNEXT\_MASK

protected static final byte **CURNEXT\_MASK**

The Constant `CURNEXT_MASK`.  
Constant value: **1**

---

## SECTION\_OFFSET

protected static final int **SECTION\_OFFSET**

The Constant `SECTION_OFFSET`.  
Constant value: **6**

---

## LAST\_SECTION\_OFFSET

protected static final int **LAST\_SECTION\_OFFSET**

The Constant `LAST_SECTION_OFFSET`.  
Constant value: **7**

---

## Constructors

### MPEG2Section

```
public MPEG2Section()
```

---

## Methods

### write

```
public int write(byte[] bytes)  
    throws java.io.IOException
```

(continued from last page)

Write.

**Parameters:**

bytes - the bytes

**Returns:**

the int

**Throws:**

`IOException` - Signals that an I/O exception has occurred.

---

## bytesWritten

```
public int bytesWritten()
```

Bytes written.

**Returns:**

the int

---

## getTableID

```
public int getTableID()
```

Gets the table id.

**Returns:**

the table id

---

## getSectionLength

```
public int getSectionLength()
```

Gets the section length.

**Returns:**

the section length

---

## getTableIDExtension

```
public int getTableIDExtension()
```

Gets the table id extension.

**Returns:**

the table id extension

---

## getVersion

```
public int getVersion()
```

Gets the version.

**Returns:**

the version

---

(continued from last page)

## isCurrent

```
public boolean isCurrent()
```

Checks if is current.

**Returns:**

true, if is current

---

## getSectionNo

```
public int getSectionNo()
```

Gets the section no.

**Returns:**

the section no

---

## getLastSectionNo

```
public int getLastSectionNo()
```

Gets the last section no.

**Returns:**

the last section no

---

## getAvailableData

```
public int getAvailableData()
```

Gets the available data.

**Returns:**

the available data

---

## CRCIsValid

```
public boolean CRCIsValid()
```

CRC is valid.

**Returns:**

true, if successful

---

## rewind

```
public void rewind()
```

Rewind.

---

## read

```
public int read()
```

Read.

**Returns:**

(continued from last page)

the int

---

## readBytes

```
public int readBytes(byte[] buf,  
    int offset,  
    int count)
```

Read bytes.

### Parameters:

buf - the buf  
offset - the offset  
count - the count

### Returns:

the int

---

## readInt

```
public int readInt(int count,  
    int mask)
```

Read int.

### Parameters:

count - the count  
mask - the mask

### Returns:

the int

---

## readInt

```
public int readInt()
```

---

## skip

```
public void skip(int count)
```

Skip.

### Parameters:

count - the count

---

## toString

```
public String toString()
```

---

## dumpSection

```
public String dumpSection(String contextStr)
```

Dump section.

---

## com.wowza.wms.transport.mpeg2 Class MPEG2SectionAssembler

java.lang.Object

└─com.wowza.wms.transport.mpeg2.MPEG2SectionAssembler

All Implemented Interfaces:

[IMPEG2PacketProcessor](#)

public class **MPEG2SectionAssembler**  
extends Object  
implements [IMPEG2PacketProcessor](#)

The Class MPEG2SectionAssembler.

### Field Summary

public static final	<a href="#">INVALID</a> The Constant INVALID. Value: <b>-1</b>
public	<a href="#">listeners</a> The listeners.

### Constructor Summary

public	<a href="#">MPEG2SectionAssembler</a> ()
--------	--

### Method Summary

void	<a href="#">notifyAdaptationHeaders</a> (boolean notify)
void	<a href="#">processMpeg2Buffer</a> (int pid, byte[] bytes, int offset, int count)
void	<a href="#">processMpeg2Packet</a> ( <a href="#">MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet</a> packet)
void	<a href="#">setHeaderLengthMin</a> (int size) Sets the header length min.

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

#### Methods inherited from interface [com.wowza.wms.transport.mpeg2.IMPEG2PacketProcessor](#)

[notifyAdaptationHeaders](#), [processMpeg2Buffer](#), [processMpeg2Packet](#)

### Fields

(continued from last page)

## INVALID

```
public static final int INVALID
```

The Constant INVALID.  
Constant value: **-1**

---

## listeners

```
public java.util.List listeners
```

The listeners.

## Constructors

### MPEG2SectionAssembler

```
public MPEG2SectionAssembler()
```

## Methods

### setHeaderLengthMin

```
public void setHeaderLengthMin(int size)
```

Sets the header length min.

**Parameters:**

size - the new header length min

---

### notifyAdaptationHeaders

```
public void notifyAdaptationHeaders(boolean notify)
```

---

### processMpeg2Buffer

```
public void processMpeg2Buffer(int pid,  
    byte[] bytes,  
    int offset,  
    int count)
```

---

### processMpeg2Packet

```
public void processMpeg2Packet(MPEG2MPTS.MPEG2MPTSTBuffer.MPEG2Packet packet)  
    throws java.io.IOException
```

## com.wowza.wms.transport.mpeg2

### Class MPEG2TableAssembler

java.lang.Object

└─com.wowza.wms.transport.mpeg2.MPEG2TableAssembler

All Implemented Interfaces:

[IMPEG2SectionListener](#)

Direct Known Subclasses:

[MPEG2PMTAssembler](#), [MPEG2PATAssembler](#)

public abstract class **MPEG2TableAssembler**

extends Object

implements [IMPEG2SectionListener](#)

The Class mpeg2TableAssembler.

#### Field Summary

public	<a href="#">currentVersion</a> The current version.
public	<a href="#">deliver</a> The deliver.
public static final	<a href="#">INVALID</a> The Constant INVALID. Value: <b>-1</b>
protected	<a href="#">sections</a> The sections.

Fields inherited from interface [com.wowza.wms.transport.mpeg2.IMPEG2SectionListener](#)

[INVALID](#)

#### Constructor Summary

public	<a href="#">MPEG2TableAssembler()</a>
--------	---------------------------------------

#### Method Summary

abstract void	<a href="#">adaptationHeader</a> ( <a href="#">AdaptationField</a> field)
abstract void	<a href="#">buildTable</a> () Builds the table.
String	<a href="#">getShortClassName</a> () getShortClassName returns just the class name instead of the com.wms.xxx.xx.className

boolean	<a href="#">headerNotify</a> ( <a href="#">MPEG2Section</a> section)
void	<a href="#">sectionNotify</a> ( <a href="#">MPEG2Section</a> section, boolean continuityError)
abstract boolean	<a href="#">tableExist</a> () Table exist.
abstract int	<a href="#">tableVersion</a> () Table version.

#### Methods inherited from class [java.lang.Object](#)

[clone](#), [equals](#), [finalize](#), [getClass](#), [hashCode](#), [notify](#), [notifyAll](#), [toString](#), [wait](#), [wait](#), [wait](#)

#### Methods inherited from interface [com.wowza.wms.transport.mpeg2.IMPEG2SectionListener](#)

[adaptationHeader](#), [headerNotify](#), [logDebug](#), [logError](#), [logError](#), [logFatal](#), [logInfo](#), [logThrottleDoLog](#), [logWarn](#), [sectionNotify](#)

## Fields

### INVALID

public static final int **INVALID**

The Constant INVALID.  
Constant value: **-1**

### deliver

public boolean **deliver**

The deliver.

### sections

protected java.util.Map **sections**

The sections.

### currentVersion

public int **currentVersion**

The current version.

## Constructors

### MPEG2TableAssembler

public **MPEG2TableAssembler**()

(continued from last page)

## Methods

### headerNotify

```
public boolean headerNotify(MPEG2Section section)
```

### sectionNotify

```
public void sectionNotify(MPEG2Section section,  
    boolean continuityError)
```

### getShortClassName

```
public String getShortClassName()
```

getShortClassName returns just the class name instead of the com.wms.xxx.xx.className

### adaptationHeader

```
public abstract void adaptationHeader(AdaptationField field)
```

### tableExist

```
public abstract boolean tableExist()
```

Table exist.

**Returns:**

true, if successful

### tableVersion

```
public abstract int tableVersion()
```

Table version.

**Returns:**

the int

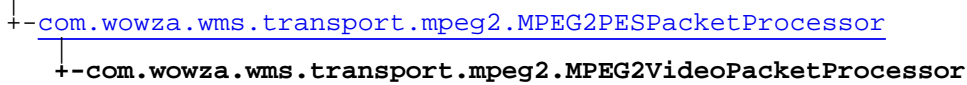

### buildTable

```
public abstract void buildTable()
```

Builds the table.

## com.wowza.wms.transport.mpeg2 Class MPEG2VideoPacketProcessor

java.lang.Object

All Implemented Interfaces:

[IMPEG2PacketProcessor](#)

public class **MPEG2VideoPacketProcessor**  
extends [MPEG2PESPacketProcessor](#)

The Class mpeg2VideoPacketProcessor.

Fields inherited from class [com.wowza.wms.transport.mpeg2.MPEG2PESPacketProcessor](#)

[continuityCounter](#), [continuityError](#), [currentPacket](#), [INVALID](#), [listener](#), [pesPacket](#), [PID](#)

### Constructor Summary

public	<a href="#">MPEG2VideoPacketProcessor</a> (int PID, <a href="#">IMPEG2StreamListener</a> listener) Instantiates a new mpeg2 video packet processor.
--------	--

### Method Summary

void	<a href="#">handlePESData</a> (int length, <a href="#">MPEG2PESPacket.PESHeader</a> header)
------	---

Methods inherited from class [com.wowza.wms.transport.mpeg2.MPEG2PESPacketProcessor](#)

[checkContinuity](#), [findPESHeader](#), [getCodec](#), [handlePESData](#), [notifyAdaptationHeaders](#), [processMpeg2Buffer](#), [processMpeg2Packet](#), [processPESHeader](#), [setCodec](#)

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

Methods inherited from interface [com.wowza.wms.transport.mpeg2.IMPEG2PacketProcessor](#)

[notifyAdaptationHeaders](#), [processMpeg2Buffer](#), [processMpeg2Packet](#)

### Constructors

#### MPEG2VideoPacketProcessor

public **MPEG2VideoPacketProcessor**(int PID,  
[IMPEG2StreamListener](#) listener)

Instantiates a new mpeg2 video packet processor.

(continued from last page)

**Parameters:**

PID - the pid

listener - the listener

## Methods

**handlePESData**

```
public void handlePESData(int length,  
    MPEG2PESPacket.PESHeader header)
```

Handle pes data.

## com.wowza.wms.transport.mpeg2 Class PESAssembler

java.lang.Object

└─com.wowza.wms.transport.mpeg2.PESAssembler

All Implemented Interfaces:

[IMPEG2PESListener](#)

public class **PESAssembler**

extends Object

implements [IMPEG2PESListener](#)

### Constructor Summary

public	<a href="#">PESAssembler()</a>
--------	--------------------------------

### Method Summary

void	<a href="#">monitorStart</a> (int PID, <a href="#">IMPEG2StreamListener</a> listener, <a href="#">MPEG2MPTS</a> stream, <a href="#">IMPEG2UserMonitorPESNotify</a> monitor) Monitor start.
void	<a href="#">monitorStop()</a> Monitor stop.
void	<a href="#">pesDataAvailable</a> ( <a href="#">MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet</a> packet, int length, <a href="#">MPEG2PESPacket.PESHeader</a> header)

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

#### Methods inherited from interface [com.wowza.wms.transport.mpeg2.IMPEG2PESListener](#)

[pesDataAvailable](#)

### Constructors

#### PESAssembler

public **PESAssembler()**

### Methods

(continued from last page)

## pesDataAvailable

```
public void pesDataAvailable(MPEG2MPTS.MPEG2MPTSBuffer.MPEG2Packet packet,  
    int length,  
    MPEG2PESPacket.PESHeader header)
```

---

## monitorStart

```
public void monitorStart(int PID,  
    IMPEG2StreamListener listener,  
    MPEG2MPTS stream,  
    IMPEG2UserMonitorPESNotify monitor)
```

Monitor start.

### Parameters:

PID - the pid  
listener - the listener  
stream - the stream

---

## monitorStop

```
public void monitorStop()
```

Monitor stop.

## com.wowza.wms.transport.mpeg2 Class ProgramAssociationTable

java.lang.Object

└─com.wowza.wms.transport.mpeg2.ProgramAssociationTable

public class **ProgramAssociationTable**  
extends Object

The Class ProgramAssociationTable.

### Nested Class Summary

class	<a href="#">ProgramAssociationTable.ProgramEntry</a> ProgramAssociationTable.ProgramEntry
-------	--

### Field Summary

public static final	<a href="#">INVALID</a> The Constant INVALID. Value: <b>-1</b>
public static final	<a href="#">PAT_TABLE_ID</a> The Constant PAT_TABLE_ID. Value: <b>0</b>
public	<a href="#">programs</a> The programs.
public	<a href="#">version</a> The version.

### Constructor Summary

public	<a href="#">ProgramAssociationTable</a> (java.util.Map sections) Instantiates a new program association table.
--------	---

### Method Summary

boolean	<a href="#">equals</a> (Object obj)
int	<a href="#">hashCode</a> ()
String	<a href="#">toString</a> ()

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### INVALID

```
public static final int INVALID
```

The Constant INVALID.

Constant value: **-1**

### PAT\_TABLE\_ID

```
public static final int PAT_TABLE_ID
```

The Constant PAT\_TABLE\_ID.

Constant value: **0**

### version

```
public int version
```

The version.

### programs

```
public java.util.Map programs
```

The programs.

## Constructors

### ProgramAssociationTable

```
public ProgramAssociationTable(java.util.Map sections)
```

Instantiates a new program association table.

**Parameters:**

sections - the sections

## Methods

### toString

```
public String toString()
```

### hashCode

```
public int hashCode()
```

### equals

```
public boolean equals(Object obj)
```

(continued from last page)

## com.wowza.wms.transport.mpeg2 Class ProgramAssociationTable.ProgramEntry

java.lang.Object

└─com.wowza.wms.transport.mpeg2.ProgramAssociationTable.ProgramEntry

```
public class ProgramAssociationTable.ProgramEntry
    extends Object
```

The Class ProgramEntry.

### Field Summary

public	<a href="#">pmtPID</a> The pmt pid.
public	<a href="#">programNo</a> The program no.

### Method Summary

boolean	<a href="#">equals</a> (Object obj)
int	<a href="#">hashCode</a> ()
String	<a href="#">toString</a> ()

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Fields

#### programNo

```
public int programNo
```

The program no.

#### pmtPID

```
public int pmtPID
```

The pmt pid.

### Methods

(continued from last page)

**toString**

```
public String toString()
```

---

**equals**

```
public boolean equals(Object obj)
```

---

**hashCode**

```
public int hashCode()
```

---

## com.wowza.wms.transport.mpeg2

### Class ProgramMapTable

java.lang.Object

└─com.wowza.wms.transport.mpeg2.ProgramMapTable

public class **ProgramMapTable**  
extends Object

The Class ProgramMapTable.

#### Nested Class Summary

class	<a href="#">ProgramMapTable.StreamInfo</a> ProgramMapTable.StreamInfo
-------	--

#### Field Summary

public static final	<a href="#">INVALID</a> The Constant INVALID. Value: <b>-1</b>
public static final	<a href="#">NO_PCR_PID</a> The Constant NO_PCR_PID. Value: <b>131071</b>
public	<a href="#">PCR_PID</a> The pcr pid.
public static final	<a href="#">PMT_TABLE_ID</a> The Constant PMT_TABLE_ID. Value: <b>2</b>
public	<a href="#">programDescriptors</a> The program descriptors.
public	<a href="#">programNo</a> The program no.
public	<a href="#">streams</a> The streams.
public	<a href="#">version</a> The version.

#### Constructor Summary

public	<a href="#">ProgramMapTable()</a> Instantiates a new program map table.
public	<a href="#">ProgramMapTable(java.util.Map sections)</a> Instantiates a new program map table.

## Method Summary

int	<a href="#">binarySize()</a> calculates the binary size of the Stream Info structure
void	<a href="#">toBin(java.nio.ByteBuffer buffer)</a> converts the Program map table to binary for use in a transport form
String	<a href="#">toString()</a>

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### INVALID

public static final int **INVALID**

The Constant INVALID.  
Constant value: **-1**

### PMT\_TABLE\_ID

public static final int **PMT\_TABLE\_ID**

The Constant PMT\_TABLE\_ID.  
Constant value: **2**

### NO\_PCR\_PID

public static final int **NO\_PCR\_PID**

The Constant NO\_PCR\_PID.  
Constant value: **131071**

### programNo

public int **programNo**

The program no.

### version

public int **version**

The version.

### PCR\_PID

public int **PCR\_PID**

The pcr pid.

---

## programDescriptors

```
public com.wowza.util.MultiMap programDescriptors
```

The program descriptors.

---

## streams

```
public java.util.Map streams
```

The streams.

## Constructors

### ProgramMapTable

```
public ProgramMapTable()
```

Instantiates a new program map table.

---

### ProgramMapTable

```
public ProgramMapTable(java.util.Map sections)
```

Instantiates a new program map table.

**Parameters:**

sections - the sections

## Methods

### toBin

```
public void toBin(java.nio.ByteBuffer buffer)
```

converts the Program map table to binary for use in a transport form

**Parameters:**

buffer - a ByteBuffer to put the binary data.

---

### binarySize

```
public int binarySize()
```

calculates the binary size of the Stream Info structure

**Returns:**

includes the size of all descriptors included in the stream

---

### toString

```
public String toString()
```

## com.wowza.wms.transport.mpeg2 Class ProgramMapTable.StreamInfo

java.lang.Object

└─com.wowza.wms.transport.mpeg2.ProgramMapTable.StreamInfo

public class **ProgramMapTable.StreamInfo**  
extends Object

The Class StreamInfo.

### Field Summary

public	<a href="#">descriptors</a> The descriptors.
public	<a href="#">PID</a> The pid.
public	<a href="#">streamType</a> The stream type.
public static final	<a href="#">STREAMTYPE_AUDIO_AAC_LOAS</a> Value: <b>17</b>
public static final	<a href="#">STREAMTYPE_AUDIO_AC3_ATSC</a> Value: <b>129</b>
public static final	<a href="#">STREAMTYPE_AUDIO_ADTS_AAC</a> Value: <b>15</b>
public static final	<a href="#">STREAMTYPE_AUDIO_EAC3_ATSC</a> Value: <b>135</b>
public static final	<a href="#">STREAMTYPE_AUDIO_MP3_1</a> Value: <b>3</b>
public static final	<a href="#">STREAMTYPE_AUDIO_MP3_2</a> Value: <b>4</b>

public static final	<a href="#">STREAMTYPE_VIDEO_H264</a> Value: <b>27</b>
public static final	<a href="#">STREAMTYPE_VIDEO_HEVC</a> Value: <b>36</b>

public static final	<a href="#">STREAMTYPE_VIDEO_MPEG4</a> Value: <b>16</b>
public static final	<a href="#">STREAMTYPE_VIDEO1_MPEG2</a> Value: <b>2</b>
public static final	<a href="#">STREAMTYPE_VIDEO2_MPEG2</a> Value: <b>128</b>

## Constructor Summary

public	<a href="#">ProgramMapTable.StreamInfo()</a> Instantiates a new stream info.
public	<a href="#">ProgramMapTable.StreamInfo(MPEG2Section section)</a> Instantiates a new stream info.

## Method Summary

int	<a href="#">binarySize()</a> calculates the binary size of the Stream Info structure
int	<a href="#">getAudioCodec()</a>
int	<a href="#">getVideoCodec()</a>
boolean	<a href="#">isAudioStreamType()</a> Checks if is audio stream type.
boolean	<a href="#">isVideoStreamType()</a> Checks if is video stream type.
String	<a href="#">toString()</a>

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### STREAMTYPE\_VIDEO\_H264

public static final int **STREAMTYPE\_VIDEO\_H264**

Constant value: **27**

### STREAMTYPE\_VIDEO1\_MPEG2

public static final int **STREAMTYPE\_VIDEO1\_MPEG2**

(continued from last page)

Constant value: **2**

---

**STREAMTYPE\_VIDEO2\_MPEG2**

```
public static final int STREAMTYPE_VIDEO2_MPEG2
```

Constant value: **128**

---

**STREAMTYPE\_VIDEO\_MPEG4**

```
public static final int STREAMTYPE_VIDEO_MPEG4
```

Constant value: **16**

---

**STREAMTYPE\_VIDEO\_HEVC**

```
public static final int STREAMTYPE_VIDEO_HEVC
```

Constant value: **36**

---

**STREAMTYPE\_AUDIO\_ADTS\_AAC**

```
public static final int STREAMTYPE_AUDIO_ADTS_AAC
```

Constant value: **15**

---

**STREAMTYPE\_AUDIO\_AAC\_LOAS**

```
public static final int STREAMTYPE_AUDIO_AAC_LOAS
```

Constant value: **17**

---

**STREAMTYPE\_AUDIO\_MP3\_1**

```
public static final int STREAMTYPE_AUDIO_MP3_1
```

Constant value: **3**

---

**STREAMTYPE\_AUDIO\_MP3\_2**

```
public static final int STREAMTYPE_AUDIO_MP3_2
```

Constant value: **4**

---

**STREAMTYPE\_AUDIO\_AC3\_ATSC**

```
public static final int STREAMTYPE_AUDIO_AC3_ATSC
```

Constant value: **129**

(continued from last page)

## STREAMTYPE\_AUDIO\_EAC3\_ATSC

```
public static final int STREAMTYPE_AUDIO_EAC3_ATSC
```

Constant value: **135**

## STREAMTYPE\_CUEI

```
public static final int STREAMTYPE_CUEI
```

Constant value: **134**

## streamType

```
public int streamType
```

The stream type.

## PID

```
public int PID
```

The pid.

## descriptors

```
public com.wowza.util.MultiMap descriptors
```

The descriptors.

## Constructors

### ProgramMapTable.StreamInfo

```
public ProgramMapTable.StreamInfo()
```

Instantiates a new stream info.

### ProgramMapTable.StreamInfo

```
public ProgramMapTable.StreamInfo(MPEG2Section section)
```

Instantiates a new stream info.

#### Parameters:

section - the section

## Methods

### isAudioStreamType

```
public boolean isAudioStreamType()
```

Checks if is audio stream type.

#### Returns:

(continued from last page)

true, if is audio stream type

---

## getAudioCodec

```
public int getAudioCodec()
```

---

## isVideoStreamType

```
public boolean isVideoStreamType()
```

Checks if is video stream type.

**Returns:**

true, if is video stream type

---

## getVideoCodec

```
public int getVideoCodec()
```

---

## toString

```
public String toString()
```

---

## binarySize

```
public int binarySize()
```

calculates the binary size of the Stream Info structure

**Returns:**

includes the size of all descriptors included in the stream

## com.wowza.wms.transport.mpeg2

### Class RawAssembler

java.lang.Object

└─com.wowza.wms.transport.mpeg2.RawAssembler

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait,  
wait

## Fields

### REG\_IDENTIFICATION\_SCTE\_SPLICE\_FORMAT

```
public static final int REG_IDENTIFICATION_SCTE_SPLICE_FORMAT
```

The Constant REG\_IDENTIFICATION\_SCTE\_SPLICE\_FORMAT.  
Constant value: **1129661769**

### REG\_IDENTIFICATION\_HEVC

```
public static final int REG_IDENTIFICATION_HEVC
```

Constant value: **1212503619**

### REG\_IDENTIFICATION\_KLV

```
public static final int REG_IDENTIFICATION_KLV
```

Constant value: **1263294017**

### formatIdentifier

```
public int formatIdentifier
```

The format identifier.

(continued from last page)

## additionalIdentificationData

```
public byte additionalIdentificationData
```

The additional identification data.

