## Fields

### MAXHEADERSIZE

public static final int **MAXHEADERSIZE**

Constant value: **4096**

## BUFFERINCSIZE

```
public static final int BUFFERINCSIZE
```

Constant value: **1024**

---

## TIMEOUT

```
public static final int TIMEOUT
```

Constant value: **6000**

---

## SENDBUFSIZE

```
public static final int SENDBUFSIZE
```

Constant value: **65000**

---

## RECEIVEBUFSIZE

```
public static final int RECEIVEBUFSIZE
```

Constant value: **65000**

---

## CRLF

```
public static final java.lang.String CRLF
```

Constant value:

---

## HEADINDEX\_STATUS

```
public static final int HEADINDEX_STATUS
```

Constant value: **0**

---

## HEADINDEX\_CONTENTLENGTH

```
public static final int HEADINDEX_CONTENTLENGTH
```

Constant value: **1**

---

## HEADINDEX\_LASTMODIFIED

```
public static final int HEADINDEX_LASTMODIFIED
```

Constant value: **2**

---

(continued on next page)

---

(continued from last page)

## HEADINDEX\_SIZE

```
public static final int HEADINDEX_SIZE
```

Constant value: **3**

---

## host

```
protected java.lang.String host
```

---

## port

```
protected int port
```

---

## reqPath

```
protected java.lang.String reqPath
```

---

## proxyHost

```
protected java.lang.String proxyHost
```

---

## proxyPort

```
protected int proxyPort
```

---

## dateFormat

```
protected org.apache.commons.lang.time.FastDateFormat dateFormat
```

---

## socket

```
protected java.net.Socket socket
```

---

## msgBuf

```
protected java.lang.StringBuffer msgBuf
```

---

## maxRetries

```
protected int maxRetries
```

(continued on next page)

(continued from last page)

---

## **maxUsesBeforeReconnect**

protected int **maxUsesBeforeReconnect**

---

## **uses**

protected int **uses**

---

---

## **readTimeout**

protected int **readTimeout**

---

---

## **connectionTimeout**

protected int **connectionTimeout**

---

---

## **debugInfo**

protected java.util.List **debugInfo**

---

---

## **debugPrefix**

protected java.lang.String **debugPrefix**

---

---

## **requestFullURL**

protected boolean **requestFullURL**

---

---

## **parseDateFormats**

protected java.lang.String **parseDateFormats**

---

---

## **sendBufferSize**

protected int **sendBufferSize**

---

(continued on next page)

(continued from last page)

---

## receiveBufferSize

protected int **receiveBufferSize**

---

---

## userAgent

protected java.lang.String **userAgent**

---

## Constructors

### HTTPByteReader

```
public HTTPByteReader(String host,  
                       int port)
```

## Methods

### setProxyAddress

```
public void setProxyAddress(String host,  
                             int port)
```

---

### close

```
public void close()
```

---

---

### connect

```
public void connect()
```

---

---

### reconnect

```
protected void reconnect()
```

---

---

### isOpen

```
public boolean isOpen()
```

---

(continued on next page)

(continued from last page)

## parseHeader

```
protected void parseHeader(HTTPByteReader.SendResult result,  
    byte[] buffer,  
    int offset,  
    int len,  
    boolean isHead)
```

---

## read

```
public HTTPByteReaderResult read(String path,  
    long pos,  
    int flen)
```

---

## delete

```
public HTTPByteReaderResult delete(String path)
```

---

## getDeleteCommand

```
protected void getDeleteCommand(String path)
```

---

## deleteDirect

```
public HTTPByteReaderResult deleteDirect(String path)
```

---

## write

```
public HTTPByteReaderResult write(String path,  
    String str)
```

---

## write

```
public HTTPByteReaderResult write(String path,  
    byte[] buffer,  
    int offset,  
    int len)
```

---

## write

```
public HTTPByteReaderResult write(String path,  
    PacketFragmentList fragmentList)
```

---

(continued on next page)

(continued from last page)

## getPostCommand

```
protected void getPostCommand(String path,  
    PacketFragmentList fragmentList)
```

---

## writeDirect

```
public HTTPByteReaderResult writeDirect(String path,  
    PacketFragmentList fragmentList)
```

---

## getRequestPath

```
protected String getRequestPath(String path,  
    String host,  
    int port)
```

---

## getConextPath

```
protected String getConextPath()
```

---

## getHeadCommand

```
protected void getHeadCommand(String path)
```

---

## head

```
public long[] head(String path)
```

---

## getGetCommand

```
protected void getGetCommand(String path,  
    long pos,  
    int flen)
```

---

## readDirect

```
public HTTPByteReaderResult readDirect(String path,  
    long pos,  
    int flen)
```

---

## dumpDebug

```
protected void dumpDebug()
```

(continued on next page)

(continued from last page)

---

**sendRequest**

```
public HTTPByteReader.SendResult sendRequest(byte[] request,  
        boolean isHead)
```

---

**sendRequest**

```
public HTTPByteReader.SendResult sendRequest(byte[] request,  
        int len,  
        boolean isHead)
```

---

**sendRequest**

```
public HTTPByteReader.SendResult sendRequest(byte[] request,  
        PacketFragmentList fragmentList,  
        int len,  
        boolean isHead)
```

---

**getMaxUsesBeforeReconnect**

```
public int getMaxUsesBeforeReconnect()
```

---

**setMaxUsesBeforeReconnect**

```
public void setMaxUsesBeforeReconnect(int maxUsesBeforeReconnect)
```

---

**getMaxRetries**

```
public int getMaxRetries()
```

---

**setMaxRetries**

```
public void setMaxRetries(int maxRetries)
```

---

**getReadTimeout**

```
public int getReadTimeout()
```

---

(continued on next page)

(continued from last page)

**setReadTimeout**

```
public void setReadTimeout(int readTimeout)
```

---

**isRequestFullURL**

```
public boolean isRequestFullURL()
```

---

**setRequestFullURL**

```
public void setRequestFullURL(boolean requestFullURL)
```

---

**getConnectionTimeout**

```
public int getConnectionTimeout()
```

---

**setConnectionTimeout**

```
public void setConnectionTimeout(int connectionTimeout)
```

---

**getSendBufferSize**

```
public int getSendBufferSize()
```

---

**setSendBufferSize**

```
public void setSendBufferSize(int sendBufferSize)
```

---

**getReceiveBufferSize**

```
public int getReceiveBufferSize()
```

---

**setReceiveBufferSize**

```
public void setReceiveBufferSize(int receiveBufferSize)
```

---

**getUserAgent**

```
public String getUserAgent()
```

---

(continued on next page)

(continued from last page)

---

## **setUserAgent**

```
public void setUserAgent(String userAgent)
```

## Constructors

### HTTPByteWriter

```
public HTTPByteWriter(String host,  
                      int port,  
                      Boolean nonblocked)
```

(continued from last page)

## Methods

### **getConnectionTimeout**

```
public int getConnectionTimeout()
```

### **setConnectionTimeout**

```
public void setConnectionTimeout(int connectionTimeout)
```

### **getRetryTimeout**

```
public long getRetryTimeout()
```

### **setRetryTimeout**

```
public void setRetryTimeout(long timeout)
```

### **getSendBufferSize**

```
public int getSendBufferSize()
```

### **setSendBufferSize**

```
public void setSendBufferSize(int sendBufferSize)
```

### **getReceiveBufferSize**

```
public int getReceiveBufferSize()
```

### **setReceiveBufferSize**

```
public void setReceiveBufferSize(int receiveBufferSize)
```

### **getUserAgent**

```
public String getUserAgent()
```

(continued from last page)

---

## setUserAgent

```
public void setUserAgent(String userAgent)
```

---

## getLogOptions

```
public int getLogOptions()
```

---

## setLogOptions

```
public void setLogOptions(int options)
```

---

## addLogOptions

```
public void addLogOptions(int options)
```

---

## removeLogOptions

```
public void removeLogOptions(int options)
```

---

## isLogOption

```
public boolean isLogOption(int option)
```

---

## setIsSSL

```
public void setIsSSL(boolean ssl)
```

---

## getIsSSL

```
public boolean getIsSSL()
```

---

## setProxyAddress

```
public void setProxyAddress(String host,  
                             int port)
```

---

## close

```
public void close()

## com.wowza.io Interface IRandomAccessReader

public interface **IRandomAccessReader**  
extends

### Field Summary

public static final	<a href="#"><u>FORWARD</u></a> Value: <b>1</b>
public static final	<a href="#"><u>REVERSE</u></a> Value: <b>-1</b>

### Method Summary

void	<a href="#"><u>close()</u></a> Close the media asset
boolean	<a href="#"><u>exists()</u></a> Does the media asset exist
String	<a href="#"><u>getBasePath()</u></a> Get the basePath for the random access reader
int	<a href="#"><u>getDirecton()</u></a> Get the current direction hint for the random access reader.
long	<a href="#"><u>getFilePointer()</u></a> Get the current byte location in the media asset
String	<a href="#"><u>getMediaExtension()</u></a> Get the media extension
String	<a href="#"><u>getMediaName()</u></a> Get the media name
String	<a href="#"><u>getPath()</u></a> Get the unique path to the media asset item
void	<a href="#"><u>init(IApplicationInstance appInstance, IMediaStream stream, String basePath, String mediaName, String mediaExtension)</u></a> Intialize RandomAccessReader
boolean	<a href="#"><u>isOpen()</u></a> Is the media asset open
long	<a href="#"><u>lastModified()</u></a> Return the lastModified date (same format as File.lastModified)
long	<a href="#"><u>length()</u></a> Get the media asset length in bytes

void	<a href="#"><code>open()</code></a> Open the media asset
int	<a href="#"><code>read(byte[] buf, int off, int size)</code></a> Read bytes from the media asset
void	<a href="#"><code>seek(long pos)</code></a> Seek to a position in the media asset
void	<a href="#"><code>setDirecton(int directon)</code></a> Set the current direction hint

## Fields

### FORWARD

```
public static final int FORWARD
```

Constant value: **1**

### REVERSE

```
public static final int REVERSE
```

Constant value: **-1**

## Methods

### init

```
public void init(IApplicationInstance appInstance,
IMediaStream stream,
String basePath,
String mediaName,
String mediaExtension)
```

Intialize RandomAccessReader

#### Parameters:

appInstance - application instance  
stream - parent stream if one exists  
basePath - basePath for IApplicationInstance  
mediaName - media name  
mediaExtension - media extension from mediaReaders

### open

```
public void open()
throws java.io.IOException
```

Open the media asset

#### Throws:

IOException

## close

```
public void close()  
    throws java.io.IOException
```

Close the media asset

**Throws:**

IOException

---

## isOpen

```
public boolean isOpen()
```

Is the media asset open

**Returns:**

true if media asset is open

---

## getFilePointer

```
public long getFilePointer()
```

Get the current byte location in the media asset

**Returns:**

current byte location in the media asset

---

## seek

```
public void seek(long pos)
```

Seek to a position in the media asset

**Parameters:**

pos - position to seek to

---

## read

```
public int read(byte[] buf,  
               int off,  
               int size)
```

Read bytes from the media asset

**Parameters:**

buf - buffer to fill

off - offset in buffer

size - size of block to read

**Returns:**

number of bytes read, -1 if failure

---

## getDirecton

```
public int getDirecton()
```

---

(continued from last page)

Get the current direction hint for the random access reader. The underlying system will call `setDirection` to hint at the current direction the media assets is being read.

**Returns:**

current direction hint for the random access reader

---

## **setDirecton**

```
public void setDirecton(int directon)
```

Set the current direction hint

**Parameters:**

`directon` - current direction hint for the random access reader

---

## **getBasePath**

```
public String getBasePath()
```

Get the basePath for the random access reader

**Returns:**

basePath for the random access reader

---

## **getMediaName**

```
public String getMediaName()
```

Get the media name

**Returns:**

media name

---

## **getMediaExtension**

```
public String getMediaExtension()
```

Get the media extension

**Returns:**

media extension

---

## **exists**

```
public boolean exists()
```

Does the media asset exist

**Returns:**

true if media assets exists

---

## **lastModified**

```
public long lastModified()
```

Return the lastModified date (same format as `File.lastModified`)

**Returns:**

lastModified date (same format as `File.lastModified`)

---

---

## length

```
public long length()
```

Get the media asset length in bytes

**Returns:**

media asset length in bytes

---

## getPath

```
public String getPath()
```

Get the unique path to the media asset item

**Returns:**

unique path to the media asset item

com.wowza.io

## Interface IRandomAccessReadOptimizer

All Subinterfaces:

[IRandomAccessReadOptimizer2](#)public interface **IRandomAccessReadOptimizer**

extends

### Method Summary

void	<a href="#">addRequest</a> (long foffset, int fsize, byte[] buffer, int offset)

<a href="#">IRandomAccessReader</a>	<a href="#">getReader</a> ()
void	<a href="#">setBufferSize</a> (int bufferSize)
void	<a href="#">setContextStr</a> (String contextStr)
void	<a href="#">setDebugLog</a> (boolean debugLog)
void	<a href="#">setReader</a> ( <a href="#">IRandomAccessReader</a> reader)

### Methods

#### addRequest

```
public void addRequest(long foffset,
    int fsize,
    byte[] buffer,
    int offset)
```

#### flushReads

```
public void flushReads()
```

(continued from last page)

**getContextStr**

```
public String getContextStr()
```

---

**setContextStr**

```
public void setContextStr(String contextStr)
```

---

**getBufferSize**

```
public int getBufferSize()
```

---

**setBufferSize**

```
public void setBufferSize(int bufferSize)
```

---

**setDebugLog**

```
public void setDebugLog(boolean debugLog)
```

---

**getReader**

```
public IRandomAccessReader getReader()
```

---

**setReader**

```
public void setReader(IRandomAccessReader reader)
```

long	<a href="#"><u>lastModified()</u></a> Return the lastModified date (same format as File.lastModified)
long	<a href="#"><u>length()</u></a> Get the media asset length in bytes

void	<a href="#"><code>open()</code></a> Open the media asset
void	<a href="#"><code>seek(long pos)</code></a> Seek to a position in the media asset
void	<a href="#"><code>setDirecton(int directon)</code></a> Set the current direction hint
void	<a href="#"><code>write(byte[] buf, int off, int len)</code></a> Writes len bytes from the specified byte array starting at offset off to this file.

## Fields

### FORWARD

```
public static final int FORWARD
```

Constant value: **1**

### REVERSE

```
public static final int REVERSE
```

Constant value: **-1**

## Methods

### init

```
public void init(IApplicationInstance appInstance,
IMediaStream stream,
String basePath,
String mediaName,
String mediaExtension)
```

Intialize RandomAccessReader

#### Parameters:

appInstance - application instance  
stream - parent stream if one exists  
basePath - basePath for IApplicationInstance  
mediaName - media name  
mediaExtension - media extension from mediaReaders

### open

```
public void open()
throws java.io.IOException
```

Open the media asset

#### Throws:

IOException

## close

```
public void close()  
    throws java.io.IOException
```

Close the media asset

**Throws:**

IOException

---

## isOpen

```
public boolean isOpen()
```

Is the media asset open

**Returns:**

true if media asset is open

---

## getFilePointer

```
public long getFilePointer()
```

Get the current byte location in the media asset

**Returns:**

current byte location in the media asset

---

## seek

```
public void seek(long pos)
```

Seek to a position in the media asset

**Parameters:**

pos - position to seek to

---

## write

```
public void write(byte[] buf,  
    int off,  
    int len)
```

Writes len bytes from the specified byte array starting at offset off to this file.

**Parameters:**

buf - the data.  
off - the start offset in the data.  
len - the number of bytes to write.

**Throws:**

IOException - if an I/O error occurs.

---

## getDirecton

```
public int getDirecton()
```

---

(continued from last page)

Get the current direction hint for the random access reader. The underlying system will call `setDirection` to hint at the current direction the media assets is being read.

**Returns:**

current direction hint for the random access reader

---

## **setDirecton**

```
public void setDirecton(int directon)
```

Set the current direction hint

**Parameters:**

`directon` - current direction hint for the random access reader

---

## **getBasePath**

```
public String getBasePath()
```

Get the `basePath` for the random access reader

**Returns:**

`basePath` for the random access reader

---

## **getMediaName**

```
public String getMediaName()
```

Get the media name

**Returns:**

media name

---

## **getMediaExtension**

```
public String getMediaExtension()
```

Get the media extension

**Returns:**

media extension

---

## **exists**

```
public boolean exists()
```

Does the media asset exist

**Returns:**

true if media assets exists

---

## **lastModified**

```
public long lastModified()
```

Return the `lastModified` date (same format as `File.lastModified`)

**Returns:**

`lastModified` date (same format as `File.lastModified`)

---

---

## length

```
public long length()
```

Get the media asset length in bytes

**Returns:**

media asset length in bytes

---

## getPath

```
public String getPath()
```

Get the unique path to the media asset item

**Returns:**

unique path to the media asset item

---

## com.wowza.io Interface ITextReader

All Subinterfaces:

[IDvrTextReader](#)

public interface **ITextReader**  
extends

### Method Summary

void	<a href="#">close()</a> Close the media asset
boolean	<a href="#">exists()</a> Does the media asset exist

## init

```
public void init(IApplicationInstance appInstance,  
                IMediaStream stream,  
                String basePath,  
                String mediaName)
```

---

## open

```
public void open()  
    throws java.io.IOException
```

Open the media asset

**Throws:**

IOException

---

## ready

```
public boolean ready()  
    throws java.io.IOException
```

---

## close

```
public void close()  
    throws java.io.IOException
```

Close the media asset

**Throws:**

IOException

---

## isOpen

```
public boolean isOpen()
```

Is the media asset open

**Returns:**

true if media asset is open

---

## read

```
public int read(char[] buf,  
               int off,  
               int size)  
    throws java.io.IOException
```

---

## getBasePath

```
public String getBasePath()
```

Get the basePath for the random access reader

---

(continued from last page)

**Returns:**basePath for the random access reader

---

**getMediaName**

```
public String getMediaName()
```

Get the media name

**Returns:**media name

---

**exists**

```
public boolean exists()
```

Does the media asset exist

**Returns:**true if media assets exists

---

**lastModified**

```
public long lastModified()
```

Return the lastModified date (same format as File.lastModified)

**Returns:**lastModified date (same format as File.lastModified)

---

**length**

```
public long length()
```

Get the media asset length in bytes

**Returns:**media asset length in bytes

---

**getPath**

```
public String getPath()
```

Get the unique path to the media asset item

**Returns:**unique path to the media asset item

---

------	--

## Methods

### init

```
public void init(IApplicationInstance appInstance,  
                IMediaStream stream,  
                String basePath,  
                String mediaName)
```

### isAppend

```
public boolean isAppend()
```

### setAppend

```
public void setAppend(boolean append)
```

### open

```
public void open()  
    throws java.io.IOException
```

Open the media asset

**Throws:**

IOException

### close

```
public void close()  
    throws java.io.IOException
```

Close the media asset

**Throws:**

IOException

### isOpen

```
public boolean isOpen()
```

Is the media asset open

**Returns:**

true if media asset is open

(continued from last page)

**write**

```
public void write(char[] cbuf,  
                 int off,  
                 int len)  
    throws java.io.IOException
```

---

**write**

```
public void write(char[] cbuf)  
    throws java.io.IOException
```

---

**write**

```
public void write(String str,  
                 int off,  
                 int len)  
    throws java.io.IOException
```

---

**write**

```
public void write(String str)  
    throws java.io.IOException
```

---

**getBasePath**

```
public String getBasePath()
```

Get the basePath for the random access reader

**Returns:**

basePath for the random access reader

---

**getMediaName**

```
public String getMediaName()
```

Get the media name

**Returns:**

media name

---

**exists**

```
public boolean exists()
```

Does the media asset exist

**Returns:**

true if media assets exists

---

(continued from last page)

## lastModified

```
public long lastModified()
```

Return the lastModified date (same format as File.lastModified)

**Returns:**

lastModified date (same format as File.lastModified)

---

## length

```
public long length()
```

Get the media asset length in bytes

**Returns:**

media asset length in bytes

---

## getPath

```
public String getPath()
```

Get the unique path to the media asset item

**Returns:**

unique path to the media asset item

---

---

Package

**com.wowza.util**

## com.wowza.util Class AMFUtils

java.lang.Object

└─com.wowza.util.AMFUtils

public class **AMFUtils**  
extends Object

Utilities for the conversion between Java and AMF

### Constructor Summary

public	<a href="#">AMFUtils()</a>
--------	----------------------------

### Method Summary

static <a href="#">AMFData[]</a>	<a href="#">convertParams</a> (Object[] params) Converts an array of Java native data values and class to AMF data types.
----------------------------------	--

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### AMFUtils

public **AMFUtils**()

### Methods

#### convertParams

public static [AMFData\[\]](#) **convertParams**(Object[] params)

(continued from last page)

Converts an array of Java native data values and class to AMF data types. It will box primitive data types into wrapper classes. Supported input data types are:

- null
- Double
- Float
- Long
- Integer
- Short
- Byte
- Number
- Date
- Boolean
- String
- StringBuffer
- byte[] - assumed to be raw AMFData
- ByteBuffer - assumed to be raw AMFData
- AMFData
- AMFDataMixedArray
- AMFDataArray
- AMFDataItem
- AMFDataList
- AMFDataObj

**Parameters:**

params - Array of Java

**Returns:**

Array of AMFData[] objects

## com.wowza.util Class Base64