## Constructors

### RegistrationDescriptor

```
public RegistrationDescriptor()
```

Instantiates a new registration descriptor.

### RegistrationDescriptor

```
public RegistrationDescriptor(java.nio.ByteBuffer descriptorData)
```

Instantiates a new registration descriptor from the provided byte buffer

**Parameters:**

descriptorData - the descriptor data

## Methods

### decodeDescriptorData

```
public void decodeDescriptorData(java.nio.ByteBuffer descriptorData)
```

Decode descriptor data.

### toBin

```
public void toBin(java.nio.ByteBuffer buffer)
```

Encodes the registration descriptor into binary format for use in a transport

**Parameters:**

buffer - a ByteBuffer to put the descriptor binary data into

### binarySize

```
public int binarySize()
```

How big is the registration descriptor in binary.

**Returns:**

the total size of the descriptor in binary form, includes tag and length fields

### toString

```
public String toString()
```

## field

protected com.wowza.wms.transport.mpeg2.AdaptationField **field**

## Constructors

### SectionAssembler

```
public SectionAssembler()
```

## Methods

### adaptationHeader

```
public void adaptationHeader(AdaptationField field)
```

### headerNotify

```
public boolean headerNotify(MPEG2Section section)
```

### sectionNotify

```
public void sectionNotify(MPEG2Section section,  
    boolean continuityError)
```

### monitorStart

```
public void monitorStart(int PID,  
    IMPEG2StreamListener listener,  
    MPEG2MPTS stream,  
    IMPEG2UserMonitorSectionNotify monitor)
```

Monitor start.

#### Parameters:

PID - the pid

listener - the listener

stream - the stream

### monitorStop

```
public void monitorStop()
```

Monitor stop.

### logThrottleDoLog

```
public boolean logThrottleDoLog()
```

(continued from last page)

## com.wowza.wms.transport.mpeg2 Class StreamIdentifierDescriptor

java.lang.Object

public class **StreamIdentifierDescriptor**  
extends [Descriptor](#)

The Class StreamIdentifierDescriptor. The stream identifier descriptor may be used in the PMT to label component streams of a service so that they can be differentiated. The stream identifier descriptor shall be located in the elementary descriptor loop following the relevant ES\_info\_length field. The stream identifier descriptor shall be used if either the program\_splice\_flag or the program\_segmentation\_flag is zero. If stream identifier descriptors are used, a stream identifier descriptor shall be present in each occurrence of the elementary stream loop within the PMT and shall have a unique component tag within the given program.

### Field Summary

public	<a href="#">componentTag</a> The component tag.
--------	--

## Fields

### componentTag

public int **componentTag**

The component tag.

## Constructors

### StreamIdentifierDescriptor

public **StreamIdentifierDescriptor**()

Instantiates a new stream identifier descriptor.

### StreamIdentifierDescriptor

public **StreamIdentifierDescriptor**(java.nio.ByteBuffer descriptorData)

Instantiates a new stream identifier descriptor.

#### Parameters:

descriptorData - the descriptor data

## Methods

### decodeDescriptorData

public void **decodeDescriptorData**(java.nio.ByteBuffer descriptorData)

Decode descriptor data.

(continued from last page)

## toBin

```
public void toBin(java.nio.ByteBuffer buffer)
```

Encodes the descriptor into binary format for use in a transport

---

## binarySize

```
public int binarySize()
```

How big is the Stream Identifier descriptor in binary.

**Returns:**

the total size of the descriptor in binary form, includes tag and length fields

---

## toString

```
public String toString()
```

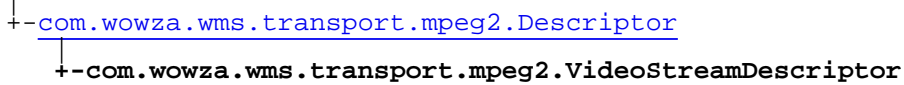

---

## getComponentTag

```
public int getComponentTag()
```

## com.wowza.wms.transport.mpeg2 Class VideoStreamDescriptor

java.lang.Object

```

public class VideoStreamDescriptor
extends Descriptor
  
```

The Class VideoStreamDescriptor. The video stream descriptor provides basic information which identifies the coding parameters of a video elementary stream as described in ITU-T Rec. H.262 I ISO/IEC 13818-2 or ISO/IEC 11172-2.

### Field Summary

---

## FRAME\_RATE\_60

public static final int **FRAME\_RATE\_60**

The Constant FRAME\_RATE\_60.  
Constant value: **8**

---

## multipleFrameRate

public boolean **multipleFrameRate**

The multiple frame rate.

---

## frameRateCode

public int **frameRateCode**

The frame rate code.

---

## mpeg1Only

public boolean **mpeg1Only**

The mpeg1 only.

---

## constrainedParameter

public boolean **constrainedParameter**

The constrained parameter.

---

## stillPicture

public boolean **stillPicture**

The still picture.

---

## mpeg1ProfileLevel

public int **mpeg1ProfileLevel**

The mpeg1 profile level.

---

## mpeg1ChromaFormat

public int **mpeg1ChromaFormat**

The mpeg1 chroma format.

---

## mpeg1FrameRateExt

public boolean **mpeg1FrameRateExt**

The mpeg1 frame rate ext.

---

(continued from last page)

## Constructors

### VideoStreamDescriptor

```
public VideoStreamDescriptor()
```

Instantiates a new video stream descriptor.

### VideoStreamDescriptor

```
public VideoStreamDescriptor(java.nio.ByteBuffer descriptorData)
```

Instantiates a new video stream descriptor.

**Parameters:**

descriptorData - the descriptor data

## Methods

### decodeDescriptorData

```
public void decodeDescriptorData(java.nio.ByteBuffer descriptorData)
```

Decode descriptor data.

### toBin

```
public void toBin(java.nio.ByteBuffer buffer)
```

Encodes the Video stream descriptor into binary form for use in transport

**Parameters:**

buffer - ByteBuffer to put the binary data

### binarySize

```
public int binarySize()
```

How big is the video stream descriptor in binary.

**Returns:**

the total size of the descriptor in binary form, includes tag and length fields

### toString

```
public String toString()
```

---

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### eventID

public int **eventID**

(continued from last page)

The event id.

---

## cancel

public boolean **cancel**

The cancel.

---

## outOfNetwork

public boolean **outOfNetwork**

The out of network.

---

## programSplice

public boolean **programSplice**

The program splice.

---

## durationFlag

public boolean **durationFlag**

The duration flag.

---

## spliceImmediate

public boolean **spliceImmediate**

The splice immediate.

---

## spliceTime

public com.wowza.wms.transport.mpeg2.section.cue.SpliceTime **spliceTime**

The splice time.

---

## componentSplices

public java.util.Map **componentSplices**

The component splices.

---

## breakDuration

public com.wowza.wms.transport.mpeg2.section.cue.SpliceEvent.BreakDuration  
**breakDuration**

The break duration.

---

## programID

public int **programID**

The program id.

(continued from last page)

---

## availNum

```
public int availNum
```

The avail num.

---

## availsExpected

```
public int availsExpected
```

The avails expected.

---

## Constructors

### SpliceEvent

```
public SpliceEvent(MPEG2Section data,  
                   boolean fromInsertCmd)
```

Instantiates a new splice event.

**Parameters:**

data - the data

fromInsertCmd - the from insert cmd

## Methods

### getEventID

```
public int getEventID()
```

---

### isCancel

```
public boolean isCancel()
```

---

### isOutOfNetwork

```
public boolean isOutOfNetwork()
```

---

### isProgramSplice

```
public boolean isProgramSplice()
```

---

### isDurationFlag

```
public boolean isDurationFlag()
```

---

(continued from last page)

---

## isSpliceImmediate

```
public boolean isSpliceImmediate()
```

---

## getSpliceTime

```
public SpliceTime getSpliceTime()
```

---

## getComponentSplices

```
public java.util.Map getComponentSplices()
```

## getBreakDuration

```
public SpliceEvent.BreakDuration getBreakDuration()
```

---

## getProgramID

```
public int getProgramID()
```

---

## getAvailNum

```
public int getAvailNum()
```

---

## getAvailsExpected

```
public int getAvailsExpected()
```

---

## serializeAMF

```
public AMFDataObj serializeAMF(SpliceInformationTableSerializeAMFContext context)
```

---

## toString

```
public String toString()
```

---

## com.wowza.wms.transport.mpeg2.section.cue Class **SpliceEvent.BreakDuration**

java.lang.Object

└─com.wowza.wms.transport.mpeg2.section.cue.SpliceEvent.BreakDuration

public class **SpliceEvent.BreakDuration**  
extends Object

The Class BreakDuration.

### Constructor Summary

public	<a href="#">SpliceEvent.BreakDuration</a> ( <a href="#">MPEG2Section</a> data)	Instantiates a new break duration.
--------	--	------------------------------------

### Method Summary

String	<a href="#">toString()</a>
--------	----------------------------

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### **SpliceEvent.BreakDuration**

public **SpliceEvent.BreakDuration**([MPEG2Section](#) data)

Instantiates a new break duration.

##### Parameters:

data - the data

### Methods

#### **toString**

public String **toString**()

## com.wowza.wms.transport.mpeg2.section.cue Class SpliceEvent.ComponentSpliceTime

```
java.lang.Object
```

```
└--com.wowza.wms.transport.mpeg2.section.cue.SpliceEvent.ComponentSpliceTime
```

```
public class SpliceEvent.ComponentSpliceTime
extends Object
```

The Class ComponentSpliceTime.

### Field Summary

public	<a href="#">componentTag</a> The component tag.
public	<a href="#">spliceTime</a> The splice time.

### Constructor Summary

public	<a href="#">SpliceEvent.ComponentSpliceTime</a> ( <a href="#">MPEG2Section</a> data, boolean fromInsertCommand) Instantiates a new component splice time.
--------	--

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### componentTag

```
public int componentTag
```

The component tag.

### spliceTime

```
public com.wowza.wms.transport.mpeg2.section.cue.SpliceTime spliceTime
```

The splice time.

## Constructors

### SpliceEvent.ComponentSpliceTime

```
public SpliceEvent.ComponentSpliceTime(MPEG2Section data,
                                         boolean fromInsertCommand)
```

Instantiates a new component splice time.

(continued from last page)

**Parameters:**

data - the data

fromInsertCommand - the from insert command

## com.wowza.wms.transport.mpeg2.section.cue Class SpliceInformationTable

java.lang.Object

└─com.wowza.wms.transport.mpeg2.section.cue.SpliceInformationTable

public class **SpliceInformationTable**  
extends Object

The Class SpliceInformationTable.

### Field Summary

public static final	<a href="#"><u>AMF_VERSION</u></a> Value: <b>1</b>
public	<a href="#"><u>command</u></a> The command.
public	<a href="#"><u>cwIndex</u></a> The CW index.
public	<a href="#"><u>encryptedCRC</u></a> The encrypted crc.
public	<a href="#"><u>encryptedPacket</u></a> The encrypted packet.
public	<a href="#"><u>encryptionAlgorithm</u></a> The encryption algorithm.
public static final	<a href="#"><u>INVALID</u></a> The Constant INVALID. Value: <b>-1</b>
public	<a href="#"><u>protocolVersion</u></a> The protocol version.
public	<a href="#"><u>ptsAdjustment</u></a> The PTS adjustment.
public static final	<a href="#"><u>SIT_TABLE_ID</u></a> The Constant SIT_TABLE_ID. Value: <b>252</b>
public	<a href="#"><u>spliceDescriptors</u></a> The splice descriptors.

### Constructor Summary

public	<a href="#"><u>SpliceInformationTable</u></a> ( <a href="#"><u>MPEG2Section</u></a> section) Instantiates a new splice information table.
--------	--

## Method Summary

<a href="#"><u>SpliceCommand</u></a>	<a href="#"><u>getCommand()</u></a>
int	<a href="#"><u>getCwIndex()</u></a>
int	<a href="#"><u>getEncryptedCRC()</u></a>
int	<a href="#"><u>getEncryptionAlgorithm()</u></a>

String	<a href="#"><u>toString()</u></a>

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### AMF\_VERSION

```
public static final int AMF_VERSION
```

Constant value: **1**

### INVALID

```
public static final int INVALID
```

The Constant INVALID.  
Constant value: **-1**

### SIT\_TABLE\_ID

```
public static final int SIT_TABLE_ID
```

The Constant SIT\_TABLE\_ID.  
Constant value: **252**

(continued from last page)

---

## protocolVersion

```
public int protocolVersion
```

The protocol version.

---

## encryptedPacket

```
public boolean encryptedPacket
```

The encrypted packet.

---

## encryptionAlgorithm

```
public int encryptionAlgorithm
```

The encryption algorithm.

---

## ptsAdjustment

```
public long ptsAdjustment
```

The PTS adjustment.

---

## cwIndex

```
public int cwIndex
```

The CW index.

---

## command

```
public com.wowza.wms.transport.mpeg2.section.cue.SpliceCommand command
```

The command.

---

## spliceDescriptors

```
public java.util.List spliceDescriptors
```

The splice descriptors.

---

## encryptedCRC

```
public int encryptedCRC
```

The encrypted crc.

## Constructors

### SpliceInformationTable

```
public SpliceInformationTable(MPEG2Section section)
```

Instantiates a new splice information table.

**Parameters:**

section - the section

---

## Methods

### **getProtocolVersion**

```
public int getProtocolVersion()
```

### **isEncryptedPacket**

```
public boolean isEncryptedPacket()
```

### **getEncryptionAlgorithm**

```
public int getEncryptionAlgorithm()
```

### **getPtsAdjustment**

```
public long getPtsAdjustment()
```

### **getCwIndex**

```
public int getCwIndex()
```

### **getCommand**

```
public SpliceCommand getCommand()
```

### **getSpliceDescriptors**

```
public java.util.List getSpliceDescriptors()
```

### **getEncryptedCRC**

```
public int getEncryptedCRC()
```

### **serializeAMF**

```
public AMFDataObj serializeAMF(SpliceInformationTableSerializeAMFContext context)
```

(continued from last page)

## **toString**

```
public String toString()
```

## event

```
public com.wowza.wms.transport.mpeg2.section.cue.SpliceEvent event
```

The event.

## Constructors

### SpliceInsertCommand

```
public SpliceInsertCommand(MPEG2Section data)
```

Instantiates a new splice insert command.

**Parameters:**

data - the data

## Methods

### getEvent

```
public SpliceEvent getEvent()
```

---

### serializeAMF

```
public AMFDataObj serializeAMF(SpliceInformationTableSerializeAMFContext context)
```

---

### toString

```
public String toString()
```

## com.wowza.wms.transport.mpeg2.section.cue Class SpliceNullCommand

```

## com.wowza.wms.transport.mpeg2.section.cue Class SpliceTime

java.lang.Object

└--com.wowza.wms.transport.mpeg2.section.cue.SpliceTime

public class **SpliceTime**  
extends Object

The Class SpliceTime.

### Constructor Summary

public	<a href="#">SpliceTime</a> (int spliceTime) Instantiates a new splice time.
public	<a href="#">SpliceTime</a> ( <a href="#">MPEG2Section</a> data) Instantiates a new splice time.

### Method Summary

long	<a href="#">getSpliceTime</a> ()
boolean	<a href="#">isSpecified</a> ()
boolean	<a href="#">isUTC</a> ()
<a href="#">AMFDataObj</a>	<a href="#">serializeAMF</a> ( <a href="#">SpliceInformationTableSerializeAMFContext</a> context)
String	<a href="#">toString</a> ()

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### SpliceTime

public **SpliceTime**(int spliceTime)

Instantiates a new splice time.

**Parameters:**

spliceTime - the splice time

(continued from last page)

## SpliceTime

```
public SpliceTime(MPEG2Section data)
```

Instantiates a new splice time.

### Parameters:

data - the data

## Methods

### isSpecified

```
public boolean isSpecified()
```

### isUTC

```
public boolean isUTC()
```

### getSpliceTime

```
public long getSpliceTime()
```

### serializeAMF

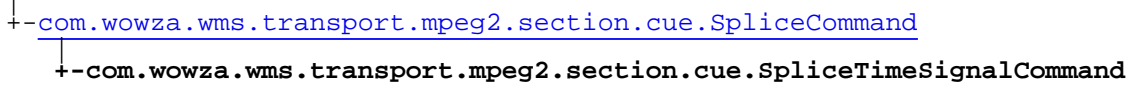

```
public AMFDataObj serializeAMF(SpliceInformationTableSerializeAMFContext context)
```

### toString

```
public String toString()
```

## com.wowza.wms.transport.mpeg2.section.cue Class SpliceTimeSignalCommand

java.lang.Object

public class **SpliceTimeSignalCommand**  
extends [SpliceCommand](#)

The Class SpliceTimeSignalCommand.

### Field Summary

public	<a href="#">time</a> The time.
--------	-----------------------------------

Fields inherited from class [com.wowza.wms.transport.mpeg2.section.cue.SpliceCommand](#)

[INVALID](#), [name](#), [SPLICE\\_COMMAND\\_BANDWIDTH\\_RES](#), [SPLICE\\_COMMAND\\_INSERT](#), [SPLICE\\_COMMAND\\_NULL](#), [SPLICE\\_COMMAND\\_SCHEDULE](#), [SPLICE\\_COMMAND\\_TIME\\_SIGNAL](#), [type](#)

### Constructor Summary

public	<a href="#">SpliceTimeSignalCommand</a> ( <a href="#">MPEG2Section</a> data) Instantiates a new splice time signal command.
--------	--

### Method Summary

<a href="#">SpliceTime</a>	<a href="#">getTime()</a>
<a href="#">AMFDataObj</a>	<a href="#">serializeAMF</a> ( <a href="#">SpliceInformationTableSerializeAMFContext</a> context)
String	<a href="#">toString()</a>

Methods inherited from class [com.wowza.wms.transport.mpeg2.section.cue.SpliceCommand](#)

[getName](#), [getType](#), [serializeAMF](#), [toString](#)

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Fields

(continued from last page)

## time

```
public com.wowza.wms.transport.mpeg2.section.cue.SpliceTime time
```

The time.

## Constructors

### SpliceTimeSignalCommand

```
public SpliceTimeSignalCommand(MPEG2Section data)
```

Instantiates a new splice time signal command.

**Parameters:**

data - the data

## Methods

### getTime

```
public SpliceTime getTime()
```

### serializeAMF

```
public AMFDataObj serializeAMF(SpliceInformationTableSerializeAMFContext context)
```

### toString

```
public String toString()
```

---

Package

**com.wowza.wms.util**

## com.wowza.wms.util

### Class RTPUtils

java.lang.Object

└─com.wowza.wms.util.RTPUtils

public class **RTPUtils**  
extends Object

#### Constructor Summary

public	<a href="#">RTPUtils()</a>
--------	----------------------------

#### Method Summary

static double[]	<a href="#">decodeRangeHeader</a> (String rangeStr) Decode RTP range header, Internal use.
static <a href="#">RTPStream</a>	<a href="#">decodeStreamInfo</a> ( <a href="#">IApplicationInstance</a> appInstance, <a href="#">RTPContext</a> context, String streamId, String streamInfo) Decode SDP info and create RTP stream
static <a href="#">RTPStream</a>	<a href="#">decodeStreamInfo</a> ( <a href="#">IApplicationInstance</a> appInstance, <a href="#">RTPStreamContext</a> rtpStreamContext, <a href="#">RTPContext</a> context, String streamId, String streamInfo) Decode SDP info and create RTP stream
static <a href="#">RTPStream</a>	<a href="#">decodeStreamInfo</a> ( <a href="#">RTPContext</a> context, String streamId, String streamInfo) Decode SDP info and create RTP stream
static byte[]	<a href="#">formatH264CodecConfig</a> (byte[] sps, java.util.List ppss, byte[] profileLevel) Format codec config info, Internal use.
static byte[]	<a href="#">formatH264CodecConfigPacket</a> (byte[] sps, java.util.List ppss, byte[] profileLevel) Format codec config info, Internal use.
static boolean	<a href="#">loadConfigFile</a> ( <a href="#">RTPContext</a> rtpContext, String fileURL) Load config file, Internal use.
static <a href="#">RTTPushPublishSession</a>	<a href="#">startRTTPull</a> ( <a href="#">IApplicationInstance</a> appInstance, String streamName, boolean streamPacketizer, String ipAddress, int streamPort) Start pushing an RTP stream
static <a href="#">RTTPushPublishSession</a>	<a href="#">startRTTPull</a> ( <a href="#">IApplicationInstance</a> appInstance, String streamName, boolean streamPacketizer, String ipAddress, int streamPort, boolean isRTPWrapped) Start pushing an RTP stream
static <a href="#">RTTPushPublishSession</a>	<a href="#">startRTTPull</a> ( <a href="#">IApplicationInstance</a> appInstance, String streamName, boolean streamPacketizer, String ipAddress, int audioPort, int videoPort) Start pushing an RTP stream

static <a href="#">RTPPushPublishSession</a>	<a href="#">startRTPPull</a> ( <a href="#">IApplicationInstance</a> appInstance, String streamName, boolean streamPacketizer, String ipAddress, int audioPort, int videoPort, boolean isRTPWrapped) Start pushing an RTP stream
static <a href="#">RTPPushPublishSession</a>	<a href="#">startRTPPull</a> ( <a href="#">IApplicationInstance</a> appInstance, String streamName, <a href="#">RTPDestination</a> rtpDestination) Start pushing an RTP stream
static void	<a href="#">stopRTPPull</a> ( <a href="#">RTPPushPublishSession</a> rtpPushPublishSession) Stop pushing an RTP stream
static String	<a href="#">updateSDPDestination</a> ( <a href="#">RTPDestination</a> rtpDestination, String sdpData) Update SDP data information with RTP destination information
static void	<a href="#">writeCodecConfig</a> (RTPTrack rtpTrack, int codecId, long adjTimecode, byte[] codecConfig)
static void	<a href="#">writeCodecConfig</a> (RTPTrack rtpTrack, long adjTimecode, byte[] codecConfig) Write codec config information, Internal use.
static void	<a href="#">writeCodecConfig</a> (RTPTrack rtpTrack, long adjTimecode, byte[] codecConfig, int codec)

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### RTPUtils

```
public RTPUtils()
```

## Methods

### updateSDPDestination

```
public static String updateSDPDestination(RTPDestination rtpDestination, String sdpData)
```

Update SDP data information with RTP destination information

#### Parameters:

rtpDestination - RTP destination

sdpData - SDP data

#### Returns:

modified SDP data

(continued from last page)

## decodeRangeHeader

```
public static double[] decodeRangeHeader(String rangeStr)
```

Decode RTP range header, Internal use.

**Parameters:**

rangeStr

**Returns:**

range values

---

## stopRTPPull

```
public static void stopRTPPull(RTPPushPublishSession rtpPushPublishSession)
```

Stop pushing an RTP stream

**Parameters:**

rtpPushPublishSession - RTP push session

---

## startRTPPull

```
public static RTPPushPublishSession startRTPPull(IApplicationInstance appInstance,  
String streamName,  
boolean streamPacketizer,  
String ipAddress,  
int streamPort,  
boolean isRTPWrapped)
```

Start pushing an RTP stream

**Parameters:**

appInstance - application instance  
streamName - stream name  
streamPacketizer - stream packetizer  
ipAddress - IP address  
streamPort - stream port  
isRTPWrapped - is RTP wrapped

**Returns:**

RTP push session

---

## startRTPPull

```
public static RTPPushPublishSession startRTPPull(IApplicationInstance appInstance,  
String streamName,  
boolean streamPacketizer,  
String ipAddress,  
int streamPort)
```

Start pushing an RTP stream

**Parameters:**

appInstance - application instance  
streamName - stream name  
streamPacketizer - stream packetizer  
ipAddress - IP address  
streamPort - stream port

(continued from last page)

**Returns:**

RTP push session

---

**startRTPPull**

```
public static RTTPushPublishSession startRTPPull(IApplicationInstance appInstance,  
    String streamName,  
    boolean streamPacketizer,  
    String ipAddress,  
    int audioPort,  
    int videoPort)
```

Start pushing an RTP stream

**Parameters:**

appInstance - application instance  
streamName - stream name  
streamPacketizer - stream packetizer  
ipAddress - IP address  
audioPort - audio port  
videoPort - video port

**Returns:**

RTP push session

---

**startRTPPull**

```
public static RTTPushPublishSession startRTPPull(IApplicationInstance appInstance,  
    String streamName,  
    boolean streamPacketizer,  
    String ipAddress,  
    int audioPort,  
    int videoPort,  
    boolean isRTPWrapped)
```

Start pushing an RTP stream

**Parameters:**

appInstance - application instance  
streamName - stream name  
streamPacketizer - stream packetizer  
ipAddress - IP address  
audioPort - audio port  
videoPort - video port  
isRTPWrapped - is RTP wrapped

**Returns:**

RTP push session

---

**startRTPPull**

```
public static RTTPushPublishSession startRTPPull(IApplicationInstance appInstance,  
    String streamName,  
    RTPDestination rtpDestination)
```

Start pushing an RTP stream

**Parameters:**

appInstance - application instance  
streamName - stream name  
rtpDestination - RTP destination

(continued from last page)

**Returns:**

RTP push session

---

**writeCodecConfig**

```
public static void writeCodecConfig(RTPTrack rtpTrack,
    int codecId,
    long adjTimecode,
    byte[] codecConfig)
```

---

**writeCodecConfig**

```
public static void writeCodecConfig(RTPTrack rtpTrack,
    long adjTimecode,
    byte[] codecConfig)
```

Write codec config information, Internal use.

**Parameters:**

rtpTrack - RTP track  
adjTimecode - timecode (milliseconds)  
codecConfig - codec config

---

**writeCodecConfig**

```
public static void writeCodecConfig(RTPTrack rtpTrack,
    long adjTimecode,
    byte[] codecConfig,
    int codec)
```

---

**loadConfigFile**

```
public static boolean loadConfigFile(RTPContext rtpContext,
    String fileURL)
```

Load config file, Internal use.

**Parameters:**

rtpContext  
fileURL

---

**decodeStreamInfo**

```
public static RTPStream decodeStreamInfo(RTPContext context,
    String streamId,
    String streamInfo)
```

Decode SDP info and create RTP stream

**Parameters:**

context - RTP context  
streamId - stream id  
streamInfo - SDP data

**Returns:**

(continued from last page)

## RTP stream

---

## decodeStreamInfo

```
public static RTPStream decodeStreamInfo(IApplicationInstance appInstance,  
    RTPContext context,  
    String streamId,  
    String streamInfo)
```

Decode SDP info and create RTP stream

**Parameters:**

appInstance - app instance  
context - rtp context  
streamId - stream id  
streamInfo - stream info (SDP data)

**Returns:**

rtp stream

---

## decodeStreamInfo

```
public static RTPStream decodeStreamInfo(IApplicationInstance appInstance,  
    RTPStreamContext rtpStreamContext,  
    RTPContext context,  
    String streamId,  
    String streamInfo)
```

Decode SDP info and create RTP stream

**Parameters:**

appInstance - app instance  
rtpStreamContext - rtp stream context  
context - rtp context  
streamId - stream id  
streamInfo - stream info (SDP data)

**Returns:**

rtp stream

---

## formatH264CodecConfigPacket

```
public static byte[] formatH264CodecConfigPacket(byte[] sps,  
    java.util.List ppss,  
    byte[] profileLevel)
```

Format codec config info, Internal use.

**Parameters:**

sps  
ppss  
profileLevel

**Returns:**

bytes

---

(continued from last page)

## formatH264CodecConfig

```
public static byte[] formatH264CodecConfig(byte[] sps,  
      java.util.List ppss,  
      byte[] profileLevel)
```

Format codec config info, Internal use.

### Parameters:

sps  
ppss  
profileLevel

### Returns:

bytes

## com.wowza.wms.util Class StreamUtils

java.lang.Object

└─com.wowza.wms.util.StreamUtils

public class **StreamUtils**  
extends Object

### Constructor Summary

public	<a href="#">StreamUtils()</a>
--------	-------------------------------

### Method Summary

static int	<a href="#">directOutput</a> (byte[] dataBuffer, int[] headerValues, boolean isAbsTimecode, int src, java.io.OutputStream out, <a href="#">AMFObj</a> wmsObj, byte[] workBuffer, int chunkSize) Direct output, Internal use.
static double	<a href="#">getStreamBitrate</a> ( <a href="#">IApplicationInstance</a> appInstance, String streamName)
static double	<a href="#">getStreamBitrate</a> ( <a href="#">IMediaStream</a> stream) Get the approximate bitrate of a media file in bits/per-second.
static double	<a href="#">getStreamLength</a> ( <a href="#">IApplicationInstance</a> appInstance, String streamName) Get the duration of a media file in seconds.
static double	<a href="#">getStreamLength</a> ( <a href="#">IMediaStream</a> stream) Get the duration of a media file in seconds.
static boolean	<a href="#">loadConfigFile</a> ( <a href="#">StreamList</a> streamDefs, String fileURL) Load Streams.xml, Internal use.
static int	<a href="#">packetOutput</a> (java.io.OutputStream out, <a href="#">IMediaStream</a> stream, <a href="#">AMFPacket</a> packet, long timecode, <a href="#">AMFObj</a> wmsObj, byte[] workBuffer, int chunkSize) Packet output.
static int	<a href="#">packetOutput</a> (java.io.OutputStream out, <a href="#">IMediaStream</a> stream, <a href="#">AMFPacket</a> packet, long timecode, <a href="#">AMFObj</a> wmsObj, byte[] workBuffer, int chunkSize, boolean referenceWrite) Packet output.

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

(continued from last page)

## StreamUtils

```
public StreamUtils()
```

## Methods

### getStreamLength

```
public static double getStreamLength(IMediaStream stream)
```

Get the duration of a media file in seconds. This will work correctly with all RandomAccessReaders and caching technology

**Parameters:**

stream - stream

**Returns:**

duration in seconds

### getStreamBitrate

```
public static double getStreamBitrate(IMediaStream stream)
```

Get the approximate bitrate of a media file in bits/per-second. This will work correctly with all RandomAccessReaders and caching technology.

**Parameters:**

stream - stream

**Returns:**

bitrate in bits/per-second

### getStreamLength

```
public static double getStreamLength(IApplicationInstance appInstance,  
String streamName)
```

Get the duration of a media file in seconds. This will work correctly with all RandomAccessReaders and caching technology

**Parameters:**

appInstance - application instance  
streamName - stream name

**Returns:**

duration in seconds

### getStreamBitrate

```
public static double getStreamBitrate(IApplicationInstance appInstance,  
String streamName)
```

(continued from last page)

## directOutput

```
public static int directOutput(byte[] dataBuffer,  
    int[] headerValues,  
    boolean isAbsTimecode,  
    int src,  
    java.io.OutputStream out,  
    AMFObj wmsObj,  
    byte[] workBuffer,  
    int chunkSize)
```

Direct output. Internal use.

### Parameters:

dataBuffer  
headerValues  
isAbsTimecode  
src  
out  
wmsObj  
workBuffer  
chunkSize

### Returns:

c

---

## packetOutput

```
public static int packetOutput(java.io.OutputStream out,  
    IMediaStream stream,  
    AMFPacket packet,  
    long timecode,  
    AMFObj wmsObj,  
    byte[] workBuffer,  
    int chunkSize)
```

Packet output. Internal use.

### Parameters:

out  
stream  
packet  
timecode  
wmsObj  
workBuffer  
chunkSize

### Returns:

bytes

---

## packetOutput

```
public static int packetOutput(java.io.OutputStream out,  
    IMediaStream stream,  
    AMFPacket packet,  
    long timecode,  
    AMFObj wmsObj,  
    byte[] workBuffer,  
    int chunkSize,  
    boolean referenceWrite)
```

Packet output. Internal use.

(continued from last page)

**Parameters:**

out  
stream  
packet  
timecode  
wmsObj  
workBuffer  
chunkSize  
referenceWrite

**Returns:**

bytes

---

## loadConfigFile

```
public static boolean loadConfigFile(StreamList streamDefs,  
    String fileURL)
```

Load Streams.xml, Internal use.

**Parameters:**

streamDefs  
fileURL

---

Package

**com.wowza.wms.util.crontab**

## com.wowza.wms.util.crontab Class CrontabEvent

java.lang.Object

└─com.wowza.wms.util.crontab.CrontabEvent

All Implemented Interfaces:

Comparable

public class **CrontabEvent**  
extends Object  
implements Comparable

Holds an event's schedule and is responsible for calculating event activation.

### Field Summary

public static final	<a href="#">DAY</a> Value: <b>2</b>
public static	<a href="#">DT_FORMAT</a>
public static final	<a href="#">HOUR</a> Value: <b>1</b>
public static final	<a href="#">MINUTE</a> Value: <b>0</b>
public static final	<a href="#">MONTH</a> Value: <b>3</b>
public static final	<a href="#">WEEKDAY</a> Value: <b>5</b>
public static final	<a href="#">YEAR</a> Value: <b>4</b>

### Constructor Summary

public	<a href="#">CrontabEvent</a> ( )
--------	----------------------------------

### Method Summary

int	<a href="#">compareTo</a> ( <a href="#">CrontabEvent</a> o) Allows CronEvents to be sorted via Java Sort Class.
void	<a href="#">dump</a> ( ) dumps this event's information to the console

String	<a href="#"><u>getError()</u></a>
int	<a href="#"><u>getErrorField()</u></a>
<a href="#"><u>ICrontabEventHandler</u></a>	<a href="#"><u>getEventHandler()</u></a>
String	<a href="#"><u>getEventStr()</u></a>
CrontabField	<a href="#"><u>getField()</u></a> (int whichField)
org.joda.time.MutableDateTime	<a href="#"><u>getLastRun()</u></a>
org.joda.time.MutableDateTime	<a href="#"><u>getNextRun()</u></a>
String	<a href="#"><u>getTarget()</u></a>
boolean	<a href="#"><u>isDebugEnabled()</u></a>
boolean	<a href="#"><u>isExpired()</u></a> Indicates whether or not all execution dates for this event occur in the past
boolean	<a href="#"><u>isMatch()</u></a> (org.joda.time.MutableDateTime date) Determines if this event will fire on the date passed in
void	<a href="#"><u>setDebug()</u></a> (boolean debug) turns on/off debug logging
void	<a href="#"><u>setError()</u></a> (String error)
void	<a href="#"><u>setErrorField()</u></a> (int errorField)
void	<a href="#"><u>setEventHandler()</u></a> ( <a href="#"><u>ICrontabEventHandler</u></a> handler)
void	<a href="#"><u>setEventStr()</u></a> (String entry)
void	<a href="#"><u>setField()</u></a> (int whichField, CrontabField field)
void	<a href="#"><u>setLastRun()</u></a> Sets the last run time to now
void	<a href="#"><u>setLastRun()</u></a> (org.joda.time.MutableDateTime date)
void	<a href="#"><u>setTarget()</u></a> (String target)
boolean	<a href="#"><u>start()</u></a> Starts this events timer
void	<a href="#"><u>stop()</u></a> stops this events timer

Methods inherited from class java.lang.Object

```
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait
```

Methods inherited from interface `java.lang.Comparable`

```
compareTo
```

## Fields

### DT\_FORMAT

```
public static org.joda.time.format.DateTimeFormatter DT_FORMAT
```

### MINUTE

```
public static final int MINUTE
```

Constant value: **0**

### HOURL

```
public static final int HOUR
```

Constant value: **1**

### DAY

```
public static final int DAY
```

Constant value: **2**

### MONTH

```
public static final int MONTH
```

Constant value: **3**

### YEAR

```
public static final int YEAR
```

Constant value: **4**

### WEEKDAY

```
public static final int WEEKDAY
```

Constant value: **5**

## Constructors

### CrontabEvent

```
public CrontabEvent()
```

## Methods

### start

```
public boolean start()
```

Starts this events timer

**Returns:**

true - if timer is started, else false

---

### stop

```
public void stop()
```

stops this events timer

---

### isMatch

```
public boolean isMatch(org.joda.time.MutableDateTime date)
```

Determines if this event will fire on the date passed in

**Parameters:**

date

**Returns:**

boolean

---

### setField

```
public void setField(int whichField,  
    CrontabField field)
```

---

### getField

```
public CrontabField getField(int whichField)
```

---

### setTarget

```
public void setTarget(String target)
```

---

(continued from last page)

---

**getTarget**

```
public String getTarget()
```

---

**setEventStr**

```
public void setEventStr(String entry)
```

---

**getEventStr**

```
public String getEventStr()
```

---

**getNextRun**

```
public org.joda.time.MutableDateTime getNextRun()
```

---

**getLastRun**

```
public org.joda.time.MutableDateTime getLastRun()
```

---

**setLastRun**

```
public void setLastRun(org.joda.time.MutableDateTime date)
```

---

**getError**

```
public String getError()
```

---

**setError**

```
public void setError(String error)
```

---

**getErrorField**

```
public int getErrorField()
```

---

**setErrorField**

```
public void setErrorField(int errorField)
```

---

(continued from last page)

---

## setLastRun

```
public void setLastRun()
```

Sets the last run time to now

---

## setDebug

```
public void setDebug(boolean debug)
```

turns on/off debug logging

**Parameters:**

debug - - true/false

---

## isDebugEnabled

```
public boolean isDebugEnabled()
```

---

## setEventHandler

```
public void setEventHandler(ICrontabEventHandler handler)
```

---

## getEventHandler

```
public ICrontabEventHandler getEventHandler()
```

---

## isExpired

```
public boolean isExpired()
```

Indicates whether or not all execution dates for this event occur in the past

**Returns:**

true/false

---

## compareTo

```
public int compareTo(CrontabEvent o)
```

Allows CronEvents to be sorted via Java Sort Class. Compares nextRun dates of two CronEvents where earlier events are considered "less" than later events, (e.g. today < tomorrow) and nulls are "greater" than events with dates (e.g. tomorrow < null) This provides the logic to sort events by soonest to latest with nulls at the end

**Parameters:**

o - - CronEvent to compare this event to

**Returns:**

-1,0,1 - if equal, if this event is greater than

(continued from last page)

**dump**

```
public void dump()
```

    dumps this event's information to the console

---

## com.wowza.wms.util.crontab Interface ICrontabEventHandler

---

public interface **ICrontabEventHandler**  
extends

EventHandler functions are called from a Java timer task context and therefore should execute very quickly so as not to delay execution of subsequent timers. If there is heavy processing which needs to take place, the implementation for these functions should spawn a thread to do it.

---

### Method Summary

void	<a href="#">onCronEvent</a> ( <a href="#">CrontabEvent</a> event)
------	---

---

### Methods

#### onCronEvent

public void **onCronEvent**([CrontabEvent](#) event)

---

Package

**com.wowza.wms.vhost**

## com.wowza.wms.vhost Class HostPort

java.lang.Object

└─com.wowza.wms.vhost.HostPort

public class **HostPort**  
extends Object

HostPort: data object that describes a socket connection. The address can be defined by ipAddress or by domainName. It can also contain a reference to an SSLFactory class that can be used to create a secure connection to the server.

### Field Summary

public static final	<a href="#">TYPE_ADMIN</a> Value: <b>Admin</b>
public static final	<a href="#">TYPE_STREAMING</a> Value: <b>Streaming</b>

### Constructor Summary

public	<a href="#">HostPort()</a> Create an empty HostPort object

String	<a href="#"><code>toString</code></a> (boolean mBeanSafe) Return object as formatted string

#### Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Fields

### TYPE\_ADMIN

```
public static final java.lang.String TYPE_ADMIN
```

Constant value: **Admin**

### TYPE\_STREAMING

```
public static final java.lang.String TYPE_STREAMING
```

Constant value: **Streaming**

## Constructors

### HostPort

```
public HostPort()
```

Create an empty HostPort object

## Methods

### setDomainName

```
public void setDomainName(String domainName)
```

Set domainName. A domainName of \* defines a local connection.

#### Parameters:

domainName - domainName like www.mycompany.com or \* for local

---

## getAddress

```
public java.net.InetAddress getAddress()
```

Get the ipAddress as an InetAddress object

**Returns:**

ipAddress as an InetAddress object. At this point the domainName (if specified) will be resolved.

---

## getAddressStr

```
public String getAddressStr()
```

Get a String representation of the address

**Returns:**

String representation of the address/domainName. If \* it will return [any]

---

## getAddressRawStr

```
public String getAddressRawStr()
```

---

## setIpAddress

```
public void setIpAddress(String ipAddress)
```

Set ipAddress for object. A ipAddress of \* defines a local connection.

**Parameters:**

ipAddress - ipAddress like 127.0.0.1 or \* for local

---

## getPort

```
public int getPort()
```

Get port

**Returns:**

port

---

## setPort

```
public void setPort(int port)
```

Set port

**Parameters:**

port - port

---

## getSslFactoryClass

```
public String getSslFactoryClass()
```

Get full class name or SSLFactory class

---

---

(continued from last page)

**Returns:**

full class name or SSLFactory or "" if not specified

---

**setSslFactoryClass**

```
public void setSslFactoryClass(String sslFactoryClass)
```

Set full class name of SSLFactory class

**Parameters:**

sslFactoryClass - full class name or SSLFactory or "" if not specified

---

**getProcessorCount**

```
public int getProcessorCount( )
```

Get the number of threads to use to service this incoming port

**Returns:**

number of processor threads

---

**setProcessorCount**

```
public void setProcessorCount(int processorCount)
```

Set the number of threads to use to service this incoming port

**Parameters:**

processorCount - number of processor threads

---

**toString**

```
public String toString(boolean mBeanSafe)
```

Return object as formatted string

**Parameters:**

mBeanSafe - make the name safe for JMX management interface

**Returns:**

formmatted string

---

**toString**

```
public String toString( )
```

Return object as formatted string

**Returns:**

formmatted string

---

**getConfiguration**

```
public HostPortConfig getConfiguration( )
```

Get the socket configuration

**Returns:**

(continued from last page)

socket configuration

---

## configureSocketAcceptor

```
public void  
configureSocketAcceptor(org.apache.mina.transport.socket.nio.SocketAcceptorConfig  
socketConfig)
```

Configure a socketAcceptor

### Parameters:

socketConfig - socket acceptor

---

## getHttpProviders

```
public java.util.List getHttpProviders()
```

---

## addHttpProvider

```
public void addHttpProvider(IHTTPProvider httpProvider)
```

---

## addHttpProvider

```
public void addHttpProvider(IHTTPProvider2 httpProvider)
```

---

## addHttpProvider

```
public void addHttpProvider(int index,  
    IHTTPProvider2 httpProvider)
```

---

## size

```
public int size(int index,  
    IHTTPProvider2 httpProvider)
```

---

## isSuspended

```
public boolean isSuspended()
```

---

## setSuspended

```
public void setSuspended(boolean isSuspended)
```

---

(continued from last page)

---

## getHTTPStreamerAdapterIDs

```
public java.util.List getHTTPStreamerAdapterIDs()
```

---

## addHTTPStreamerAdapterID

```
public void addHTTPStreamerAdapterID(String ID)
```

---

## isSecure

```
public boolean isSecure()
```

---

## getSSLConfig

```
public HostPortSSLConfig getSSLConfig()
```

---

## setSSLConfig

```
public void setSSLConfig(HostPortSSLConfig sslConfig)
```

---

## getHTTPIdentResponse

```
public String getHTTPIdentResponse()
```

---

## setHTTPIdentResponse

```
public void setHTTPIdentResponse(String httpIdentResponse)
```

---

## getHTTPIdent2Response

```
public String getHTTPIdent2Response()
```

---

## setHTTPIdent2Response

```
public void setHTTPIdent2Response(String httpIdent2Response)
```

---

## getTypeStr

```
public String getTypeStr()
```

---

(continued from last page)

---

## setTypeStr

```
public void setTypeStr(String typeStr)
```

---

## getName

```
public String getName()
```

---

## setName

```
public void setName(String name)
```

---

## isAdmin

```
public boolean isAdmin()
```

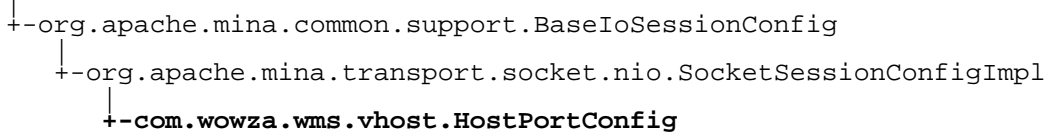

---

## isStreaming

```
public boolean isStreaming()
```

## com.wowza.wms.vhost Class HostPortConfig

java.lang.Object

### All Implemented Interfaces:

## com.wowza.wms.vhost Class HostPortList

java.lang.Object

└--com.wowza.wms.vhost.HostPortList

```
public class HostPortList
extends Object
```

HostPortList: data object that contains a collection of HostPort objects.

### Constructor Summary

public	<a href="#">HostPortList</a> () Create empty HostPortList
--------	--

### Method Summary

void	<a href="#">add</a> ( <a href="#">HostPort</a> hostPort) Add HostPort object
<a href="#">HostPort</a>	<a href="#">get</a> (int index) Get HostPort object at index, null if out of bounds
int	<a href="#">size</a> () Get number of HostPort objects

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### HostPortList

```
public HostPortList()
```

Create empty HostPortList

### Methods

#### add

```
public void add(HostPort hostPort)
```

Add HostPort object

#### Parameters:

hostPort

---

## size

```
public int size()
```

Get number of HostPort objects

**Returns:**

number of HostPort objects

---

## get

```
public HostPort get(int index)
```

Get HostPort object at index, null if out of bounds

**Parameters:**

index - index

**Returns:**

HostPort object at index, null if out of bounds

## com.wowza.wms.vhost Class HostPortSSLCertificateConfig

java.lang.Object

└─com.wowza.wms.vhost.HostPortSSLCertificateConfig

public class **HostPortSSLCertificateConfig**

void	<a href="#"><u>setDomainToKeyStoreMapPathStr()</u></a> (String domainToKeyStoreMapPathStr)
void	<a href="#"><u>setKeyStorePass()</u></a> (String keystorePass)
void	<a href="#"><u>setKeyStorePath()</u></a> (String keyStorePath)

void	<a href="#"><code>setKeyStoreType</code></a> (String keystoreType)
void	<a href="#"><code>setProtocols</code></a> (String[] protocols)
void	<a href="#"><code>setSSLProtocol</code></a> (String sslProtocol)

Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Constructors

### HostPortSSLConfig

```
public HostPortSSLConfig()
```

## Methods

### getUniqueId

```
public String getUniqueId()
```

### getKeyStorePath

```
public String getKeyStorePath()
```

### setKeyStorePath

```
public void setKeyStorePath(String keyStorePath)
```

### getKeyStorePass

```
public String getKeyStorePass()
```

### setKeyStorePass

```
public void setKeyStorePass(String keystorePass)
```

(continued from last page)

---

## getKeyStoreType

```
public String getKeyStoreType()
```

---

## setKeyStoreType

```
public void setKeyStoreType(String keystoreType)
```

---

## getSSLProtocol

```
public String getSSLProtocol()
```

---

## setSSLProtocol

```
public void setSSLProtocol(String sslProtocol)
```

---

## getAlgorithm

```
public String getAlgorithm()
```

---

## setAlgorithm

```
public void setAlgorithm(String algorithm)
```

---

## getCipherSuites

```
public String[] getCipherSuites()
```

---

## setCipherSuites

```
public void setCipherSuites(String[] cipherSuites)
```

---

## getProtocols

```
public String[] getProtocols()
```

---

## setProtocols

```
public void setProtocols(String[] protocols)
```

---

(continued from last page)

---

## getCertificateConfig