```
java.lang.Object
|
+-com.wowza.util.Base64
```

public class **Base64**  
extends Object

Encodes and decodes to and from Base64 notation.

Homepage: <http://iharder.net/base64>.

Change Log:

- v2.2.1 - Fixed bug using URL\_SAFE and ORDERED encodings. Fixed bug when using very small files (~< 40 bytes).
- v2.2 - Added some helper methods for encoding/decoding directly from one file to the next. Also added a main() method to support command line encoding/decoding from one file to the next. Also added these Base64 dialects:
  1. The default is RFC3548 format.
  2. Calling Base64.setFormat(Base64.BASE64\_FORMAT.URLSAFE\_FORMAT) generates URL and file name friendly format as described in Section 4 of RFC3548. <http://www.faqs.org/rfcs/rfc3548.html>
  3. Calling Base64.setFormat(Base64.BASE64\_FORMAT.ORDERED\_FORMAT) generates URL and file name friendly format that preserves lexical ordering as described in <http://www.faqs.org/qa/rfcc-1940.html>
 Special thanks to Jim Kellerman at <http://www.powerset.com/> for contributing the new Base64 dialects.
- v2.1 - Cleaned up javadoc comments and unused variables and methods. Added some convenience methods for reading and writing to and from files.
- v2.0.2 - Now specifies UTF-8 encoding in places where the code fails on systems with other encodings (like EBCDIC).
- v2.0.1 - Fixed an error when decoding a single byte, that is, when the encoded data was a single byte.
- v2.0 - I got rid of methods that used booleans to set options. Now everything is more consolidated and cleaner. The code now detects when data that's being decoded is gzip-compressed and will decompress it automatically. Generally things are cleaner. You'll probably have to change some method calls that you were making to support the new options format (ints that you "OR" together).
- v1.5.1 - Fixed bug when decompressing and decoding to a byte[] using decode( String s, boolean gzipCompressed ). Added the ability to "suspend" encoding in the Output Stream so you can turn on and off the encoding if you need to embed base64 data in an otherwise "normal" stream (like an XML file).
- v1.5 - Output stream pases on flush() command but doesn't do anything itself. This helps when using GZIP streams. Added the ability to GZip-compress objects before encoding them.
- v1.4 - Added helper methods to read/write files.
- v1.3.6 - Fixed OutputStream.flush() so that 'position' is reset.
- v1.3.5 - Added flag to turn on and off line breaks. Fixed bug in input stream where last buffer being read, if not completely full, was not returned.
- v1.3.4 - Fixed when "improperly padded stream" error was thrown at the wrong time.
- v1.3.3 - Fixed I/O streams which were totally messed up.

I am placing this code in the Public Domain. Do with it as you will. This software comes with no guarantees or warranties but with plenty of well-wishing instead! Please visit <http://iharder.net/base64> periodically to check for updates or to contribute improvements.

### Nested Class Summary

class	<a href="#">Base64.InputStream</a> Base64.InputStream
class	<a href="#">Base64.OutputStream</a> Base64.OutputStream

## Field Summary

<code>public static final</code>	<a href="#"><u>DECODE</u></a> Specify decoding. Value: <b>0</b>
<code>public static final</code>	<a href="#"><u>DONT_BREAK_LINES</u></a> Don't break lines when encoding (violates strict Base64 specification) Value: <b>8</b>
<code>public static final</code>	<a href="#"><u>ENCODE</u></a> Specify encoding. Value: <b>1</b>
<code>public static final</code>	<a href="#"><u>GZIP</u></a> Specify that data should be gzip-compressed. Value: <b>2</b>
<code>public static final</code>	<a href="#"><u>NO_OPTIONS</u></a> No options specified. Value: <b>0</b>
<code>public static final</code>	<a href="#"><u>ORDERED</u></a> Encode using the special "ordered" dialect of Base64 described here: <a href="http://www.faqs.org/qa/rfcc-1940.html">http://www.faqs.org/qa/rfcc-1940.html</a> . Value: <b>32</b>
<code>public static final</code>	<a href="#"><u>URL_SAFE</u></a> Encode using Base64-like encoding that is URL- and Filename-safe as described in Section 4 of RFC3548: <a href="http://www.faqs.org/rfcs/rfc3548.html">http://www.faqs.org/rfcs/rfc3548.html</a> . Value: <b>16</b>

## Method Summary

<code>static byte[]</code>	<a href="#"><u>decode</u></a> (byte[] source, int off, int len, int options) Very low-level access to decoding ASCII characters in the form of a byte array.
<code>static byte[]</code>	<a href="#"><u>decode</u></a> (String s) Decodes data from Base64 notation, automatically detecting gzip-compressed data and decompressing it.
<code>static byte[]</code>	<a href="#"><u>decode</u></a> (String s, int options) Decodes data from Base64 notation, automatically detecting gzip-compressed data and decompressing it.
<code>static void</code>	<a href="#"><u>decodeFileToFile</u></a> (String infile, String outfile) Reads infile and decodes it to outfile.
<code>static byte[]</code>	<a href="#"><u>decodeFromFile</u></a> (String filename) Convenience method for reading a base64-encoded file and decoding it.
<code>static void</code>	<a href="#"><u>decodeString</u></a> (String inString) Decodes inString and outputs result to stdout
<code>static boolean</code>	<a href="#"><u>decodeToFile</u></a> (String dataToDecode, String filename) Convenience method for decoding data to a file.

static Object	<a href="#"><code>decodeToObject</code></a> (String encodedObject) Attempts to decode Base64 data and deserialize a Java Object within.
static String	<a href="#"><code>encodeAndReplacePlusesAndDashes</code></a> (String s)
static String	<a href="#"><code>encodeBytes</code></a> (byte[] source) Encodes a byte array into Base64 notation.
static String	<a href="#"><code>encodeBytes</code></a> (byte[] source, int options) Encodes a byte array into Base64 notation.
static String	<a href="#"><code>encodeBytes</code></a> (byte[] source, int off, int len) Encodes a byte array into Base64 notation.
static String	<a href="#"><code>encodeBytes</code></a> (byte[] source, int off, int len, int options) Encodes a byte array into Base64 notation.
static void	<a href="#"><code>encodeFileToFile</code></a> (String infile, String outfile) Reads infile and encodes it to outfile.
static String	<a href="#"><code>encodeFromFile</code></a> (String filename) Convenience method for reading a binary file and base64-encoding it.
static String	<a href="#"><code>encodeObject</code></a> (java.io.Serializable serializableObject) Serializes an object and returns the Base64-encoded version of that serialized object.
static String	<a href="#"><code>encodeObject</code></a> (java.io.Serializable serializableObject, int options) Serializes an object and returns the Base64-encoded version of that serialized object.
static void	<a href="#"><code>encodeString</code></a> (String inString) Encodes inString and outputs result to stdout
static boolean	<a href="#"><code>encodeToFile</code></a> (byte[] dataToEncode, String filename) Convenience method for encoding data to a file.
static void	<a href="#"><code>main</code></a> (String[] args) Encodes or decodes two files from the command line; <b>feel free to delete this method (in fact you probably should) if you're embedding this code into a larger program.</b>

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### NO\_OPTIONS

public static final int **NO\_OPTIONS**

No options specified. Value is zero.  
Constant value: **0**

### ENCODE

public static final int **ENCODE**

(continued from last page)

Specify encoding.  
Constant value: **1**

---

## DECODE

```
public static final int DECODE
```

Specify decoding.  
Constant value: **0**

---

## GZIP

```
public static final int GZIP
```

Specify that data should be gzip-compressed.  
Constant value: **2**

---

## DONT\_BREAK\_LINES

```
public static final int DONT_BREAK_LINES
```

Don't break lines when encoding (violates strict Base64 specification)  
Constant value: **8**

---

## URL\_SAFE

```
public static final int URL_SAFE
```

Encode using Base64-like encoding that is URL- and Filename-safe as described in Section 4 of RFC3548: <http://www.faqs.org/rfcs/rfc3548.html>. It is important to note that data encoded this way is *not* officially valid Base64, or at the very least should not be called Base64 without also specifying that it was encoded using the URL- and Filename-safe dialect.  
Constant value: **16**

---

## ORDERED

```
public static final int ORDERED
```

Encode using the special "ordered" dialect of Base64 described here: <http://www.faqs.org/qa/rfcc-1940.html>.  
Constant value: **32**

---

## Methods

### main

```
public final static void main(String[] args)
```

Encodes or decodes two files from the command line; **feel free to delete this method (in fact you probably should) if you're embedding this code into a larger program.**

---

### encodeObject

```
public static String encodeObject(java.io.Serializable serializableObject)
```

Serializes an object and returns the Base64-encoded version of that serialized object. If the object cannot be serialized or there is another error, the method will return null. The object is not GZip-compressed before being encoded.

#### Parameters:

`serializableObject` - The object to encode

#### Returns:

(continued from last page)

The Base64-encoded object

---

## encodeObject

```
public static String encodeObject(java.io.Serializable serializableObject,  
    int options)
```

Serializes an object and returns the Base64-encoded version of that serialized object. If the object cannot be serialized or there is another error, the method will return null.

Valid options:

GZIP: gzip-compresses object before encoding it.  
DONT\_BREAK\_LINES: don't break lines at 76 characters  
*Note: Technically, this makes your encoding non-compliant.*

Example: `encodeObject( myObj, Base64.GZIP )` or

Example: `encodeObject( myObj, Base64.GZIP | Base64.DONT_BREAK_LINES )`

### Parameters:

`serializableObject` - The object to encode  
`options` - Specified options

### Returns:

The Base64-encoded object

### See Also:

[GZIP](#)  
[DONT\\_BREAK\\_LINES](#)

---

## encodeBytes

```
public static String encodeBytes(byte[] source)
```

Encodes a byte array into Base64 notation. Does not GZip-compress data.

### Parameters:

`source` - The data to convert

---

## encodeBytes

```
public static String encodeBytes(byte[] source,  
    int options)
```

(continued from last page)

Encodes a byte array into Base64 notation.

Valid options:

GZIP: gzip-compresses object before encoding it.  
DONT\_BREAK\_LINES: don't break lines at 76 characters  
*Note: Technically, this makes your encoding non-compliant.*

Example: `encodeBytes( myData, Base64.GZIP )` or

Example: `encodeBytes( myData, Base64.GZIP | Base64.DONT_BREAK_LINES )`

**Parameters:**

source - The data to convert  
options - Specified options

**See Also:**

[GZIP](#)  
[DONT\\_BREAK\\_LINES](#)

---

## encodeBytes

```
public static String encodeBytes(byte[] source,  
    int off,  
    int len)
```

Encodes a byte array into Base64 notation. Does not GZip-compress data.

**Parameters:**

source - The data to convert  
off - Offset in array where conversion should begin  
len - Length of data to convert

---

## encodeBytes

```
public static String encodeBytes(byte[] source,  
    int off,  
    int len,  
    int options)
```

Encodes a byte array into Base64 notation.

Valid options:

GZIP: gzip-compresses object before encoding it.  
DONT\_BREAK\_LINES: don't break lines at 76 characters  
*Note: Technically, this makes your encoding non-compliant.*

Example: `encodeBytes( myData, Base64.GZIP )` or

Example: `encodeBytes( myData, Base64.GZIP | Base64.DONT_BREAK_LINES )`

(continued from last page)

**Parameters:**

source - The data to convert  
off - Offset in array where conversion should begin  
len - Length of data to convert  
options - Specified options, alphabet type is pulled from this (standard, url-safe, ordered)

**See Also:**[GZIP](#)[DONT\\_BREAK\\_LINES](#)

---

## decode

```
public static byte[] decode(byte[] source,  
    int off,  
    int len,  
    int options)
```

Very low-level access to decoding ASCII characters in the form of a byte array. Does not support automatically gunzipping or any other "fancy" features.

**Parameters:**

source - The Base64 encoded data  
off - The offset of where to begin decoding  
len - The length of characters to decode

**Returns:**

decoded data

---

## decode

```
public static byte[] decode(String s)
```

Decodes data from Base64 notation, automatically detecting gzip-compressed data and decompressing it.

**Parameters:**

s - the string to decode

**Returns:**

the decoded data

---

## decode

```
public static byte[] decode(String s,  
    int options)
```

Decodes data from Base64 notation, automatically detecting gzip-compressed data and decompressing it.

**Parameters:**

s - the string to decode  
options - encode options such as URL\_SAFE

**Returns:**

the decoded data

---

## decodeToObject

```
public static Object decodeToObject(String encodedObject)
```

(continued from last page)

Attempts to decode Base64 data and deserialize a Java Object within. Returns null if there was an error.

**Parameters:**

encodedObject - The Base64 data to decode

**Returns:**

The decoded and deserialized object

---

## encodeToFile

```
public static boolean encodeToFile(byte[] dataToEncode,  
    String filename)
```

Convenience method for encoding data to a file.

**Parameters:**

dataToEncode - byte array of data to encode in base64 form

filename - Filename for saving encoded data

**Returns:**

true if successful, false otherwise

---

## decodeToFile

```
public static boolean decodeToFile(String dataToDecode,  
    String filename)
```

Convenience method for decoding data to a file.

**Parameters:**

dataToDecode - Base64-encoded data as a string

filename - Filename for saving decoded data

**Returns:**

true if successful, false otherwise

---

## decodeFromFile

```
public static byte[] decodeFromFile(String filename)
```

Convenience method for reading a base64-encoded file and decoding it.

**Parameters:**

filename - Filename for reading encoded data

**Returns:**

decoded byte array or null if unsuccessful

---

## encodeFromFile

```
public static String encodeFromFile(String filename)
```

Convenience method for reading a binary file and base64-encoding it.

**Parameters:**

filename - Filename for reading binary data

**Returns:**

base64-encoded string or null if unsuccessful

---

---

## encodeFileToFile

```
public static void encodeFileToFile(String infile,  
                                     String outfile)
```

Reads infile and encodes it to outfile.

**Parameters:**

infile - Input file  
outfile - Output file

---

## encodeString

```
public static void encodeString(String inString)
```

Encodes inString and outputs result to stdout

**Parameters:**

inString - Input string

---

## decodeString

```
public static void decodeString(String inString)
```

Decodes inString and outputs result to stdout

**Parameters:**

inString - Input string

---

## decodeFileToFile

```
public static void decodeFileToFile(String infile,  
                                     String outfile)
```

Reads infile and decodes it to outfile.

**Parameters:**

infile - Input file  
outfile - Output file

---

## encodeAndReplacePlusesAndDashes

```
public static String encodeAndReplacePlusesAndDashes(String s)
```

## com.wowza.util Class Base64.InputStream

```

java.lang.Object
  |
  +- java.io.InputStream
        |
        +- java.io.FilterInputStream
              |
              +- com.wowza.util.Base64.InputStream
  
```

### All Implemented Interfaces:

java.io.Closeable

public static class **Base64.InputStream**  
extends java.io.FilterInputStream

A [Base64.InputStream](#) will read data from another java.io.InputStream, given in the constructor, and encode/decode to/from Base64 notation on the fly.

### See Also:

[Base64](#)

#### Fields inherited from class java.io.FilterInputStream

in

### Constructor Summary

public	<a href="#">Base64.InputStream</a> (java.io.InputStream in) Constructs a <a href="#">Base64.InputStream</a> in DECODE mode.
public	<a href="#">Base64.InputStream</a> (java.io.InputStream in, int options) Constructs a <a href="#">Base64.InputStream</a> in either ENCODE or DECODE mode.

### Method Summary

int	<a href="#">read</a> () Reads enough of the input stream to convert to/from Base64 and returns the next byte.
int	<a href="#">read</a> (byte[] dest, int off, int len) Calls <a href="#">read()</a> repeatedly until the end of stream is reached or len bytes are read.

#### Methods inherited from class java.io.FilterInputStream

available, close, mark, markSupported, read, read, read, reset, skip

#### Methods inherited from class java.io.InputStream

available, close, mark, markSupported, read, read, read, reset, skip

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

#### Methods inherited from interface java.io.Closeable

---

```
close
```

---

Methods inherited from interface `java.lang.AutoCloseable`

```
close
```

---

## Constructors

### Base64.InputStream

```
public Base64.InputStream(java.io.InputStream in)
```

Constructs a [Base64.InputStream](#) in DECODE mode.

**Parameters:**

`in` - the `java.io.InputStream` from which to read data.

---

### Base64.InputStream

```
public Base64.InputStream(java.io.InputStream in,  
                           int options)
```

Constructs a [Base64.InputStream](#) in either ENCODE or DECODE mode.

Valid options:

```
ENCODE or DECODE: Encode or Decode as data is read.  
DONT_BREAK_LINES: don't break lines at 76 characters  
    (only meaningful when encoding)  
    Note: Technically, this makes your encoding non-compliant.
```

Example: `new Base64.InputStream( in, Base64.DECODE )`

**Parameters:**

`in` - the `java.io.InputStream` from which to read data.

`options` - Specified options

**See Also:**

[Base64.ENCODE](#)

[Base64.DECODE](#)

[Base64.DONT\\_BREAK\\_LINES](#)

## Methods

### read

```
public int read()  
    throws java.io.IOException
```

Reads enough of the input stream to convert to/from Base64 and returns the next byte.

---

(continued from last page)

**Returns:**

next byte

---

**read**

```
public int read(byte[] dest,  
               int off,  
               int len)  
throws java.io.IOException
```

Calls [read\(\)](#) repeatedly until the end of stream is reached or len bytes are read. Returns number of bytes read into array or -1 if end of stream is encountered.

**Parameters:**

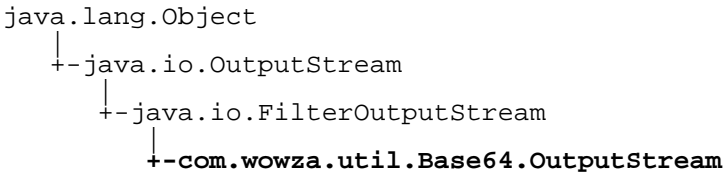

dest - array to hold values  
off - offset for array  
len - max number of bytes to read into array

**Returns:**

bytes read into array or -1 if end of stream is encountered.

com.wowza.util

# Class Base64.OutputStream

All Implemented Interfaces:  
java.io.Flushable, java.io.Closeable

public static class **Base64.OutputStream**  
extends java.io.FilterOutputStream

A [Base64.OutputStream](#) will write data to another java.io.OutputStream, given in the constructor, and encode/decode to/from Base64 notation on the fly.  
**See Also:** [Base64](#)

Fields inherited from class java.io.FilterOutputStream	
	out

Constructor Summary	
public	<a href="#">Base64.OutputStream</a> ( java.io.OutputStream out) Constructs a <a href="#">Base64.OutputStream</a> in ENCODE mode.
public	<a href="#">Base64.OutputStream</a> ( java.io.OutputStream out, int options) Constructs a <a href="#">Base64.OutputStream</a> in either ENCODE or DECODE mode.

Method Summary	
void	<a href="#">close</a> () Flushes and closes (I think, in the superclass) the stream.
void	<a href="#">flushBase64</a> () Method added by PHIL.
void	<a href="#">resumeEncoding</a> () Resumes encoding of the stream.
void	<a href="#">suspendEncoding</a> () Suspends encoding of the stream.
void	<a href="#">write</a> (byte[] theBytes, int off, int len) Calls <a href="#">write(int)</a> repeatedly until len bytes are written.
void	<a href="#">write</a> (int theByte) Writes the byte to the output stream after converting to/from Base64 notation.

Methods inherited from class java.io.FilterOutputStream
---

```
close, flush, write, write, write
```

#### Methods inherited from class `java.io.OutputStream`

```
close, flush, write, write, write
```

#### Methods inherited from class `java.lang.Object`

```
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait
```

#### Methods inherited from interface `java.io.Closeable`

```
close
```

#### Methods inherited from interface `java.lang.AutoCloseable`

```
close
```

#### Methods inherited from interface `java.io.Flushable`

```
flush
```

## Constructors

### Base64.OutputStream

```
public Base64.OutputStream(java.io.OutputStream out)
```

Constructs a [Base64.OutputStream](#) in ENCODE mode.

#### Parameters:

out - the `java.io.OutputStream` to which data will be written.

### Base64.OutputStream

```
public Base64.OutputStream(java.io.OutputStream out,  
                           int options)
```

Constructs a [Base64.OutputStream](#) in either ENCODE or DECODE mode.

Valid options:

```
ENCODE or DECODE: Encode or Decode as data is read.  
DONT_BREAK_LINES: don't break lines at 76 characters  
    (only meaningful when encoding)  
Note: Technically, this makes your encoding non-compliant.
```

Example: `new Base64.OutputStream( out, Base64.ENCODE )`

(continued from last page)

**Parameters:**

out - the java.io.OutputStream to which data will be written.  
options - Specified options.

**See Also:**[Base64.ENCODER](#)[Base64.DECODER](#)[Base64.DONT\\_BREAK\\_LINES](#)

## Methods

**write**

```
public void write(int theByte)
    throws java.io.IOException
```

Writes the byte to the output stream after converting to/from Base64 notation. When encoding, bytes are buffered three at a time before the output stream actually gets a write() call. When decoding, bytes are buffered four at a time.

**Parameters:**

theByte - the byte to write

**write**

```
public void write(byte[] theBytes,
    int off,
    int len)
    throws java.io.IOException
```

Calls [write\(int\)](#) repeatedly until len bytes are written.

**Parameters:**

theBytes - array from which to read bytes  
off - offset for array  
len - max number of bytes to read into array

**flushBase64**

```
public void flushBase64()
    throws java.io.IOException
```

Method added by PHIL. [Thanks, PHIL. -Rob] This pads the buffer without closing the stream.

**close**

```
public void close()
    throws java.io.IOException
```

Flushes and closes (I think, in the superclass) the stream.

**suspendEncoding**

```
public void suspendEncoding()
    throws java.io.IOException
```

Suspends encoding of the stream. May be helpful if you need to embed a piece of base64-encoded data in a stream.

(continued from last page)

## **resumeEncoding**

```
public void resumeEncoding()
```

Resumes encoding of the stream. May be helpful if you need to embed a piece of base64-encoded data in a stream.

## com.wowza.util Class BitReader

java.lang.Object

└─com.wowza.util.BitReader

All Implemented Interfaces:

[IBitReader](#)

public class **BitReader**  
 extends Object  
 implements [IBitReader](#)

### Constructor Summary

public	<a href="#">BitReader</a> (byte[] bytes)
public	<a href="#">BitReader</a> (byte[] bytes, int len)
public	<a href="#">BitReader</a> (byte[] bytes, int offset, int len)

### Method Summary

#### BitWriter

public **BitWriter**(byte[] bytes,  
int len)

(continued from last page)

## Methods

### count

```
public int count()
```

### putBit

```
public void putBit(int bit)
```

### putInt

```
public void putInt(int numberBits,  
int val)
```

### putLong

```
public void putLong(int numberBits,  
long val)
```

### alignToByte

```
public void alignToByte()
```

## com.wowza.util Class BufferUtils

java.lang.Object

└─com.wowza.util.BufferUtils

public class **BufferUtils**  
extends Object

BufferUtils: utilities for converting between binary data and Java primitive types. Faster than Java runtime equivalents

### Field Summary

public static final	<a href="#">alphas</a>
public static final	<a href="#">hexadecimal</a>

### Constructor Summary

public	<a href="#">BufferUtils()</a>
--------	-------------------------------

### Method Summary

static int	<a href="#">byteArrayToInt</a> (byte[] b) Convert byte array to int
static int	<a href="#">byteArrayToInt</a> (byte[] b, int offset) Convert byte array to int with offset
static int	<a href="#">byteArrayToInt</a> (byte[] b, int offset, int count) Convert byte array to int with offset.
static int	<a href="#">byteArrayToInt</a> (byte[] b, int offset, int count, boolean isReverse) Convert byte array to int with offset.
static long	<a href="#">byteArrayToLong</a> (byte[] b) Convert byte array to long
static long	<a href="#">byteArrayToLong</a> (byte[] b, int offset) Convert byte array to long with offset
static long	<a href="#">byteArrayToLong</a> (byte[] b, int offset, int count) Convert byte array to long with offset.
static long	<a href="#">byteArrayToLong</a> (byte[] b, int offset, int count, boolean isReverse) Convert byte array to long with offset.
static int	<a href="#">byteArrayToShort</a> (byte[] b) Convert byte array to int

static int	<a href="#"><code>byteArrayToShort</code></a> (byte[] b, int offset) Convert byte array to int with offset
static int	<a href="#"><code>byteArrayToShort</code></a> (byte[] b, int offset, int count) Convert byte array to int with offset.
static int	<a href="#"><code>byteArrayToShort</code></a> (byte[] b, int offset, int count, boolean isReverse) Convert byte array to int with offset.
static String	<a href="#"><code>byteArrayToString</code></a> (byte[] b) Convert a byte array to a String (UTF-8 encoding assumed)
static String	<a href="#"><code>byteArrayToString</code></a> (byte[] b, int offset, int count) Convert a byte array to a String (UTF-8 encoding assumed)
static String	<a href="#"><code>byteArrayToString</code></a> (byte[] b, int offset, int count, String charsetName) Convert a byte array to a String
static byte[]	<a href="#"><code>decodeHexString</code></a> (String hexStr) Decode a string as a byte array
static int	<a href="#"><code>doCRC32</code></a> (int crc, byte[] buffer, int offset, int len) Calculate an IEEE CRC32 value for MPEG transport stream from a starting crc value
static String	<a href="#"><code>encodeHexString</code></a> (byte[] bytes) Encode a byte array as a string
static String	<a href="#"><code>encodeHexString</code></a> (byte[] bytes, int offset, int len) Encode a byte array as a string
static int	<a href="#"><code>getUnsignedShort</code></a> (java.nio.ByteBuffer buffer)
static int	<a href="#"><code>indexOf</code></a> (byte[] source, byte[] pattern) Finds the first occurrence of a byte pattern in a byte buffer.
static int	<a href="#"><code>indexOfDifferent</code></a> (byte[] buffer1, byte[] buffer2) Compare two byte buffers, and return the index of the first byte that is different.
static byte[]	<a href="#"><code>intToByteArray</code></a> (int value) Convert a int value to a byte array in network order
static void	<a href="#"><code>intToByteArray</code></a> (int value, byte[] buffer, int offset, int size) Convert a int value to a byte array in network order
static void	<a href="#"><code>intToByteArray</code></a> (int value, byte[] buffer, int offset, int size, boolean isReverse) Convert a int value to a byte array in network order
static byte[]	<a href="#"><code>intToByteArray</code></a> (int value, int size) Convert a int value to a byte array in network order
static byte[]	<a href="#"><code>longToByteArray</code></a> (long value) Convert a long value to a byte array in network order
static void	<a href="#"><code>longToByteArray</code></a> (long value, byte[] buffer, int offset, int size) Convert a long value to a byte array in network order
static void	<a href="#"><code>longToByteArray</code></a> (long value, byte[] buffer, int offset, int size, boolean isReverse) Convert a long value to a byte array in network order

static byte[]	<a href="#"><code>longToByteArray</code></a> (long value, int size) Convert a long value to a byte array in network order
static boolean	<a href="#"><code>startsWith</code></a> (byte[] source, byte[] pattern)

Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Fields

### hexadecimal

```
public static final java.lang.String hexadecimal
```

### alphas

```
public static final java.lang.String alphas
```

## Constructors

### BufferUtils