```
public HostPortSSLCertificateConfig getCertificateConfig()
```

---

## getDomainToKeyStoreMapPathStr

```
public String getDomainToKeyStoreMapPathStr()
```

---

## setDomainToKeyStoreMapPathStr

```
public void setDomainToKeyStoreMapPathStr(String domainToKeyStoreMapPathStr)
```

## com.wowza.wms.vhost Interface IAcceptorNotify

public interface **IAcceptorNotify**  
extends

IAcceptorNotify: listener interface used by IVHost addAcceptorListener

### Method Summary

void	<a href="#"><u>onAcceptorCreate</u></a> ( <a href="#"><u>HostPort</u></a> hostPort, java.util.Map acceptorMap) Triggered when a new acceptor is created
void	<a href="#"><u>onAcceptorDestroy</u></a> ( <a href="#"><u>HostPort</u></a> hostPort, java.util.Map acceptorMap) Triggered when a new acceptor is deleted

### Methods

#### onAcceptorCreate

```
public void onAcceptorCreate(HostPort hostPort,  
                             java.util.Map acceptorMap)
```

Triggered when a new acceptor is created

**Parameters:**

hostPort - HostPort object

acceptorMap - Map of acceptors

#### onAcceptorDestroy

```
public void onAcceptorDestroy(HostPort hostPort,  
                               java.util.Map acceptorMap)
```

Triggered when a new acceptor is deleted

**Parameters:**

hostPort - HostPort object

acceptorMap - Map of acceptors

## com.wowza.wms.vhost Interface IVHost

public interface **IVHost**  
extends

IVHost: public interface to VHost object.

### Field Summary

public static final	<a href="#">ACCEPTORS_ACCEPTOR</a> Acceptor types: acceptor Value: <b>acceptor</b>
public static final	<a href="#">ACCEPTORS_HANDLERADAPTER</a> Acceptor types: handler Value: <b>handlerAdapter</b>
public static final	<a href="#">CODEC_AUDIO_AAC</a> Value: <b>10</b>
public static final	<a href="#">CODEC_AUDIO_AC3</a> Value: <b>1</b>
public static final	<a href="#">CODEC_AUDIO_ALS</a> Value: <b>13</b>
public static final	<a href="#">CODEC_AUDIO_G711_ALAW</a> Value: <b>7</b>
public static final	<a href="#">CODEC_AUDIO_G711_MULAW</a> Value: <b>8</b>
public static final	<a href="#">CODEC_AUDIO_MP3</a> Value: <b>2</b>
public static final	<a href="#">CODEC_AUDIO_MP3_8</a> Value: <b>15</b>
public static final	<a href="#">CODEC_AUDIO_NELLYMOSER</a> Value: <b>6</b>
public static final	<a href="#">CODEC_AUDIO_NELLYMOSER_16MONO</a> Value: <b>4</b>
public static final	<a href="#">CODEC_AUDIO_NELLYMOSER_8MONO</a> Value: <b>5</b>

public static final	<a href="#">CODEC_AUDIO_OPUS</a> Value: <b>12</b>
public static final	<a href="#">CODEC_AUDIO_PCM_BE</a> Value: <b>0</b>

public static final	<a href="#">VHOST_DEFAULT_HTTP_PERSISTENT</a> Value: <b>false</b>

## Method Summary

void	<a href="#">addAcceptorListener</a> ( <a href="#">IAcceptorNotify</a> acceptorListener) Add acceptor listener.
void	<a href="#">addApplicationListener</a> ( <a href="#">IApplicationNotify</a> applicationListener) Add application listener.
void	<a href="#">addIdleWorkerListener</a> ( <a href="#">IIdleWorkerNotify</a> idleWorkerListener) Add idleWorker listener.
void	<a href="#">addStartupStream</a> (StartupStream startupStream) Add a stream to the list of streams to start and virtual host startup
boolean	<a href="#">applicationExists</a> (String name) Return true if an application folder exists for this application name
void	<a href="#">closeHostPort</a> ( <a href="#">HostPort</a> hostPort, boolean isSuspend) Close an individual HostPort
<a href="#">IApplication</a>	<a href="#">getApplication</a> (String applicationName) Get application by name.
java.util.List	<a href="#">getApplicationFolderNames</a> () Get a list of application folder names
edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock	<a href="#">getApplicationLock</a> () Get the object used in synchronized statements to lock and application.
java.util.List	<a href="#">getApplicationNames</a> () Get a list of application names

int	<a href="#"><u>getApplicationTimeout()</u></a> Get application time out (milliseconds).
AuthenticationList	<a href="#"><u>getAuthenticationList()</u></a> Get the list of available authentication methods
CEACaptionConversionContext	<a href="#"><u>getCEACaptionConversionContext()</u></a> Get CEACaptionConversionContextMP3 tag map attached to vHost (CEACaptionConversion.xml).
<a href="#"><u>IClient</u></a>	<a href="#"><u>getClient(int clientId)</u></a> Get client by client id.
<a href="#"><u>IClient</u></a>	<a href="#"><u>getClient(int clientId, boolean create)</u></a> Get client by client id and create if does not exist.
int	<a href="#"><u>getClientCount()</u></a> Get number of clients connected to this vHost.
int	<a href="#"><u>getClientIdleFrequency()</u></a> Get default client idle frequency (milliseconds)
int	<a href="#"><u>getClientTimeout()</u></a> Get client timeout.
<a href="#"><u>ConnectionCounter</u></a>	<a href="#"><u>getConnectionCounter()</u></a> Get vHost connection counter.
ConnectionCounterSimple	<a href="#"><u>getConnectionCounter(int counterIndex)</u></a> Get vHost connection counter for a specific technology (see IVHost.COUNTER_*)
int	<a href="#"><u>getConnectionLimit()</u></a> Get vHost connection limit.
int	<a href="#"><u>getCoreHandlerPoolSize()</u></a> Get the handler core thread pool size.
int	<a href="#"><u>getCoreTransportPoolSize()</u></a> Get the transport core thread pool size.
String	<a href="#"><u>getDateStarted()</u></a> Get date and time the server was started.
DomainToKeyStoreMapList	<a href="#"><u>getDomainToKeyStoreMapList()</u></a> Get the SSL certificate map list.
DvrRecorderList	<a href="#"><u>getDvrRecorderList()</u></a> Get the DvrRecorderList
DvrStoreList	<a href="#"><u>getDvrStoreList()</u></a> Get the list of DVR Stores
java.util.Properties	<a href="#"><u>getDynamicLogProperties()</u></a> Get the dynamic log properties defined at the vhost level in conf/log4j.properties
int	<a href="#"><u>getFileIOPoolSize()</u></a> Get the default file io pool size.
<a href="#"><u>ThreadPool</u></a>	<a href="#"><u>getHandlerThreadPool()</u></a> Get the VHost handler thread pool.

String	<a href="#"><u>getHomePath()</u></a> Get vHost configuration path.
<a href="#"><u>HostPortList</u></a>	<a href="#"><u>getHostPortsList()</u></a> Get list of host port definitions for vHost.
boolean	<a href="#"><u>getHTTPPersistentRejectInvalid()</u></a> Get HTTPPersistent rejection status.
HTTPProviderContext	<a href="#"><u>getHTTPProviderContext()</u></a> Get the HTTPProvider Context
<a href="#"><u>IHTTPStreamerAdapter</u></a>	<a href="#"><u>getHTTPStreamerAdapter(String ID)</u></a> Get an HTTPStreamerAdapter by ID
java.util.List	<a href="#"><u>getHTTPStreamerAdapterIDs()</u></a> Get a list of HTTPStreamerAdapter IDs
HTTPStreamerContext	<a href="#"><u>getHTTPStreamerContext()</u></a> Get the HTTPStreamer (Cupertino Streaming and Silverlight Smooth Streaming) host context
HTTPStreamerList	<a href="#"><u>getHTTPStreamerList()</u></a> Get the list of HTTPStreamers
int	<a href="#"><u>getHTTPStreamerMaxPathLen()</u></a> Get the max HTTP streamer path length
<a href="#"><u>IVHostHTTPStreamerRequestValidator</u></a>	<a href="#"><u>getHTTPStreamerRequestValidator()</u></a> Get the HTTP streamer request validator
int	<a href="#"><u>getIdleCheckFrequency()</u></a> Get idle check frequency (milliseconds)
int	<a href="#"><u>getIdleMinimumWaitTime()</u></a> Get the minimum time (milliseconds) the idle worker thread will sleep before generating idle events
int	<a href="#"><u>getIdleWorkerCount()</u></a> Get number of threads used to generate idle events
IdleWorkersUtil	<a href="#"><u>getIdleWorkers()</u></a> Get the idle worker utility
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getIoPerformanceCounter()</u></a> Get vHost IO performance counter.
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getIoPerformanceCounter(int counterIndex)</u></a> Get vHost IO performance counter for a specific technology (see IVHost.COUNTER_*)
IOScheduler	<a href="#"><u>getIOScheduler()</u></a> Get IO scheduler for vHost.
int	<a href="#"><u>getKeepAliveTimeout()</u></a> Get the RTMPT connection keep alive timeout
LiveStreamPacketizerList	<a href="#"><u>getLiveStreamPacketizerList()</u></a> Get the LiveStreamPacketizerList

<a href="#">ILiveStreamRecordManager</a>	<a href="#">getLiveStreamRecordManager()</a> Returns the LiveStreamRecordManager associated with this vhost This object contains the active LiveStreamRecorders
LiveStreamTranscoderList	<a href="#">getLiveStreamTranscoderList()</a> Get the LiveStreamTranscoderList
long	<a href="#">getLiveStreamTranscoderSessionCount()</a> Get the current number of live stream transcoder sessions.
<a href="#">WMSProperties</a>	<a href="#">getManagerProperties()</a> Get VHost's manager's properties collection
int	<a href="#">getMaximumPendingReadBytes()</a> Set maximum number of bytes a client connection can have waiting to be written before the connection is terminated.
int	<a href="#">getMaximumPendingWriteBytes()</a> Get maximum number a bytes a client connection can have waiting to be sent before the connection is terminated.
int	<a href="#">getMaximumSetBufferTime()</a> Get maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call.
<a href="#">MediaCasterList</a>	<a href="#">getMediaCasterList()</a> Get the list of media caster definitions (MediaCaster.xml)
<a href="#">MediaCasterSettings</a>	<a href="#">getMediaCasterSettings()</a> Get the media caster settings
int	<a href="#">getMediaReaderContentType()</a> (String mediaType) Get the content type of a media stream name prefix (see IMediaReader.CONTENTTYPE_*)
MediaReaderList	<a href="#">getMediaReaders()</a> Get the media readers attached to vHost (MediaReaders.xml).
MediaWriterList	<a href="#">getMediaWriters()</a> Get the media writers attached to vHost (MediaWriters.xml).
java.util.Map	<a href="#">getMp3TagMap()</a> Get MP3 tag map attached to vHost (MP3Tags.xml).
java.util.Map	<a href="#">getMp4TagMap()</a> Get MP4 tag map attached to vHost (MP4Tags.xml).
String	<a href="#">getName()</a> Get vHost name
<a href="#">HostPortConfig</a>	<a href="#">getNetConnectionHostPortConfig()</a> Get the socket configuration for server to server connections
int	<a href="#">getNetConnectionIdleFrequency()</a> Get server to server idle frequency (milliseconds)
int	<a href="#">getNetConnectionProcessorCount()</a> Get net connection processor count.
int	<a href="#">getNextNetConnectionId()</a> Get next connection id.

int	<a href="#"><u>getPingTimeout()</u></a> Get ping timeout (milliseconds)
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get properties attached to this vHost.
String	<a href="#"><u>getProperty(String key)</u></a> Get virtual host property.
void	<a href="#"><u>getProtocolUsage(boolean[] protocolsInUse)</u></a> Get the protocols in use by this application instance (see IApplicationInstance.PROTOCOLUSAGE_*)
<a href="#"><u>PushPublishContext</u></a>	<a href="#"><u>getPushPublishContext()</u></a> Get the push publish context
com.wowza.wms.pushpublish.manager.IPushPublishManager	<a href="#"><u>getPushPublishManager()</u></a> Returns the PushPublishManager associated with this vhost This object provides access to PushPublbers associated with
<a href="#"><u>RTPContext</u></a>	<a href="#"><u>getRTPContext()</u></a> Get the RTP (real time protocol) virtual host context
RTPUDPDatagramConfig	<a href="#"><u>getRTPDatagramConfigIncoming()</u></a> Get the RTP Datagram Socket configuration
RTPUDPDatagramConfig	<a href="#"><u>getRTPDatagramConfigOutgoing()</u></a> Get the RTP Datagram Socket configuration
int	<a href="#"><u>getRTPIidleFrequency()</u></a> Get default RTP idle frequency (milliseconds)
int	<a href="#"><u>getRTSPMaxPathLen()</u></a> Get the max RTSP stream path length
<a href="#"><u>IVHostRTSPRequestValidator</u></a>	<a href="#"><u>getRTSPRequestValidator()</u></a> Get the RTSP request validator
java.util.List	<a href="#"><u>getStartupStreams()</u></a> Get the list of streams to start at virtual host startup
int	<a href="#"><u>getStartupStreamsDelayTime()</u></a> Get startup streams delay time (milliseconds).
<a href="#"><u>StreamList</u></a>	<a href="#"><u>getStreamTypes()</u></a> Get default stream type.
<a href="#"><u>ThreadPool</u></a>	<a href="#"><u>getThreadPool()</u></a> Get the VHost handler thread pool.
com.wowza.wms.transcoder.thumbnailer.ThumbnailerContext	<a href="#"><u>getThumbnailerContext()</u></a> Get the VOD transcoder context
TimedTextProviderConfiguration	<a href="#"><u>getTimedTextProviderConfig()</u></a> Get the config of TimedTextProviders
String	<a href="#"><u>getTimeRunning()</u></a> Get the time vHost has been running.

double	<a href="#"><u>getTimeRunningSeconds()</u></a> Get time running in seconds
com.wowza.wms.transcoder.vod.TranscoderVODContext	<a href="#"><u>getTranscoderVODContext()</u></a> Get the VOD transcoder context
<a href="#"><u>ThreadPool</u></a>	<a href="#"><u>getTransportThreadPool()</u></a> Get the VHost transport thread pool.
UDPTransportManager	<a href="#"><u>getUDPTransportManager()</u></a> Get the UDP transport manager.
int	<a href="#"><u>getUnidentifiedSessionTimeout()</u></a> Get the unidentified session timeout (TCP session that we are not able to identify)
int	<a href="#"><u>getValidationFrequency()</u></a> Get time between validation pings (milliseconds)
com.wowza.wms.webrtc.model.WebRTCContext	<a href="#"><u>getWebRTCContext()</u></a> Get the WebRTC virtual host context
int	<a href="#"><u>getWebRTCIdleFrequency()</u></a> Get default WebRTC idle frequency (milliseconds)
com.wowza.wms.webrtc.tcpsession.IWebRTCTCPSessionFactory	<a href="#"><u>getWebRTCSessionFactory()</u></a> Get WebRTC session factory
<a href="#"><u>WebSocketContext</u></a>	<a href="#"><u>getWebSocketContext()</u></a> Get the WebSocket Context
int	<a href="#"><u>getWebSocketSessionCount()</u></a> Get the total number of WebSocket sessions
java.util.List	<a href="#"><u>getWebSocketSessions()</u></a> Get a list of active WebSocket sessions
void	<a href="#"><u>init()</u></a> (String basePath) Initialize vHost.
boolean	<a href="#"><u>isApplicationLoaded()</u></a> (String applicationName) Return true is the application is loaded
boolean	<a href="#"><u>isShuttingDown()</u></a> Is the VHost shutting down
boolean	<a href="#"><u>isStartStarupStreams()</u></a> Returns true if the startup streams are to start and vhost startup
boolean	<a href="#"><u>isSuspended()</u></a> Returns true is all HostPorts connected to this VHost are suspended
boolean	<a href="#"><u>isWebRTCSessionFactory()</u></a> Is WebRTC enabled for this virtual host
void	<a href="#"><u>killClient()</u></a> (int clientId) Remove client from vHost and send disconnect message.
void	<a href="#"><u>killRTSPSession()</u></a> (String rtspSessionId) Kill an RTSP connection by the RTSP session id

void	<a href="#"><u>putHTTPStreamerAdapter</u></a> (String ID, <a href="#"><u>IHTTPStreamerAdapter</u></a> adapter) Add an HTTPStreamerAdapter
void	<a href="#"><u>removeAcceptorListener</u></a> ( <a href="#"><u>IAcceptorNotify</u></a> acceptorListener) Remove acceptor listener.
void	<a href="#"><u>removeApplicationListener</u></a> ( <a href="#"><u>IApplicationNotify</u></a> applicationListener) Remove applation listener.
void	<a href="#"><u>removeClient</u></a> (int clientId) Remove client from vHost.
void	<a href="#"><u>removeIdleWorkerListener</u></a> ( <a href="#"><u>IIIdleWorkerNotify</u></a> idleWorkerListener) Remove idleWorker listener
void	<a href="#"><u>reparentClient</u></a> ( <a href="#"><u>IClient</u></a> client) Move a client object to a new vhost.
void	<a href="#"><u>setAdminInterfaceHostPort</u></a> ( <a href="#"><u>HostPort</u></a> adminInterfaceHostPort) Set admin interface host port (not used)
void	<a href="#"><u>setApplicationTimeout</u></a> (int applicationTimeout) Set application time out (milliseconds).
void	<a href="#"><u>setClientIdleFrequency</u></a> (int clientIdleFrequency) Set default client idle frequency (milliseconds)
void	<a href="#"><u>setClientTimeout</u></a> (int clientTimeout) Set client timeout.
void	<a href="#"><u>setCoreHandlerPoolSize</u></a> (int corePoolSize) Set the handler core thread pool size.
void	<a href="#"><u>setCoreTransportPoolSize</u></a> (int corePoolSize) Set the transport core thread pool size.
void	<a href="#"><u>setDynamicLogProperties</u></a> (java.util.Properties dynamicLogProperties) Set the dynamic log properties set at the vhost level
void	<a href="#"><u>setFileIOPoolSize</u></a> (int fileIOPoolSize) Set default file io thread pool size.
void	<a href="#"><u>setHTTTPersistentRejectInvalid</u></a> (boolean flag) Set if invalid HTTP requests should be rejected when using persistent connections
void	<a href="#"><u>setHTTPStreamerMaxPathLen</u></a> (int httpStreamerMaxPathLen) Set the max HTTP streamer path length
void	<a href="#"><u>setHTTPStreamerRequestValidator</u></a> ( <a href="#"><u>IVHostHTTPStreamerRequestValidator</u></a> httpRequestValidator) Set the HTTP streamer request validator
void	<a href="#"><u>setIdleCheckFrequency</u></a> (int idleCheckFrequency) Set idle check frequency (milliseconds)
void	<a href="#"><u>setIdleMinimumWaitTime</u></a> (int idleMinimumWaitTime) Set the minimum time (milliseconds) the idle worker thread will sleep before generating idle events

void	<a href="#"><u>setIdleWorkerCount</u></a> (int idleWorkerCount) Set number of threads used to generate idle events
void	<a href="#"><u>setKeepAliveTimeout</u></a> (int keepAliveTimeout) Set the RTMPT connection keep alive timeout
void	<a href="#"><u>setMaximumPendingReadBytes</u></a> (int maximumPendingReaderBytes) Get maximum number of bytes a client connection can have waiting to be written before the connection is terminated.
void	<a href="#"><u>setMaximumPendingWriteBytes</u></a> (int maximumPendingWriteBytes) Set maximum number a bytes a client connection can have waiting to be sent before the connection is terminated.
void	<a href="#"><u>setMaximumSetBufferTime</u></a> (int maximumSetBufferTime) Set maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call.
void	<a href="#"><u>setNetConnectionIdleFrequency</u></a> (int netConnectionIdleFrequency) Set the server to server idle frequency (milliseconds)
void	<a href="#"><u>setNetConnectionProcessorCount</u></a> (int netConnectionProcessorCount) Set net connection processor count.
void	<a href="#"><u>setPingTimeout</u></a> (int pingTimeout) Set ping timeout (milliseconds)
void	<a href="#"><u>setRTPIdleFrequency</u></a> (int rtpIdleFrequency) Set default RTP idle frequency (milliseconds)
void	<a href="#"><u>setRTSPMaxPathLen</u></a> (int rtspStreamerMaxPathLen) Set the max RTSP stream path length
void	<a href="#"><u>setRTSPRequestValidator</u></a> ( <a href="#"><u>IVHostRTSPRequestValidator</u></a> rtspRequestValidator) Set the RTSP request validator
void	<a href="#"><u>setShuttingDown</u></a> (boolean shuttingDown) Set VHost shutting down flag
void	<a href="#"><u>setStartStartupStreams</u></a> (boolean startStartupStreams) Set to true to startup startup stream as vhost startup
void	<a href="#"><u>setStartupStreamsDelayTime</u></a> (int startupStreamsDelayTime) Set startup streams delay time (milliseconds).
void	<a href="#"><u>setUnidentifiedSessionTimeout</u></a> (int unidentifiedSessionTimeout) Set the unidentified session timeout (TCP session that we are not able to identify)
void	<a href="#"><u>setValidationFrequency</u></a> (int validationFrequency) Set time between validation pings (milliseconds)
void	<a href="#"><u>setWebRTCIdleFrequency</u></a> (int webrtcIdleFrequency) Set default WebRTC idle frequency (milliseconds)
void	<a href="#"><u>shutdown</u></a> ( ) Shutdown.
void	<a href="#"><u>shutdownApplication</u></a> (String appName) Shutdown an application by name.

void	<a href="#"><code>shutdownApplication</code></a> (String appName, boolean deleteFolder) Shutdown an application by name.
boolean	<a href="#"><code>startApplicationInstance</code></a> (String appName) Start an application instance.
boolean	<a href="#"><code>startApplicationInstance</code></a> (String appName, String appInstanceName) Start an application instance.
void	<a href="#"><code>startStartupStreams</code></a> () Method to start startup streams
void	<a href="#"><code>stopStartupStreams</code></a> () Method to stop startup streams
void	<a href="#"><code>suspendAllHostPorts</code></a> () Suspend all HostPorts from accepting new connections.
boolean	<a href="#"><code>touchApplicationInstance</code></a> (String appName) Start an application instance if it is not already started then touch it so it stays loaded for at least 3 seconds.
boolean	<a href="#"><code>touchApplicationInstance</code></a> (String appName, String appInstanceName) Start an application instance if it is not already started then touch it so it stays loaded for at least 3 seconds.
void	<a href="#"><code>unbindAllHostPorts</code></a> () Unbind all HostPorts and drop all connections
void	<a href="#"><code>updateLoggingDuration</code></a> () Internal: update the internal logging values.

## Fields

### VHOST\_DEFAULT

```
public static final java.lang.String VHOST_DEFAULT
```

Constant value: `_defaultVHost_`

## CODEC\_STREAM\_MP2T

```
public static final int CODEC_STREAM_MP2T
```

Constant value: **0**

---

## FILEFORMAT\_UNKNOWN

```
public static final int FILEFORMAT_UNKNOWN
```

Constant value: **-1**

---

## FILEFORMAT\_FLV

```
public static final int FILEFORMAT_FLV
```

Constant value: **1**

---

## FILEFORMAT\_MP4

```
public static final int FILEFORMAT_MP4
```

Constant value: **2**

---

## CONTENTTYPE\_UNKNOWN