```
public BufferUtils()
```

## Methods

### encodeHexString

```
public static String encodeHexString(byte[] bytes)
```

Encode a byte array as a string

#### Parameters:

`bytes` - byte array

#### Returns:

string

### encodeHexString

```
public static String encodeHexString(byte[] bytes,
    int offset,
    int len)
```

Encode a byte array as a string

#### Parameters:

(continued from last page)

bytes - byte array  
offset - offset  
len - length

**Returns:**  
string

---

## decodeHexString

```
public static byte[] decodeHexString(String hexStr)
```

Decode a string as a byte array

**Parameters:**  
hexStr - string

**Returns:**  
byte array

---

## byteArrayToString

```
public static String byteArrayToString(byte[] b)
```

Convert a byte array to a String (UTF-8 encoding assumed)

**Parameters:**  
b - byte array

**Returns:**  
resultant string

---

## byteArrayToString

```
public static String byteArrayToString(byte[] b,  
    int offset,  
    int count)
```

Convert a byte array to a String (UTF-8 encoding assumed)

**Parameters:**  
b - byte array  
offset - offset  
count - len

**Returns:**  
resultant string

---

## byteArrayToString

```
public static String byteArrayToString(byte[] b,  
    int offset,  
    int count,  
    String charsetName)
```

Convert a byte array to a String

**Parameters:**  
b - byte array  
offset - offset

---

(continued from last page)

count - len  
charsetName - character set name

**Returns:**  
resultant string

---

## byteArrayToLong

```
public static long byteArrayToLong(byte[] b)
```

Convert byte array to long

**Parameters:**  
b - byte array (8 bytes)

**Returns:**  
long value

---

## byteArrayToLong

```
public static long byteArrayToLong(byte[] b,  
int offset)
```

Conver byte array to long with offset

**Parameters:**  
b - byte array (8 bytes)  
offset - offset

**Returns:**  
long value

---

## byteArrayToLong

```
public static long byteArrayToLong(byte[] b,  
int offset,  
int count)
```

Convert byte array to long with offset. Count is the number of bytes. Can be less than 8. If less than 8 just fills lower bits in value.

**Parameters:**  
b - byte array  
offset - offset  
count - number of bytes

**Returns:**  
long value

---

## byteArrayToLong

```
public static long byteArrayToLong(byte[] b,  
int offset,  
int count,  
boolean isReverse)
```

Convert byte array to long with offset. Count is the number of bytes. Can be less than 8. If less than 8 just fills lower bits in value. The reverse flag allows data to be in reverse order.

**Parameters:**

---

(continued from last page)

b - byte array  
offset - offset  
count - number of bytes  
isReverse - is data in reverse order

**Returns:**

long value

---

## byteArrayToInt

```
public static int byteArrayToInt(byte[] b)
```

Convert byte array to int

**Parameters:**

b - byte array (4 bytes)

**Returns:**

int value

---

## byteArrayToInt

```
public static int byteArrayToInt(byte[] b,  
    int offset)
```

Convert byte array to int with offset

**Parameters:**

b - byte array (4 bytes)  
offset - offset

**Returns:**

int value

---

## byteArrayToInt

```
public static int byteArrayToInt(byte[] b,  
    int offset,  
    int count)
```

Convert byte array to int with offset. Count is the number of bytes. Can be less than 4. If less than 4 just fills lower bits in value.

**Parameters:**

b - byte array  
offset - offset  
count - number of bytes

**Returns:**

int value

---

## byteArrayToInt

```
public static int byteArrayToInt(byte[] b,  
    int offset,  
    int count,  
    boolean isReverse)
```

Convert byte array to int with offset. Count is the number of bytes. Can be less than 4. If less than 4 just fills lower bits in value. The reverse flag allows data to be in reverse order.

---

(continued from last page)

**Parameters:**

b - byte array  
offset - offset  
count - number of bytes  
isReverse - is data in reverse order

**Returns:**

int value

---

## byteArrayToShort

```
public static int byteArrayToShort(byte[] b)
```

Convert byte array to int

**Parameters:**

b - byte array (2 bytes)

**Returns:**

int value

---

## byteArrayToShort

```
public static int byteArrayToShort(byte[] b,  
    int offset)
```

Convert byte array to int with offset

**Parameters:**

b - byte array (2 bytes)  
offset - offset

**Returns:**

int value

---

## byteArrayToShort

```
public static int byteArrayToShort(byte[] b,  
    int offset,  
    int count)
```

Convert byte array to int with offset. Count is the number of bytes. Can be less than 2. If less than 2 just fills lower bits in value.

**Parameters:**

b - byte array  
offset - offset  
count - number of bytes

**Returns:**

int value

---

## byteArrayToShort

```
public static int byteArrayToShort(byte[] b,  
    int offset,  
    int count,  
    boolean isReverse)
```

Convert byte array to int with offset. Count is the number of bytes. Can be less than 2. If less than 2 just fills lower bits in value. The reverse flag allows data to be in reverse order.

(continued from last page)

**Parameters:**

b - byte array  
offset - offset  
count - number of bytes  
isReverse - is data in reverse order

**Returns:**

int value

---

## intToByteArray

```
public static byte[] intToByteArray(int value)
```

Convert a int value to a byte array in network order

**Parameters:**

value - value

**Returns:**

4-byte array with value

---

## intToByteArray

```
public static byte[] intToByteArray(int value,  
                                     int size)
```

Convert a int value to a byte array in network order

**Parameters:**

value - value  
size - size of resultant byte array

**Returns:**

size-byte array with value

---

## intToByteArray

```
public static void intToByteArray(int value,  
                                   byte[] buffer,  
                                   int offset,  
                                   int size)
```

Convert a int value to a byte array in network order

**Parameters:**

value - value  
buffer - destination byte array  
offset - starting offset in byte array  
size - number of bytes to write

---

## intToByteArray

```
public static void intToByteArray(int value,  
                                   byte[] buffer,  
                                   int offset,  
                                   int size,  
                                   boolean isReverse)
```

Convert a int value to a byte array in network order

(continued from last page)

**Parameters:**

value - value  
buffer - destination byte array  
offset - starting offset in byte array  
size - number of bytes to write  
isReverse - is data in reverse order

---

**longToByteArray**

```
public static byte[] longToByteArray(long value)
```

Convert a long value to a byte array in network order

**Parameters:**

value - value

**Returns:**

8-byte array with value

---

**longToByteArray**

```
public static byte[] longToByteArray(long value,  
                                     int size)
```

Convert a long value to a byte array in network order

**Parameters:**

value - value  
size - size of resultant byte array

**Returns:**

size-byte array with value

---

**longToByteArray**

```
public static void longToByteArray(long value,  
                                   byte[] buffer,  
                                   int offset,  
                                   int size)
```

Convert a long value to a byte array in network order

**Parameters:**

value - value  
buffer - destination byte array  
offset - starting offset in byte array  
size - number of bytes to write

---

**longToByteArray**

```
public static void longToByteArray(long value,  
                                   byte[] buffer,  
                                   int offset,  
                                   int size,  
                                   boolean isReverse)
```

Convert a long value to a byte array in network order

**Parameters:**

(continued from last page)

value - value  
buffer - destination byte array  
offset - starting offset in byte array  
size - number of bytes to write  
isReverse - is data in reverse order

---

## getUnsignedShort

```
public static int getUnsignedShort(java.nio.ByteBuffer buffer)
```

---

## doCRC32

```
public static int doCRC32(int crc,  
    byte[] buffer,  
    int offset,  
    int len)
```

Calculate an IEEE CRC32 value for MPEG transport stream from a starting crc value

### Parameters:

crc - starting crc value  
buffer - buffer  
offset - offset  
len - len

### Returns:

crc value

---

## indexOf

```
public static int indexOf(byte[] source,  
    byte[] pattern)
```

Finds the first occurrence of a byte pattern in a byte buffer.

Note: If we want to improve the performance, we could implement the Knuth-Morris-Pratt algorithm. But I don't need the speed nor do I have time today!

### Parameters:

source - The source byte buffer  
pattern - the pattern we're looking for.

### Returns:

the index of source where the pattern is found, else -1

---

## indexOfDifferent

```
public static int indexOfDifferent(byte[] buffer1,  
    byte[] buffer2)
```

Compare two byte buffers, and return the index of the first byte that is different.

### Parameters:

buffer1 - byte array1  
buffer2 - byte array2

### Returns:

index where buffers differ, or -1.

---

---

## startsWith

```
public static boolean startsWith(byte[] source,  
    byte[] pattern)
```

## com.wowza.util Class DebugUtils

java.lang.Object

└─com.wowza.util.DebugUtils

public final class **DebugUtils**  
extends Object

DebugUtils: Debugging utilities.

### Constructor Summary

public	<a href="#">DebugUtils()</a>
--------	------------------------------

### Method Summary

static java.io.File	<a href="#">byteArrayToFile</a> (byte[] data, String filePath) Dump a buffer of bytes to a file.
static boolean	<a href="#">doesStackContainMethod</a> (String methodName) Examine current stack trace to determine if the specified method name in the the trace.
static String	<a href="#">formatBytes</a> (byte[] data) Format byte array for printing.
static String	<a href="#">formatBytes</a> (byte[] data, boolean showIndex) Format byte array for printing.
static String	<a href="#">formatBytes</a> (byte[] data, int offset, int len) Format byte array for printing.
static String	<a href="#">formatBytes</a> (byte[] data, int offset, int len, boolean showIndex) Format byte array for printing.
static String	<a href="#">formatBytesInSingleRow</a> (byte[] data, int offset, int len) Format byte array for printing.
static String	<a href="#">formatBytesShort</a> (byte[] data) Format byte array for printing.
static String	<a href="#">formatBytesShort</a> (byte[] data, int offset, int len) Format byte array for printing.
static String	<a href="#">formatBytesStruct</a> (byte[] data)
static String	<a href="#">formatBytesStruct</a> (byte[] data, int offset, int len) Format byte array for printing.
static String	<a href="#">formatMilliseconds</a> (long ms) Give a time in seconds, return a String representing the time in hh:mm:ss.mmm.

static String	<a href="#"><code>formatSeconds</code></a> (long t) Give a time in seconds, return a String representing the time in hh:mm:ss.
static String	<a href="#"><code>formatUtcTime</code></a> (long utcTime)
static String	<a href="#"><code>stackTraceToSingleLineString</code></a> (Throwable e, int maxLines) Given an exception, return single line String representation.
static String	<a href="#"><code>stackTraceToString</code></a> (Throwable e) Given an exception, return String representation.
static String	<a href="#"><code>stackTraceToString</code></a> (Throwable e, int maxLines, String separator) Given an exception, return single line String representation.
static String	<a href="#"><code>toHex</code></a> (byte value) Format a byte value to a 0xff format
static String	<a href="#"><code>toHex</code></a> (int value) Format a byte value to a 0xffffffff format
static String	<a href="#"><code>toLong</code></a> (long value) Format a long value to a 0xffffffffffffffff format

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### DebugUtils

```
public DebugUtils()
```

## Methods

### formatBytesShort

```
public static String formatBytesShort(byte[] data)
```

Format byte array for printing. Simple format as rows of hex values (16 values per row)

#### Parameters:

data - byte array

#### Returns:

formatted string

### formatBytesShort

```
public static String formatBytesShort(byte[] data,  
    int offset,  
    int len)
```

(continued from last page)

Format byte array for printing. Simple format as rows of hex values (16 values per row)

**Parameters:**

data - byte array  
offset - offset in array  
len - data len

**Returns:**

formatted string

---

## formatBytes

```
public static String formatBytes(byte[] data)
```

Format byte array for printing. Format as rows of hex values (16 values per row) along with text representation of data.

**Parameters:**

data - byte array

**Returns:**

formatted string

---

## formatBytes

```
public static String formatBytes(byte[] data,  
    boolean showIndex)
```

Format byte array for printing. Format as rows of hex values (16 values per row) along with text representation of data.

**Parameters:**

data - byte array

**Returns:**

formatted string

---

## formatBytes

```
public static String formatBytes(byte[] data,  
    int offset,  
    int len)
```

Format byte array for printing. Format as rows of hex values (16 values per row) along with text representation of data.

**Parameters:**

data - byte array  
offset - start index in array  
len - length to format

**Returns:**

formatted string

---

## formatBytes

```
public static String formatBytes(byte[] data,  
    int offset,  
    int len,  
    boolean showIndex)
```

Format byte array for printing. Format as rows of hex values (16 values per row) along with text representation of data.

---

(continued from last page)

**Parameters:**

data - byte array  
offset - start index in array  
len - length to format

**Returns:**

formatted string

---

## formatBytesInSingleRow

```
public static String formatBytesInSingleRow(byte[] data,  
    int offset,  
    int len)
```

Format byte array for printing. Format as rows of hex values all in one row along with text representation of data.

**Parameters:**

data - byte array  
offset - start index in array  
len - length to format

**Returns:**

formatted string

---

## formatBytesStruct

```
public static String formatBytesStruct(byte[] data)
```

---

## formatBytesStruct

```
public static String formatBytesStruct(byte[] data,  
    int offset,  
    int len)
```

Format byte array for printing. Format as Java primitive byte values (8 per row).

**Parameters:**

data - byte array

**Returns:**

formatted string

---

## toHex

```
public static String toHex(byte value)
```

Format a byte value to a 0xff format

**Parameters:**

value - byte value

**Returns:**

return string

---

## toHex

```
public static String toHex(int value)
```

(continued from last page)

Format a byte value to a 0xffffffff format

**Parameters:**

value - int value

**Returns:**

return string

---

## toLong

```
public static String toLong(long value)
```

Format a long value to a 0xffffffffffffffff format

**Parameters:**

value - long value

**Returns:**

return string

---

## byteArrayToFile

```
public static java.io.File byteArrayToFile(byte[] data,  
String filePath)
```

Dump a buffer of bytes to a file. Useful for debugging.

**Parameters:**

data - a buffer of bytes

filePath - The path and filename

---

## formatSeconds

```
public static String formatSeconds(long t)
```

Give a time in seconds, return a String representing the time in hh:mm:ss.

123 s --> 00:02:03

**Parameters:**

t

**Returns:**

time representation

---

## formatMilliseconds

```
public static String formatMilliseconds(long ms)
```

Give a time in seconds, return a String representing the time in hh:mm:ss.mmm.

123456 ms --> 00:02:03.456

**Parameters:**

ms

**Returns:**

time representation

---

## formatUtcTime

```
public static String formatUtcTime(long utcTime)
```

---

## stackTraceToString

```
public static String stackTraceToString(Throwable e)
```

Given an exception, return String representation. Note: this is the entire raw stack trace including tabs and line endings

**Parameters:**

e - throwable

**Returns:**

stack trace representation

---

## stackTraceToSingleLineString

```
public static String stackTraceToSingleLineString(Throwable e,  
int maxLines)
```

Given an exception, return single line String representation. Note: line endings are replaced with "|" character. Tabs are removed.

**Parameters:**

e - throwable

maxLines - If greater than zero, returns only first maxLines of trace

**Returns:**

stack trace info

---

## stackTraceToString

```
public static String stackTraceToString(Throwable e,  
int maxLines,  
String seperator)
```

Given an exception, return single line String representation. Note: line endings are replaced with "|" character. Tabs are removed.

**Parameters:**

e - throwable

maxLines - If greater than zero, returns only first maxLines of trace

seperator - character to replace line endings with

**Returns:**

stack trace info

---

## doesStackContainMethod

```
public static boolean doesStackContainMethod(String methodName)
```

Examine current stack trace to determine if the specified method name in the the trace.

Could be enhanced quite a bit by also checking for Class and method. But simple for now.

**Parameters:**

(continued from last page)

methodName

**Returns:**

true if in trace, else false

## com.wowza.util Class ElapsedTimer

java.lang.Object

└─com.wowza.util.ElapsedTimer

public class **ElapsedTimer**  
extends Object

ElapsedTimer: Utility class for keep track of the duration an object has been in existence.

### Constructor Summary

public	<a href="#">ElapsedTimer()</a> Construct a new ElapsedTimer and start the clock
--------	--

### Method Summary

java.util.Date	<a href="#">getDate()</a> Get the date the object was created
String	<a href="#">getDateString()</a> Get the date object was created as formatted String
long	<a href="#">getTime()</a> Get elapsed time object in existence (milliseconds)
double	<a href="#">getTimeSeconds()</a> Get elapsed time object in seconds
String	<a href="#">getTimeString()</a> Get elapsed time object in existence as formatted String (Ex: 3 days 2 minutes 5 seconds)

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### ElapsedTimer

public **ElapsedTimer()**

Construct a new ElapsedTimer and start the clock

### Methods

(continued from last page)

## getDate

```
public java.util.Date getDate()
```

Get the date the object was created

**Returns:**

date object created

---

## getDateString

```
public String getDateString()
```

Get the date object was created as formatted String

**Returns:**

date object created as formatted String

---

## getTime

```
public long getTime()
```

Get elapsed time object in existence (milliseconds)

**Returns:**

elapsed time (milliseconds)

---

## getTimeSeconds

```
public double getTimeSeconds()
```

Get elapsed time object in seconds

**Returns:**

elapsed time in seconds

---

## getTimeString

```
public String getTimeString()
```

Get elapsed time object in existence as formatted String (Ex: 3 days 2 minutes 5 seconds)

**Returns:**

elapsed time as formatted String

---

## com.wowza.util Class FileUtils

java.lang.Object

└─com.wowza.util.FileUtils

public class **FileUtils**  
extends Object

FileUtils: File utilities

### Field Summary

protected static	<a href="#">fileEditors</a>
------------------	-----------------------------

### Constructor Summary

public	<a href="#">FileUtils()</a>
--------	-----------------------------

### Method Summary

static void	<a href="#">closeQuietly</a> (java.io.InputStream stream)
static void	<a href="#">closeQuietly</a> (java.io.OutputStream stream)
static void	<a href="#">closeQuietly</a> (java.io.Reader reader)
static void	<a href="#">copyFile</a> (java.io.File fromFile, java.io.File toFile) Simple file copy routine
static void	<a href="#">copyFile2</a> (java.io.File fromFile, java.io.File toFile)
static boolean	<a href="#">deleteDirectory</a> (java.io.File path)
static void	<a href="#">deleteFolder</a> (java.io.File folder)
static byte[]	<a href="#">fileToByteArray</a> (java.io.File file)
static Object	<a href="#">getFileEditor</a> (String filePath)
static String	<a href="#">streamNameToValidFilename</a> (String name) Encode a stream name (deal with path elements) to a valid filename.
static String	<a href="#">toValidFilename</a> (String name) Encode a name to a valid filename.
static void	<a href="#">traverseDirectory</a> (java.io.File dir, <a href="#">IFileProcess</a> fileNotify) Traverse a directory recursively calling fileNotify for each file and folder encountered

```
static java.io.File
```

```
versionFile(java.io.File newFile)
```

Rename a file using the file format [original-name]\_#[.ext].

Methods inherited from class `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Fields

### fileEditors

```
protected static java.util.Map fileEditors
```

## Constructors

### FileUtils

```
public FileUtils()
```

## Methods

### fileToByteArray

```
public static byte[] fileToByteArray(java.io.File file)
```

### streamNameToValidFilename

```
public static String streamNameToValidFilename(String name)
```

Encode a stream name (deal with path elements) to a valid filename.

**Parameters:**

name - stream name

**Returns:**

encoded filename

### toValidFilename

```
public static String toValidFilename(String name)
```

Encode a name to a valid filename.

**Parameters:**

name

**Returns:**

encoded filename

## copyFile

```
public static void copyFile(java.io.File fromFile,  
                             java.io.File toFile)
```

Simple file copy routine

### Parameters:

fromFile - from file  
toFile - to file

---

## copyFile2

```
public static void copyFile2(java.io.File fromFile,  
                               java.io.File toFile)  
    throws java.io.IOException
```

---

## closeQuietly

```
public static void closeQuietly(java.io.InputStream stream)
```

---

## closeQuietly

```
public static void closeQuietly(java.io.OutputStream stream)
```

---

## closeQuietly

```
public static void closeQuietly(java.io.Reader reader)
```

---

## deleteDirectory

```
public static boolean deleteDirectory(java.io.File path)
```

---

## versionFile

```
public static java.io.File versionFile(java.io.File newFile)
```

Rename a file using the file format [original-name]\_#[.ext].

### Parameters:

newFile - input file

### Returns:

renamed file

---

(continued from last page)

## traverseDirectory

```
public static void traverseDirectory(java.io.File dir,  
    IFileProcess fileNotify)
```

Traverse a directory recursively calling fileNotify for each file and folder encountered

### Parameters:

dir - starting directory

fileNotify - file notify object

---

## deleteFolder

```
public static void deleteFolder(java.io.File folder)
```

---

## getFileEditor

```
public static Object getFileEditor(String filePath)
```

## com.wowza.util Class FLVUtils

java.lang.Object

└─com.wowza.util.FLVUtils

public final class **FLVUtils**  
extends Object

FLVUtils: utility for reading and writing .flv files.

### Field Summary

public static final	<a href="#"><u>CLASS</u></a>
public static final	<a href="#"><u>CLASSNAME</u></a> Value: <b>FLVUtils</b>
public static final	<a href="#"><u>FLV_CHUNKHEADER_BUFFERSIZE</u></a> Size of temporary buffer needed for flv reading (byte[]) Value: <b>13</b>
public static final	<a href="#"><u>FLV_CHUNKHEADER_FIRSTBYTE</u></a> Header values: first byte of packet data Value: <b>3</b>
public static final	<a href="#"><u>FLV_CHUNKHEADER_HEADERSIZE</u></a> Size of packet header (byte[]) Value: <b>11</b>
public static final	<a href="#"><u>FLV_CHUNKHEADER_ISIZE</u></a> Header values: packet size Value: <b>1</b>
public static final	<a href="#"><u>FLV_CHUNKHEADER_IMECODE</u></a> Header values: timecode (milliseconds) Value: <b>2</b>
public static final	<a href="#"><u>FLV_CHUNKHEADER_ITYPE</u></a> Header values: packet type Value: <b>0</b>
public static final	<a href="#"><u>FLV_CHUNKHEADER_SECONDBYTE</u></a> Header values: second byte of packet data Value: <b>4</b>
public static final	<a href="#"><u>FLV_CHUNKHEADER_VALUESIZE</u></a> Size of header values array (long[]) Value: <b>5</b>

public static final	<a href="#">FLV_DFRAME</a> D video frame type (partial frame based on key frame) Value: <b>3</b>
public static final	<a href="#">FLV_KFRAME</a> Key video frame type Value: <b>1</b>
public static final	<a href="#">FLV_PFRAME</a> P video frame type (partial frame based on previous frame) Value: <b>2</b>
public static final	<a href="#">FLV_TCINDEXAUDIO</a> Value: <b>0</b>
public static final	<a href="#">FLV_TCINDEXDATA</a> Value: <b>2</b>
public static final	<a href="#">FLV_TCINDEXVIDEO</a> Value: <b>1</b>
public static final	<a href="#">FLV_UFRAME</a> Unknown video frame type Value: <b>0</b>
public static final	<a href="#">METADATAFILTER_NONE</a> Value: <b>0</b>
public static final	<a href="#">METADATAFILTER_REMOVE_OBJS</a> Value: <b>1</b>

## Constructor Summary

public	<a href="#">FLVUtils()</a>
--------	----------------------------

## Method Summary

static long	<a href="#">adjustFirstPacketTCs</a> (java.util.List audioTCs, java.util.List videoTCs, java.util.List dataTCs) Align list of timecode for each data type.
static int	<a href="#">audioCodecStringToId</a> (String codecString) Parse a string to get the codec ID defined by IVHost.CODEC_AUDIO_*
static String	<a href="#">audioCodecToMetaDataString</a> (int codec) Get a printable string representation of the audio codecs defined as IVHost.CODEC_AUDIO_* as the string used in the onMetaData event
static String	<a href="#">audioCodecToString</a> (int codec) Get a printable string representation of the audio codecs defined as IVHost.CODEC_AUDIO_*
static String	<a href="#">frameTypeToString</a> (int frameType)

static int	<a href="#"><code>getAudioCodec</code></a> ( <a href="#"><code>AMFPacket</code></a> packet) Get the codec id for this audio packet.
static int	<a href="#"><code>getAudioCodec</code></a> (int value) Return the codec portion of the first byte of an audio packet.
static int	<a href="#"><code>getAudioMP3Layer</code></a> ( <a href="#"><code>AMFPacket</code></a> packet) Audio marked as MP3 is really MPEG1 Layer 1-3.
static int	<a href="#"><code>getFrameType</code></a> (byte value) Given the first byte of a video packet, determine the frame type (FLV_*FRAME)
static int	<a href="#"><code>getFrameType</code></a> (int value) Given the first byte of a video packet, determine the frame type (FLV_*FRAME)
static int	<a href="#"><code>getFrameType</code></a> (int[] values) Given the headers values (including first byte of the packet), determine the type of video frame (FLV_*FRAME)
static byte	<a href="#"><code>getHeaderFlags</code></a> (java.io.File file)
static long	<a href="#"><code>getLastTC</code></a> (java.io.File file) Get the duration of an .flv file.
static <a href="#"><code>OnMetadataBasic</code></a>	<a href="#"><code>getOnMetadataData</code></a> ( <a href="#"><code>AMFPacket</code></a> metaDataPacket)
static int	<a href="#"><code>getVideoCodec</code></a> ( <a href="#"><code>AMFPacket</code></a> packet) Get the codec id for this video packet.
static int	<a href="#"><code>getVideoCodec</code></a> (int value) Return the codec portion of the first byte of an video packet.
static int	<a href="#"><code>getVideoFrameType</code></a> ( <a href="#"><code>AMFPacket</code></a> packet)
static int	<a href="#"><code>getVideoTimecodeOffset</code></a> ( <a href="#"><code>AMFPacket</code></a> packet) Get the timecode offset in milliseconds between the PTS and DTS for this frame.
static int	<a href="#"><code>getVideoTimecodeOffset</code></a> (byte[] buffer) Get the timecode offset in milliseconds between the PTS and DTS for this frame.
static java.util.List	<a href="#"><code>interleavePackets</code></a> (java.util.List audioPackets, java.util.List videoPackets, java.util.List dataPackets, java.util.List audioTCs, java.util.List videoTCs, java.util.List dataTCs, java.util.List dataTypes, long[] currentTCs) This is a utility function primarily used for IMediaWriters.
static java.util.List	<a href="#"><code>interleavePackets</code></a> (java.util.List audioPackets, java.util.List videoPackets, java.util.List dataPackets, java.util.List audioTCs, java.util.List videoTCs, java.util.List dataTCs, long[] currentTCs) This is a utility function primarily used for IMediaWriters.
static boolean	<a href="#"><code>isAudioCodecConfig</code></a> ( <a href="#"><code>AMFPacket</code></a> packet) Returns true if the packet is a audio codec config packet
static boolean	<a href="#"><code>isAudioCodecConfig</code></a> (java.nio.ByteBuffer buffer) Returns true if the packet is a audio codec config packet
static boolean	<a href="#"><code>isOnMetadata</code></a> (byte[] dataDataBytes)

static boolean	<a href="#"><code>isOnMetadataPacket</code></a> ( <a href="#"><code>AMFPacket</code></a> packet) Returns true if packet is onMetaData or [setDataFrame, onMetaData] data packet.
static boolean	<a href="#"><code>isVideoCodecConfig</code></a> ( <a href="#"><code>AMFPacket</code></a> packet) Returns true if the packet is a video codec config packet
static boolean	<a href="#"><code>isVideoCodecConfig</code></a> (java.nio.ByteBuffer buffer) Returns true if the packet is a video codec config packet
static boolean	<a href="#"><code>isVideoCodecConfig</code></a> (int firstByte, int secondByte) Returns true if the packet is a video codec config packet
static boolean	<a href="#"><code>isVideoKeyFrame</code></a> ( <a href="#"><code>AMFPacket</code></a> packet) Returns true if the packet is a video key frame
static boolean	<a href="#"><code>isVideoKeyFrame</code></a> (byte[] buffer) Returns true if the packet is a video key frame
static boolean	<a href="#"><code>isVideoKeyFrame</code></a> (java.nio.ByteBuffer buffer) Returns true if the packet is a video key frame
static boolean	<a href="#"><code>isVideoKeyFrame</code></a> (int[] chunkHeaderValues) Returns true if the packet is a video key frame
static byte[]	<a href="#"><code>modifyOnMetadataEvent</code></a> (byte[] buffer, long flags, java.util.List itemsToRemove, java.util.Map itemsToAdd) Modifies onMetadata event to remove or add items
static <a href="#"><code>AMFPacket</code></a>	<a href="#"><code>readChunk</code></a> (java.io.DataInput is) Read a packets worth of .flv data from an InputStream and return as an AMFPacket
static <a href="#"><code>AMFPacket</code></a>	<a href="#"><code>readChunk</code></a> (java.io.InputStream is) Read a packets worth of .flv data from an InputStream and return as an AMFPacket
static void	<a href="#"><code>readChunkHeader</code></a> (java.io.RandomAccessFile is, byte[] buffer, int[] values) Read packet header.
static boolean	<a href="#"><code>readHeader</code></a> (java.io.DataInput is) Read file header.
static boolean	<a href="#"><code>readHeader</code></a> (java.io.InputStream is) Read file header.
static void	<a href="#"><code>readPrevChunkHeader</code></a> (java.io.RandomAccessFile is, byte[] buffer, int[] values) Back up one packet from current position in the file and read the packet header.
static String	<a href="#"><code>streamCodecToString</code></a> (int codec) Get a printable string representation of the stream codecs defined as IVHost.CODEC_STREAM_*
static <a href="#"><code>AMFPacket</code></a>	<a href="#"><code>updateOnCuePointTimecode</code></a> ( <a href="#"><code>AMFPacket</code></a> packet, long timecode)
static java.nio.ByteBuffer	<a href="#"><code>updateOnCuePointTimecode</code></a> (java.nio.ByteBuffer data, int dataType, long timecode)
static int	<a href="#"><code>videoCodecStringToCodecVersion</code></a> (String codecString) Parse a string to get the codec version defined by IVHost.CODEC_VIDEO_VERSION_*

static int	<a href="#">videoCodecStringToId</a> (String codecString) Parse a string to get the codec ID defined by IVHost.CODEC_VIDEO_*
static String	<a href="#">videoCodecToMetaDateString</a> (int codec) Get a printable string representation of the video codecs defined as IVHost.CODEC_VIDEO_* as the string used in the onMetaData event
static String	<a href="#">videoCodecToMetaDateString</a> (int codec, int codecVersion) Get a printable string representation of the video codecs defined as IVHost.CODEC_VIDEO_* as the string used in the onMetaData event
static String	<a href="#">videoCodecToString</a> (int codec) Get a printable string representation of the video codecs defined as IVHost.CODEC_VIDEO_*
static String	<a href="#">videoCodecToString</a> (int codec, int codecVersion)
static com.wowza.wms.mediawriter.MediaWriterStatus	<a href="#">writeChunk</a> (java.io.DataOutput ds, java.nio.ByteBuffer data, int size, long timecode, byte type)
static com.wowza.wms.mediawriter.MediaWriterStatus	<a href="#">writeChunk</a> (java.io.OutputStream ds, java.nio.ByteBuffer data, int size, long timecode, byte type) Write a packets worth of data.
static void	<a href="#">writeDuration</a> (java.io.File file, double duration) Write the duration to an existing .flv file.
static void	<a href="#">writeHeader</a> (java.io.OutputStream ds, double duration, int audiocodecid, int videocodecid, String createdBy, java.util.Map extraMetadata) Write file header including onMetaData packet.
static void	<a href="#">writeHeader</a> (java.io.OutputStream ds, double duration, java.util.Map extraMetadata) Write file header including onMetaData packet.
static void	<a href="#">writeHeaderFlags</a> (java.io.File file, byte newFlags)
static void	<a href="#">writePackets</a> (java.io.OutputStream ds, java.util.List audioPackets, java.util.List videoPackets, java.util.List dataPackets, java.util.List audioTCs, java.util.List videoTCs, java.util.List dataTCs, java.util.List dataTypes, long[] currentTCs) Write a bunch of packets to .flv file all at once.
static void	<a href="#">writePackets</a> (java.io.OutputStream ds, java.util.List audioPackets, java.util.List videoPackets, java.util.List dataPackets, java.util.List audioTCs, java.util.List videoTCs, java.util.List dataTCs, java.util.List dataTypes, long[] currentTCs, IFLVWriterAdjustTimecode dataPacketTimecodeAdjuster) Write a bunch of packets to .flv file all at once.
static void	<a href="#">writePackets</a> (java.io.OutputStream ds, java.util.List audioPackets, java.util.List videoPackets, java.util.List dataPackets, java.util.List audioTCs, java.util.List videoTCs, java.util.List dataTCs, long[] currentTCs) Write a bunch of packets to .flv file all at once.
static void	<a href="#">writePackets</a> (java.io.OutputStream ds, java.util.List packetList, long tcOffset) Write audio/video/data packets to an .flv file.

static void	<a href="#">writeShortHeader</a> ( java.io.DataOutput ds)
static void	<a href="#">writeShortHeader</a> ( java.io.OutputStream ds) Write just the FLV file header (without the metadata packet)

```

Constant value: **1**

## Constructors

### FLVUtils

```
public FLVUtils()
```

## Methods

### streamCodecToString

```
public static String streamCodecToString(int codec)
```

Get a printable string representation of the stream codecs defined as IVHost.CODEC\_STREAM\_\*

**Parameters:**

codec - codec id defined IVHost.CODEC\_STREAM\_\*

**Returns:**

codec name

---

### audioCodecStringToId

```
public static int audioCodecStringToId(String codecString)
```

Parse a string to get the codec ID defined by IVHost.CODEC\_AUDIO\_\*

(continued from last page)

**Parameters:**

codecString - codec string

**Returns:**

codec ID

---

**videoCodecToMetaDataString**

```
public static String videoCodecToMetaDataString(int codec)
```

Get a printable string representation of the video codecs defined as IVHost.CODEC\_VIDEO\_\* as the string used in the onMetaData event

**Parameters:**

codec - codec id defined IVHost.CODEC\_VIDEO\_\*

**Returns:**

codec name

---

**videoCodecToMetaDataString**

```
public static String videoCodecToMetaDataString(int codec,  
int codecVersion)
```

Get a printable string representation of the video codecs defined as IVHost.CODEC\_VIDEO\_\* as the string used in the onMetaData event

**Parameters:**

codec - codec id defined IVHost.CODEC\_VIDEO\_\*

codecVersion - codec version

**Returns:**

metadata string

---

**audioCodecToMetaDataString**

```
public static String audioCodecToMetaDataString(int codec)
```

Get a printable string representation of the audio codecs defined as IVHost.CODEC\_AUDIO\_\* as the string used in the onMetaData event

**Parameters:**

codec - codec id defined IVHost.CODEC\_AUDIO\_\*

**Returns:**

codec name

---

**audioCodecToString**

```
public static String audioCodecToString(int codec)
```

Get a printable string representation of the audio codecs defined as IVHost.CODEC\_AUDIO\_\*

**Parameters:**

codec - codec id defined IVHost.CODEC\_AUDIO\_\*

**Returns:**

codec name

## videoCodecStringToCodecVersion

```
public static int videoCodecStringToCodecVersion(String codecString)
```

Parse a string to get the codec version defined by IVHost.CODEC\_VIDEO\_VERSION\_\*

**Parameters:**

codecString

**Returns:**

codec version string

---

## videoCodecStringToId

```
public static int videoCodecStringToId(String codecString)
```

Parse a string to get the codec ID defined by IVHost.CODEC\_VIDEO\_\*

**Parameters:**

codecString - codec string

**Returns:**

codec ID

---

## videoCodecToString

```
public static String videoCodecToString(int codec)
```

Get a printable string representation of the video codecs defined as IVHost.CODEC\_VIDEO\_\*

**Parameters:**

codec - codec id defined IVHost.CODEC\_VIDEO\_\*

**Returns:**

codec name

---

## videoCodecToString

```
public static String videoCodecToString(int codec,  
int codecVersion)
```

---

## frameTypeToString

```
public static String frameTypeToString(int frameType)
```

---

## getFrameType

```
public static int getFrameType(int[] values)
```

Given the headers values (including first byte of the packet), determine the type of video frame (FLV\_\*FRAME)

**Parameters:**

values - header values

---

(continued from last page)

**Returns:**

type of video frame (FLV\_\*FRAME)

---

## getFrameType

```
public static int getFrameType(int value)
```

Given the first byte of a video packet, determine the frame type (FLV\_\*FRAME)

**Parameters:**

value - first byte of packet

**Returns:**

type of video frame (FLV\_\*FRAME)

---

## getAudioCodec

```
public static int getAudioCodec(int value)
```

Return the codec portion of the first byte of an audio packet. Return should be one of IVHost.CODEC\_AUDIO\_\*

**Parameters:**

value - first byte of audio packet

**Returns:**

codec id

---

## getVideoCodec

```
public static int getVideoCodec(int value)
```

Return the codec portion of the first byte of an video packet. Return should be one of IVHost.CODEC\_VIDEO\_\*

**Parameters:**

value - first byte of audio packet

**Returns:**

codec id

---

## getFrameType

```
public static int getFrameType(byte value)
```

Given the first byte of a video packet, determine the frame type (FLV\_\*FRAME)

**Parameters:**

value - first byte of packet

**Returns:**

type of video frame (FLV\_\*FRAME)

---

## readChunk

```
public static AMFPacket readChunk(java.io.InputStream is)
```

Read a packets worth of .flv data from an InputStream and return as an AMFPacket

**Parameters:**

(continued from last page)

is - InputStream

**Returns:**

AMFPacket of data or null if unsuccessful or end of file

---

## readChunk

```
public static AMFPacket readChunk(java.io.DataInput is)
```

Read a packets worth of .flv data from an InputStream and return as an AMFPacket

**Parameters:**

is - InputStream

**Returns:**

AMFPacket of data or null if unsuccessful or end of file

---

## readPrevChunkHeader

```
public static void readPrevChunkHeader(java.io.RandomAccessFile is,  
    byte[] buffer,  
    int[] values)
```

Back up one packet from current position in the file and read the packet header. This includes reading the first byte of the packet data. The file pointer will be positioned at the first byte of the packet data. values[FLV\_CHUNKHEADER\_ITYPE] will be set to 0x7f if failure or start of file.

**Parameters:**

is - RandomAccessFile

buffer - temporary buffer byte[FLV\_CHUNKHEADER\_BUFFERSIZE]

values - header values long[FLV\_CHUNKHEADER\_VALUESIZE]

---

## readChunkHeader

```
public static void readChunkHeader(java.io.RandomAccessFile is,  
    byte[] buffer,  
    int[] values)
```

Read packet header. This includes reading the first byte of the packet data. The file pointer will be positioned at the first byte of the packet data. values[FLV\_CHUNKHEADER\_ITYPE] will be set to 0x7f if failure or end of file.

**Parameters:**

is - RandomAccessFile

buffer - temporary buffer byte[FLV\_CHUNKHEADER\_BUFFERSIZE]

values - header values long[FLV\_CHUNKHEADER\_VALUESIZE]

---

## readHeader

```
public static boolean readHeader(java.io.InputStream is)
```

Read file header. Return true if successful. Basically this just skips first 13 bytes in file.

---

## readHeader

```
public static boolean readHeader(java.io.DataInput is)
```

Read file header. Return true if successful. Basically this just skips first 13 bytes in file.

---

(continued from last page)

## writeShortHeader

```
public static void writeShortHeader(java.io.OutputStream ds)
```

Write just the FLV file header (without the metadata packet)

**Parameters:**

ds - OutputStream

## writeShortHeader

```
public static void writeShortHeader(java.io.DataOutput ds)
```

## writeHeader

```
public static void writeHeader(java.io.OutputStream ds,
    double duration,
    java.util.Map extraMetadata)
```

Write file header including onMetaData packet.

**Parameters:**

ds - OutputStream

duration - duration of .flv file in seconds

extraMetadata - Map of name/value pairs of metadata that will be appended to the onMetaData block

## writeHeader

```
public static void writeHeader(java.io.OutputStream ds,
    double duration,
    int audiocodecid,
    int videocodecid,
    String createdBy,
    java.util.Map extraMetadata)
```

Write file header including onMetaData packet.

With this method you can provide a Map of metadata to write to the file. This map can include a mixture of simple types like: int, long, String, boolean. These types will be wrapped in AMFData classes before they are written to the file. This map can also contain AMFData items. For example if you wanted to insert an array of **cuePoints** the code would look like:

```
Map extraMetadata = new HashMap();

AMFDataArray amfArray = new AMFDataArray();
for(int i=0;i
```

**Parameters:**

ds - OutputStream

duration - duration of .flv file in seconds

audiocodecid - audio codec ID see IVHost.CODEC\_AUDIO\_\* (-1 for now audio)

videocodecid - video codec ID see IVHost.CODEC\_VIDEO\_\* (-1 for now video)

(continued from last page)

createdBy - created by string (null for empty)

extraMetadata - Map of name/value pairs of metadata that will be appended to the onMetaData block

---

## writeChunk

```
public static com.wowza.wms.mediawriter.MediaWriterStatus
writeChunk( java.io.OutputStream ds,
            java.nio.ByteBuffer data,
            int size,
            long timecode,
            byte type)
```

Write a packets worth of data.

**Parameters:**

ds - OutputStream

data - packet data

size - size of the packet

timecode - timecode (milliseconds)

type - type of packet IVHost.CONTENTTYPE\_\*

---

## writeChunk

```
public static com.wowza.wms.mediawriter.MediaWriterStatus
writeChunk( java.io.DataOutput ds,
            java.nio.ByteBuffer data,
            int size,
            long timecode,
            byte type)
```

---

## interleavePackets

```
public static java.util.List interleavePackets( java.util.List audioPackets,
        java.util.List videoPackets,
        java.util.List dataPackets,
        java.util.List audioTCs,
        java.util.List videoTCs,
        java.util.List dataTCs,
        long[] currentTCs)
```

This is a utility function primarily used for IMediaWriters. It is a way of taking the discrete audio/video/data packets and timecodes and interleaving them into a single list of AMFPacket objects. The currentTCs array is an array of longs containing the last timecode for each of the packet types FLV\_TCINDEX\* (long[3]). This array will be used to calculate the absolute timecode for a given packet. For example if the relative timecode for an audio packet is 26 and the currentTCs value for the audio channel is 1003 then the absolute timecode for that packet will be 1029. The currentTCs array will be updated after this call to reflect the absolute timecode of the last packet processed of each type.

**Parameters:**

audioPackets - list of audio packets (ByteBuffer)

videoPackets - list of video packets (ByteBuffer)

dataPackets - list of data packets (ByteBuffer)

audioTCs - list of relative audio timecodes (Long)

videoTCs - list of relative video timecodes (Long)

dataTCs - list of relative data timecodes (Long)

currentTCs - array of longs containing last TCs written for each packet type FLV\_TCINDEX\* (long[3]). Last timecode written for each packet type will be returned in this same array.

**Returns:**

List of AMFPacket objects sorted by timecodes

## interleavePackets

```
public static java.util.List interleavePackets(java.util.List audioPackets,
        java.util.List videoPackets,
        java.util.List dataPackets,
        java.util.List audioTCs,
        java.util.List videoTCs,
        java.util.List dataTCs,
        java.util.List dataTypes,
        long[] currentTCs)
```

This is a utility function primarily used for IMediaWriters. It is a way of taking the discrete audio/video/data packets and timecodes and interleaving them into a single list of AMFPacket objects. The currentTCs array is an array of longs containing the last timecode for each of the packet types FLV\_TCINDEX\* (long[3]). This array will be used to calculate the absolute timecode for a given packet. For example if the relative timecode for an audio packet is 26 and the currentTCs value for the audio channel is 1003 then the absolute timecode for that packet will be 1029. The currentTCs array will be updated after this call to reflect the absolute timecode of the last packet processed of each type.

### Parameters:

audioPackets - list of audio packets (ByteBuffer)  
 videoPackets - list of video packets (ByteBuffer)  
 dataPackets - list of data packets (ByteBuffer)  
 audioTCs - list of relative audio timecodes (Long)  
 videoTCs - list of relative video timecodes (Long)  
 dataTCs - list of relative data timecodes (Long)  
 dataTypes - list of integer packets types (IVHost.CONTENTTYPE\_DATA0, IVHost.CONTENTTYPE\_DATA3) - if null assumed to be IVHost.CONTENTTYPE\_DATA0  
 currentTCs - array of longs containing last TCs written for each packet type FLV\_TCINDEX\* (long[3]). Last timecode written for each packet type will be returned in this same array.

### Returns:

List of AMFPacket objects sorted by timecodes

## writePackets

```
public static void writePackets(java.io.OutputStream ds,
        java.util.List packetList,
        long tcOffset)
```

Write audio/video/data packets to an .flv file. They will be written in the packetList order.

### Parameters:

ds - OutputStream  
 packetList - List of AMFPacket objects  
 tcOffset - timecode offset

## writePackets

```
public static void writePackets(java.io.OutputStream ds,
        java.util.List audioPackets,
        java.util.List videoPackets,
        java.util.List dataPackets,
        java.util.List audioTCs,
        java.util.List videoTCs,
        java.util.List dataTCs,
        long[] currentTCs)
```

Write a bunch of packets to .flv file all at once. The packets will be sorted by timecode as written

### Parameters:

ds - OutputStream  
 audioPackets - list of audio packets (ByteBuffer)

(continued from last page)

videoPackets - list of video packets (ByteBuffer)  
 dataPackets - list of data packets (ByteBuffer)  
 audioTCs - list of relative audio timecodes (Long)  
 videoTCs - list of relative video timecodes (Long)  
 dataTCs - list of relative data timecodes (Long)  
 currentTCs - array of longs containing last TCs written for each packet type FLV\_TCINDEX\* (long[3]). Last timecode written for each packet type will be returned in this same array.

---

## writePackets

```
public static void writePackets(java.io.OutputStream ds,
    java.util.List audioPackets,
    java.util.List videoPackets,
    java.util.List dataPackets,
    java.util.List audioTCs,
    java.util.List videoTCs,
    java.util.List dataTCs,
    java.util.List dataTypes,
    long[] currentTCs)
```

Write a bunch of packets to .flv file all at once. The packets will be sorted by timecode as written

### Parameters:

ds - OutputStream  
 audioPackets - list of audio packets (ByteBuffer)  
 videoPackets - list of video packets (ByteBuffer)  
 dataPackets - list of data packets (ByteBuffer)  
 audioTCs - list of relative audio timecodes (Long)  
 videoTCs - list of relative video timecodes (Long)  
 dataTCs - list of relative data timecodes (Long)  
 dataTypes - list of integer packets types (IVHost.CONTENTTYPE\_DATA0, IVHost.CONTENTTYPE\_DATA3) - if null assumed to be IVHost.CONTENTTYPE\_DATA0  
 currentTCs - array of longs containing last TCs written for each packet type FLV\_TCINDEX\* (long[3]). Last timecode written for each packet type will be returned in this same array.

---

## writePackets

```
public static void writePackets(java.io.OutputStream ds,
    java.util.List audioPackets,
    java.util.List videoPackets,
    java.util.List dataPackets,
    java.util.List audioTCs,
    java.util.List videoTCs,
    java.util.List dataTCs,
    java.util.List dataTypes,
    long[] currentTCs,
    IFLVWriterAdjustTimecode dataPacketTimecodeAdjuster)
```

Write a bunch of packets to .flv file all at once. The packets will be sorted by timecode as written

### Parameters:

ds - OutputStream  
 audioPackets - list of audio packets (ByteBuffer)  
 videoPackets - list of video packets (ByteBuffer)  
 dataPackets - list of data packets (ByteBuffer)  
 audioTCs - list of relative audio timecodes (Long)  
 videoTCs - list of relative video timecodes (Long)  
 dataTCs - list of relative data timecodes (Long)  
 dataTypes - list of integer packets types (IVHost.CONTENTTYPE\_DATA0, IVHost.CONTENTTYPE\_DATA3) - if null assumed to be IVHost.CONTENTTYPE\_DATA0  
 currentTCs - array of longs containing last TCs written for each packet type FLV\_TCINDEX\* (long[3]). Last timecode written for each packet type will be returned  
 dataPacketTimecodeAdjuster - class that implements the IFLVWriterAdjustTimecode interface for adjusting timecodes in this same array.