```
public static final byte CONTENTTYPE_UNKNOWN
```

AMF Content type: unknown  
Constant value: **0**

---

## CONTENTTYPE\_SETCHUNKSIZE

```
public static final byte CONTENTTYPE_SETCHUNKSIZE
```

AMF Content type: set packet chunk size  
Constant value: **1**

---

## CONTENTTYPE\_WATCHDOG

```
public static final byte CONTENTTYPE_WATCHDOG
```

AMF Content type: watch dog  
Constant value: **3**

---

## CONTENTTYPE\_BUFFERSIZE

```
public static final byte CONTENTTYPE_BUFFERSIZE
```

AMF Content type: set buffer size  
Constant value: **4**

---

## CONTENTTYPE\_ACKBANDWIDTH

```
public static final byte CONTENTTYPE_ACKBANDWIDTH
```

---

(continued from last page)

AMF Content type: set acknowledge bandwidth size  
Constant value: **5**

---

## CONTENTTYPE\_SETBANDWIDTH

public static final byte **CONTENTTYPE\_SETBANDWIDTH**

AMF Content type: set bandwidth size  
Constant value: **6**

---

## CONTENTTYPE\_AUDIO

public static final byte **CONTENTTYPE\_AUDIO**

AMF Content type: audio packet  
Constant value: **8**

---

## CONTENTTYPE\_VIDEO

public static final byte **CONTENTTYPE\_VIDEO**

AMF Content type: video packet  
Constant value: **9**

---

## CONTENTTYPE\_DATA

public static final byte **CONTENTTYPE\_DATA**

AMF Content type: data packet  
Constant value: **18**

---

## CONTENTTYPE\_DATA0

public static final byte **CONTENTTYPE\_DATA0**

AMF Content type: data packet (AMF0)  
Constant value: **18**

---

## CONTENTTYPE\_DATA3

public static final byte **CONTENTTYPE\_DATA3**

AMF Content type: data packet (AMF3)  
Constant value: **15**

---

## CONTENTTYPE\_SHARED OBJECTS

public static final byte **CONTENTTYPE\_SHARED OBJECTS**

AMF Content type: shared object packet (AMF0)  
Constant value: **19**

---

## CONTENTTYPE\_SHARED OBJECTS0

public static final byte **CONTENTTYPE\_SHARED OBJECTS0**

AMF Content type: shared object packet (AMF0)  
Constant value: **19**

---

## CONTENTTYPE\_SHARED OBJECTS3

public static final byte **CONTENTTYPE\_SHARED OBJECTS3**

AMF Content type: shared object packet (AMF3)  
Constant value: **16**

---

## CONTENTTYPE\_FUNCTION

public static final byte **CONTENTTYPE\_FUNCTION**

AMF Content type: function data (AMF0)  
Constant value: **20**

---

## CONTENTTYPE\_FUNCTION0

public static final byte **CONTENTTYPE\_FUNCTION0**

AMF Content type: function data (AMF0)  
Constant value: **20**

---

## CONTENTTYPE\_MEDIACHUNK

public static final byte **CONTENTTYPE\_MEDIACHUNK**

AMF Content type: media chunk  
Constant value: **22**

---

## CONTENTTYPE\_FUNCTION3

public static final byte **CONTENTTYPE\_FUNCTION3**

AMF Content type: function data (AMF3)  
Constant value: **17**

---

## CONTENTTYPE\_PLAYCALLBACK

public static final byte **CONTENTTYPE\_PLAYCALLBACK**

AMF Content type: play callback  
Constant value: **127**

---

## ACCEPTORS\_ACCEPTOR

public static final java.lang.String **ACCEPTORS\_ACCEPTOR**

Acceptor types: acceptor  
Constant value: **acceptor**

---

## ACCEPTORS\_HANDLERADAPTER

public static final java.lang.String **ACCEPTORS\_HANDLERADAPTER**

Acceptor types: handler  
Constant value: **handlerAdapter**

---

(continued from last page)

## DEFAULT\_WEBRTC\_IDLEFREQUENCY

```
public static final int DEFAULT_WEBRTC_IDLEFREQUENCY
```

Constant value: **25**

## Methods

### init

```
public void init(String basePath)
```

Initialize vHost.

**Parameters:**

basePath - base path to configuration files

---

### shutdown

```
public void shutdown()
```

Shutdown.

---

### getStreamTypes

```
public StreamList getStreamTypes()
```

Get default stream type.

**Returns:**

default stream type

---

### getProperty

```
public String getProperty(String key)
```

Get virtual host property.

**Parameters:**

key - key

**Returns:**

property value or null if does not exist

---

### getClientTimeout

```
public int getClientTimeout()
```

Get client timeout.

**Returns:**

client timeout

---

### getNextNetConnectionId

```
public int getNextNetConnectionId()
```

(continued from last page)

Get next connection id.

**Returns:**

next connection id

---

## getClient

```
public IClient getClient(int clientId)
```

Get client by client id.

**Parameters:**

clientId - client id

**Returns:**

client

---

## getClient

```
public IClient getClient(int clientId,  
                        boolean create)
```

Get client by client id and create if does not exist.

**Parameters:**

clientId - client id

create - create if does not exist

**Returns:**

client

---

## removeClient

```
public void removeClient(int clientId)
```

Remove client from vHost.

**Parameters:**

clientId - client id

---

## killClient

```
public void killClient(int clientId)
```

Remove client from vHost and send disconnect message.

**Parameters:**

clientId - client id

---

## killRTSPSession

```
public void killRTSPSession(String rtspSessionId)
```

Kill an RTSP connection by the RTSP session id

**Parameters:**

rtspSessionId - RTSP session id

(continued from last page)

## getApplication

```
public IApplication getApplication(String applicationName)
```

Get application by name.

**Parameters:**

applicationName - application name

**Returns:**

application

---

## isApplicationLoaded

```
public boolean isApplicationLoaded(String applicationName)
```

Return true is the application is loaded

**Parameters:**

applicationName - application name

**Returns:**

true if application is loaded

---

## getHomePath

```
public String getHomePath()
```

Get vHost configuration path.

**Returns:**

configuration path

---

## getProperties

```
public WMSProperties getProperties()
```

Get properties attached to this vHost.

**Returns:**

properties attached to this vHost

---

## getManagerProperties

```
public WMSProperties getManagerProperties()
```

Get VHost's manager's properties collection

**Returns:**

manager's property collection

---

## getCoreTransportPoolSize

```
public int getCoreTransportPoolSize()
```

Get the transport core thread pool size.

**Returns:**

(continued from last page)

default core thread pool size

---

## setCoreTransportPoolSize

```
public void setCoreTransportPoolSize(int corePoolSize)
```

Set the transport core thread pool size.

**Parameters:**

corePoolSize - core thread pool size

---

## getCoreHandlerPoolSize

```
public int getCoreHandlerPoolSize()
```

Get the handler core thread pool size.

**Returns:**

default core thread pool size

---

## setCoreHandlerPoolSize

```
public void setCoreHandlerPoolSize(int corePoolSize)
```

Set the handler core thread pool size.

**Parameters:**

corePoolSize - core thread pool size

---

## getFileIOPoolSize

```
public int getFileIOPoolSize()
```

Get the default file io pool size.

**Returns:**

default file io pool size

---

## setFileIOPoolSize

```
public void setFileIOPoolSize(int fileIOPoolSize)
```

Set default file io thread pool size.

**Parameters:**

fileIOPoolSize - default file io thread pool size

---

## setClientTimeout

```
public void setClientTimeout(int clientTimeout)
```

Set client timeout. An inactive client connected by RTMPT protocol will be deleted after this timeout.

**Parameters:**

clientTimeout - client timeout

(continued from last page)

---

## getHostPortsList

```
public HostPortList getHostPortsList()
```

Get list of host port definitions for vHost.

**Returns:**

list of host port definitions for vHost

---

## getThreadPool

```
public ThreadPool getThreadPool()
```

Get the VHost handler thread pool. Same as getHandlerThreadPool.

**Returns:**

VHost handler thread pool

---

## getTransportThreadPool

```
public ThreadPool getTransportThreadPool()
```

Get the VHost transport thread pool. This thread pool is used to read/write data from the transports sockets.

**Returns:**

VHost transport thread pool

---

## getHandlerThreadPool

```
public ThreadPool getHandlerThreadPool()
```

Get the VHost handler thread pool. This thread pool is used to process the incoming events.

**Returns:**

VHost handler thread pool

---

## getName

```
public String getName()
```

Get vHost name

**Returns:**

vHost name

---

## setAdminInterfaceHostPort

```
public void setAdminInterfaceHostPort(HostPort adminInterfaceHostPort)
```

Set admin interface host port (not used)

**Parameters:**

adminInterfaceHostPort - admin interface host port

---

## getClientCount

```
public int getClientCount()
```

(continued from last page)

Get number of clients connected to this vHost.

**Returns:**

number of clients connected to this vHost

---

## getNetConnectionProcessorCount

```
public int getNetConnectionProcessorCount()
```

Get net connection processor count. Number of threads used for server to server communication (not finished).

**Returns:**

net connection processor count

---

## setNetConnectionProcessorCount

```
public void setNetConnectionProcessorCount(int netConnectionProcessorCount)
```

Set net connection processor count. Number of threads used for server to server communication (not finished).

**Parameters:**

netConnectionProcessorCount - net connection processor count

---

## addApplicationListener

```
public void addApplicationListener(IApplicationNotify applicationListener)
```

Add application listener. An application listener will receive the following events: onApplicationCreate, onApplicationDestroy.

**Parameters:**

applicationListener - application listener

---

## removeApplicationListener

```
public void removeApplicationListener(IApplicationNotify applicationListener)
```

Remove application listener.

**Parameters:**

applicationListener - application listener

---

## addAcceptorListener

```
public void addAcceptorListener(IAcceptorNotify acceptorListener)
```

Add acceptor listener. Acceptor listeners will receive the following events: onAcceptorCreate, onAcceptorDestroy.

**Parameters:**

acceptorListener - acceptor listener

---

## removeAcceptorListener

```
public void removeAcceptorListener(IAcceptorNotify acceptorListener)
```

Remove acceptor listener.

**Parameters:**

acceptorListener - acceptor listener

---

## getIOScheduler

```
public IOScheduler getIOScheduler()
```

Get IO scheduler for vHost. IO scheduler is used to schedule reads from the disk to increase server throughput for static flv serving.

**Returns:**

IO scheduler for vHost

---

## getIoPerformanceCounter

```
public IoPerformanceCounter getIoPerformanceCounter()
```

Get vHost IO performance counter.

**Returns:**

io performance counter

---

## getIoPerformanceCounter

```
public IoPerformanceCounter getIoPerformanceCounter(int counterIndex)
```

Get vHost IO performance counter for a specific technology (see IVHost.COUNTER\_\*)

**Parameters:**

counterIndex - counter index (see IVHost.COUNTER\_\*)

**Returns:**

io performance counter

---

## getConnectionCounter

```
public ConnectionCounter getConnectionCounter()
```

Get vHost connection counter.

**Returns:**

connection counter

---

## getConnectionCounter

```
public ConnectionCounterSimple getConnectionCounter(int counterIndex)
```

Get vHost connection counter for a specific technology (see IVHost.COUNTER\_\*)

**Parameters:**

counterIndex - counter index (see IVHost.COUNTER\_\*)

**Returns:**

connection counter

---

## getDateStarted

```
public String getDateStarted()
```

Get date and time the server was started.

---

---

(continued from last page)

**Returns:**

date and time the server was started

---

## getTimeRunning

```
public String getTimeRunning()
```

Get the time vHost has been running.

**Returns:**

formatted string with vHost uptime

---

## getTimeRunningSeconds

```
public double getTimeRunningSeconds()
```

Get time running in seconds

**Returns:**

time running in seconds

---

## getConnectionLimit

```
public int getConnectionLimit()
```

Get vHost connection limit.

**Returns:**

vHost connection limit

---

## getMediaReaders

```
public MediaReaderList getMediaReaders()
```

Get the media readers attached to vHost (MediaReaders.xml).

**Returns:**

media readers attached to vHost

---

## getMediaWriters

```
public MediaWriterList getMediaWriters()
```

Get the media writers attached to vHost (MediaWriters.xml).

**Returns:**

media writers attached to vHost

---

## getMp3TagMap

```
public java.util.Map getMp3TagMap()
```

Get MP3 tag map attached to vHost (MP3Tags.xml).

**Returns:**

MP3 tag map attached to vHost

---

(continued from last page)

---

## getMp4TagMap

```
public java.util.Map getMp4TagMap()
```

Get MP4 tag map attached to vHost (MP4Tags.xml).

**Returns:**

MP4 tag map attached to vHost

---

## getCEACaptionConversionContext

```
public CEACaptionConversionContext getCEACaptionConversionContext()
```

Get CEACaptionConversionContextMP3 tag map attached to vHost (CEACaptionConversion.xml).

**Returns:**

MP3 tag map attached to vHost

---

## updateLoggingDuration

```
public void updateLoggingDuration()
```

Internal: update the internal logging values.

---

## getApplicationTimeout

```
public int getApplicationTimeout()
```

Get application time out (milliseconds). Time from last client disconnect to application destruction.

**Returns:**

application time out (milliseconds)

---

## setApplicationTimeout

```
public void setApplicationTimeout(int applicationTimeout)
```

Set application time out (milliseconds).

**Parameters:**

applicationTimeout - application time out (milliseconds)

---

## getPingTimeout

```
public int getPingTimeout()
```

Get ping timeout (milliseconds)

**Returns:**

ping timeout (milliseconds)

---

## setPingTimeout

```
public void setPingTimeout(int pingTimeout)
```

Set ping timeout (milliseconds)

**Parameters:**

(continued from last page)

pingTimeout - ping timeout (milliseconds)

---

## getValidationFrequency

```
public int getValidationFrequency()
```

Get time between validation pings (milliseconds)

**Returns:**

time between validation pings (milliseconds)

---

## setValidationFrequency

```
public void setValidationFrequency(int validationFrequency)
```

Set time between validation pings (milliseconds)

**Parameters:**

validationFrequency - time between validation pings (milliseconds)

---

## getMaximumPendingWriteBytes

```
public int getMaximumPendingWriteBytes()
```

Get maximum number a bytes a client connection can have waiting to be sent before the connection is terminated. If set to zero this feature is turned off.

**Returns:**

maximum number a bytes a client connection can have waiting to be sent before the connection is terminated

---

## setMaximumPendingWriteBytes

```
public void setMaximumPendingWriteBytes(int maximumPendingWriteBytes)
```

Set maximum number a bytes a client connection can have waiting to be sent before the connection is terminated. If set to zero this feature is turned off.

**Parameters:**

maximumPendingWriteBytes - maximum number a bytes a client connection can have waiting to be sent before the connection is terminated

---

## getMaximumPendingReadBytes

```
public int getMaximumPendingReadBytes()
```

Set maximum number of bytes a client connection can have waiting to be written before the connection is terminated. If set to zero this feature is off.

**Returns:**

maximum number of bytes a client connection can have waiting to be written before the connection is terminated

---

## setMaximumPendingReadBytes

```
public void setMaximumPendingReadBytes(int maximumPendingReaderBytes)
```

Get maximum number of bytes a client connection can have waiting to be written before the connection is terminated. If set to zero this feature is off.

**Parameters:**

(continued from last page)

`maximumPendingReaderBytes` - maximum number of bytes a client connection can have waiting to be written before the connection is terminated

---

## getMaximumSetBufferTime

```
public int getMaximumSetBufferTime()
```

Get maximum number of milliseconds allowed for the `NetStream.setBufferTime(secs)` call. If set to zero this feature is turned off.

**Returns:**

maximum number of milliseconds allowed for the `NetStream.setBufferTime(secs)` call

---

## setMaximumSetBufferTime

```
public void setMaximumSetBufferTime(int maximumSetBufferTime)
```

Set maximum number of milliseconds allowed for the `NetStream.setBufferTime(secs)` call. If set to zero this feature is turned off.

**Parameters:**

`maximumSetBufferTime` - maximum number of milliseconds allowed for the `NetStream.setBufferTime(secs)` call

---

## getApplicationLock

```
public edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock  
getApplicationLock()
```

Get the object used in synchronized statements to lock and application.

**Returns:**

object used in synchronized statements to lock and application

---

## getClientIdleFrequency

```
public int getClientIdleFrequency()
```

Get default client idle frequency (milliseconds)

**Returns:**

default client idle frequency (milliseconds)

---

## setClientIdleFrequency

```
public void setClientIdleFrequency(int clientIdleFrequency)
```

Set default client idle frequency (milliseconds)

**Parameters:**

`clientIdleFrequency` - default client idle frequency (milliseconds)

---

## getRTPIdeFrequency

```
public int getRTPIdeFrequency()
```

Get default RTP idle frequency (milliseconds)

**Returns:**

default RTP idle frequency (milliseconds)

---

## setRTPIdleFrequency

```
public void setRTPIdleFrequency(int rtpIdleFrequency)
```

Set default RTP idle frequency (milliseconds)

### Parameters:

rtpIdleFrequency - RTP default client idle frequency (milliseconds)

---

## getWebRTCIdleFrequency

```
public int getWebRTCIdleFrequency()
```

Get default WebRTC idle frequency (milliseconds)

### Returns:

default WebRTC idle frequency (milliseconds)

---

## setWebRTCIdleFrequency

```
public void setWebRTCIdleFrequency(int webrtcIdleFrequency)
```

Set default WebRTC idle frequency (milliseconds)

### Parameters:

webrtcIdleFrequency - default WebRTC idle frequency (milliseconds)

---

## getNetConnectionIdleFrequency

```
public int getNetConnectionIdleFrequency()
```

Get server to server idle frequency (milliseconds)

### Returns:

server to server idle frequency (milliseconds)

---

## setNetConnectionIdleFrequency

```
public void setNetConnectionIdleFrequency(int netConnectionIdleFrequency)
```

Set the server to server idle frequency (milliseconds)

### Parameters:

netConnectionIdleFrequency - server to server idle frequency (milliseconds)

---

## getIdleCheckFrequency

```
public int getIdleCheckFrequency()
```

Get idle check frequency (milliseconds)

### Returns:

idle check frequency (milliseconds)

---

## setIdleCheckFrequency

```
public void setIdleCheckFrequency(int idleCheckFrequency)
```

---

(continued from last page)

Set idle check frequency (milliseconds)

**Parameters:**

idleCheckFrequency - idle check frequency (milliseconds)

---

## getIdleWorkerCount

```
public int getIdleWorkerCount()
```

Get number of threads used to generate idle events

**Returns:**

number of threads used to generate idle events

---

## setIdleWorkerCount

```
public void setIdleWorkerCount(int idleWorkerCount)
```

Set number of threads used to generate idle events

**Parameters:**

idleWorkerCount - number of threads used to generate idle events

---

## getKeepAliveTimeout

```
public int getKeepAliveTimeout()
```

Get the RTMPT connection keep alive timeout

**Returns:**

RTMPT connection keep alive timeout

---

## setKeepAliveTimeout

```
public void setKeepAliveTimeout(int keepAliveTimeout)
```

Set the RTMPT connection keep alive timeout

**Parameters:**

keepAliveTimeout - RTMPT connection keep alive timeout

---

## addIdleWorkerListener

```
public void addIdleWorkerListener(IIdleWorkerNotify idleWorkerListener)
```

Add idleWorker listener. An idleWorker listener will receive the following events: onIdleWorkerCreate, onIdleWorkerDestroy.

**Parameters:**

idleWorkerListener - idleWorker listener

---

## removeIdleWorkerListener

```
public void removeIdleWorkerListener(IIdleWorkerNotify idleWorkerListener)
```

Remove idleWorker listener

**Parameters:**

idleWorkerListener - idleWorker listener

## getNetConnectionHostPortConfig

```
public HostPortConfig getNetConnectionHostPortConfig()
```

Get the socket configuration for server to server connections

**Returns:**

socket configuration for server to server connections

---

## getMediaCasterSettings

```
public MediaCasterSettings getMediaCasterSettings()
```

Get the media caster settings

**Returns:**

media caster settings

---

## getMediaCasterList

```
public MediaCasterList getMediaCasterList()
```

Get the list of media caster definitions (MediaCaster.xml)

**Returns:**

list of media caster definitions

---

## getApplicationNames

```
public java.util.List getApplicationNames()
```

Get a list of application names

**Returns:**

list of application names

---

## getApplicationFolderNames

```
public java.util.List getApplicationFolderNames()
```

Get a list of application folder names

**Returns:**

list of application folder names

---

## applicationExists

```
public boolean applicationExists(String name)
```

Return true if an application folder exists for this application name

**Parameters:**

name - application name

**Returns:**

true if an application folder exists for this application name

---

## getRTPContext

```
public RTPContext getRTPContext()
```

Get the RTP (real time protocol) virtual host context

**Returns:**

RTP (real time protocol) virtual host context

---

## getWebRTCContext

```
public com.wowza.wms.webrtc.model.WebRTCContext getWebRTCContext()
```

Get the WebRTC virtual host context

**Returns:**

WebRTC virtual host context

---

## getHTTPStreamerContext

```
public HTTPStreamerContext getHTTPStreamerContext()
```

Get the HTTPStreamer (Cupertino Streaming and Silverlight Smooth Streaming) host context

**Returns:**

HTTPStreamer (Cupertino Streaming and Silverlight Smooth Streaming) host context

---

## getRTPDatagramConfigIncoming

```
public RTPUDPDatagramConfig getRTPDatagramConfigIncoming()
```

Get the RTP Datagram Socket configuration

**Returns:**

RTP Datagram Socket configuration

---

## getRTPDatagramConfigOutgoing

```
public RTPUDPDatagramConfig getRTPDatagramConfigOutgoing()
```

Get the RTP Datagram Socket configuration

**Returns:**

RTP Datagram Socket configuration

---

## getAuthenticationList

```
public AuthenticationList getAuthenticationList()
```

Get the list of available authentication methods

**Returns:**

list of available authentication methods

---

## getIdleMinimumWaitTime

```
public int getIdleMinimumWaitTime()
```

(continued from last page)

Get the minimum time (milliseconds) the idle worker thread will sleep before generating idle events

**Returns:**

minimum time (milliseconds) the idle worker thread will sleep before generating idle events

---

## setIdleMinimumWaitTime

```
public void setIdleMinimumWaitTime(int idleMinimumWaitTime)
```

Set the minimum time (milliseconds) the idle worker thread will sleep before generating idle events

**Parameters:**

idleMinimumWaitTime - minimum time (milliseconds) the idle worker thread will sleep before generating idle events

---

## getIdleWorkers

```
public IdleWorkersUtil getIdleWorkers()
```

Get the idle worker utility

**Returns:**

idle worker utility

---

## isShuttingDown

```
public boolean isShuttingDown()
```

Is the VHost shutting down

**Returns:**

true if the vhost is shutting down

---

## setShuttingDown

```
public void setShuttingDown(boolean shuttingDown)
```

Set VHost shutting down flag

**Parameters:**

shuttingDown - true if the vhost is shutting down

---

## reparentClient

```
public void reparentClient(IClient client)
```

Move a client object to a new vhost. This can only be done right after the handshake process has completed. See `IVHostNotify.onVHostClientConnect`.

**Parameters:**

client - client object to move

---

## getDynamicLogProperties

```
public java.util.Properties getDynamicLogProperties()
```

Get the dynamic log properties defined at the vhost level in `conf/log4j.properties`

**Returns:**

(continued from last page)

dynamic log properties defined at the vhost level

---

## setDynamicLogProperties

```
public void setDynamicLogProperties(java.util.Properties dynamicLogProperties)
```

Set the dynamic log properties set at the vhost level

### Parameters:

dynamicLogProperties - dynamic log properties defined at the vhost level

---

## shutdownApplication

```
public void shutdownApplication(String appName)
```

Shutdown an application by name. This will disconnect all clients connected to all child application instances.

### Parameters:

appName - application name

---

## shutdownApplication

```
public void shutdownApplication(String appName,  
    boolean deleteFolder)
```

Shutdown an application by name. This will disconnect all clients connected to all child application instances.

### Parameters:

appName - application name

deleteFolder - delete the application folder

---

## unbindAllHostPorts

```
public void unbindAllHostPorts()
```

Unbind all HostPorts and drop all connections

---

## suspendAllHostPorts

```
public void suspendAllHostPorts()
```

Suspend all HostPorts from accepting new connections. Current connections will continue to be serviced

---

## closeHostPort

```
public void closeHostPort(HostPort hostPort,  
    boolean isSuspend)
```

Close an individual HostPort

### Parameters:

hostPort - host port to close

isSuspend - if true will just suspend the HostPort from accepting new connections, if false will unbind and drop all connections

---

## isSuspended

```
public boolean isSuspended()
```

(continued from last page)

Returns true is all HostPorts connected to this VHost are suspended

---

## touchApplicationInstance

```
public boolean touchApplicationInstance(String appName)
```

Start an application instance if it is not already started then touch it so it stays loaded for at least 3 seconds.

**Parameters:**

appName - application name

**Returns:**

true is successful

---

## touchApplicationInstance

```
public boolean touchApplicationInstance(String appName,  
String appInstanceName)
```

Start an application instance if it is not already started then touch it so it stays loaded for at least 3 seconds. The default appInstanceName \_definst\_ will be used.

**Parameters:**

appName - application name

appInstanceName - app instance name

**Returns:**

true is successful

---

## startApplicationInstance

```
public boolean startApplicationInstance(String appName)
```

Start an application instance. The default appInstanceName \_definst\_ will be used.

**Parameters:**

appName - application name

**Returns:**

true is successful

---

## startApplicationInstance

```
public boolean startApplicationInstance(String appName,  
String appInstanceName)
```

Start an application instance.

**Parameters:**

appName - application name

appInstanceName - app instance name

**Returns:**

true is successful

---

## getUDPTransportManager

```
public UDPTransportManager getUDPTransportManager()
```

---

(continued from last page)

Get the UDP transport manager.

**Returns:**

UDP transport manager

---

## getHTTPStreamerList

```
public HTTPStreamerList getHTTPStreamerList()
```

Get the list of HTTPStreamers

**Returns:**

list of HTTPStreamers

---

## getHTTPStreamerAdapter

```
public IHTTPStreamerAdapter getHTTPStreamerAdapter(String ID)
```

Get an HTTPStreamerAdapter by ID

**Parameters:**

ID - HTTPStreamerAdapter ID

**Returns:**

HTTPStreamerAdapter

---

## putHTTPStreamerAdapter

```
public void putHTTPStreamerAdapter(String ID,  
    IHTTPStreamerAdapter adapter)
```

Add an HTTPStreamerAdapter

**Parameters:**

ID - HTTPStreamerAdapter ID

adapter - HTTPStreamerAdapter

---

## getHTTPStreamerAdapterIDs

```
public java.util.List getHTTPStreamerAdapterIDs()
```

Get a list of HTTPStreamerAdapter IDs

**Returns:**

list of HTTPStreamerAdapter IDs

---

## getLiveStreamPacketizerList

```
public LiveStreamPacketizerList getLiveStreamPacketizerList()
```

Get the LiveStreamPacketizerList

**Returns:**

LiveStreamPacketizerList

---

## getLiveStreamTranscoderList

```
public LiveStreamTranscoderList getLiveStreamTranscoderList()
```

(continued from last page)

Get the LiveStreamTranscoderList

**Returns:**

LiveStreamTranscoderList

---

## getTimedTextProviderConfig

```
public TimedTextProviderConfiguration getTimedTextProviderConfig()
```

Get the config of TimedTextProviders

**Returns:**

TimedTextProviders config

---

## getStartupStreams

```
public java.util.List getStartupStreams()
```

Get the list of streams to start at virtual host startup

**Returns:**

list of streams to start at virtual host startup

---

## addStartupStream

```
public void addStartupStream(StartupStream startupStream)
```

Add a stream to the list of streams to start and virtual host startup

**Parameters:**

startupStream - startup stream

---

## isStartStarupStreams

```
public boolean isStartStarupStreams()
```

Returns true if the startup streams are to start and vhost startup

**Returns:**

true if the startup streams are to start and vhost startup

---

## setStartStarupStreams

```
public void setStartStarupStreams(boolean startStarupStreams)
```

Set to true to startup startup stream as vhost startup

**Parameters:**

startStarupStreams - true if the startup streams are to start and vhost startup

---

## startStartupStreams

```
public void startStartupStreams()
```

Method to start startup streams

(continued from last page)

## stopStartupStreams

```
public void stopStartupStreams()
```

Method to stop startup streams

---

## getDvrRecorderList

```
public DvrRecorderList getDvrRecorderList()
```

Get the DvrRecorderList

**Returns:**

list of DVR Recorders

---

## getDvrStoreList

```
public DvrStoreList getDvrStoreList()
```

Get the list of DVR Stores

**Returns:**

list of DVR Stores

---

## getLiveStreamRecordManager

```
public ILiveStreamRecordManager getLiveStreamRecordManager()
```

Returns the LiveStreamRecordManager associated with this vhost This object contains the active LiveStreamRecorders

**Returns:**

ILiveStreamRecordManager associated with this vhost

---

## getPushPublishManager

```
public com.wowza.wms.pushpublish.manager.IPushPublishManager getPushPublishManager()
```

Returns the PushPbulishManager associated with this vhost This object provides access to PushPublbers associated with

**Returns:**

IPushPublishManager associated with this vhost

---

## getMediaReaderContentType

```
public int getMediaReaderContentType(String mediaType)
```

Get the content type of a media stream name prefix (see IMediaReader.CONTENTTYPE\_\*)

**Parameters:**

mediaType - mediaType (such as flv or smil)

**Returns:**

content type (see IMediaReader.CONTENTTYPE\_\*)

---

## getProtocolUsage

```
public void getProtocolUsage(boolean[] protocolsInUse)
```

(continued from last page)

Get the protocols in use by this application instance (see `IApplicationInstance.PROTOCOLUSAGE_*`)

---

## getTranscoderVODContext

```
public com.wowza.wms.transcoder.vod.TranscoderVODContext getTranscoderVODContext()
```

Get the VOD transcoder context

**Returns:**

VOD transcoder context

---

## getThumbnailerContext

```
public com.wowza.wms.transcoder.thumbnailer.ThumbnailerContext getThumbnailerContext()
```

Get the VOD transcoder context

**Returns:**

VOD transcoder context

---

## getHTTPStreamerRequestValidator

```
public IVHostHTTPStreamerRequestValidator getHTTPStreamerRequestValidator()
```

Get the HTTP streamer request validator

**Returns:**

HTTP streamer request validator

---

## setHTTPStreamerRequestValidator

```
public void setHTTPStreamerRequestValidator(IVHostHTTPStreamerRequestValidator  
httpRequestValidator)
```

Set the HTTP streamer request validator

**Parameters:**

httpRequestValidator - HTTP streamer request validator

---

## getHTTPStreamerMaxPathLen

```
public int getHTTPStreamerMaxPathLen()
```

Get the max HTTP streamer path length

**Returns:**

max HTTP streamer path length

---

## setHTTPStreamerMaxPathLen

```
public void setHTTPStreamerMaxPathLen(int httpStreamerMaxPathLen)
```

Set the max HTTP streamer path length

**Parameters:**

httpStreamerMaxPathLen - max HTTP streamer path length

(continued from last page)

---

## getRTSPRequestValidator

```
public IVHostRTSPRequestValidator getRTSPRequestValidator()
```

Get the RTSP request validator

**Returns:**

RTSP request validator

---

## setRTSPRequestValidator

```
public void setRTSPRequestValidator(IVHostRTSPRequestValidator rtspRequestValidator)
```

Set the RTSP request validator

**Parameters:**

rtspRequestValidator - RTSP request validator

---

## getRTSPMaxPathLen

```
public int getRTSPMaxPathLen()
```

Get the max RTSP stream path length

**Returns:**

max RTSP stream path length

---

## setRTSPMaxPathLen

```
public void setRTSPMaxPathLen(int rtspStreamerMaxPathLen)
```

Set the max RTSP stream path length

**Parameters:**

rtspStreamerMaxPathLen - max RTSP stream path length

---

## getLiveStreamTranscoderSessionCount

```
public long getLiveStreamTranscoderSessionCount()
```

Get the current number of live stream transcoder sessions.

**Returns:**

current number of live stream transcoder sessions

---

## getPushPublishContext

```
public PushPublishContext getPushPublishContext()
```

Get the push publish context

**Returns:**

push publish context

---

## getUnidentifiedSessionTimeout

```
public int getUnidentifiedSessionTimeout()
```

(continued from last page)

Get the unidentified session timeout (TCP session that we are not able to identify)

**Returns:**

timeout in milliseconds

---

## setUnidentifiedSessionTimeout

```
public void setUnidentifiedSessionTimeout(int unidentifiedSessionTimeout)
```

Set the unidentified session timeout (TCP session that we are not able to identify)

**Parameters:**

unidentifiedSessionTimeout - timeout in milliseconds

---

## getStartupStreamsDelayTime

```
public int getStartupStreamsDelayTime()
```

Get startup streams delay time (milliseconds). Time between items started in StartupStreams.xml.

**Returns:**

delay time

---

## setStartupStreamsDelayTime

```
public void setStartupStreamsDelayTime(int startupStreamsDelayTime)
```

Set startup streams delay time (milliseconds). Time between items started in StartupStreams.xml.

**Parameters:**

startupStreamsDelayTime - delay time

---

## getHTTTPersistentRejectInvalid

```
public boolean getHTTTPersistentRejectInvalid()
```

Get HTTTPersistent rejection status. Default is false.

**Returns:**

status

---

## setHTTTPersistentRejectInvalid

```
public void setHTTTPersistentRejectInvalid(boolean flag)
```

Set if invalid HTTP requests should be rejected when using persistent connections

**Parameters:**

flag - enable/disable

---

## isWebRTCSessionFactory

```
public boolean isWebRTCSessionFactory()
```

Is WebRTC enabled for this virtual host

**Returns:**

true if WebRTC is enabled

---

## getWebRTCSessionFactory

```
public com.wowza.wms.webrtc.tcpsession.IWebRTCTCPSessionFactory  
getWebRTCSessionFactory()
```

Get WebRTC session factory

**Returns:**

WebRTC session factory

---

## getWebSocketContext

```
public WebSocketContext getWebSocketContext()
```

Get the WebSocket Context

**Returns:**

WebSocket Context

---

## getHTTPProviderContext

```
public HTTPProviderContext getHTTPProviderContext()
```

Get the HTTPProvider Context

**Returns:**

HTTPProvider Context

---

## getWebSocketSessions

```
public java.util.List getWebSocketSessions()
```

Get a list of active WebSocket sessions

**Returns:**

list of active WebSocket sessions

---

## getWebSocketSessionCount

```
public int getWebSocketSessionCount()
```

Get the total number of WebSocket sessions

**Returns:**

total number of WebSocket sessions

---

## getDomainToKeyStoreMapList

```
public DomainToKeyStoreMapList getDomainToKeyStoreMapList()
```

Get the SSL certificate map list. It is a list of maps that map domain names to SSL certificates.

**Returns:**

SSL certificate map list

---

---

## com.wowza.wms.vhost Interface IVHostHTTPStreamerRequestValidator

---

public interface IVHostHTTPStreamerRequestValidator  
extends

---

### Method Summary

boolean	<a href="#">validateHTTPStreamerRequest</a> (RtmpRequestMessage request, <a href="#">HostPort</a> hostPort, String path)
---------	--

---

### Methods

#### validateHTTPStreamerRequest

```
public boolean validateHTTPStreamerRequest(RtmpRequestMessage request,  
    HostPort hostPort,  
    String path)
```

## com.wowza.wms.vhost Interface IVHostItemNotify

public interface **IVHostItemNotify**  
extends

IVHostItemNotify: listener interface used by VHostList addVHostItemListener

VHostList is the list vHost definitions in VHosts.xml not the vHosts themselves. With this listener interface you can monitor the vHost definition changes.

### Method Summary

void	<a href="#">onVHostItemCreate</a> ( <a href="#">VHostItem</a> vhostItem) Triggered when vHostItem created
void	<a href="#">onVHostItemDestroy</a> ( <a href="#">VHostItem</a> vhostItem) Triggered when vHostItem destroyed
void	<a href="#">onVHostItemUpdate</a> ( <a href="#">VHostItem</a> vhostItem) Triggered when vHostItem updated

### Methods

#### onVHostItemCreate

public void **onVHostItemCreate**([VHostItem](#) vhostItem)

Triggered when vHostItem created

**Parameters:**

vhostItem - vhostItem

#### onVHostItemUpdate

public void **onVHostItemUpdate**([VHostItem](#) vhostItem)

Triggered when vHostItem updated

**Parameters:**

vhostItem - vhostItem

#### onVHostItemDestroy

public void **onVHostItemDestroy**([VHostItem](#) vhostItem)

Triggered when vHostItem destroyed

**Parameters:**

vhostItem - vhostItem

## com.wowza.wms.vhost Interface IVHostNotify

All Known Implementing Classes:

[VHostNotifyBase](#), [ServerListenerStreamDemoPublisher](#)

public interface **IVHostNotify**  
extends

IVHostNotify: listener interface used by VHostSingleton addVHostListener

### Method Summary

void	<a href="#">onVHostClientConnect</a> ( <a href="#">IVHost</a> vhost, <a href="#">IClient</a> inClient, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params) Triggered before a client connects to this virtual host.
void	<a href="#">onVHostCreate</a> ( <a href="#">IVHost</a> vhost) Triggered when vHost created
void	<a href="#">onVHostInit</a> ( <a href="#">IVHost</a> vhost) Triggered when vHost initialized
void	<a href="#">onVHostShutdownComplete</a> ( <a href="#">IVHost</a> vhost) Triggered at the end of vhost shutdown
void	<a href="#">onVHostShutdownStart</a> ( <a href="#">IVHost</a> vhost) Triggered at the beginning of vhost shutdown

### Methods

#### onVHostCreate

public void **onVHostCreate**([IVHost](#) vhost)

Triggered when vHost created

**Parameters:**

vhost

#### onVHostInit

public void **onVHostInit**([IVHost](#) vhost)

Triggered when vHost initialized

**Parameters:**

vhost - vhost

#### onVHostShutdownStart

public void **onVHostShutdownStart**([IVHost](#) vhost)

(continued from last page)

Triggered at the beginning of vhost shutdown

**Parameters:**

vhost - vhost

---

## onVHostShutdownComplete

```
public void onVHostShutdownComplete(IVHost vhost)
```

Triggered at the end of vhost shutdown

**Parameters:**

vhost - vhost

---

## onVHostClientConnect

```
public void onVHostClientConnect(IVHost vhost,  
    IClient inClient,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Triggered before a client connects to this virtual host. Provides an opportunity to rewrite the information that is being used to connect.

**Parameters:**

vhost

inClient - client object of the connection

function - function

params - parameters

---

## com.wowza.wms.vhost Interface IVHostRTSPRequestValidator

---

public interface IVHostRTSPRequestValidator  
extends

---

### Method Summary

boolean	<a href="#">validateRTSPRequest</a> (com.wowza.wms.rtsp.RTSPRequestMessage req)
---------	---

---

### Methods

#### **validateRTSPRequest**

public boolean **validateRTSPRequest**(com.wowza.wms.rtsp.RTSPRequestMessage req)

## com.wowza.wms.vhost Interface IWorkerThreadClear

public interface **IWorkerThreadClear**  
extends

IWorkerThreadClear: Internal use.

### Method Summary

void	<a href="#">clear()</a>
void	<a href="#">reset()</a>

### Methods

#### **reset**

public void **reset**()

#### **clear**

public void **clear**()

## com.wowza.wms.vhost Class StreamItem

java.lang.Object

└─com.wowza.wms.vhost.StreamItem

public class **StreamItem**  
extends Object

StreamItem: data object that defines a streamType.

### Constructor Summary

public	<a href="#"><u>StreamItem</u></a> (String name, String baseClass, String playClass) Create a new streamItem
--------	--

### Method Summary

void	<a href="#"><u>clearProperty</u></a> (String name) Clear property.
String	<a href="#"><u>getBaseClass</u></a> () Get base class path.
String	<a href="#"><u>getDescription</u></a> () Get streamType description.
String	<a href="#"><u>getName</u></a> () Get streamType name.
String	<a href="#"><u>getPlayClass</u></a> () Get play class path.
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties</u></a> () Get properties.
String	<a href="#"><u>getProperty</u></a> (String name) Get property by name.
void	<a href="#"><u>setBaseClass</u></a> (String baseClass) Set base class path.
void	<a href="#"><u>setDescription</u></a> (String description) Set streamType description.
void	<a href="#"><u>setName</u></a> (String name) Set streamType name.
void	<a href="#"><u>setPlayClass</u></a> (String playClass) Set play class path.
void	<a href="#"><u>setProperty</u></a> (String name, String value) Set property value.

String	<a href="#">toString()</a>
--------	----------------------------

Methods inherited from class `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Constructors

### StreamItem

```
public StreamItem(String name,  
                  String baseClass,  
                  String playClass)
```

Create a new streamItem

**Parameters:**

name - streamType name  
baseClass - base class path  
playClass - play class path

## Methods

### getBaseClass

```
public String getBaseClass()
```

Get base class path.

**Returns:**

base clas path

### setBaseClass

```
public void setBaseClass(String baseClass)
```

Set base class path.

**Parameters:**

baseClass - base class path

### getName

```
public String getName()
```

Get streamType name.

**Returns:**

streamType name

### setName

```
public void setName(String name)
```

(continued from last page)

Set streamType name.

**Parameters:**

name - streamType name

---

## getPlayClass

```
public String getPlayClass()
```

Get play class path.

**Returns:**

play class path

---

## setPlayClass

```
public void setPlayClass(String playClass)
```

Set play class path.

**Parameters:**

playClass - play class path

---

## setProperty

```
public void setProperty(String name,  
                        String value)
```

Set property value.

**Parameters:**

name - property name

value - property value

---

## clearProperty

```
public void clearProperty(String name)
```

Clear property.

**Parameters:**

name - property name

---

## getProperty

```
public String getProperty(String name)
```

Get property by name.

**Parameters:**

name - property name

**Returns:**

property value

---

## getProperties

```
public WMSProperties getProperties()
```

---

(continued from last page)

Get properties.

**Returns:**

properties

---

## getDescription

```
public String getDescription()
```

Get streamType description.

**Returns:**

streamType description

---

## setDescription

```
public void setDescription(String description)
```

Set streamType description.

**Parameters:**

description - streamType description

---

## toString

```
public String toString()
```

## com.wowza.wms.vhost Class StreamList

java.lang.Object

└─com.wowza.wms.vhost.StreamList

```
public class StreamList
    extends Object
```

StreamList: collection of StreamItems

### Constructor Summary

public	<a href="#">StreamList()</a> Create empty StreamList
--------	---

### Method Summary

<a href="#">StreamItem</a>	<a href="#">getStreamDef(String name)</a> Get streamItem by streamType name.
java.util.Map	<a href="#">getStreamDefs()</a> Get Map of streamItems (by streamType names).
java.util.List	<a href="#">getStreamTypeNames()</a> Get list of streamType names.

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### StreamList

```
public StreamList()
```

Create empty StreamList

### Methods

#### getStreamDefs

```
public java.util.Map getStreamDefs()
```

Get Map of streamItems (by streamType names).

##### Returns:

Map of streamItems

## getStreamTypeNames

```
public java.util.List getStreamTypeNames()
```

Get list of streamType names. Returns shallow copy of list.

**Returns:**

list of streamType names

---

## getStreamDef

```
public StreamItem getStreamDef(String name)
```

Get streamItem by streamType name.

**Parameters:**

name - streamType name

**Returns:**

streamItem

## com.wowza.wms.vhost Class ThreadPool

java.lang.Object

└─com.wowza.wms.vhost.ThreadPool

public class **ThreadPool**  
extends Object

ThreadPool: class for managing a pool of threads.

### Constructor Summary

public	<a href="#">ThreadPool</a> ( <a href="#">IVHost</a> vhost, String name) Create a new thread pool attached to a vHost.
--------	--

### Method Summary

void	<a href="#">execute</a> (Runnable command) Execute a runnable object.
int	<a href="#">getActiveCount</a> () Get number of active threads.
java.util.concurrent. Executor	<a href="#">getExecutor</a> () Get the underlying Executor pool.
int	<a href="#">getQueueSize</a> () Get the number of command objects in the LinkedBlockingQueue.
void	<a href="#">init</a> (int corePoolSize) Initialize threadPool.
void	<a href="#">terminate</a> () Terminate all threads and cleanup threadPool.

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### ThreadPool

public **ThreadPool**([IVHost](#) vhost,  
[String](#) name)

Create a new thread pool attached to a vHost.

#### Parameters:

(continued from last page)

vhost - vHost

## Methods

### init

```
public void init(int corePoolSize)
```

Initialize threadPool.

**Parameters:**

corePoolSize - core pool size

### terminate

```
public void terminate()
```

Terminate all threads and cleanup threadPool.

### execute

```
public void execute(Runnable command)
```

Execute a runnable object. If the threadPool is at the corePool size, the object will be added to a LinkedBlockingQueue in the order it was received.

**Parameters:**

command

### getExecutor

```
public java.util.concurrent.Executor getExecutor()
```

Get the underlying Executor pool.

**Returns:**

Executor pool

### getActiveCount

```
public int getActiveCount()
```

Get number of active threads.

**Returns:**

number of active threads

### getQueueSize

```
public int getQueueSize()
```

Get the number of command objects in the LinkedBlockingQueue.

**Returns:**

number of command objects in the LinkedBlockingQueue

## com.wowza.wms.vhost Class VHostItem

java.lang.Object

└─com.wowza.wms.vhost.VHostItem

public class **VHostItem**  
extends Object

VHostItem: data class that hold definition of a virtual host.

### Constructor Summary

public	<a href="#">VHostItem()</a> Create empty vHostItem
--------	---

### Method Summary

String	<a href="#">getConfigDir()</a> Get configuration path for vHost.
int	<a href="#">getConnectionLimit()</a> Get connection limit of this vHost item.
String	<a href="#">getName()</a> Get vHost name
<a href="#">WMSProperties</a>	<a href="#">getProperties()</a> Get properties
boolean	<a href="#">isVisited()</a> Has this vHostItem been visited during load of VHosts.xml file.
void	<a href="#">reset()</a> Reset vHostItem to empty state
void	<a href="#">setConfigDir(String configDir)</a> Set configuration path for vHost.
void	<a href="#">setConnectionLimit(int connectionLimit)</a> Set connection limit of this vHost item.
void	<a href="#">setName(String name)</a> Set vHost name
void	<a href="#">setProperties(WMSProperties properties)</a> Set properties
void	<a href="#">setVisited(boolean visited)</a> Set is visited.
String	<a href="#">toString()</a> Format vHost item

**Methods inherited from class** `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Constructors

### VHostItem

```
public VHostItem()
```

Create empty vHostItem

## Methods

### reset

```
public void reset()
```

Reset vHostItem to empty state

### getConfigDir

```
public String getConfigDir()
```

Get configuration path for vHost.

**Returns:**

configuration path for vHost

### setConfigDir

```
public void setConfigDir(String configDir)
```

Set configuration path for vHost.