## adjustFirstPacketTCs

```
public static long adjustFirstPacketTCs(java.util.List audioTCs,  
    java.util.List videoTCs,  
    java.util.List dataTCs)
```

Align list of timecode for each data type. Assume first entry in each list is absolute timecode. When done lowest entry in three lists will be zero and other lists will be offset accordingly.

**Parameters:**

audioTCs - list of audio timecodes  
videoTCs - list of video timecodes  
dataTCs - list of data timecodes

**Returns:**

lowest of three absolute timecodes

---

## writeDuration

```
public static void writeDuration(java.io.File file,  
    double duration)
```

Write the duration to an existing .flv file. This routine will hunt through the .flv file for the onMetaData packet and the duration metadata. It will rewrite the value if found. If not found it will do nothing.

**Parameters:**

file - .flv file  
duration - new duration value (seconds)

---

## getLastTC

```
public static long getLastTC(java.io.File file)
```

Get the duration of an .flv file. This routine will find the onMetaData packet and the duration metadata and return the value. If not found it will read the last packet in the file and return the timecode of that packet.

**Parameters:**

file

**Returns:**

duration (milliseconds)

---

## isVideoKeyFrame

```
public static boolean isVideoKeyFrame(AMFPacket packet)
```

Returns true if the packet is a video key frame

**Parameters:**

packet - packet

**Returns:**

true if is video key frame

---

## isVideoCodecConfig

```
public static boolean isVideoCodecConfig(int firstByte,  
    int secondByte)
```

(continued from last page)

Returns true if the packet is a video codec config packet

**Parameters:**

firstByte - first byte of packet  
secondByte - second byte of packet

**Returns:**

true if video codec

---

## isVideoCodecConfig

```
public static boolean isVideoCodecConfig(AMFPacket packet)
```

Returns true if the packet is a video codec config packet

**Parameters:**

packet

**Returns:**

true if the packet is a video codec config packet

---

## isVideoCodecConfig

```
public static boolean isVideoCodecConfig(java.nio.ByteBuffer buffer)
```

Returns true if the packet is a video codec config packet

**Parameters:**

buffer - packet data

**Returns:**

true if the packet is a video codec config packet

---

## isAudioCodecConfig

```
public static boolean isAudioCodecConfig(AMFPacket packet)
```

Returns true if the packet is a audio codec config packet

**Parameters:**

packet

**Returns:**

true if the packet is a audio codec config packet

---

## isAudioCodecConfig

```
public static boolean isAudioCodecConfig(java.nio.ByteBuffer buffer)
```

Returns true if the packet is a audio codec config packet

**Parameters:**

buffer - packet data

**Returns:**

true if the packet is a audio codec config packet

(continued from last page)

## getAudioMP3Layer

```
public static int getAudioMP3Layer(AMFPacket packet)
```

Audio marked as MP3 is really MPEG1 Layer 1-3. Only MPEG1 Layer 3 is truly MP3. This function will return the layer number for this packet.

**Parameters:**

packet - amf packet

**Returns:**

layer number

---

## getAudioCodec

```
public static int getAudioCodec(AMFPacket packet)
```

Get the codec id for this audio packet. Returns IVHost.CODEC\_AUDIO\_UNKNOWN is unknown or not audio packet

**Parameters:**

packet - packet

**Returns:**

codec id IVHost.CODEC\_AUDIO\_\*

---

## getVideoCodec

```
public static int getVideoCodec(AMFPacket packet)
```

Get the codec id for this video packet. Returns IVHost.CODEC\_VIDEO\_UNKNOWN is unknown or not video packet

**Parameters:**

packet - packet

**Returns:**

codec id IVHost.CODEC\_VIDEO\_\*

---

## getVideoFrameType

```
public static int getVideoFrameType(AMFPacket packet)
```

---

## getVideoTimecodeOffset

```
public static int getVideoTimecodeOffset(AMFPacket packet)
```

Get the timecode offset in milliseconds between the PTS and DTS for this frame.

**Parameters:**

packet - AMFPacket

**Returns:**

timecode offset in milliseconds (can be negative)

---

## getVideoTimecodeOffset

```
public static int getVideoTimecodeOffset(byte[] buffer)
```

(continued from last page)

Get the timecode offset in milliseconds between the PTS and DTS for this frame.

**Parameters:**

buffer - video packet buffer

**Returns:**

timecode offset in milliseconds (can be negative)

---

## isVideoKeyFrame

```
public static boolean isVideoKeyFrame(java.nio.ByteBuffer buffer)
```

Returns true if the packet is a video key frame

**Parameters:**

buffer - packet data (only need first two bytes of data)

**Returns:**

true if is video key frame

---

## isVideoKeyFrame

```
public static boolean isVideoKeyFrame(byte[] buffer)
```

Returns true if the packet is a video key frame

**Parameters:**

buffer - packet data (only need first two bytes of data)

**Returns:**

true if is video key frame

---

## isVideoKeyFrame

```
public static boolean isVideoKeyFrame(int[] chunkHeaderValues)
```

Returns true if the packet is a video key frame

**Parameters:**

chunkHeaderValues - chunk header values returned by FLVUtils.readChunkHeader

**Returns:**

true if is video key frame

---

## updateOnCuePointTimecode

```
public static AMFPacket updateOnCuePointTimecode(AMFPacket packet,  
long timecode)
```

---

## updateOnCuePointTimecode

```
public static java.nio.ByteBuffer updateOnCuePointTimecode(java.nio.ByteBuffer data,  
int dataType,  
long timecode)
```

## isOnMetadata

```
public static boolean isOnMetadata(byte[] dataDataBytes)
```

---

## isOnMetadataPacket

```
public static boolean isOnMetadataPacket(AMFPacket packet)
```

Returns true if packet is onMetaData or [@setDataFrame, onMetaData] data packet.

**Parameters:**

packet - packet

**Returns:**

true if onMetaData packet

---

## getOnMetadataData

```
public static OnMetadataBasic getOnMetadataData(AMFPacket metaDataPacket)
```

---

## getHeaderFlags

```
public static byte getHeaderFlags(java.io.File file)
```

---

## writeHeaderFlags

```
public static void writeHeaderFlags(java.io.File file,  
    byte newFlags)
```

---

## modifyOnMetadataEvent

```
public static byte[] modifyOnMetadataEvent(byte[] buffer,  
    long flags,  
    java.util.List itemsToRemove,  
    java.util.Map itemsToAdd)
```

Modifies onMetadata event to remove or add items

**Parameters:**

buffer - byte buffer with onMetadata event serialized

flags - flags to control what gets removed (see METADATAFILTER\_\*)

itemsToRemove - list of names of fields to remove

itemsToAdd - map of items to add

**Returns:**

serialized onMetadata event

---

## com.wowza.util Class HTTPUtils

java.lang.Object

└─com.wowza.util.HTTPUtils

public class **HTTPUtils**  
extends Object

HTTPUtils: utility class for making http requests.

### Field Summary

public static final	<a href="#">COOKIEFORMAT</a>
---------------------	------------------------------

### Constructor Summary

public	<a href="#">HTTPUtils()</a>
--------	-----------------------------

### Method Summary

static String	<a href="#">assembleQueryStr</a> (java.util.Map queryMap, boolean enableEncoding) Assemble a map of name value pairs into a single query string.
---------------	---

static java.util.Map	<a href="#">expandHTTPHeadersStr</a> (String httpUserHTTPHeadersStr)
----------------------	--

static String	<a href="#">formatDeleteCookie</a> (String name, String path, String domain) Formats a cookie header value that is in the past to delete a cookie
---------------	--

static String	<a href="#">formatSetCookie</a> (String name, String value, int timeoffset, String path, String domain, boolean isSecure) Format a HTTP header Set-Cookie value
---------------	--

static byte[]	<a href="#">HTTPRequestToByteArray</a> (String inUrl, String method, String data, java.util.Map headers) Make a HTTP request and return the result as a byte array
---------------	---

static byte[]	<a href="#">HTTPRequestToByteArray</a> (String inUrl, String method, String data, java.util.Map inHeaders, java.util.Map outHeaders, long dataLimit) Make a HTTP request and return the result as a byte array
---------------	---

static boolean	<a href="#">HTTPRequestToFile</a> (java.io.File file, String inUrl, String method, String data, java.util.List headers) Make a HTTP request and have the result saved to a file.
----------------	---

static java.util.List	<a href="#">splitCookie</a> (String str) Breaks Cookies header value into a list of name/value pairs.
-----------------------	--

static String[]	<a href="#">splitPragmas</a> (String str) Split HTTP Pragma values at commas that separate values.
-----------------	---

static java.util.Map	<a href="#"><code>splitQueryStr</code></a> (String queryStr) Split a query string into a map and URL decode the values
static String	<a href="#"><code>statusCodeToStr</code></a> (int statusCode) Convert an HTTP status code to a string

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### COOKIEDATEFORMAT

public static final org.apache.commons.lang.time.FastDateFormat **COOKIEDATEFORMAT**

## Constructors

### HTTPUtils

public **HTTPUtils**()

## Methods

### HTTPRequestToFile

```
public static boolean HTTPRequestToFile(java.io.File file,
    String inUrl,
    String method,
    String data,
    java.util.List headers)
```

Make a HTTP request and have the result saved to a file.

#### Parameters:

file - destination  
inUrl - url (will work with http and https)  
method - method (POST, GET)  
data - post data  
headers - map of headers (Content-type...)

#### Returns:

true if successful

### HTTPRequestToByteArray

```
public static byte[] HTTPRequestToByteArray(String inUrl,
    String method,
    String data,
    java.util.Map headers)
```

Make a HTTP request and return the result as a byte array

(continued from last page)

**Parameters:**

inUrl - url (will work with http and https)  
method - method (POST, GET)  
data - post data  
headers - map of headers (Content-type...)

**Returns:**

byte array of result or null if not successful

---

## HTTPRequestToByteArray

```
public static byte[] HTTPRequestToByteArray(String inUrl,  
      String method,  
      String data,  
      java.util.Map inHeaders,  
      java.util.Map outHeaders,  
      long dataLimit)
```

Make a HTTP request and return the result as a byte array

**Parameters:**

inUrl - url (will work with http and https)  
method - method (POST, GET)  
data - data  
inHeaders - map of headers (Content-type...)  
outHeaders - response headers  
dataLimit - maximum number of bytes to read, zero for no limit

**Returns:**

byte array of result or null if not successful

---

## assembleQueryStr

```
public static String assembleQueryStr(java.util.Map queryMap,  
      boolean enableEncoding)
```

Assemble a map of name value pairs into a single query string. URL encode query string values.

**Parameters:**

queryMap - name value pairs

**Returns:**

query string

---

## splitQueryStr

```
public static java.util.Map splitQueryStr(String queryStr)
```

Split a query string into a map and URL decode the values

**Parameters:**

queryStr - query string

**Returns:**

map of name value pairs

---

(continued from last page)

## splitPragmas

```
public static String[] splitPragmas(String str)
```

Split HTTP Pragma values at commas that separate values. It deals with internal commas in strings. Example:

```
no-cache, client-id=1485578017, features="seekable, stridable", timeout=6
```

Result:

```
no-cache  
client-id=1485578017  
features="seekable, stridable"  
timeout=6
```

**Parameters:**

str - Pragma value

**Returns:**

array of strings broken at commas

---

## splitCookie

```
public static java.util.List splitCookie(String str)
```

Breaks Cookies header value into a list of name/value pairs. The Cookie string: "name1=value1;name2;name1=value3" is returned as: List(item({"name1", "value1"}), item("name2", null), item("name1", "value3"))

**Parameters:**

str - input string

**Returns:**

List of name value pairs

---

## formatDeleteCookie

```
public static String formatDeleteCookie(String name,  
    String path,  
    String domain)
```

Formats a cookie header value that is in the past to delete a cookie

**Parameters:**

name - variable name

path - path

(continued from last page)

domain - domain

**Returns:**formatted cookie string

---

**formatSetCookie**

```
public static String formatSetCookie(String name,  
    String value,  
    int timeoffset,  
    String path,  
    String domain,  
    boolean isSecure)
```

Format a HTTP header Set-Cookie value

**Parameters:**

name - variable name  
value - variable value - null if no value  
timeoffset - expiration time in seconds  
path - cookie path  
domain - cookie domain  
isSecure - is cookie secure

**Returns:**formatted cookie string

---

**statusCodeToStr**

```
public static String statusCodeToStr(int statusCode)
```

Convert an HTTP status code to a string

**Parameters:**

statusCode - HTTP status code

**Returns:**string

---

**expandHTTPHeadersStr**

```
public static java.util.Map expandHTTPHeadersStr(String httpUserHTTPHeadersStr)
```

## com.wowza.util Interface IBandwidthThrottler

public interface **IBandwidthThrottler**  
extends

### Method Summary

long	<a href="#"><code>getBytesAllocation</code></a> (long request) Requests bytes from the bandwidth throttler interface.
------	--

### Methods

#### **getBytesAllocation**

public long **getBytesAllocation**(long request)

Requests bytes from the bandwidth throttler interface. Return value is the number of bytes allocated

**Parameters:**

request - request number of bytes

**Returns:**

allocated number of bytes

## com.wowza.util Interface IBitReader

All Known Implementing Classes:  
[BitReaderFast](#), [BitReader](#)

public interface **IBitReader**  
extends

### Method Summary

int	<a href="#">getBytes</a> (byte[] buffer, int offset, int len)
int	<a href="#">getInt</a> (int numberBits)
int	<a href="#">getIntLE</a> (int numberBits)
long	<a href="#">getLong</a> (int numberBits)
int	<a href="#">peekInt</a> (int numberBits)
int	<a href="#">peekIntLE</a> (int numberBits)
long	<a href="#">peekLong</a> (int numberBits)
int	<a href="#">remaining</a> ()
void	<a href="#">skip</a> (int numberBits)

### Methods

#### **remaining**

public int **remaining**()

#### **skip**

public void **skip**(int numberBits)

#### **getInt**

public int **getInt**(int numberBits)

---

**peekInt**

```
public int peekInt(int numberBits)
```

---

---

**getIntLE**

```
public int getIntLE(int numberBits)
```

---

---

**peekIntLE**

```
public int peekIntLE(int numberBits)
```

---

---

**getLong**

```
public long getLong(int numberBits)
```

---

---

**peekLong**

```
public long peekLong(int numberBits)
```

---

---

**getBytes**

```
public int getBytes(byte[] buffer,  
                    int offset,  
                    int len)
```

---

## com.wowza.util Interface IFileProcess

public interface **IFileProcess**  
extends

Used by FileUtils.traverseDirectory

### Method Summary

void	<a href="#">onFile</a> (java.io.File file) Triggered for each file encountered in FileUtils.traverseDirectory
------	--

### Methods

#### onFile

public void **onFile**(java.io.File file)

Triggered for each file encountered in FileUtils.traverseDirectory

#### Parameters:

file - file descriptor

## com.wowza.util Class IOPerformanceCounter

java.lang.Object

└─com.wowza.util.IOPerformanceCounter

public class **IOPerformanceCounter**  
extends Object

IOPerformanceCounter: data object that tracks the server performance of a particular component (client, vHost, server, stream). It tracks bytes and messages sent to and from the object being measured.

### Constructor Summary

public	<a href="#">IOPerformanceCounter</a> ( ) Create an empty performance counter.
--------	--

### Method Summary

void	<a href="#">add</a> ( <a href="#">IOPerformanceCounter</a> value) Add (value) to this counter.
void	<a href="#">addDifference</a> ( <a href="#">IOPerformanceCounter</a> current, <a href="#">IOPerformanceCounter</a> last) Add the result of (current-last) to this counter.
void	<a href="#">clear</a> () Clear or reset this counter back to zero.
<a href="#">IOPerformanceCounter</a>	<a href="#">clone</a> () Create a deep clone (copy) if this object.
void	<a href="#">doSet</a> ( <a href="#">IOPerformanceCounter</a> value) Set this object to value.
void	<a href="#">dummy</a> ()
long	<a href="#">getFileInBytes</a> () Get file in bytes
double	<a href="#">getFileInBytesRate</a> () Get estimate of file byte-in byte rate.
long	<a href="#">getFileOutBytes</a> () Get file byte-out bytes (not implemented)
double	<a href="#">getFileOutBytesRate</a> () Get estimate of file byte-out message byte rate (not implemented).
long	<a href="#">getMessagesInBytes</a> () Get byte-in bytes
double	<a href="#">getMessagesInBytesRate</a> () Get estimate of byte-in message byte rate.

long	<a href="#"><u>getMessagesInCount</u></a> ( ) Get byte-in message count
long	<a href="#"><u>getMessagesInCountRate</u></a> ( ) Get estimate of byte-in message count rate.
long	<a href="#"><u>getMessagesLossBytes</u></a> ( ) Get byte-loss bytes
double	<a href="#"><u>getMessagesLossBytesRate</u></a> ( ) Get estimate of byte-loss message byte rate.
long	<a href="#"><u>getMessagesLossCount</u></a> ( ) Get byte-loss message count
long	<a href="#"><u>getMessagesLossCountRate</u></a> ( ) Get estimate of byte-loss message count rate.
long	<a href="#"><u>getMessagesOutBytes</u></a> ( ) Get byte-out bytes
double	<a href="#"><u>getMessagesOutBytesRate</u></a> ( ) Get estimate of byte-out message byte rate.
long	<a href="#"><u>getMessagesOutCount</u></a> ( ) Get byte-out message count
long	<a href="#"><u>getMessagesOutCountRate</u></a> ( ) Get estimate of byte-out message count rate.
long	<a href="#"><u>incrementBytesIn</u></a> (long bytes) Increment bytes-in by bytes and increment message count by 0.
long	<a href="#"><u>incrementBytesLoss</u></a> (long bytes) Increment bytes-loss by bytes and increment message count by 0.
long	<a href="#"><u>incrementBytesOut</u></a> (long bytes) Increment bytes-out by bytes and increment message count by 0.
long	<a href="#"><u>incrementFileIn</u></a> (long bytes) Increment file-bytes-in by bytes.
long	<a href="#"><u>incrementFileOut</u></a> (long bytes) Increment file bytes-out by bytes.
long	<a href="#"><u>incrementMessagesIn</u></a> ( ) Increment byte-in message count by 1.
long	<a href="#"><u>incrementMessagesIn</u></a> (long bytes) Increment bytes-in by bytes and increment message count by 1.
long	<a href="#"><u>incrementMessagesIn</u></a> (long bytes, long count) Increment bytes-in by bytes and message count by count.
long	<a href="#"><u>incrementMessagesLoss</u></a> ( ) Increment byte-loss message count by 1.
long	<a href="#"><u>incrementMessagesLoss</u></a> (long bytes) Increment bytes-loss by bytes and increment message count by 1.

long	<a href="#"><code>incrementMessagesLoss</code></a> (long bytes, long count) Increment bytes-loss by bytes and message count by count.
long	<a href="#"><code>incrementMessagesOut</code></a> () Increment byte-out message count by 1.
long	<a href="#"><code>incrementMessagesOut</code></a> (long bytes) Increment bytes-out by bytes and increment message count by 1.
long	<a href="#"><code>incrementMessagesOut</code></a> (long bytes, long count) Increment bytes-out by bytes and message count by count.
boolean	<a href="#"><code>isDebugLog</code></a> ()
void	<a href="#"><code>setDebugLog</code></a> (boolean debugLog)

Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Constructors

### IOPerformanceCounter

```
public IOPerformanceCounter()
```

Create an empty performance counter.

## Methods

### clone

```
public IOPerformanceCounter clone()
```

Create a deep clone (copy) if this object.

### addDifference

```
public void addDifference(IOPerformanceCounter current,
    IOPerformanceCounter last)
```

Add the result of (current-last) to this counter. Used internally to efficiently track object performance on a timer.

#### Parameters:

`current` - current counter

`last` - last counter

### clear

```
public void clear()
```

Clear or reset this counter back to zero.

(continued from last page)

## add

```
public void add(IOPerformanceCounter value)
```

Add (value) to this counter.

**Parameters:**

value - value to add

---

## doSet

```
public void doSet(IOPerformanceCounter value)
```

Set this object to value.

**Parameters:**

value - value to set

---

## incrementMessagesIn

```
public long incrementMessagesIn(long bytes)
```

Increment bytes-in by bytes and increment message count by 1.

**Parameters:**

bytes - number of bytes

**Returns:**

bytes-in bytes

---

## incrementFileIn

```
public long incrementFileIn(long bytes)
```

Increment file-bytes-in by bytes.

**Parameters:**

bytes - number of bytes

**Returns:**

bytes-in bytes

---

## incrementMessagesIn

```
public long incrementMessagesIn(long bytes,  
    long count)
```

Increment bytes-in by bytes and message count by count.

**Parameters:**

bytes - number of bytes  
count - number of messages

**Returns:**

bytes-in bytes

---

(continued from last page)

## incrementBytesIn

```
public long incrementBytesIn(long bytes)
```

Increment bytes-in by bytes and increment message count by 0.

**Parameters:**

bytes

**Returns:**

bytes-in bytes

---

## incrementMessagesIn

```
public long incrementMessagesIn()
```

Increment byte-in message count by 1.

**Returns:**

bytes-in message count

---

## incrementMessagesOut

```
public long incrementMessagesOut(long bytes)
```

Increment bytes-out by bytes and increment message count by 1.

**Parameters:**

bytes - number of bytes

**Returns:**

bytes-out bytes

---

## incrementFileOut

```
public long incrementFileOut(long bytes)
```

Increment file bytes-out by bytes.

**Parameters:**

bytes - number of bytes

**Returns:**

bytes-out bytes

---

## incrementMessagesLoss

```
public long incrementMessagesLoss(long bytes)
```

Increment bytes-loss by bytes and increment message count by 1.

**Parameters:**

bytes - number of bytes

**Returns:**

bytes-loss bytes

---

(continued from last page)

## incrementMessagesOut

```
public long incrementMessagesOut(long bytes,  
    long count)
```

Increment bytes-out by bytes and message count by count.

**Parameters:**

bytes - number of bytes  
count - number of messages

**Returns:**

bytes-out bytes

---

## incrementMessagesLoss

```
public long incrementMessagesLoss(long bytes,  
    long count)
```

Increment bytes-loss by bytes and message count by count.

**Parameters:**

bytes - number of bytes  
count - number of messages

**Returns:**

bytes-loss bytes

---

## incrementBytesOut

```
public long incrementBytesOut(long bytes)
```

Increment bytes-out by bytes and increment message count by 0.

**Parameters:**

bytes

**Returns:**

bytes-out bytes

---

## incrementBytesLoss

```
public long incrementBytesLoss(long bytes)
```

Increment bytes-loss by bytes and increment message count by 0.

**Parameters:**

bytes

**Returns:**

bytes-loss bytes

---

## incrementMessagesOut

```
public long incrementMessagesOut( )
```

Increment byte-out message count by 1.

**Returns:**

(continued from last page)

bytes-out message count

---

## incrementMessagesLoss

```
public long incrementMessagesLoss()
```

Increment byte-loss message count by 1.

**Returns:**

bytes-loss message count

---

## getMessagesInCount

```
public long getMessagesInCount()
```

Get byte-in message count

**Returns:**

byte-in message count

---

## getMessagesOutCount

```
public long getMessagesOutCount()
```

Get byte-out message count

**Returns:**

byte-out message count

---

## getMessagesLossCount

```
public long getMessagesLossCount()
```

Get byte-loss message count

**Returns:**

byte-loss message count

---

## getMessagesInBytes

```
public long getMessagesInBytes()
```

Get byte-in bytes

**Returns:**

byte-in bytes

---

## getFileInBytes

```
public long getFileInBytes()
```

Get file in bytes

**Returns:**

file in bytes

---

(continued from last page)

---

## getMessagesOutBytes

```
public long getMessagesOutBytes()
```

Get byte-out bytes

**Returns:**

byte-out bytes

---

## getFileOutBytes

```
public long getFileOutBytes()
```

Get file byte-out bytes (not implemented)

**Returns:**

byte-out bytes

---

## getMessagesLossBytes

```
public long getMessagesLossBytes()
```

Get byte-loss bytes

**Returns:**

byte-loss bytes

---

## getMessagesInCountRate

```
public long getMessagesInCountRate()
```

Get estimate of byte-in message count rate.

**Returns:**

estimate of byte-in message count rate (messages per second)

---

## getMessagesOutCountRate

```
public long getMessagesOutCountRate()
```

Get estimate of byte-out message count rate.