**Parameters:**

configDir - configuration path for vHost

### getName

```
public String getName()
```

Get vHost name

**Returns:**

vHost name

### setName

```
public void setName(String name)
```

Set vHost name

**Parameters:**

(continued from last page)

name - vHost name

---

## getProperties

```
public WMSProperties getProperties()
```

Get properties

**Returns:**

properties

---

## setProperties

```
public void setProperties(WMSProperties properties)
```

Set properties

**Parameters:**

properties - properties

---

## isVisited

```
public boolean isVisited()
```

Has this vHostItem been visited during load of VHosts.xml file. Internally used to track and delete vHost definitions on reload of VHosts.xml.

**Returns:**

Has this vHostItem been visited during load

---

## setVisited

```
public void setVisited(boolean visited)
```

Set is visited.

**Parameters:**

visited - is visited

---

## getConnectionLimit

```
public int getConnectionLimit()
```

Get connection limit of this vHost item.

**Returns:**

connection limit of this vHost item

---

## setConnectionLimit

```
public void setConnectionLimit(int connectionLimit)
```

Set connection limit of this vHost item.

**Parameters:**

connectionLimit - connection limit of this vHost item

---

(continued from last page)

**toString**

```
public String toString()
```

Format vHost item

## com.wowza.wms.vhost Class VHostList

java.lang.Object

└─com.wowza.wms.vhost.VHostList

public class **VHostList**  
extends Object

VHostList: list of VHost items. Result of parsing VHosts.xml at server startup or VHosts.xml reload. This interface can keep track of reloads and carefully mark items for deletion.

### Constructor Summary

public	<a href="#">VHostList()</a> Create empty vHostList
--------	---

### Method Summary

void	<a href="#">addVHostItemListener()</a> ( <a href="#">IVHostItemNotify</a> vHostItemListener) Add vHostItem listener.
java.util.List	<a href="#">getVHostItems()</a> Get a list of vHostItems.
java.util.Map	<a href="#">getVHostMap()</a> Get the Map of vHostItem definitions.
java.util.List	<a href="#">getVHostNames()</a> Get a list of vHost names.
void	<a href="#">loadConfig()</a>
void	<a href="#">notifyVHostItemCreate()</a> ( <a href="#">VHostItem</a> vhostItem) Notify vHostItem listener of item create.
void	<a href="#">notifyVHostItemDestroy()</a> ( <a href="#">VHostItem</a> vhostItem) Notify vHostItem listener of item destroy.
void	<a href="#">notifyVHostItemUpdate()</a> ( <a href="#">VHostItem</a> vhostItem) Notify vHostItem listener of item update.
void	<a href="#">reloadConfig()</a> Reload VHosts.xml file.
void	<a href="#">removeVHostItemListener()</a> ( <a href="#">IVHostItemNotify</a> vHostItemListener) Remove vHostItem listener.

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

---

## Constructors

### VHostList

```
public VHostList()
```

Create empty vHostList

---

## Methods

### loadConfig

```
public void loadConfig()
```

---

### reloadConfig

```
public void reloadConfig()
```

Reload VHosts.xml file.

---

### getVHostMap

```
public java.util.Map getVHostMap()
```

Get the Map of vHostItem defintions.

**Returns:**

Map of vHostItem defintions

---

### addVHostItemListener

```
public void addVHostItemListener(IVHostItemNotify vHostItemListener)
```

Add vHostItem listener. vHostItem listeners will receive the following events: onVHostItemCreate, onVHostItemUpdate, onVHostItemDestroy.

**Parameters:**

vHostItemListener - vHostItem listener

---

### removeVHostItemListener

```
public void removeVHostItemListener(IVHostItemNotify vHostItemListener)
```

Remove vHostItem listener.

**Parameters:**

vHostItemListener - vHostItem listener

---

### notifyVHostItemCreate

```
public void notifyVHostItemCreate(VHostItem vhostItem)
```

Notify vHostItem listener of item create.

(continued from last page)

**Parameters:**

vhostItem - vHostItem

---

**notifyVHostItemUpdate**

```
public void notifyVHostItemUpdate(VHostItem vhostItem)
```

Notify vHostItem listener of item update.

**Parameters:**

vhostItem - vHostItem

---

**notifyVHostItemDestroy**

```
public void notifyVHostItemDestroy(VHostItem vhostItem)
```

Notify vHostItem listener of item destroy.

**Parameters:**

vhostItem - vHostItem

---

**getVHostNames**

```
public java.util.List getVHostNames()
```

Get a list of vHost names. Creates a copy of list.

**Returns:**

list of vHost names

---

**getVHostItems**

```
public java.util.List getVHostItems()
```

Get a list of vHostItems. Create a shallow copy of list.

**Returns:**

list of vHostItems

## com.wowza.wms.vhost Class VHostNotifyBase

java.lang.Object

└─com.wowza.wms.vhost.VHostNotifyBase

All Implemented Interfaces:

[IVHostNotify](#)

public class **VHostNotifyBase**  
extends Object  
implements [IVHostNotify](#)

### Constructor Summary

public	<a href="#">VHostNotifyBase()</a>
--------	-----------------------------------

### Method Summary

void	<a href="#">onVHostClientConnect</a> ( <a href="#">IVHost</a> vhost, <a href="#">IClient</a> inClient, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params)
void	<a href="#">onVHostCreate</a> ( <a href="#">IVHost</a> vhost)
void	<a href="#">onVHostInit</a> ( <a href="#">IVHost</a> vhost)
void	<a href="#">onVHostShutdownComplete</a> ( <a href="#">IVHost</a> vhost)
void	<a href="#">onVHostShutdownStart</a> ( <a href="#">IVHost</a> vhost)

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

#### Methods inherited from interface [com.wowza.wms.vhost.IVHostNotify](#)

[onVHostClientConnect](#), [onVHostCreate](#), [onVHostInit](#), [onVHostShutdownComplete](#), [onVHostShutdownStart](#)

### Constructors

#### VHostNotifyBase

public **VHostNotifyBase**()

(continued from last page)

## Methods

---

### onVHostCreate

```
public void onVHostCreate(IVHost vhost)
```

---

### onVHostInit

```
public void onVHostInit(IVHost vhost)
```

---

### onVHostShutdownStart

```
public void onVHostShutdownStart(IVHost vhost)
```

---

### onVHostShutdownComplete

```
public void onVHostShutdownComplete(IVHost vhost)
```

---

### onVHostClientConnect

```
public void onVHostClientConnect(IVHost vhost,  
    IClient inClient,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

## com.wowza.wms.vhost Class VHostSingleton

java.lang.Object

└─com.wowza.wms.vhost.VHostSingleton

public class **VHostSingleton**  
extends Object

VHostSingleton: singleton that provide access to running vHosts.

### Constructor Summary

public	<a href="#">VHostSingleton()</a>
--------	----------------------------------

### Method Summary

static void	<a href="#">addVHostListener</a> ( <a href="#">IVHostNotify</a> vhostListener) Add a vHost listener.
static <a href="#">IVHost</a>	<a href="#">getInstance</a> (String vhostName) Get vHost by name.
static <a href="#">IVHost</a>	<a href="#">getInstance</a> (String vhostName, boolean doCreate) Get vHost by name.
static java.util.List	<a href="#">getVHostNames</a> () Get a list of vHost names.
static void	<a href="#">init</a> (String vhostName, String configHome) Initialize vhost by name.
static void	<a href="#">notifyVHostClientConnect</a> ( <a href="#">IVHost</a> vhost, <a href="#">IClient</a> inClient, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params) Notify vhost client connect
static void	<a href="#">notifyVHostCreate</a> ( <a href="#">IVHost</a> vhost) Notify vHost listener of create.
static void	<a href="#">notifyVHostInit</a> ( <a href="#">IVHost</a> vhost) Notify vHost listener of ini.
static void	<a href="#">notifyVHostShutdownComplete</a> ( <a href="#">IVHost</a> vhost) Notify vHost listener of destruction.
static void	<a href="#">notifyVHostShutdownStart</a> ( <a href="#">IVHost</a> vhost) Notify vHost listener of destruction.
static void	<a href="#">remove</a> (String vhostName) Remove a vHost from list of running vHosts.
static void	<a href="#">removeApplicationListener</a> ( <a href="#">IVHostNotify</a> vhostListener) Remove vHost listener

static void	<a href="#">setServer</a> ( <a href="#">IServer</a> server) Set a reference to the current running server.
static void	<a href="#">shutdown</a> (String vhostName) Shutdown a vHost by name.

Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Constructors

### VHostSingleton

```
public VHostSingleton()
```

## Methods

### getInstance

```
public static IVHost getInstance(String vhostName)
```

Get vHost by name. Do NOT create if does not exist.

**Parameters:**

vhostName - vHost name

**Returns:**

vHost

### getInstance

```
public static IVHost getInstance(String vhostName,  
    boolean doCreate)
```

Get vHost by name. Create if does not exist.

**Parameters:**

vhostName - vhost name

doCreate - if true, create if does not exist

**Returns:**

vHost

### init

```
public static void init(String vhostName,  
    String configHome)
```

Initialize vhost by name.

**Parameters:**

vhostName - vHost name

(continued from last page)

configHome - configuration path, path to VHost.xml

---

## setServer

```
public static void setServer(IServer server)
```

Set a reference to the current running server.

**Parameters:**

server - server

---

## shutdown

```
public static void shutdown(String vhostName)
```

Shutdown a vHost by name.

**Parameters:**

vhostName - vhost name

---

## getVHostNames

```
public static java.util.List getVHostNames()
```

Get a list of vHost names. Return copy of list.

**Returns:**

vHost names

---

## remove

```
public static void remove(String vhostName)
```

Remove a vHost from list of running vHosts.

**Parameters:**

vhostName - vhost name

---

## addVHostListener

```
public static void addVHostListener(IVHostNotify vhostListener)
```

Add a vHost listener. A vHost listener receives the following events: onVHostCreate, onVHostInit, onVHostDestroy

**Parameters:**

vhostListener - vHost listener

---

## removeApplicationListener

```
public static void removeApplicationListener(IVHostNotify vhostListener)
```

Remove vHost listener

**Parameters:**

vhostListener - vHost listener

---

(continued from last page)

## notifyVHostClientConnect

```
public static void notifyVHostClientConnect(IVHost vhost,  
      IClient inClient,  
      com.wowza.wms.request.RequestFunction function,  
      AMFDataList params)
```

Notify vhost client connect

### Parameters:

vhost - vHost  
inClient - client  
function - function  
params - parameters

---

## notifyVHostCreate

```
public static void notifyVHostCreate(IVHost vhost)
```

Notify vHost listener of create.

### Parameters:

vhost - vHost

---

## notifyVHostInit

```
public static void notifyVHostInit(IVHost vhost)
```

Notify vHost listener of ini.

### Parameters:

vhost - vHost

---

## notifyVHostShutdownStart

```
public static void notifyVHostShutdownStart(IVHost vhost)
```

Notify vHost listener of destruction.

### Parameters:

vhost - vHost

---

## notifyVHostShutdownComplete

```
public static void notifyVHostShutdownComplete(IVHost vhost)
```

Notify vHost listener of destruction.

### Parameters:

vhost - vHost

---

Package

**com.wowza.wms.websocket.model**

## com.wowza.wms.websocket.model Interface IWebSocketEventNotify

All Subinterfaces:

[IWebSocketEventNotify2](#)

public interface **IWebSocketEventNotify**  
extends

### Method Summary

void	<a href="#">onCreate</a> ( <a href="#">IWebSocketSession</a> webSocketSession) Trigger when WebSocket session is created
void	<a href="#">onDestroy</a> ( <a href="#">IWebSocketSession</a> webSocketSession) Triggered when WebSocket session is destroyed
void	<a href="#">onMessage</a> ( <a href="#">IWebSocketSession</a> webSocketSession, <a href="#">WebSocketMessage</a> message) Triggered when WebSocket message (binary or text) is received (control messages are not included).

### Methods

#### onCreate

public void **onCreate**([IWebSocketSession](#) webSocketSession)

Trigger when WebSocket session is created

**Parameters:**

webSocketSession - WebSocket session

#### onDestroy

public void **onDestroy**([IWebSocketSession](#) webSocketSession)

Triggered when WebSocket session is destroyed

**Parameters:**

webSocketSession - WebSocket session

#### onMessage

public void **onMessage**([IWebSocketSession](#) webSocketSession,  
[WebSocketMessage](#) message)

Triggered when WebSocket message (binary or text) is received (control messages are not included).

**Parameters:**

webSocketSession - WebSocket session

message - WebSocket message

## com.wowza.wms.websocket.model Interface IWebSocketEventNotify2

All Superinterfaces:

[IWebSocketEventNotify](#)

All Known Implementing Classes:

[WebSocketEventNotifyBase](#)

---

public interface **IWebSocketEventNotify2**  
extends [IWebSocketEventNotify](#)

---

### Method Summary

void	<a href="#">onIdle</a> ( <a href="#">IWebSocketSession</a> websocketSession)
------	--

Methods inherited from interface [com.wowza.wms.websocket.model.IWebSocketEventNotify](#)

[onCreate](#), [onDestroy](#), [onMessage](#)

---

### Methods

#### onIdle

public void **onIdle**([IWebSocketSession](#) websocketSession)

com.wowza.wms.websocket.model

# Interface IWebSocketPingResult

public interface IWebSocketPingResult  
extends

Method Summary	
void	<a href="#">onResult(IWebSocketSession</a> websocketSession, long pingTime, long pingId, boolean result) Triggered when WebSocket pong is received or pong is not received within ping timeout

## Methods

### onResult

```
public void onResult(IWebSocketSession websocketSession,  
                    long pingTime,  
                    long pingId,  
                    boolean result)
```

Triggered when WebSocket pong is received or pong is not received within ping timeout

**Parameters:**

- websocketSession - WebSocket session
- pingTime - elapsed time for ping response
- pingId - ping ID
- result - true, if pong received, false if timeout

## com.wowza.wms.websocket.model Interface IWebSocketSession

public interface **IWebSocketSession**  
extends

### Field Summary

public static final	<a href="#"><u>CHARENCODING</u></a> Value: <b>UTF-8</b>
public static final	<a href="#"><u>CLOSECODE_ABNORMAL</u></a> Value: <b>1006</b>
public static final	<a href="#"><u>CLOSECODE_GOINGAWAY</u></a> Value: <b>1001</b>
public static final	<a href="#"><u>CLOSECODE_INTERNALSERVER</u></a> Value: <b>1011</b>

public static final	<a href="#">SECURITY_GUID</a> Value: <b>258EAF5-E914-47DA-95CA-C5AB0DC85B11</b>

## Method Summary

void	<a href="#">close</a> (boolean immediately, int reasonCode, String reasonStr) Close the WebSocket session
String	<a href="#">getContextStr</a> () Get context string for logging
<a href="#">ElapsedTimer</a>	<a href="#">getElapsedTime</a> () Get the time the WebSocket session has been alive
<a href="#">IWebSocketEventNotify</a>	<a href="#">getEventListener</a> () Get the listener object that receives WebSockets events
java.util.Map	<a href="#">getHeaderMap</a> () Get map of HTTP headers from original upgrade HTTP request
<a href="#">IHTTPProvider</a>	<a href="#">getHTTPProvider</a> () Get the HTTPProvider that is the parent of this WebSocket session
HttpRequest	<a href="#">getHttpRequest</a> () Get HttpRequest object
int	<a href="#">getIdleFrequency</a> () Get time in milliseconds between idle events
<a href="#">IOPerformanceCounter</a>	<a href="#">getIOPerformanceCounter</a> () Get IO performance counter that tracks incoming and outgoing TCP traffic
org.apache.mina.common.io.Session	<a href="#">getIoSession</a> () Get the low level IOSession for this websocket
Object	<a href="#">getLock</a> () Get the internal synchronization lock for this session
long	<a href="#">getMaximumMessageSize</a> () Get the maximum WebSocket message size for a single message (0 = no limit)
int	<a href="#">getMaximumPendingWriteBytes</a> () Get the number of bytes that can be pending waiting to be sent before messages are no longer send (0 turns off this feature)

long	<a href="#"><u>getPacketFragmentationSize()</u></a> Not being used currently
java.util.Map	<a href="#"><u>getParameterMap()</u></a> Get map of HTTP parameters from original upgrade HTTP request
int	<a href="#"><u>getPingTimeout()</u></a> Get the timeout (milliseconds) that we wait for a response (pong) to a ping message
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get user properties
String	<a href="#"><u>getQueryString()</u></a> Get query string from original upgrade HTTP request
String	<a href="#"><u>getRemoteHost()</u></a> Get remote host
String	<a href="#"><u>getRemoteIpAddress()</u></a> Get the remote Ip address
String	<a href="#"><u>getReqURI()</u></a> Get request URI from original upgrade HTTP request
String	<a href="#"><u>getReqURL()</u></a> Get request URL from original upgrade HTTP request
int	<a href="#"><u>getSessionId()</u></a> Get WebSocket session Id
int	<a href="#"><u>getValidationFrequency()</u></a> Get time in milliseconds between validation messages (ping from server to client).
boolean	<a href="#"><u>isActive()</u></a> True if WebSocket session is still active, false if close has been called but session is still connected (waiting to close)
boolean	<a href="#"><u>isMaskOutgoingMessages()</u></a> Should outgoing messages be masked (many browsers do not support masked outgoing messages)
void	<a href="#"><u>ping(IWebSocketPingResult pingResult)</u></a> Send a ping message from server to client
void	<a href="#"><u>sendMessage(WebSocketMessage message)</u></a> Send a WebSocket message from server to client
void	<a href="#"><u>setHttpRequest(HttpRequest httpRequest)</u></a> Set HttpRequest object
void	<a href="#"><u>setIdleFrequency(int idleFrequency)</u></a> Set time in milliseconds between idle events
void	<a href="#"><u>setMaskOutgoingMessages(boolean maskOutgoingMessages)</u></a> Should outgoing messages be masked (many browsers do not support masked outgoing messages)
void	<a href="#"><u>setMaximumMessageSize(long maxMessageSize)</u></a> Set the maximum WebSocket message size for a single message (0 = no limit)

void	<a href="#"><code>setMaximumPendingWriteBytes</code></a> (int maximumPendingWriteBytes) Set the number of bytes that can be pending waiting to be sent before messages are no longer send (0 turns off this feature)
void	<a href="#"><code>setPacketFragmentationSize</code></a> (long packetFragmentationSize) Not being used currently
void	<a href="#"><code>setPingTimeout</code></a> (int pingTimeout) Set the timeout (milliseconds) that we wait for a response (pong) to a ping message
void	<a href="#"><code>setRemoteHost</code></a> (String remoteHost) Set remote host
void	<a href="#"><code>setRemoteIpAddress</code></a> (String remoteIpAddress) Set remote Ip address
void	<a href="#"><code>setValidationFrequency</code></a> (int validationFrequency) Set time in milliseconds between validation messages (ping from server to client).

## Fields

### SECURITY\_GUID

```
public static final java.lang.String SECURITY_GUID
```

Constant value: **258EAF5-E914-47DA-95CA-C5AB0DC85B11**

### SECURITY\_DIGEST\_ALGORITHM

```
public static final java.lang.String SECURITY_DIGEST_ALGORITHM
```

Constant value: **SHA-1**

### CHARENCODING

```
public static final java.lang.String CHARENCODING
```

Constant value: **UTF-8**

### PINGWOWZAID

```
public static final int PINGWOWZAID
```

Constant value: **1464817498**

### CLOSETIMEOUT

```
public static final int CLOSETIMEOUT
```

Constant value: **1500**

(continued from last page)

---

## HTTPHEADER\_NAME

```
public static final java.lang.String HTTPHEADER_NAME
```

Constant value: **websocket**

---

## HTTPHEADER\_SECKEY

```
public static final java.lang.String HTTPHEADER_SECKEY
```

Constant value: **Sec-WebSocket-Key**

---

## HTTPHEADER\_SECACCEPT

```
public static final java.lang.String HTTPHEADER_SECACCEPT
```

Constant value: **Sec-WebSocket-Accept**

---

## CLOSECODE\_NORMAL

```
public static final int CLOSECODE_NORMAL
```

Constant value: **1000**

---

## CLOSESTR\_NORMAL

```
public static final java.lang.String CLOSESTR_NORMAL
```

Constant value: **Normal Closure**

---

## CLOSECODE\_GOINGAWAY

```
public static final int CLOSECODE_GOINGAWAY
```

Constant value: **1001**

---

## CLOSESTR\_GOINGAWAY

```
public static final java.lang.String CLOSESTR_GOINGAWAY
```

Constant value: **Going Away**

---

## CLOSECODE\_PROTOCOLERROR

```
public static final int CLOSECODE_PROTOCOLERROR
```

Constant value: **1002**

---

## CLOSESTR\_PROTOCOLERROR

```
public static final java.lang.String CLOSESTR_PROTOCOLERROR
```

---

(continued from last page)

---

Constant value: **Protocol error**

---

**CLOSECODE\_UNSUPPORTEDDATA**

```
public static final int CLOSECODE_UNSUPPORTEDDATA
```

Constant value: **1003**

---

**CLOSESTR\_UNSUPPORTEDDATA**

```
public static final java.lang.String CLOSESTR_UNSUPPORTEDDATA
```

Constant value: **Unsupported Data**

---

**CLOSECODE\_RESERVED**

```
public static final int CLOSECODE_RESERVED
```

Constant value: **1004**

---

**CLOSESTR\_RESERVED**

```
public static final java.lang.String CLOSESTR_RESERVED
```

Constant value: **Reserved**

---

**CLOSECODE\_NOSTATUSRECEIVED**

```
public static final int CLOSECODE_NOSTATUSRECEIVED
```

Constant value: **1005**

---

**CLOSESTR\_NOSTATUSRECEIVED**

```
public static final java.lang.String CLOSESTR_NOSTATUSRECEIVED
```

Constant value: **No Status Rcvd**

---

**CLOSECODE\_ABNORMAL**

```
public static final int CLOSECODE_ABNORMAL
```

Constant value: **1006**

---

**CLOSESTR\_ABNORMAL**

```
public static final java.lang.String CLOSESTR_ABNORMAL
```

Constant value: **Abnormal Closure**

---

## CLOSECODE\_INVALIDFRAME

```
public static final int CLOSECODE_INVALIDFRAME
```

Constant value: **1007**

---

## CLOSESTR\_INVALIDFRAME

```
public static final java.lang.String CLOSESTR_INVALIDFRAME
```

Constant value: **Invalid frame**

---

## CLOSECODE\_POLICYVIOLATION

```
public static final int CLOSECODE_POLICYVIOLATION
```

Constant value: **1008**

---

## CLOSESTR\_POLICYVIOLATION

```
public static final java.lang.String CLOSESTR_POLICYVIOLATION
```

Constant value: **Policy Violation**

---

## CLOSECODE\_MESSAGETOOBIG

```
public static final int CLOSECODE_MESSAGETOOBIG
```

Constant value: **1009**

---

## CLOSESTR\_MESSAGETOOBIG

```
public static final java.lang.String CLOSESTR_MESSAGETOOBIG
```

Constant value: **Message Too Big**

---

## CLOSECODE\_MANDATORYEXT

```
public static final int CLOSECODE_MANDATORYEXT
```

Constant value: **1010**

---

## CLOSESTR\_MANDATORYEXT

```
public static final java.lang.String CLOSESTR_MANDATORYEXT
```

Constant value: **Mandatory Ext.**

---

(continued from last page)

## CLOSECODE\_INTERNALSERVER

```
public static final int CLOSECODE_INTERNALSERVER
```

Constant value: **1011**

## CLOSESTR\_INTERNALSERVER