**Returns:**

estimate of byte-out message count rate (messages per second)

---

## getMessagesLossCountRate

```
public long getMessagesLossCountRate()
```

Get estimate of byte-loss message count rate.

**Returns:**

estimate of byte-loss message count rate (messages per second)

---

## getMessagesInBytesRate

```
public double getMessagesInBytesRate()
```

---

(continued from last page)

Get estimate of byte-in message byte rate.

**Returns:**

estimate of byte-in message byte rate (bytes per second)

---

**getFileInBytesRate**

```
public double getFileInBytesRate()
```

Get estimate of file byte-in byte rate.

**Returns:**

estimate of file byte-in byte rate (bytes per second)

---

**getMessagesOutBytesRate**

```
public double getMessagesOutBytesRate()
```

Get estimate of byte-out message byte rate.

**Returns:**

estimate of byte-out message byte rate (bytes per second)

---

**getFileOutBytesRate**

```
public double getFileOutBytesRate()
```

Get estimate of file byte-out message byte rate (not implemented).

**Returns:**

estimate of file byte-out message byte rate (bytes per second)

---

**getMessagesLossBytesRate**

```
public double getMessagesLossBytesRate()
```

Get estimate of byte-loss message byte rate.

**Returns:**

estimate of byte-loss message byte rate (bytes per second)

---

**dummy**

```
public void dummy()
```

---

**isDebugLog**

```
public boolean isDebugLog()
```

---

**setDebugLog**

```
public void setDebugLog(boolean debugLog)
```

## com.wowza.util Interface IPacketFragment

All Known Implementing Classes:  
[PacketFragment](#)

public interface **IPacketFragment**  
extends

### Method Summary

<a href="#">IPacketFragment</a>	<a href="#">clone()</a>
byte[]	<a href="#">getBuffer()</a>
int	<a href="#">getLen()</a>
int	<a href="#">getOffset()</a>
void	<a href="#">setBuffer</a> (byte[] buffer)
void	<a href="#">setLen</a> (int len)
void	<a href="#">setOffset</a> (int offset)

### Methods

#### getBuffer

```
public byte[] getBuffer()
```

#### setBuffer

```
public void setBuffer(byte[] buffer)
```

#### getOffset

```
public int getOffset()
```

#### setOffset

```
public void setOffset(int offset)
```

(continued from last page)

---

## **getLen**

```
public int getLen()
```

---

## **setLen**

```
public void setLen(int len)
```

---

## **clone**

```
public IPacketFragment clone()
```

## com.wowza.util Class MD5DigestUtils

java.lang.Object

└─com.wowza.util.MD5DigestUtils

public class **MD5DigestUtils**  
extends Object

MD5DigestUtils: MD5 hash utilities.

### Field Summary

protected static	<a href="#">md5Digest</a>
protected static	<a href="#">md5Lock</a>

### Constructor Summary

public	<a href="#">MD5DigestUtils()</a>
--------	----------------------------------

### Method Summary

static String	<a href="#">generateAuth</a> (String method, String uri, String username, String password, String realm, String nonce) Generate an HTTP authorization response
static String	<a href="#">generateAuth</a> (String a2Hash, String alHash, String realm, String nonce, String qop, String nonceCount, String cnonce) Generate an HTTP authorization response
static String	<a href="#">generateAuth</a> (String method, String uri, String alHash, String realm, String nonce, String qop, String nonceCount, String cnonce) Generate an HTTP authorization response
static String	<a href="#">generateAuth</a> (String method, String uri, String username, String password, String realm, String nonce, String qop, String nonceCount, String cnonce) Generate an HTTP authorization response
static String	<a href="#">generateAuthHTTP</a> (String method, String uri, String alHash, String nonce, String qop, String nonceCount, String cnonce) Generate an HTTP authorization response
static String	<a href="#">generateAuthHTTP</a> (String method, String uri, String username, String password, String realm, String nonce, String qop, String nonceCount, String cnonce) Generate an HTTP authorization response
static String	<a href="#">generateHash</a> (String value) Generate MD5 hash

static byte[]	<a href="#">generateHashBytes</a> (byte[] value) Generate MD5 hash
static byte[]	<a href="#">generateHashBytes</a> (String value) Generate MD5 hash

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### md5Digest

protected static java.security.MessageDigest **md5Digest**

### md5Lock

protected static java.lang.Object **md5Lock**

## Constructors

### MD5DigestUtils

public **MD5DigestUtils**()

## Methods

### generateAuth

```
public static String generateAuth(String method,
    String uri,
    String username,
    String password,
    String realm,
    String nonce)
```

Generate an HTTP authorization response

#### Parameters:

method - method  
uri - URI  
username - username  
password - password  
realm - realm  
nonce - nonce

#### Returns:

auth response

## generateAuth

```
public static String generateAuth(String method,
    String uri,
    String username,
    String password,
    String realm,
    String nonce,
    String qop,
    String nonceCount,
    String cnonce)
```

Generate an HTTP authorization response

### Parameters:

method - method  
uri - URI  
username - username  
password - password  
realm - realm  
nonce - nonce  
qop - qop  
nonceCount - nonceCount  
cnonce - cnonce

### Returns:

auth response

---

## generateAuthHTTP

```
public static String generateAuthHTTP(String method,
    String uri,
    String username,
    String password,
    String realm,
    String nonce,
    String qop,
    String nonceCount,
    String cnonce)
```

Generate an HTTP authorization response

### Parameters:

method - method  
uri - URI  
username - username  
password - password  
realm - realm  
nonce - nonce  
qop - qop  
nonceCount - nonceCount  
cnonce - cnonce

### Returns:

response

---

(continued from last page)

## generateAuthHTTP

```
public static String generateAuthHTTP(String method,  
    String uri,  
    String alHash,  
    String nonce,  
    String qop,  
    String nonceCount,  
    String cnonce)
```

Generate an HTTP authorization response

### Parameters:

method - method  
uri - URI  
username - username  
password - password  
realm - realm  
nonce - nonce  
qop - qop  
nonceCount - nonceCount  
cnonce - cnonce

### Returns:

response

---

## generateAuth

```
public static String generateAuth(String method,  
    String uri,  
    String alHash,  
    String realm,  
    String nonce,  
    String qop,  
    String nonceCount,  
    String cnonce)
```

Generate an HTTP authorization response

### Parameters:

method - method  
uri - URI  
alHash - alHash  
realm - realm  
nonce - nonce  
qop - qop  
nonceCount - nonceCount  
cnonce - cnonce

### Returns:

auth

---

## generateAuth

```
public static String generateAuth(String a2Hash,  
    String alHash,  
    String realm,  
    String nonce,  
    String qop,  
    String nonceCount,  
    String cnonce)
```

(continued from last page)

Generate an HTTP authorization response

**Parameters:**

a2Hash - a2Hash  
a1Hash - a1Hash  
realm - realm  
nonce - nonce  
qop - qop  
nonceCount - nonceCount  
cnonce - cnonce

**Returns:**

auth

---

## generateHashBytes

```
public static byte[] generateHashBytes(byte[] value)
```

Generate MD5 hash

**Parameters:**

value - byte array to hash

**Returns:**

byte array result

---

## generateHashBytes

```
public static byte[] generateHashBytes(String value)
```

Generate MD5 hash

**Parameters:**

value - in string converted to byte array (UTF-8)

**Returns:**

byte array result

---

## generateHash

```
public static String generateHash(String value)
```

Generate MD5 hash

**Parameters:**

value - in string converted to byte array (UTF-8)

**Returns:**

hash as binhex string

---

## com.wowza.util Class MediaUtils

java.lang.Object

└─com.wowza.util.MediaUtils

public class **MediaUtils**  
extends Object

MediaUtils: Media utilities.

### Field Summary

public static final	<a href="#">CODECSTR_FORMAT_VIDEO_POSTIOS4</a> Value: <b>2</b>
public static final	<a href="#">CODECSTR_FORMAT_VIDEO_PREIOS4</a> Value: <b>1</b>
public static final	<a href="#">CODECSTR_FORMAT_VIDEO_UNKNOWN</a> Value: <b>0</b>

### Constructor Summary

public	<a href="#">MediaUtils()</a>
--------	------------------------------

### Method Summary

static String	<a href="#">audioCodecTypeToString</a> (int codecType) Audio codec ID to string.
static String	<a href="#">videoCodecTypeToString</a> (int codecType) Video codec ID to string.

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Fields

#### CODECSTR\_FORMAT\_VIDEO\_UNKNOWN

public static final int **CODECSTR\_FORMAT\_VIDEO\_UNKNOWN**

Constant value: **0**

---

## CODECSTR\_FORMAT\_VIDEO\_PREIOS4

```
public static final int CODECSTR_FORMAT_VIDEO_PREIOS4
```

Constant value: **1**

---

## CODECSTR\_FORMAT\_VIDEO\_POSTIOS4

```
public static final int CODECSTR_FORMAT_VIDEO_POSTIOS4
```

Constant value: **2**

## Constructors

### MediaUtils

```
public MediaUtils()
```

## Methods

### audioCodecTypeToString

```
public static String audioCodecTypeToString(int codecType)
```

Audio codec ID to string. See IVHost.CODEC\_AUDIO\_\*

**Parameters:**

codecType - codec id. See IVHost.CODEC\_AUDIO\_\*

**Returns:**

codec string

---

### videoCodecTypeToString

```
public static String videoCodecTypeToString(int codecType)
```

Video codec ID to string. See IVHost.CODEC\_VIDEO\_\*

**Parameters:**

codecType - codec id. See IVHost.CODEC\_VIDEO\_\*

**Returns:**

codec string

---

## com.wowza.util Class NetworkUtils

java.lang.Object

└─com.wowza.util.NetworkUtils

public class **NetworkUtils**  
extends Object

NetworkUtils: Networking utilities.

### Constructor Summary

public	<a href="#">NetworkUtils()</a>
--------	--------------------------------

### Method Summary

static boolean	<a href="#">isAddressMulticast</a> (String IpAddress) Returns true if IP address is multicast address
static String	<a href="#">socketAddressToUniqueStr</a> (java.net.InetSocketAddress socketAddress)

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### NetworkUtils

public **NetworkUtils**()

### Methods

#### isAddressMulticast

public static boolean **isAddressMulticast**(String IpAddress)

Returns true if IP address is multicast address

##### Parameters:

IpAddress - IP address

##### Returns:

true if IP address is multicast address

---

## socketAddressToUniqueStr

```
public static String socketAddressToUniqueStr( java.net.InetSocketAddress  
socketAddress)
```

## com.wowza.util Interface NoMBean

---

public interface **NoMBean**  
extends `Annotation`

Annotation for excluding a method from the JMX interface. Below is an example of how it would be used

```
import com.wowza.util.NoMBean;
import com.wowza.wms.module.*;

class MyClass extends ModuleBase
{
    @NoMBean public void myMethod()
    {
    }
}
```

---

Methods inherited from interface <code>java.lang.annotation.Annotation</code>
---

<code>annotationType</code> , <code>equals</code> , <code>hashCode</code> , <code>toString</code>
---

---

## com.wowza.util Class OnMetadataBasic

java.lang.Object

└─com.wowza.util.OnMetadataBasic

public class **OnMetadataBasic**  
extends Object

### Field Summary

public	<a href="#">audiochannels</a>
public	<a href="#">audiocodecid</a>
public	<a href="#">audiodatarate</a>
public	<a href="#">audiodevice</a>
public	<a href="#">audioinputvolume</a>

public	<a href="#">displayWidth</a>
public	<a href="#">frameHeight</a>
public	<a href="#">framerate</a>
public	<a href="#">frameWidth</a>

public	<a href="#">height</a>
public	<a href="#">keywords</a>
public	<a href="#">presetname</a>
public	<a href="#">rating</a>
public	<a href="#">title</a>
public	<a href="#">videocodecid</a>
public	<a href="#">videodatarate</a>
public	<a href="#">videodevice</a>
public	<a href="#">videokeyframe_frequency</a>
public	<a href="#">width</a>

## Constructor Summary

public	<a href="#">OnMetadataBasic()</a>
--------	-----------------------------------

### Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Fields

### **author**

`public java.lang.String author`

### **copyright**

`public java.lang.String copyright`

### **description**

`public java.lang.String description`

(continued from last page)

**keywords**

```
public java.lang.String keywords
```

---

**rating**

```
public java.lang.String rating
```

---

**title**

```
public java.lang.String title
```

---

**presetname**

```
public java.lang.String presetname
```

---

**creationdate**

```
public java.lang.String creationdate
```

---

**videodevice**

```
public java.lang.String videodevice
```

---

**framerate**

```
public double framerate
```

---

**width**

```
public double width
```

---

**height**

```
public double height
```

---

**displayWidth**

```
public double displayWidth
```

---

(continued from last page)

---

**displayHeight**

```
public double displayHeight
```

---

---

**frameWidth**

```
public double frameWidth
```

---

---

**frameHeight**

```
public double frameHeight
```

---

---

**videocodecid**

```
public java.lang.String videocodecid
```

---

---

**videodatarate**

```
public double videodatarate
```

---

---

**avclevel**

```
public double avclevel
```

---

---

**avcprofile**

```
public double avcprofile
```

---

---

**videokeyframe\_frequency**

```
public double videokeyframe_frequency
```

---

---

**audiodevice**

```
public java.lang.String audiodevice
```

---

(continued from last page)

**audiosamplerate**

```
public double audiosamplerate
```

---

**audiochannels**

```
public double audiochannels
```

---

**audioinputvolume**

```
public double audioinputvolume
```

---

**audiocodecid**

```
public java.lang.String audiocodecid
```

---

**audiodatarate**

```
public double audiodatarate
```

## Constructors

**OnMetadataBasic**

```
public OnMetadataBasic()
```

## com.wowza.util Class PacketFragment

java.lang.Object

└-com.wowza.util.PacketFragment

All Implemented Interfaces:

[IPacketFragment](#)

public class **PacketFragment**

extends Object

implements [IPacketFragment](#)

### Field Summary

long	<a href="#">setAbs</a> (long val)
void	<a href="#">setHighBits</a> (long val)
String	<a href="#">toString</a> ()

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### RolloverLong

public **RolloverLong**(int bits)

### Methods

#### clone

public [RolloverLong](#) **clone**()

---

**get**

```
public long get()
```

---

---

**setHighBits**

```
public void setHighBits(long val)
```

---

---

**setAbs**

```
public long setAbs(long val)
```

---

---

**set**

```
public long set(long val)
```

---

---

**toString**

```
public String toString()
```

---

## com.wowza.util Class SetUtils

java.lang.Object

└─com.wowza.util.SetUtils

public class **SetUtils**  
extends Object

Static utilities for standard set operations: union, intersection, difference, subset and superset.

### Constructor Summary

public	<a href="#">SetUtils()</a>
--------	----------------------------

### Method Summary

static java.util.Set	<a href="#">diff</a> (java.util.Set set1, java.util.Set set2) Create difference of the 2 sets.
static java.util.Set	<a href="#">intersection</a> (java.util.Set set1, java.util.Set set2) Create intersection of 2 sets.
static boolean	<a href="#">isSubset</a> (java.util.Set set1, java.util.Set set2) Determines if set1 is a subset of set2.
static boolean	<a href="#">isSuperset</a> (java.util.Set set1, java.util.Set set2) Determines if set1 is a superset of set2.
static java.util.Set	<a href="#">union</a> (java.util.Set set1, java.util.Set set2) Create union of 2 sets.

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### SetUtils

public **SetUtils**()

## Methods

### intersection

public static java.util.Set **intersection**(java.util.Set set1,  
java.util.Set set2)

(continued from last page)

Create intersection of 2 sets.

**Parameters:**

set1 - First set  
set2 - Second set

**Returns:**

a new Set, containing the intersection of the 2 sets.

---

## union

```
public static java.util.Set union(java.util.Set set1,  
    java.util.Set set2)
```

Create union of 2 sets.

**Parameters:**

set1 - First set  
set2 - Second set

**Returns:**

a new Set, containing the union of the 2 sets.

---

## diff

```
public static java.util.Set diff(java.util.Set set1,  
    java.util.Set set2)
```

Create difference of the 2 sets.

**Parameters:**

set1 - First set  
set2 - Second set

**Returns:**

a new Set, containing the set1 - set2.

---

## isSubset

```
public static boolean isSubset(java.util.Set set1,  
    java.util.Set set2)
```

Determines if set1 is a subset of set2.

**Parameters:**

set1 - First set  
set2 - Second set

**Returns:**

true if set1 is subset of set2, otherwise false.

---

## isSuperset

```
public static boolean isSuperset(java.util.Set set1,  
    java.util.Set set2)
```

Determines if set1 is a superset of set2.

**Parameters:**

(continued from last page)

set1 - First set  
set2 - Second set

**Returns:**

true if set1 is superset of set2, otherwise false.

## com.wowza.util Class StringUtils

java.lang.Object

└─com.wowza.util.StringUtils

public class **StringUtils**  
extends Object

StringUtils: utility class of String utilities.

### Constructor Summary

public	<a href="#">StringUtils()</a>
--------	-------------------------------

### Method Summary

static boolean	<a href="#">equals</a> (String s1, String s2) Checks if 2 strings are equals, accounting for null cases.
static int	<a href="#">fastStringHash</a> (String contextStr)
static String	<a href="#">getOrDefault</a> (String s, String defaultString) Returns string s, or defaultString if s is null.
static String	<a href="#">intToHexStr</a> (int value, int strLen)
static String	<a href="#">intToStr</a> (int value, int strLen)
static boolean	<a href="#">isEmpty</a> (String s) Checks if string is empty, handling null String case.
static int	<a href="#">length</a> (String s) Returns string length, handling null String case as length of 0.
static String	<a href="#">longToHexStr</a> (long value, int strLen)
static String	<a href="#">longToStr</a> (long value, int strLen)
static String	<a href="#">stampToString</a> (long stamp) Convert a duration (milliseconds) to a formatted string.
static String	<a href="#">stampToStringNoUnits</a> (long stamp) Convert a duration (milliseconds) to a formatted string.
static long	<a href="#">stringToMilliseconds</a> (String stamp) Convert a hh:mm:ss.SSS string to milliseconds No validation that hh:mm:ss are valid ranges
static String	<a href="#">toStringList</a> (java.util.List strings) Convert list of Strings to comma-separated string

static String	<a href="#">toStringList</a> (String[] strings) Convert array of Strings to comma-separated string
static String	<a href="#">toStringList</a> ( <a href="#">WMSProperties</a> properties) Convert properties to comma-separated string
static String	<a href="#">valueOf</a> (String s) Returns string, handling null String case as "".

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### StringUtils

```
public StringUtils()
```

## Methods

### intToStr

```
public static String intToStr(int value,  
                               int strLen)
```

### intToHexStr

```
public static String intToHexStr(int value,  
                                  int strLen)
```

### longToStr

```
public static String longToStr(long value,  
                                int strLen)
```

### longToHexStr

```
public static String longToHexStr(long value,  
                                   int strLen)
```

### isEmpty

```
public static boolean isEmpty(String s)
```

(continued from last page)

Checks if string is empty, handling null String case.

**Parameters:**

s

**Returns:**

false if string is null or "", true otherwise

---

## length

```
public static int length(String s)
```

Returns string length, handling null String case as length of 0.

**Parameters:**

s

**Returns:**

0 if string is null, or length of string.

---

## valueOf

```
public static String valueOf(String s)
```

Returns string, handling null String case as "".

**Parameters:**

s

**Returns:**

"" if string is null, or string value.

---

## getOrDefault

```
public static String getOrDefault(String s,  
    String defaultString)
```

Returns string s, or defaultString if s is null.

**Parameters:**

s

defaultString

**Returns:**

"" if string is null, or string value.

---

## stampToString

```
public static String stampToString(long stamp)
```

Convert a duration (milliseconds) to a formatted string.

**Parameters:**

stamp - duration (milliseconds)

**Returns:**

formatted string (example: 3 days 4 minutes 1 seconds)

---

(continued from last page)

## stampToStringNoUnits

```
public static String stampToStringNoUnits(long stamp)
```

Convert a duration (milliseconds) to a formatted string.

**Parameters:**

stamp - duration (milliseconds)

**Returns:**

formatted string (example: 03:04:01.123 hours:minutes:seconds.milliseconds)

---

## stringToMilliseconds

```
public static long stringToMilliseconds(String stamp)
```

Convert a hh:mm:ss.SSS string to milliseconds No validation that hh:mm:ss are valid ranges

**Parameters:**

stamp - string (hours:minutes:seconds.milliseconds)

**Returns:**

milliseconds, -1 is parse failed

---

## equals

```
public static boolean equals(String s1,  
    String s2)
```

Checks if 2 strings are equals, accounting for null cases. If both are null, they are considered equal.

**Parameters:**

s1 - string one

s2 - string 2

**Returns:**

true is the strings are equal

---

## toStringList

```
public static String toStringList(WMSProperties properties)
```

Convert properties to comma-separated string

**Parameters:**

properties

**Returns:**

comma-separated string

---

## toStringList

```
public static String toStringList(java.util.List strings)
```

Convert list of Strings to comma-separated string

**Parameters:**

strings

---

(continued from last page)

**Returns:**comma-separated string

---

**toStringList**

```
public static String toStringList(String[] strings)
```

Convert array of Strings to comma-separated string

**Parameters:**

strings

**Returns:**comma-separated string

---

**fastStringHash**

```
public static int fastStringHash(String contextStr)
```

## com.wowza.util Class SystemUtils

java.lang.Object

└─com.wowza.util.SystemUtils

public class **SystemUtils**  
extends Object

### Nested Class Summary

class	<a href="#">SystemUtils.ReplaceItem</a> SystemUtils.ReplaceItem
-------	--

### Field Summary

public static final	<a href="#">defaultLocale</a>
public static final	<a href="#">defaultTimeZone</a>
public static final	<a href="#">gmtTimeZone</a>
protected static final	<a href="#">msb0baseTime</a> Value: <b>2085978496000</b>
protected static final	<a href="#">msblbaseTime</a> Value: <b>-2208988800000</b>

### Constructor Summary

public	<a href="#">SystemUtils()</a>
--------	-------------------------------

### Method Summary

static void	<a href="#">addBouncyCastleSecurityProvider()</a> Load bouncy castle providers, Internal use.
static String[]	<a href="#">execCommandGetResult</a> (String cmdStr)
static String	<a href="#">expandEnvironmentVariables</a> (String inValue) Expand system level Java properties in a String in the form \${property-name}
static String	<a href="#">expandEnvironmentVariables</a> (String inValue, java.util.Map valueMap) Expand system level Java properties in a String in the form \${property-name}.
static long	<a href="#">getCpuTime</a> () Get CPU time in nanoseconds.

static String	<a href="#">getLinuxSocketParam</a> (String cmdStr)
static byte[]	<a href="#">getMACAddress</a> () Get MAC address of localhost interface (only works on Java 6 or greater)
static long	<a href="#">getSystemTime</a> () Get system time in nanoseconds.
static long	<a href="#">getUserTime</a> () Get user time in nanoseconds.
static long	<a href="#">toNTPTime</a> (long t) Convert a timecode value in milliseconds to NTP time

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### defaultTimeZone

public static final java.util.TimeZone **defaultTimeZone**

### gmtTimeZone

public static final java.util.TimeZone **gmtTimeZone**

### defaultLocale

public static final java.util.Locale **defaultLocale**

### msb0baseTime

protected static final long **msb0baseTime**

Constant value: **2085978496000**

### msb1baseTime

protected static final long **msb1baseTime**

Constant value: **-2208988800000**

## Constructors

(continued from last page)

## SystemUtils

```
public SystemUtils()
```

## Methods

### expandEnvironmentVariables

```
public static String expandEnvironmentVariables(String inValue)
```

Expand system level Java properties in a String in the form \${property-name}

**Parameters:**

inValue - string with properties

**Returns:**

expanded string

---

### expandEnvironmentVariables

```
public static String expandEnvironmentVariables(String inValue,  
        java.util.Map valueMap)
```

Expand system level Java properties in a String in the form \${property-name}. You can also pass in a map of name/value pairs that will expand the list of available properties

**Parameters:**

inValue - string with properties

valueMap - name/value pair map

**Returns:**

expanded string

---

### getMACAddress

```
public static byte[] getMACAddress()
```

Get MAC address of localhost interface (only works on Java 6 or greater)

**Returns:**

MAC address of localhost interface

---

### addBouncyCastleSecurityProvider

```
public static void addBouncyCastleSecurityProvider()
```

Load bouncy castle providers, Internal use.