```
public static final java.lang.String CLOSESTR_INTERNALSERVER
```

Constant value: **Internal Server Error**

## CLOSECODE\_TLSHANDSHAKE

```
public static final int CLOSECODE_TLSHANDSHAKE
```

Constant value: **1015**

## CLOSESTR\_TLSHANDSHAKE

```
public static final java.lang.String CLOSESTR_TLSHANDSHAKE
```

Constant value: **TLS handshake**

## Methods

### getContextStr

```
public String getContextStr()
```

Get context string for logging

**Returns:**

context string for logging

### close

```
public void close(boolean immediately,  
                  int reasonCode,  
                  String reasonStr)
```

Close the WebSocket session

**Parameters:**

`immediately` - if true, session will be terminated immediately by closing TCP connection, if false close command will be sent

`reasonCode` - reason for close, see CLOSECODE\_\*

`reasonStr` - reason string for close, see CLOSESTR\_\*

### getHeaderMap

```
public java.util.Map getHeaderMap()
```

Get map of HTTP headers from original upgrade HTTP request

**Returns:**

(continued from last page)

HTTP headers

---

## getParameterMap

```
public java.util.Map getParameterMap()
```

Get map of HTTP parameters from original upgrade HTTP request

**Returns:**

HTTP parameters

---

## getQueryString

```
public String getQueryString()
```

Get query string from original upgrade HTTP request

**Returns:**

query string

---

## getReqURI

```
public String getReqURI()
```

Get request URI from original upgrade HTTP request

**Returns:**

request URI

---

## getReqURL

```
public String getReqURL()
```

Get request URL from original upgrade HTTP request

**Returns:**

request URL

---

## getMaximumMessageSize

```
public long getMaximumMessageSize()
```

Get the maximum WebSocket message size for a single message (0 = no limit)

**Returns:**

maximum WebSocket message size

---

## setMaximumMessageSize

```
public void setMaximumMessageSize(long maxMessageSize)
```

Set the maximum WebSocket message size for a single message (0 = no limit)

**Parameters:**

maxMessageSize - maximum WebSocket message size

---

(continued from last page)

---

## isMaskOutgoingMessages

```
public boolean isMaskOutgoingMessages()
```

Should outgoing messages be masked (many browsers do not support masked outgoing messages)

**Returns:**

true, if messages are masked

---

## setMaskOutgoingMessages

```
public void setMaskOutgoingMessages(boolean maskOutgoingMessages)
```

Should outgoing messages be masked (many browsers do not support masked outgoing messages)

**Parameters:**

maskOutgoingMessages - true, if messages are masked

---

## isActive

```
public boolean isActive()
```

True if WebSocket session is still active, false if close has been called but session is still connected (waiting to close)

**Returns:**

true if WebSocket session is still active

---

## getPacketFragmentationSize

```
public long getPacketFragmentationSize()
```

Not being used currently

**Returns:**

not being used

---

## setPacketFragmentationSize

```
public void setPacketFragmentationSize(long packetFragmentationSize)
```

Not being used currently

**Parameters:**

packetFragmentationSize - not being used

---

## getIdleFrequency

```
public int getIdleFrequency()
```

Get time in milliseconds between idle events

**Returns:**

idle time (milliseconds)

---

## setIdleFrequency

```
public void setIdleFrequency(int idleFrequency)
```

---

(continued from last page)

Set time in milliseconds between idle events

**Parameters:**

idleFrequency - idle time (milliseconds)

---

## sendMessage

```
public void sendMessage(WebSocketMessage message)
```

Send a WebSocket message from server to client

**Parameters:**

message - WebSocket message

---

## getValidationFrequency

```
public int getValidationFrequency()
```

Get time in milliseconds between validation messages (ping from server to client). Value of zero turns off validation.

**Returns:**

validation time (milliseconds)

---

## setValidationFrequency

```
public void setValidationFrequency(int validationFrequency)
```

Set time in milliseconds between validation messages (ping from server to client). Value of zero turns off validation.

**Parameters:**

validationFrequency - validation time (milliseconds)

---

## getMaximumPendingWriteBytes

```
public int getMaximumPendingWriteBytes()
```

Get the number of bytes that can be pending waiting to be sent before messages are no longer send (0 turns off this feature)

**Returns:**

number of bytes that can be pending waiting

---

## setMaximumPendingWriteBytes

```
public void setMaximumPendingWriteBytes(int maximumPendingWriteBytes)
```

Set the number of bytes that can be pending waiting to be sent before messages are no longer send (0 turns off this feature)

**Parameters:**

maximumPendingWriteBytes - number of bytes that can be pending waiting

---

## ping

```
public void ping(IWebSocketPingResult pingResult)
```

Send a ping message from server to client

**Parameters:**

pingResult - callback object when pong messages is received or ping message timeout

## getLock

```
public Object getLock()
```

Get the internal synchronization lock for this session

**Returns:**

internal synchronization lock

---

## getEventListener

```
public IWebSocketEventNotify getEventListener()
```

Get the listener object that receives WebSockets events

**Returns:**

listener object

---

## getSessionId

```
public int getSessionId()
```

Get WebSocket session Id

**Returns:**

WebSocket session Id

---

## getHTTPProvider

```
public IHTTPProvider getHTTPProvider()
```

Get the HTTPProvider that is the parent of this WebSocket session

**Returns:**

HTTPProvider

---

## getIOPerformanceCounter

```
public IOPerformanceCounter getIOPerformanceCounter()
```

Get IO performance counter that tracks incoming and outgoing TCP traffic

**Returns:**

IO performance counter

---

## getElapsedTime

```
public ElapsedTimer getElapsedTime()
```

Get the time the WebSocket session has been alive

**Returns:**

time the WebSocket session has been alive

---

## getPingTimeout

```
public int getPingTimeout()
```

---

(continued from last page)

Get the timeout (milliseconds) that we wait for a response (pong) to a ping message

**Returns:**

timeout (milliseconds)

---

## setPingTimeout

```
public void setPingTimeout(int pingTimeout)
```

Set the timeout (milliseconds) that we wait for a response (pong) to a ping message

**Parameters:**

pingTimeout - timeout (milliseconds)

---

## getProperties

```
public WMSProperties getProperties()
```

Get user properties

**Returns:**

user properties

---

## getRemoteIpAddress

```
public String getRemoteIpAddress()
```

Get the remote Ip address

**Returns:**

remote Ip address

---

## setRemoteIpAddress

```
public void setRemoteIpAddress(String remoteIpAddress)
```

Set remote Ip address

**Parameters:**

remoteIpAddress - remote Ip address

---

## setHttpRequest

```
public void setHttpRequest(HttpRequest httpRequest)
```

Set HttpRequest object

**Parameters:**

HttpRequest

---

## getHttpRequest

```
public HttpRequest getHttpRequest()
```

Get HttpRequest object

**Returns:**

## getRemoteHost

```
public String getRemoteHost()
```

Get remote host

**Returns:**

remote host

---

## setRemoteHost

```
public void setRemoteHost(String remoteHost)
```

Set remote host

**Parameters:**

remoteHost - remote host

---

## getIoSession

```
public org.apache.mina.common.Session getIoSession()
```

Get the low level IoSession for this websocket

**Returns:**

low level IoSession

---

## com.wowza.wms.websocket.model Class WebSocketContext

java.lang.Object

└─com.wowza.wms.websocket.model.WebSocketContext

public class **WebSocketContext**  
extends Object

### Field Summary

public static final	<a href="#"><u>DEFAULT_IDLEFREQUENCY</u></a> Value: <b>250</b>

void	<a href="#"><code>setValidationFrequency(int validationFrequency)</code></a> Set time in milliseconds between validation messages (ping from server to client).

#### Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Fields

### DEFAULT\_MAXMESSAGE\_SIZE

```
public static final long DEFAULT_MAXMESSAGE_SIZE
```

Constant value: **524288**

### DEFAULT\_PACKETFRAGMENTATIONSIZE

```
public static final long DEFAULT_PACKETFRAGMENTATIONSIZE
```

Constant value: **0**

---

## DEFAULT\_IDLEFREQUENCY

```
public static final int DEFAULT_IDLEFREQUENCY
```

Constant value: **250**

---

## DEFAULT\_VALIDATIONFREQUENCY

```
public static final int DEFAULT_VALIDATIONFREQUENCY
```

Constant value: **20000**

---

## DEFAULT\_MASKOUTGOINGMESSAGES

```
public static final boolean DEFAULT_MASKOUTGOINGMESSAGES
```

Constant value: **false**

---

## DEFAULT\_MAXIMUMPENDINGWRITEBYTES

```
public static final int DEFAULT_MAXIMUMPENDINGWRITEBYTES
```

Constant value: **0**

---

## DEFAULT\_PINGTIMEOUT

```
public static final int DEFAULT_PINGTIMEOUT
```

Constant value: **12000**

---

## Constructors

### WebSocketContext

```
public WebSocketContext()
```

## Methods

### getMaximumMessageSize

```
public long getMaximumMessageSize()
```

Get the maximum WebSocket message size for a single message (0 = no limit)

**Returns:**

maximum WebSocket message size

---

### setMaximumMessageSize

```
public void setMaximumMessageSize(long maxMessageSize)
```

Set the maximum WebSocket message size for a single message (0 = no limit)

---

(continued from last page)

**Parameters:**

maxMessageSize - maximum WebSocket message size

---

**isMaskOutgoingMessages**

```
public boolean isMaskOutgoingMessages()
```

Should outgoing messages be masked (many browsers do not support masked outgoing messages)

**Returns:**

true, if messages are masked

---

**setMaskOutgoingMessages**

```
public void setMaskOutgoingMessages(boolean maskOutgoingMessages)
```

Should outgoing messages be masked (many browsers do not support masked outgoing messages)

**Parameters:**

maskOutgoingMessages - true, if messages are masked

---

**getIdleFrequency**

```
public int getIdleFrequency()
```

Get time in milliseconds between idle events

**Returns:**

idle time (milliseconds)

---

**setIdleFrequency**

```
public void setIdleFrequency(int idleFrequency)
```

Set time in milliseconds between idle events

**Parameters:**

idleFrequency - idle time (milliseconds)

---

**getPacketFragmentationSize**

```
public long getPacketFragmentationSize()
```

Not being used currently

**Returns:**

not being used

---

**setPacketFragmentationSize**

```
public void setPacketFragmentationSize(long packetFragmentationSize)
```

Not being used currently

**Parameters:**

packetFragmentationSize - not being used

## getValidationFrequency

```
public int getValidationFrequency()
```

Get time in milliseconds between validation messages (ping from server to client). Value of zero turns off validation.

**Returns:**

validation time (milliseconds)

---

## setValidationFrequency

```
public void setValidationFrequency(int validationFrequency)
```

Set time in milliseconds between validation messages (ping from server to client). Value of zero turns off validation.

**Parameters:**

validationFrequency - validation time (milliseconds)

---

## getMaximumPendingWriteBytes

```
public int getMaximumPendingWriteBytes()
```

Get the number of bytes that can be pending waiting to be sent before messages are no longer send (0 turns off this feature)

**Returns:**

number of bytes that can be pending waiting

---

## setMaximumPendingWriteBytes

```
public void setMaximumPendingWriteBytes(int maximumPendingWriteBytes)
```

Set the number of bytes that can be pending waiting to be sent before messages are no longer send (0 turns off this feature)

**Parameters:**

maximumPendingWriteBytes - number of bytes that can be pending waiting

---

## getPingTimeout

```
public int getPingTimeout()
```

Get the timeout (milliseconds) that we wait for a response (pong) to a ping message

**Returns:**

timeout (milliseconds)

---

## setPingTimeout

```
public void setPingTimeout(int pingTimeout)
```

Set the timeout (milliseconds) that we wait for a response (pong) to a ping message

**Parameters:**

pingTimeout - timeout (milliseconds)

---

## com.wowza.wms.websocket.model Class WebSocketEventNotifyBase

java.lang.Object

└─com.wowza.wms.websocket.model.WebSocketEventNotifyBase

All Implemented Interfaces:

[IWebSocketEventNotify2](#)

public class **WebSocketEventNotifyBase**  
extends Object  
implements [IWebSocketEventNotify2](#)

### Constructor Summary

public	<a href="#">WebSocketEventNotifyBase()</a>
--------	--

### Method Summary

void	<a href="#">onCreate</a> ( <a href="#">IWebSocketSession</a> webSocketSession) Trigger when WebSocket session is created
void	<a href="#">onDestroy</a> ( <a href="#">IWebSocketSession</a> webSocketSession) Triggered when WebSocket session is destroyed
void	<a href="#">onIdle</a> ( <a href="#">IWebSocketSession</a> webSocketSession) Triggered for idle events
void	<a href="#">onMessage</a> ( <a href="#">IWebSocketSession</a> webSocketSession, <a href="#">WebSocketMessage</a> message) Triggered when WebSocket message (binary or text) is received (control messages are not included).

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

#### Methods inherited from interface [com.wowza.wms.websocket.model.IWebSocketEventNotify2](#)

[onIdle](#)

#### Methods inherited from interface [com.wowza.wms.websocket.model.IWebSocketEventNotify](#)

[onCreate](#), [onDestroy](#), [onMessage](#)

### Constructors

(continued from last page)

## WebSocketEventNotifyBase

```
public WebSocketEventNotifyBase()
```

## Methods

### onCreate

```
public void onCreate(IWebSocketSession websocketSession)
```

Trigger when WebSocket session is created

**Parameters:**

websocketSession - WebSocket session

### onDestroy

```
public void onDestroy(IWebSocketSession websocketSession)
```

Triggered when WebSocket session is destroyed

**Parameters:**

websocketSession - WebSocket session

### onMessage

```
public void onMessage(IWebSocketSession websocketSession,  
    WebSocketMessage message)
```

Triggered when WebSocket message (binary or text) is received (control messages are not included).

**Parameters:**

websocketSession - WebSocket session

message - WebSocket message

### onIdle

```
public void onIdle(IWebSocketSession websocketSession)
```

Triggered for idle events

**Parameters:**

websocketSession - WebSocket session

## com.wowza.wms.websocket.model Class WebSocketMessage

java.lang.Object

└─com.wowza.wms.websocket.model.WebSocketMessage

public class **WebSocketMessage**  
extends Object

### Field Summary

public static final	<a href="#"><u>DEFAULT_CLOSE_REASON</u></a> Value: <b>unknown</b>
public static final	<a href="#"><u>HEADER_SIZE_CONTROLFRAME</u></a> Value: <b>2</b>
public static final	<a href="#"><u>MASK_SIZE</u></a> Value: <b>4</b>
public static final	<a href="#"><u>OPCODE_BINARY</u></a> Value: <b>2</b>
public static final	<a href="#"><u>OPCODE_CLOSE</u></a> Value: <b>8</b>
public static final	<a href="#"><u>OPCODE_CONTINUATION</u></a> Value: <b>0</b>
public static final	<a href="#"><u>OPCODE_PING</u></a> Value: <b>9</b>
public static final	<a href="#"><u>OPCODE_PONG</u></a> Value: <b>10</b>
public static final	<a href="#"><u>OPCODE_TEXT</u></a> Value: <b>1</b>
public static final	<a href="#"><u>OPCODE_UNKNOWN</u></a> Value: <b>-1</b>

### Constructor Summary

public	<a href="#"><u>WebSocketMessage</u></a> ( )
public	<a href="#"><u>WebSocketMessage</u></a> (int type)

public	<a href="#">WebSocketMessage</a> (int type, boolean bufferIncludesHeader, byte[] buffer)
public	<a href="#">WebSocketMessage</a> (int type, boolean bufferIncludesHeader, byte[] buffer, int offset, int len)

## Method Summary

void	<a href="#">addBuffer</a> (byte[] buffer, int offset, int len, boolean fragmented) Used internally to add read TCP bytes into current pending message
static <a href="#">WebSocketMessage</a>	<a href="#">createMessageBinary</a> (boolean mask, byte[] buffer) Create binary message
static <a href="#">WebSocketMessage</a>	<a href="#">createMessageBinary</a> (boolean mask, byte[] buffer, int offset, int len) Create binary message
static <a href="#">WebSocketMessage</a>	<a href="#">createMessageBinary</a> (boolean mask, IFasterByteArrayOutputStream buffer, int offset, int len) Create binary message
static <a href="#">WebSocketMessage</a>	<a href="#">createMessageClose</a> (boolean mask, int reasonCode, String reasonStr) Create a close message
static <a href="#">WebSocketMessage</a>	<a href="#">createMessagePing</a> (boolean mask) Create a ping message (body will be 8-byte UTC in milliseconds)
static <a href="#">WebSocketMessage</a>	<a href="#">createMessagePing</a> (boolean mask, byte[] body) Create ping message
static <a href="#">WebSocketMessage</a>	<a href="#">createMessagePong</a> (boolean mask, <a href="#">WebSocketMessage</a> messagePing) Create pong message
static <a href="#">WebSocketMessage</a>	<a href="#">createMessageText</a> (boolean mask, String messageStr) Create text message
byte[]	<a href="#">getBuffer</a> () Get the raw binary message data (also need offset and len)
int	<a href="#">getCloseReason</a> () If close message, get the close reason
String	<a href="#">getCloseReasonStr</a> () If close message, get the close reason str
int	<a href="#">getLen</a> () Get len of message buffer data
int	<a href="#">getOffset</a> () Get offset into message buffer
int	<a href="#">getType</a> () Get message type, see OP*_
String	<a href="#">getValueString</a> () If text message, get body as string
boolean	<a href="#">isBinary</a> () Is binary message

boolean	<a href="#"><code>isControlMessage()</code></a> Is message a control message
boolean	<a href="#"><code>isText()</code></a> Is message text message
long	<a href="#"><code>sendMessage(IFasterByteArrayWriteReference out)</code></a> Internal method to send message over TCP connection
void	<a href="#"><code>setType(int type)</code></a> Set message type, see <code>OPCODE_*</code>
String	<a href="#"><code>toString()</code></a> Get message as a string (use <code>getValueString()</code> to get the body value of text messages)

#### Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Fields

### DEFAULT\_CLOSE\_REASON

```
public static final java.lang.String DEFAULT_CLOSE_REASON
```

Constant value: **unknown**

### HEADER\_SIZE\_CONTROLFRAME

```
public static final int HEADER_SIZE_CONTROLFRAME
```

Constant value: **2**

### MASK\_SIZE

```
public static final int MASK_SIZE
```

Constant value: **4**

### OPCODE\_UNKNOWN

```
public static final int OPCODE_UNKNOWN
```

Constant value: **-1**

### OPCODE\_CONTINUATION

```
public static final int OPCODE_CONTINUATION
```

Constant value: **0**

---

## OPCODE\_TEXT

```
public static final int OPCODE_TEXT
```

Constant value: **1**

---

## OPCODE\_BINARY

```
public static final int OPCODE_BINARY
```

Constant value: **2**

---

## OPCODE\_CLOSE

```
public static final int OPCODE_CLOSE
```

Constant value: **8**

---

## OPCODE\_PING

```
public static final int OPCODE_PING
```

Constant value: **9**

---

## OPCODE\_PONG

```
public static final int OPCODE_PONG
```

Constant value: **10**

---

## Constructors

### WebSocketMessage

```
public WebSocketMessage()
```

---

### WebSocketMessage

```
public WebSocketMessage(int type)
```

---

### WebSocketMessage

```
public WebSocketMessage(int type,  
                        boolean bufferIncludesHeader,  
                        byte[] buffer)
```

---

(continued from last page)

## WebSocketMessage

```
public WebSocketMessage(int type,  
                        boolean bufferIncludesHeader,  
                        byte[] buffer,  
                        int offset,  
                        int len)
```

## Methods

### createMessagePing

```
public static WebSocketMessage createMessagePing(boolean mask)
```

Create a ping message (body will be 8-byte UTC in milliseconds)

**Parameters:**

mask - true, to mask message

**Returns:**

WebSocketMessage

### createMessagePing

```
public static WebSocketMessage createMessagePing(boolean mask,  
                                                  byte[] body)
```

Create ping message

**Parameters:**

mask - true, to mask message

body - bytes to include as body of message

**Returns:**

WebSocketMessage

### createMessagePong

```
public static WebSocketMessage createMessagePong(boolean mask,  
                                                  WebSocketMessage messagePing)
```

Create pong message

**Parameters:**

mask - true, to mask message

messagePing - ping message that is source of pong (body copied to pong message)

**Returns:**

WebSocketMessage

### createMessageClose

```
public static WebSocketMessage createMessageClose(boolean mask,  
                                                  int reasonCode,  
                                                  String reasonStr)
```

Create a close message

(continued from last page)

**Parameters:**

mask - true, to mask message  
reasonCode - reason code, see IWebSocketSession.CLOSECODE\_\*  
reasonStr - reason string, see IWebSocketSession.CLOSESTR\_\*

**Returns:**

WebSocketMessage

---

## createMessageText

```
public static WebSocketMessage createMessageText(boolean mask,  
String messageStr)
```

Create text message

**Parameters:**

mask - true, to mask message  
messageStr - string data

**Returns:**

WebSocketMessage

---

## createMessageBinary

```
public static WebSocketMessage createMessageBinary(boolean mask,  
byte[] buffer,  
int offset,  
int len)
```

Create binary message

**Parameters:**

mask - true, to mask message  
buffer - body buffer  
offset - offset into body buffer  
len - len of message

**Returns:**

WebSocketMessage

---

## createMessageBinary

```
public static WebSocketMessage createMessageBinary(boolean mask,  
IFasterByteArrayOutputStream buffer,  
int offset,  
int len)
```

Create binary message

**Parameters:**

mask - true, to mask message  
buffer - body buffer  
offset - offset into body buffer  
len - len of message

**Returns:**

WebSocketMessage

---

(continued from last page)

## createMessageBinary

```
public static WebSocketMessage createMessageBinary(boolean mask,  
byte[] buffer)
```

Create binary message

### Parameters:

mask - true, to mask message  
buffer - body buffer

### Returns:

WebSocketMessage

---

## isControlMessage

```
public boolean isControlMessage()
```

Is message a control message

### Returns:

true if control message (ping, ping, close...)

---

## addBuffer

```
public void addBuffer(byte[] buffer,  
int offset,  
int len,  
boolean fragmented)
```

Used internally to add read TCP bytes into current pending message

### Parameters:

buffer - buffer  
offset - offset  
len - len  
fragmented - true, if fragmented

---

## getType

```
public int getType()
```

Get message type, see OPCODE\_\*

### Returns:

message type

---

## isText

```
public boolean isText()
```

Is message text message

### Returns:

true if text message

---

## isBinary

```
public boolean isBinary()
```

(continued from last page)

Is binary message

**Returns:**

true if binary message

---

## getCloseReason

```
public int getCloseReason()
```

If close message, get the close reason

**Returns:**

close reason (-1 if not close message or no reason)

---

## getCloseReasonStr

```
public String getCloseReasonStr()
```

If close message, get the close reason str

**Returns:**

close reason str (null if not close message or no reason)

---

## getValueString

```
public String getValueString()
```

If text message, get body as string

**Returns:**

get body as string

---

## getBuffer

```
public byte[] getBuffer()
```

Get the raw binary message data (also need offset and len)

**Returns:**

raw binary message data

---

## getOffset

```
public int getOffset()
```

Get offset into message buffer

**Returns:**

offset into message buffer

---

## getLen

```
public int getLen()
```

Get len of message buffer data

**Returns:**

len of message buffer data

---

## setType

```
public void setType(int type)
```

Set message type, see `OPCODE_*`

**Parameters:**

type - message type

---

## sendMessage

```
public long sendMessage(IFasterByteArrayWriteReference out)
```

Internal method to send message over TCP connection

**Parameters:**

out - writer

**Returns:**

number of bytes written

---

## toString

```
public String toString()
```

Get message as a string (use `getValueString()` to get the body value of text messages)