---

### toNTPTime

```
public static long toNTPTime(long t)
```

Convert a timecode value in milliseconds to NTP time

**Parameters:**

t - timecode value in milliseconds

(continued from last page)

**Returns:**NTP time

---

**getCpuTime**

```
public static long getCpuTime()
```

Get CPU time in nanoseconds.

---

**getUserTime**

```
public static long getUserTime()
```

Get user time in nanoseconds.

---

**getSystemTime**

```
public static long getSystemTime()
```

Get system time in nanoseconds.

---

**getLinuxSocketParam**

```
public static String getLinuxSocketParam(String cmdStr)
```

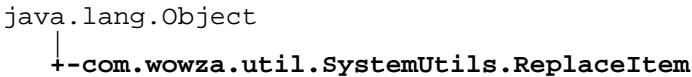

---

**execCommandGetResult**

```
public static String[] execCommandGetResult(String cmdStr)
```

com.wowza.util

# Class SystemUtils.ReplaceItem

public static class **SystemUtils.ReplaceItem**  
extends Object

## Field Summary

public	<a href="#">end</a>
public	<a href="#">newValue</a>
public	<a href="#">start</a>

## Constructor Summary

public	<a href="#">SystemUtils.ReplaceItem</a> (int start, int stop, String newValue)
--------	--

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

**start**  
public int **start**

**end**  
public int **end**

**newValue**  
public java.lang.String **newValue**

## Constructors

(continued from last page)

## SystemUtils.ReplaceItem

```
public SystemUtils.ReplaceItem(int start,  
                               int stop,  
                               String newValue)
```

## com.wowza.util Class URLUtils

java.lang.Object

└─com.wowza.util.URLUtils

public final class **URLUtils**  
extends Object

Class to deal with URLs

### Constructor Summary

public	<a href="#">URLUtils()</a>
--------	----------------------------

### Method Summary

static String	<a href="#">appendParamsToUrl</a> (String url, String params) Convenience call to add parameters to a url.
static String	<a href="#">decodeValue</a> (String val) Wrapper for URLDecoder.decode(val, "UTF-8");
static String	<a href="#">encodeValue</a> (String val) Wrapper for URLEncoder.encode(val, "UTF-8");
static String	<a href="#">getParamValue</a> (java.util.Map params, String key) Helper funtion to get single value from multiple value parameter Map
static java.util.Map	<a href="#">parseQueryStr</a> (String queryString, boolean doDecode) Parse query string part of url into Map of Lists (to support multiple values) of query parameters
static String	<a href="#">pathToFileURL</a> (String basePath) Convert a path to a url (file://[path])
static String	<a href="#">urlToId</a> (java.net.URL url) Create a MD5 message digest hash of a url

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### URLUtils

public **URLUtils**()

(continued from last page)

## Methods

### pathToFileURL

```
public static String pathToFileURL(String basePath)
```

Convert a path to a url (file://[path])

**Parameters:**

basePath - path

**Returns:**

file url

### urlToId

```
public static String urlToId(java.net.URL url)
```

Create a MD5 message digest hash of a url

**Parameters:**

url - url to hash

**Returns:**

hashed url

### appendParamsToUrl

```
public static String appendParamsToUrl(String url,  
String params)
```

Convenience call to add parameters to a url. If already has ? add &.

**Parameters:**

url - input url

params - parameters in the form param1=val1&param2=val2

**Returns:**

appended url

### encodeValue

```
public static String encodeValue(String val)
```

Wrapper for URLEncoder.encode(val, "UTF-8");

**Parameters:**

val - value to encode

**Returns:**

encoded value

### decodeValue

```
public static String decodeValue(String val)
```

Wrapper for URLDecoder.decode(val, "UTF-8");

(continued from last page)

**Parameters:**

val - value to decode

**Returns:**decoded value

---

## parseQueryStr

```
public static java.util.Map parseQueryStr(String queryString,  
                                           boolean doDecode)
```

Parse query string part of url into Map of Lists (to support multiple values) of query parameters

**Parameters:**

queryString - query string

doDecode - true to use URLDecoder.decode() to decode parameters

**Returns:**Map of Lists

---

## getParamValue

```
public static String getParamValue(java.util.Map params,  
                                     String key)
```

Helper funtion to get single value from multiple value parameter Map

**Parameters:**

params - params Map

key - key string

**Returns:**first value

---

## com.wowza.util Class XMLUtils

java.lang.Object

└─com.wowza.util.XMLUtils

public class **XMLUtils**  
extends Object

XMLUtils: utility class for parsing XML files.

### Constructor Summary

public	<a href="#">XMLUtils()</a>
--------	----------------------------

### Method Summary

static org.w3c.dom.Node	<a href="#">getNodeByTagName</a> (org.w3c.dom.Element node, String name) Return a child Node by tag name.
static String	<a href="#">getNodeValue</a> (org.w3c.dom.Node node) Return the text value of a node.
static String	<a href="#">getNodeValueByTagName</a> (org.w3c.dom.Element node, String name) Get a child Node value by tag name.
static String	<a href="#">getVersion</a> (org.w3c.dom.Element root) Given a Wowza XML file's root element, parse the version attribute
static boolean	<a href="#">getXMLPropertyBool</a> (javax.xml.xpath.XPath xpath, String xpathStr, org.w3c.dom.Element root, boolean defaultVal) Get a boolean int value pointed to by xpath or defaultVal if not found.
static double	<a href="#">getXMLPropertyDouble</a> (javax.xml.xpath.XPath xpath, String xpathStr, org.w3c.dom.Element root, double defaultVal) Get a single double value pointed to by xpath or defaultVal if not found.
static boolean	<a href="#">getXMLPropertyExists</a> (javax.xml.xpath.XPath xpath, String xpathStr, org.w3c.dom.Element root)
static int	<a href="#">getXMLPropertyInt</a> (javax.xml.xpath.XPath xpath, String xpathStr, org.w3c.dom.Element root, int defaultVal) Get a single int value pointed to by xpath or defaultVal if not found.
static int	<a href="#">getXMLPropertyIntSize</a> (javax.xml.xpath.XPath xpath, String xpathStr, org.w3c.dom.Element root, int defaultVal)
static long	<a href="#">getXMLPropertyLong</a> (javax.xml.xpath.XPath xpath, String xpathStr, org.w3c.dom.Element root, long defaultVal) Get a single long value pointed to by xpath or defaultVal if not found.
static long	<a href="#">getXMLPropertyLongSize</a> (javax.xml.xpath.XPath xpath, String xpathStr, org.w3c.dom.Element root, long defaultVal)

static String	<a href="#">getXMLPropertyStr</a> ( javax.xml.xpath.XPath xpath, String xpathStr, org.w3c.dom.Element root) Get a single string value pointed to by xpath or null if not found.
static String	<a href="#">getXMLPropertyStr</a> ( javax.xml.xpath.XPath xpath, String xpathStr, org.w3c.dom.Element root, String defaultVal) Get a single string value pointed to by xpath or defaultVal if not found.
static void	<a href="#">loadConfigProperties</a> (org.w3c.dom.Element root, String propertiesXPath, <a href="#">WMSProperties</a> properties) Loads <Properties> elemnt by xpath into properties object.
static void	<a href="#">loadConfigProperties</a> (org.w3c.dom.NodeList resultList, <a href="#">WMSProperties</a> properties) Given a nodeList load children as properties.
static javax.xml.xpath.XPath Factory	<a href="#">newXPathFactory</a> () Get a new XPath factory object.

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### XMLUtils

public **XMLUtils**()

## Methods

### getNodeValueByTagName

public static String **getNodeValueByTagName**(org.w3c.dom.Element node, String name)

Get a child Node value by tag name. Return null if does not exist.

#### Parameters:

node - parent node  
name - tag name

#### Returns:

node value or null if does not exist

### getNodeByTagName

public static org.w3c.dom.Node **getNodeByTagName**(org.w3c.dom.Element node, String name)

Return a child Node by tag name. Return null if does not exist.

#### Parameters:

node - parent node

(continued from last page)

name - tag name

**Returns:**

Node or null if does not exist

---

## getNodeValue

```
public static String getNodeValue(org.w3c.dom.Node node)
```

Return the text value of a node. Return concatenated value of all children nodes that are text nodes.

**Parameters:**

node - parent node

**Returns:**

concatenated text nodes or empty string if not found or no children

---

## loadConfigProperties

```
public static void loadConfigProperties(org.w3c.dom.Element root,  
    String propertiesXPath,  
    WMSProperties properties)
```

Loads <Properties> elemnt by xpath into properties object.

**Parameters:**

root - root node

propertiesXPath - xpath to search for <Properties> element

properties - properties to add values to

---

## loadConfigProperties

```
public static void loadConfigProperties(org.w3c.dom.NodeList resultList,  
    WMSProperties properties)
```

Given a nodeList load children as properties.

**Parameters:**

resultList - node list

properties - properties to add values to

---

## getXMLPropertyStr

```
public static String getXMLPropertyStr(javax.xml.xpath.XPath xpath,  
    String xpathStr,  
    org.w3c.dom.Element root)
```

Get a single string value pointed to by xpath or null if not found.

**Parameters:**

xpath - XPath interface

xpathStr - xpath string

root - root node to start search

**Returns:**

single string value pointed to by xpath or null if not found

---

(continued from last page)

## getXMLPropertyStr

```
public static String getXMLPropertyStr( javax.xml.xpath.XPath xpath,
    String xpathStr,
    org.w3c.dom.Element root,
    String defaultVal)
```

Get a single string value pointed to by xpath or defaultVal if not found.

### Parameters:

xpath - XPath interface  
xpathStr - xpath string  
root - node to start search  
defaultVal - default value

### Returns:

single string value pointed to by xpath or defaultVal if not found

---

## getXMLPropertyExists

```
public static boolean getXMLPropertyExists( javax.xml.xpath.XPath xpath,
    String xpathStr,
    org.w3c.dom.Element root)
```

---

## getXMLPropertyInt

```
public static int getXMLPropertyInt( javax.xml.xpath.XPath xpath,
    String xpathStr,
    org.w3c.dom.Element root,
    int defaultVal)
```

Get a single int value pointed to by xpath or defaultVal if not found.

### Parameters:

xpath - XPath interface  
xpathStr - xpath string  
root - node to start search  
defaultVal - default value

### Returns:

int value or defaultVal if not found

---

## getXMLPropertyIntSize

```
public static int getXMLPropertyIntSize( javax.xml.xpath.XPath xpath,
    String xpathStr,
    org.w3c.dom.Element root,
    int defaultVal)
```

---

## getXMLPropertyLong

```
public static long getXMLPropertyLong( javax.xml.xpath.XPath xpath,
    String xpathStr,
    org.w3c.dom.Element root,
    long defaultVal)
```

Get a single long value pointed to by xpath or defaultVal if not found.

---

(continued from last page)

**Parameters:**

xpath - XPath interface  
xpathStr - xpath string  
root - node to start search  
defaultVal - default value

**Returns:**

long value or defaultVal if not found

---

## getXMLPropertyLongSize

```
public static long getXMLPropertyLongSize( javax.xml.xpath.XPath xpath,
      String xpathStr,
      org.w3c.dom.Element root,
      long defaultVal)
```

---

## getXMLPropertyDouble

```
public static double getXMLPropertyDouble( javax.xml.xpath.XPath xpath,
      String xpathStr,
      org.w3c.dom.Element root,
      double defaultVal)
```

Get a single double value pointed to by xpath or defaultVal if not found.

**Parameters:**

xpath - XPath interface  
xpathStr - xpath string  
root - node to start search  
defaultVal - default value

**Returns:**

double value or defaultVal if not found

---

## getXMLPropertyBool

```
public static boolean getXMLPropertyBool( javax.xml.xpath.XPath xpath,
      String xpathStr,
      org.w3c.dom.Element root,
      boolean defaultVal)
```

Get a boolean int value pointed to by xpath or defaultVal if not found.

**Parameters:**

xpath - XPath interface  
xpathStr - xpath string  
root - node to start search  
defaultVal - default value

**Returns:**

boolean value or defaultVal if not found

---

## newXPathFactory

```
public static javax.xml.xpath.XPathFactory newXPathFactory()
```

(continued from last page)

Get a new XPath factory object. There is a bug in certain implementations of the Sun VM that forces an explicit creation of the "com.sun.org.apache.xpath.internal.jaxp.XPathFactoryImpl". This method will try the correct method for creation and if fails will directly create "com.sun.org.apache.xpath.internal.jaxp.XPathFactoryImpl" object.

**Returns:**

XPathFactory or null if not found

---

## getVersion

```
public static String getVersion(org.w3c.dom.Element root)
```

Given a Wowza XML file's root element, parse the version attribute

**Parameters:**

root

**Returns:**

version or "0" if not specified

## com.wowza.util Class ZipUtils

java.lang.Object

└-com.wowza.util.ZipUtils

public class **ZipUtils**  
extends Object

### Constructor Summary

public	<a href="#">ZipUtils()</a>
--------	----------------------------

### Method Summary

static byte[]	<a href="#">toGzip</a> (byte[] bytes)
static boolean	<a href="#">zipDirectory</a> (String srcDir, String destDir, String zipFileName)

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### ZipUtils

public **zipUtils**()

### Methods

#### toGzip

public static byte[] **toGzip**(byte[] bytes)

#### zipDirectory

public static boolean **zipDirectory**(String srcDir,  
String destDir,  
String zipFileName)

---

Package

**com.wowza.wms.amf**

## com.wowza.wms.amf

### Class AMF3Utils

java.lang.Object

└─com.wowza.wms.amf.AMF3Utils

public class **AMF3Utils**  
extends Object

AMF3 utilities

#### Constructor Summary

public	<a href="#">AMF3Utils()</a>
--------	-----------------------------

#### Method Summary

static java.util.Date	<a href="#">deserializeDate</a> (java.nio.ByteBuffer data) Deserialize date type
static int	<a href="#">deserializeInt</a> (java.nio.ByteBuffer data) Deserialize int
static String	<a href="#">deserializeString</a> (java.nio.ByteBuffer data) Deserialize string
static String	<a href="#">deserializeString</a> (java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context) Deserialize string
static String	<a href="#">deserializeString</a> (java.nio.ByteBuffer data, int utflen) Deserialize string
static int	<a href="#">serializeDate</a> (java.io.DataOutputStream out, java.util.Date date) Serialize a date object
static int	<a href="#">serializeInt</a> (java.io.DataOutputStream out, int val) Serialize int value
static int	<a href="#">serializeString</a> (java.io.DataOutputStream out, String str) Serialize a string value
static int	<a href="#">serializeStringNoLength</a> (java.io.DataOutputStream out, String str) Serialize string but do not write the length
static void	<a href="#">serializeZeroLengthString</a> (java.io.DataOutputStream out) Serialize empty string

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### AMF3Utils

```
public AMF3Utils()
```

## Methods

### deserializeDate

```
public static java.util.Date deserializeDate(java.nio.ByteBuffer data)
```

Deserialize date type

**Parameters:**

data - buffer

**Returns:**

date

---

### serializeDate

```
public static int serializeDate(java.io.DataOutputStream out,  
    java.util.Date date)
```

Serialize a date object

**Parameters:**

out - output stream

date - date

**Returns:**

number of bytes written

---

### deserializeInt

```
public static int deserializeInt(java.nio.ByteBuffer data)
```

Deserialize int

**Parameters:**

data - buffer

**Returns:**

int value

---

### serializeInt

```
public static int serializeInt(java.io.DataOutputStream out,  
    int val)
```

Serialize int value

**Parameters:**

(continued from last page)

out - output stream  
val - int value

**Returns:**

number of bytes written

---

## deserializeString

```
public static String deserializeString(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)  
    throws java.io.IOException
```

Deserialize string

**Parameters:**

data - data  
context - AMF context

**Returns:**

string value

**Throws:**

IOException

---

## deserializeString

```
public static String deserializeString(java.nio.ByteBuffer data)  
    throws java.io.IOException
```

Deserialize string

**Parameters:**

data - data

**Returns:**

string value

**Throws:**

IOException

---

## deserializeString

```
public static String deserializeString(java.nio.ByteBuffer data,  
    int utflen)  
    throws java.io.IOException
```

Deserialize string

**Parameters:**

data - data  
utflen - len of the string

**Returns:**

string value

**Throws:**

IOException

---

(continued from last page)

## serializeZeroLengthString

```
public static void serializeZeroLengthString(java.io.DataOutputStream out)
```

Serialize empty string

**Parameters:**

out - output stream

---

## serializeStringNoLength

```
public static int serializeStringNoLength(java.io.DataOutputStream out,  
    String str)  
throws java.io.IOException
```

Serialize string but do not write the length

**Parameters:**

out - output stream

str - string value

**Returns:**

number of bytes written

**Throws:**

IOException

---

## serializeString

```
public static int serializeString(java.io.DataOutputStream out,  
    String str)  
throws java.io.IOException
```

Serialize a string value

**Parameters:**

out - output stream

str - string value

**Returns:**

number of bytes written

**Throws:**

IOException

---

## com.wowza.wms.amf

### Class AMFData

java.lang.Object

└─com.wowza.wms.amf.AMFData

Direct Known Subclasses:

[AMFDataObj](#), [AMFDataList](#), [AMFDataItem](#), [AMFDataByteArray](#), [AMFDataArray](#)

public abstract class **AMFData**  
extends Object

Base abstract class for data in Action Message Format (AMF). Data is sent between the Flash client and the Wowza Streaming Engine using the AMF format. This class cannot be instantiated. It serves as the base class for all AMFData objects.

#### Field Summary

public static	<a href="#">AMF_DEFAULT_DESERIALIZE_CHARSETNAME</a>

## Constructor Summary

public	<a href="#">AMFData()</a>
--------	---------------------------

## Method Summary

static <a href="#">AMFDataContextDeserialize</a>	<a href="#">createContextDeserialize()</a> Create an AMF3 deserialization context
static <a href="#">AMFDataContextDeserialize</a>	<a href="#">createContextDeserialize(int objectEncoding)</a> Create an AMF3 deserialization context
static <a href="#">AMFDataContextSerialize</a>	<a href="#">createContextSerialize()</a> Create an AMF3 serialization context
static <a href="#">AMFDataContextSerialize</a>	<a href="#">createContextSerialize(int objectEncoding)</a> Create an AMF3 serialization context
abstract void	<a href="#">deserialize(java.nio.ByteBuffer data)</a> Deserialize data in byte buffer
abstract void	<a href="#">deserialize(java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)</a> Deserialize data in byte buffer
static <a href="#">AMFData</a>	<a href="#">deserializeInnerObject(java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)</a> Deserialize next item
static <a href="#">AMFData</a>	<a href="#">getReference(java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)</a> Get AMF3 object reference
int	<a href="#">getType()</a> Returns the data type for this object
abstract Object	<a href="#">getValue()</a> Convert object to Java native class
static boolean	<a href="#">isAMF3Start(java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)</a> Returns true if next byte in data is AMF3 start
static boolean	<a href="#">isArrayStart(java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)</a> Returns true if next byte in data is an array start
static boolean	<a href="#">isByteArrayStart(java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)</a> Returns true if next byte is ByteArray start
static boolean	<a href="#">isMixedArrayStart(java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)</a> Returns true if next byte in data is mixed array start
static boolean	<a href="#">isObjEnd(java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)</a> Returns true if next byte is object end
static boolean	<a href="#">isObjStart(java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)</a> Returns true if next byte in data is object start
static int	<a href="#">peekByte(java.nio.ByteBuffer data)</a> Return the next byte in the buffer without incrementing the data position

abstract byte[]	<a href="#">serialize()</a> Serial object to byte array
abstract byte[]	<a href="#">serialize(<a href="#">AMFDataContextSerialize</a> context)</a> Serial object to byte array
abstract void	<a href="#">serialize(java.io.DataOutputStream out)</a> Serialize object to output stream
abstract void	<a href="#">serialize(java.io.DataOutputStream out, <a href="#">AMFDataContextSerialize</a> context)</a> Serialize object to output stream
abstract void	<a href="#">serialize(java.io.DataOutputStream out, int objectEncoding)</a> Serialize object to output stream
abstract byte[]	<a href="#">serialize(int objectEncoding)</a> Serial object to byte array
void	<a href="#">setType(int type)</a> Sets the the data type for this object
static int	<a href="#">skipByte(java.nio.ByteBuffer data)</a> Skip forward one byte in the byte buffer
static boolean	<a href="#">testNextByte(java.nio.ByteBuffer data, int test)</a> Peek at the next value in data to see if its the test value
static boolean	<a href="#">triggerAMF3Switch(<a href="#">AMFData</a> data)</a> Return true if the object is serialized differently in AMF3

#### Methods inherited from class java.lang.Object

## Fields

### DATA\_TYPE\_UNKNOWN

public static final byte **DATA\_TYPE\_UNKNOWN**

Constant value: **-1**

### DATA\_TYPE\_NUMBER

public static final byte **DATA\_TYPE\_NUMBER**

Constant value: **0**

### DATA\_TYPE\_BOOLEAN

public static final byte **DATA\_TYPE\_BOOLEAN**

(continued from last page)

Constant value: **1**

---

## DATA\_TYPE\_STRING

```
public static final byte DATA_TYPE_STRING
```

Constant value: **2**

---

## DATA\_TYPE\_OBJECT

```
public static final byte DATA_TYPE_OBJECT
```

Constant value: **3**

---

## DATA\_TYPE\_MOVIE\_CLIP

```
public static final byte DATA_TYPE_MOVIE_CLIP
```

Constant value: **4**

---

## DATA\_TYPE\_NULL

```
public static final byte DATA_TYPE_NULL
```

Constant value: **5**

---

## DATA\_TYPE\_UNDEFINED

```
public static final byte DATA_TYPE_UNDEFINED
```

Constant value: **6**

---

## DATA\_TYPE\_REFERENCE\_OBJECT

```
public static final byte DATA_TYPE_REFERENCE_OBJECT
```

Constant value: **7**

---

## DATA\_TYPE\_MIXED\_ARRAY

```
public static final byte DATA_TYPE_MIXED_ARRAY
```

Constant value: **8**

---

## DATA\_TYPE\_OBJECT\_END

```
public static final byte DATA_TYPE_OBJECT_END
```

Constant value: **9**

(continued from last page)

---

## DATA\_TYPE\_ARRAY

```
public static final byte DATA_TYPE_ARRAY
```

Constant value: **10**

---

## DATA\_TYPE\_DATE

```
public static final byte DATA_TYPE_DATE
```

Constant value: **11**

---

## DATA\_TYPE\_LONG\_STRING

```
public static final byte DATA_TYPE_LONG_STRING
```

Constant value: **12**

---

## DATA\_TYPE\_AS\_OBJECT

```
public static final byte DATA_TYPE_AS_OBJECT
```

Constant value: **13**

---

## DATA\_TYPE\_RECORDSET

```
public static final byte DATA_TYPE_RECORDSET
```

Constant value: **14**

---

## DATA\_TYPE\_XML

```
public static final byte DATA_TYPE_XML
```

Constant value: **15**

---

## DATA\_TYPE\_CUSTOM\_CLASS

```
public static final byte DATA_TYPE_CUSTOM_CLASS
```

Constant value: **16**

---

## DATA\_TYPE\_AMF3

```
public static final byte DATA_TYPE_AMF3
```

Constant value: **17**

---

## DATA\_TYPE\_INTEGER

```
public static final byte DATA_TYPE_INTEGER
```

---

(continued from last page)

Constant value: **32**

---

## DATA\_TYPE\_BYTEARRAY

```
public static final byte DATA_TYPE_BYTEARRAY
```

Constant value: **33**

---

## DATA\_TYPE\_XML\_TOP

```
public static final byte DATA_TYPE_XML_TOP
```

Constant value: **34**

---

## DATA\_TYPE\_AMF3\_UNDEFINED

```
public static final byte DATA_TYPE_AMF3_UNDEFINED
```

Constant value: **0**

---

## DATA\_TYPE\_AMF3\_NULL

```
public static final byte DATA_TYPE_AMF3_NULL
```

Constant value: **1**

---

## DATA\_TYPE\_AMF3\_BOOLEAN\_FALSE

```
public static final byte DATA_TYPE_AMF3_BOOLEAN_FALSE
```

Constant value: **2**

---

## DATA\_TYPE\_AMF3\_BOOLEAN\_TRUE

```
public static final byte DATA_TYPE_AMF3_BOOLEAN_TRUE
```

Constant value: **3**

---

## DATA\_TYPE\_AMF3\_INTEGER

```
public static final byte DATA_TYPE_AMF3_INTEGER
```

Constant value: **4**

---

## DATA\_TYPE\_AMF3\_NUMBER

```
public static final byte DATA_TYPE_AMF3_NUMBER
```

Constant value: **5**

---

## DATA\_TYPE\_AMF3\_STRING

```
public static final byte DATA_TYPE_AMF3_STRING
```

Constant value: **6**

---

## DATA\_TYPE\_AMF3\_XML\_LEGACY

```
public static final byte DATA_TYPE_AMF3_XML_LEGACY
```

Constant value: **7**

---

## DATA\_TYPE\_AMF3\_DATE

```
public static final byte DATA_TYPE_AMF3_DATE
```

Constant value: **8**

---

## DATA\_TYPE\_AMF3\_ARRAY

```
public static final byte DATA_TYPE_AMF3_ARRAY
```

Constant value: **9**

---

## DATA\_TYPE\_AMF3\_OBJECT

```
public static final byte DATA_TYPE_AMF3_OBJECT
```

Constant value: **10**

---

## DATA\_TYPE\_AMF3\_XML\_TOP

```
public static final byte DATA_TYPE_AMF3_XML_TOP
```

Constant value: **11**

---

## DATA\_TYPE\_AMF3\_BYTEARRAY

```
public static final byte DATA_TYPE_AMF3_BYTEARRAY
```

Constant value: **12**

---

## AMF\_LEVEL0

```
public static final byte AMF_LEVEL0
```

Constant value: **0**

---

(continued from last page)

## AMF\_LEVEL3

```
public static final byte AMF_LEVEL3
```

Constant value: **3**

## AMF\_DEFAULT\_DESERIALIZE\_CHARSETNAME

```
public static java.lang.String AMF_DEFAULT_DESERIALIZE_CHARSETNAME
```

## MILLS\_PER\_HOUR

```
public static final int MILLS_PER_HOUR
```

Number of milliseconds in an hour  
Constant value: **60000**

## type

```
protected int type
```

## Constructors

### AMFData

```
public AMFData()
```

## Methods

### getType

```
public int getType()
```

Returns the data type for this object

**Returns:**

object type DATA\_TYPE\_\*

### setType

```
public void setType(int type)
```

Sets the the data type for this object

**Parameters:**

type - type DATA\_TYPE\_\*

### testNextByte

```
public static boolean testNextByte(java.nio.ByteBuffer data,  
    int test)
```

(continued from last page)

Peek at the next value in data to see if its the test value

**Parameters:**

data - binary data being deserialized  
test - value being tested

**Returns:**

return true if the next byte in the buffer equals the test value

---

## peekByte

```
public static int peekByte(java.nio.ByteBuffer data)
```

Return the next byte in the buffer without incrementing the data position

**Parameters:**

data - binary data being deserialized

**Returns:**

next byte in buffer

---

## skipByte

```
public static int skipByte(java.nio.ByteBuffer data)
```

Skip forward one byte in the byte buffer

**Parameters:**

data - binary data being deserialized

**Returns:**

next byte in buffer

---

## isObjStart

```
public static boolean isObjStart(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Returns true if next byte in data is object start

**Parameters:**

data - binary data being deserialized  
context - deserialization context

**Returns:**

Returns true if next byte in data is object start

---

## isAMF3Start

```
public static boolean isAMF3Start(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Returns true if next byte in data is AMF3 start

**Parameters:**

data - binary data being deserialized  
context - deserialization context

(continued from last page)

**Returns:**

Returns true if next byte in data is object start

---

**isArrayStart**

```
public static boolean isArrayStart(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Returns true if next byte in data is an array start

**Parameters:**data - binary data being deserialized  
context - deserialization context**Returns:**

Returns true if next byte in data is and array start

---

**isMixedArrayStart**

```
public static boolean isMixedArrayStart(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Returns true if next byte in data is mixed array start

**Parameters:**data - binary data being deserialized  
context - deserialization context**Returns:**

Returns true if next byte in data is mixed array start

---

**isObjEnd**

```
public static boolean isObjEnd(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Returns true if next byte is object end

**Parameters:**data - binary data being deserialized  
context - deserialization context**Returns:**

Returns true if next byte in object end

---

**isByteArrayStart**

```
public static boolean isByteArrayStart(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Returns true if next byte is ByteArray start

**Parameters:**data - binary data being deserialized  
context - deserialization context**Returns:**

true if next byte in object end

## getReference

```
public static AMFData getReference(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Get AMF3 object reference

**Parameters:**

data - binary data being deserialized  
context - deserialization context

**Returns:**

null if not a reference else referenced object

---

## deserializeInnerObject

```
public static AMFData deserializeInnerObject(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)  
throws java.io.IOException
```

Deserialize next item

**Parameters:**

data - binary data being deserialized  
context - deserialization context

**Returns:**

deserialized object

**Throws:**

IOException

---

## createContextSerialize

```
public static AMFDataContextSerialize createContextSerialize()
```

Create an AMF3 serialization context

**Returns:**

AMF3 serialization context

---

## createContextSerialize

```
public static AMFDataContextSerialize createContextSerialize(int objectEncoding)
```

Create an AMF3 serialization context

**Parameters:**

objectEncoding - object encoding level (see AMF\_LEVEL\*)

**Returns:**

AMF3 serialization context

---

## createContextDeserialize

```
public static AMFDataContextDeserialize createContextDeserialize()
```

Create an AMF3 deserialization context

---

(continued from last page)

**Returns:**

AMF3 deserialization context

---

**createContextDeserialize**

```
public static AMFDataContextDeserialize createContextDeserialize(int objectEncoding)
```

Create an AMF3 deserialization context

**Parameters:**

objectEncoding - object encoding level (see AMF\_LEVEL\*)

**Returns:**

AMF3 deserialization context

---

**serialize**

```
public abstract void serialize(java.io.DataOutputStream out)
```

Serialize object to output stream

**Parameters:**

out - Output stream

---

**serialize**

```
public abstract void serialize(java.io.DataOutputStream out,  
    int objectEncoding)
```

Serialize object to output stream

**Parameters:**

out - Output stream

objectEncoding - object encoding level (see AMF\_LEVEL\*)

---

**serialize**

```
public abstract void serialize(java.io.DataOutputStream out,  
    AMFDataContextSerialize context)
```

Serialize object to output stream

**Parameters:**

out - Output stream

context - serialization context used by AMF3

---

**serialize**

```
public abstract byte[] serialize()
```

Serial object to byte array

**Returns:**

serialized byte array

(continued from last page)

---

## serialize

```
public abstract byte[] serialize(int objectEncoding)
```

Serial object to byte array

**Parameters:**

objectEncoding - object encoding level (see AMF\_LEVEL\*)

**Returns:**

serialized byte array

---

## serialize

```
public abstract byte[] serialize(AMFDataContextSerialize context)
```

Serial object to byte array

**Parameters:**

context - serialization context used by AMF3

**Returns:**

serialized byte array

---

## deserialize

```
public abstract void deserialize(java.nio.ByteBuffer data)
```

Deserialize data in byte buffer

**Parameters:**

data - binary data

---

## deserialize

```
public abstract void deserialize(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Deserialize data in byte buffer

**Parameters:**

data - binary data

context - deserialization context used by AMF3

---

## getValue

```
public abstract Object getValue()
```

Convert object to Java native class

**Returns:**

java native class

---

## triggerAMF3Switch

```
public static boolean triggerAMF3Switch(AMFData data)
```

Return true if the object is serialized differently in AMF3

---

(continued from last page)

**Parameters:**

data - AMF object

**Returns:**

true if the object is serialized differently in AMF3

## com.wowza.wms.amf Class AMFDataArray

```
java.lang.Object
  |
  +--com.wowza.wms.amf.AMFData
        |
        +--com.wowza.wms.amf.AMFDataArray
```

```
public class AMFDataArray
extends AMFData
```

AMFDataArray: class for marshalling data between Wowza Pro server and Flash client. This class is a simple ordered array of items.

### Create Array of Strings

```
AMFDataArray amfDataArray = new AMFDataArray();

amfDataArray.add("item1");
amfDataArray.add("item2");
amfDataArray.add("item3");
```

### Iterate Items In Array

```
AMFDataArray amfDataArray;

for(int i=0;i<amfDataArray.size();i++)
{
    AMFData amfData = amfDataArray.get(i);
    WMSLoggerFactory.getLogger(null).debug("amfData.getType(): "+amfData.getType());
}
```

**NOTE:** There is a slight difference between this class and AMFDataList. This class when serialized/deserialized does include the DATA\_TYPE\_ARRAY header (byte) and array size (int).

**NOTE:** Simple arrays created in the Flash player client and sent to the Wowza Pro server are of type [AMFDataMixedArray](#).

## Constructor Summary

public	<a href="#">AMFDataArray</a> () Create empty AMFDataArray object
public	<a href="#">AMFDataArray</a> (byte[] data) Deserialize entire data array and create AMFDataArray object
public	<a href="#">AMFDataArray</a> (byte[] data, int offset, int size) Deserialize data array starting at offset for size bytes and create AMFDataArray object
public	<a href="#">AMFDataArray</a> (java.nio.ByteBuffer data) Deserialize entire data array and create AMFDataArray object
public	<a href="#">AMFDataArray</a> (java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)

## Method Summary

void	<a href="#">add</a> ( <a href="#">AMFData</a> data) Append a new item onto the array
void	<a href="#">add</a> (boolean data) Append a boolean (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (java.util.Date data) Append a date (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (double data) Append a double (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (int data) Append a int (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (int index, <a href="#">AMFData</a> data) Insert an item into the array
void	<a href="#">add</a> (int index, boolean data) Insert a boolean value (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (int index, java.util.Date data) Insert a date value (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (int index, double data) Insert a double value (will be wrapped in an AMFDataItem object)

void	<a href="#">add</a> (int index, int data) Insert a int value (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (int index, long data) Insert a long value (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (int index, String data) Insert a string value (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (long data) Append a long (will be wrapped in an AMFDataItem object)
void	<a href="#">add</a> (String data) Append a string (will be wrapped in an AMFDataItem object)
void	<a href="#">deserialize</a> (java.nio.ByteBuffer data)
void	<a href="#">deserialize</a> (java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)
<a href="#">AMFData</a>	<a href="#">get</a> (int index) Get item at index
boolean	<a href="#">getBoolean</a> (int index) Get item at index return as boolean
byte	<a href="#">getBytes</a> (int index) Get item at index return as byte
java.util.Date	<a href="#">getDate</a> (int index) Get item at index return as Date
double	<a href="#">getDouble</a> (int index) Get item at index return as double
float	<a href="#">getFloat</a> (int index) Get item at index return as float
int	<a href="#">getInt</a> (int index) Get item at index return as int
long	<a href="#">getLong</a> (int index) Get item at index return as long
<a href="#">AMFDataObj</a>	<a href="#">getObject</a> (int index) Get item at index return as AMFDataObj
short	<a href="#">getShort</a> (int index) Get item at index return as short
String	<a href="#">getString</a> (int index) Get item at index return as String
Object	<a href="#">getValue</a> ( )
<a href="#">AMFData</a>	<a href="#">remove</a> (int index) Remove an item from the array

byte[]	<a href="#">serialize()</a>
byte[]	<a href="#">serialize()</a> ( <a href="#">AMFDataContextSerialize</a> context)
void	<a href="#">serialize()</a> (java.io.DataOutputStream out)
void	<a href="#">serialize()</a> (java.io.DataOutputStream out, <a href="#">AMFDataContextSerialize</a> context)
void	<a href="#">serialize()</a> (java.io.DataOutputStream out, int objectEncoding)
byte[]	<a href="#">serialize()</a> (int objectEncoding)
void	<a href="#">set()</a> (int index, <a href="#">AMFData</a> data) Set an array item
void	<a href="#">set()</a> (int index, boolean data) Set an boolean value (will be wrapped in an AMFDataItem object)
void	<a href="#">set()</a> (int index, java.util.Date data) Set an date value (will be wrapped in an AMFDataItem object)
void	<a href="#">set()</a> (int index, double data) Set an double value (will be wrapped in an AMFDataItem object)
void	<a href="#">set()</a> (int index, int data) Set an int value (will be wrapped in an AMFDataItem object)
void	<a href="#">set()</a> (int index, long data) Set an long value (will be wrapped in an AMFDataItem object)
void	<a href="#">set()</a> (int index, String data) Set an string value (will be wrapped in an AMFDataItem object)
int	<a href="#">size()</a> Returns the number of items in array
String	<a href="#">toString()</a> Return object as formatted string

## Constructors

(continued from last page)

## AMFDataArray

```
public AMFDataArray()
```

Create empty AMFDataArray object

---

## AMFDataArray

```
public AMFDataArray(byte[] data)
```

Deserialize entire data array and create AMFDataArray object

**Parameters:**

data - binary data

---

## AMFDataArray

```
public AMFDataArray(byte[] data,  
                    int offset,  
                    int size)
```

Deserialize data array starting at offset for size bytes and create AMFDataArray object

**Parameters:**

data - binary data

offset - starting offset into data

size - size of data to deserialize

---

## AMFDataArray

```
public AMFDataArray(java.nio.ByteBuffer data)
```

Deserialize entire data array and create AMFDataArray object

**Parameters:**

data - binary data

---

## AMFDataArray

```
public AMFDataArray(java.nio.ByteBuffer data,  
                    AMFDataContextDeserialize context)
```

---

## Methods

### remove

```
public AMFData remove(int index)
```

Remove an item from the array

**Parameters:**

index - index

**Returns:**

delete item or null if not found

## size

```
public int size()
```

Returns the number of items in array

**Returns:**

number of items in array

---

## add

```
public void add(AMFData data)
```

Append a new item onto the array

**Parameters:**

data - AMFData object

---

## add

```
public void add(String data)
```

Append a string (will be wrapped in an AMFDataItem object)

**Parameters:**

data - string value

---

## add

```
public void add(double data)
```

Append a double (will be wrapped in an AMFDataItem object)

**Parameters:**

data - double value

---

## add

```
public void add(int data)
```

Append a int (will be wrapped in an AMFDataItem object)

**Parameters:**

data - int value

---

## add

```
public void add(long data)
```

Append a long (will be wrapped in an AMFDataItem object)

**Parameters:**

data - long value

---

## add

```
public void add(java.util.Date data)
```

---

(continued from last page)

Append a date (will be wrapped in an AMFDataItem object)

**Parameters:**

data - date value

---

**add**

```
public void add(boolean data)
```

Append a boolean (will be wrapped in an AMFDataItem object)

**Parameters:**

data - boolean value

---

**add**

```
public void add(int index,  
    AMFData data)
```

Insert an item into the array

**Parameters:**

index - index

data - AMFData object

---

**add**

```
public void add(int index,  
    String data)
```

Insert a string value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index

data - string value

---

**add**

```
public void add(int index,  
    double data)
```

Insert a double value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index

data - double value

---

**add**

```
public void add(int index,  
    int data)
```

Insert a int value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index

data - int value

---

## add

```
public void add(int index,  
                long data)
```

Insert a long value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - long value

---

## add

```
public void add(int index,  
                java.util.Date data)
```

Insert a date value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - date value

---

## add

```
public void add(int index,  
                boolean data)
```

Insert a boolean value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - boolean value

---

## set

```
public void set(int index,  
                AMFData data)
```

Set an array item

**Parameters:**

index - index  
data - AMFData object

---

## set

```
public void set(int index,  
                String data)
```

Set an string value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - string value

---

## set

```
public void set(int index,  
                double data)
```

---

(continued from last page)

Set an double value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - double value

---

**set**

```
public void set(int index,  
                int data)
```

Set an int value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - int value

---

**set**

```
public void set(int index,  
                long data)
```

Set an long value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - long value

---

**set**

```
public void set(int index,  
                java.util.Date data)
```

Set an date value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - date value

---

**set**

```
public void set(int index,  
                boolean data)
```

Set an boolean value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - boolean value

---

**get**

```
public AMFData get(int index)
```

Get item at index

**Parameters:**

index

---

(continued from last page)

**Returns:**

Returns AMFData object or null if out of bounds

---

## getString

```
public String getString(int index)
```

Get item at index return as String

**Parameters:**

index

**Returns:**

Return item as String or null if out of bounds

---

## getInt

```
public int getInt(int index)
```

Get item at index return as int

**Parameters:**

index

**Returns:**

Return item as int or 0 if out of bounds

---

## getLong

```
public long getLong(int index)
```

Get item at index return as long

**Parameters:**

index

**Returns:**

Return item as long or 0 if out of bounds

---

## getShort

```
public short getShort(int index)
```

Get item at index return as short

**Parameters:**

index

**Returns:**

Return item as short or 0 if out of bounds

---

## getByte

```
public byte getByte(int index)
```

Get item at index return as byte

**Parameters:**

(continued from last page)

index

**Returns:**

Return item as byte or 0 if out of bounds

---

## getBoolean

```
public boolean getBoolean(int index)
```

Get item at index return as boolean

**Parameters:**

index

**Returns:**

Return item as boolean or false if out of bounds

---

## getDate

```
public java.util.Date getDate(int index)
```

Get item at index return as Date

**Parameters:**

index

**Returns:**

Return item as Date or null if out of bounds

---

## getObject

```
public AMFDataObj getObject(int index)
```

Get item at index return as AMFDataObj

**Parameters:**

index

**Returns:**

Return item as AMFDataObj or null if out of bounds

---

## getDouble

```
public double getDouble(int index)
```

Get item at index return as double

**Parameters:**

index

**Returns:**

Return item as double or 0 if out of bounds

---

## getFloat

```
public float getFloat(int index)
```

Get item at index return as float

(continued from last page)

**Parameters:**

index

**Returns:**

Return item as float or 0 if out of bounds

---

**deserialize**

```
public void deserialize(java.nio.ByteBuffer data)
```

Deserialize data in byte buffer

---

**deserialize**

```
public void deserialize(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Deserialize data in byte buffer

---

**serialize**

```
public void serialize(java.io.DataOutputStream out)
```

Serialize object to output stream

---

**serialize**

```
public void serialize(java.io.DataOutputStream out,  
    int objectEncoding)
```

Serialize object to output stream

---

**serialize**

```
public void serialize(java.io.DataOutputStream out,  
    AMFDataContextSerialize context)
```

Serialize object to output stream

---

**serialize**

```
public byte[] serialize()
```

Serial object to byte array

---

**serialize**

```
public byte[] serialize(int objectEncoding)
```

Serial object to byte array

---

**serialize**

```
public byte[] serialize(AMFDataContextSerialize context)
```

Serial object to byte array

(continued from last page)

## **getValue**

```
public Object getValue()
```

Convert object to Java native class

---

## **toString**

```
public String toString()
```

Return object as formatted string

## com.wowza.wms.amf

### Class AMFDataByteArray

java.lang.Object

```

public class AMFDataByteArray
extends AMFData
  
```

AMFDataByteArray: class for marshalling data between Wowza Pro server and Flash client. This class is a simple byte array.

#### Fields inherited from class [com.wowza.wms.amf.AMFData](#)

[AMF\\_DEFAULT\\_DESERIALIZE\\_CHARSETNAME](#), [AMF\\_LEVEL0](#), [AMF\\_LEVEL3](#), [DATA\\_TYPE\\_AMF3](#), [DATA\\_TYPE\\_AMF3\\_ARRAY](#), [DATA\\_TYPE\\_AMF3\\_BOOLEAN\\_FALSE](#), [DATA\\_TYPE\\_AMF3\\_BOOLEAN\\_TRUE](#), [DATA\\_TYPE\\_AMF3\\_BYTEARRAY](#), [DATA\\_TYPE\\_AMF3\\_DATE](#), [DATA\\_TYPE\\_AMF3\\_INTEGER](#), [DATA\\_TYPE\\_AMF3\\_NULL](#), [DATA\\_TYPE\\_AMF3\\_NUMBER](#), [DATA\\_TYPE\\_AMF3\\_OBJECT](#), [DATA\\_TYPE\\_AMF3\\_STRING](#), [DATA\\_TYPE\\_AMF3\\_UNDEFINED](#), [DATA\\_TYPE\\_AMF3\\_XML\\_LEGACY](#), [DATA\\_TYPE\\_AMF3\\_XML\\_TOP](#), [DATA\\_TYPE\\_ARRAY](#), [DATA\\_TYPE\\_AS\\_OBJECT](#), [DATA\\_TYPE\\_BOOLEAN](#), [DATA\\_TYPE\\_BYTEARRAY](#), [DATA\\_TYPE\\_CUSTOM\\_CLASS](#), [DATA\\_TYPE\\_DATE](#), [DATA\\_TYPE\\_INTEGER](#), [DATA\\_TYPE\\_LONG\\_STRING](#), [DATA\\_TYPE\\_MIXED\\_ARRAY](#), [DATA\\_TYPE\\_MOVIE\\_CLIP](#), [DATA\\_TYPE\\_NULL](#), [DATA\\_TYPE\\_NUMBER](#), [DATA\\_TYPE\\_OBJECT](#), [DATA\\_TYPE\\_OBJECT\\_END](#), [DATA\\_TYPE\\_RECORDSET](#), [DATA\\_TYPE\\_REFERENCE\\_OBJECT](#), [DATA\\_TYPE\\_STRING](#), [DATA\\_TYPE\\_UNDEFINED](#), [DATA\\_TYPE\\_UNKNOWN](#), [DATA\\_TYPE\\_XML](#), [DATA\\_TYPE\\_XML\\_TOP](#), [MILLS\\_PER\\_HOUR](#), [type](#)

#### Constructor Summary

public	<a href="#">AMFDataByteArray</a> () Create empty AMFDataByteArray object
public	<a href="#">AMFDataByteArray</a> (byte[] data) Deserialize entire byte array and create AMFDataByteArray object.
public	<a href="#">AMFDataByteArray</a> (byte[] data, int offset, int size) Deserialize data array starting at offset for size bytes and create AMFDataByteArray object.
public	<a href="#">AMFDataByteArray</a> (java.nio.ByteBuffer data) Deserialize entire data array and create AMFDataByteArray object.
public	<a href="#">AMFDataByteArray</a> (java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context) Deserialize entire data array and create AMFDataByteArray object.

#### Method Summary

int	<a href="#">compress</a> () Compress the internal buffer using the ZLIB compression library
int	<a href="#">decompress</a> () Decompress the internal buffer using the ZLIB compression library

void	<a href="#">deserialize</a> (java.nio.ByteBuffer data)
void	<a href="#">deserialize</a> (java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)
Object	<a href="#">getValue</a> () Returns the underlying byte[] data buffer
byte[]	<a href="#">serialize</a> ()
byte[]	<a href="#">serialize</a> ( <a href="#">AMFDataContextSerialize</a> context)
void	<a href="#">serialize</a> (java.io.DataOutputStream out)
void	<a href="#">serialize</a> (java.io.DataOutputStream out, <a href="#">AMFDataContextSerialize</a> context)
void	<a href="#">serialize</a> (java.io.DataOutputStream out, int objectEncoding)
byte[]	<a href="#">serialize</a> (int objectEncoding)
int	<a href="#">size</a> () Returns the number of bytes in the byte array
byte[]	<a href="#">toArray</a> () Returns the underlying data buffer (not a copy)
java.nio.ByteBuffer	<a href="#">toByteBuffer</a> () Wraps the underlying data buffer with a ByteBuffer object.
String	<a href="#">toString</a> () Return object as formatted string
static <a href="#">AMFDataByteArray</a>	<a href="#">wrap</a> (byte[] data) Wraps a byte[] into a AMFDataByteArray.
static <a href="#">AMFDataByteArray</a>	<a href="#">wrap</a> (java.nio.ByteBuffer data) Wraps a ByteBuffer into a AMFDataByteArray.

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

(continued from last page)

## AMFDataByteArray

```
public AMFDataByteArray( )
```

Create empty AMFDataByteArray object

---

## AMFDataByteArray

```
public AMFDataByteArray(byte[] data)
```

Deserialize entire byte array and create AMFDataByteArray object. Note: This is for AMF3 deserialization and cannot be used to create an AMFDataByteArray with the passed in data. To create a new AMDDDataByteArray from either a byte[] or ByteBuffer, use the static wrap method.

**Parameters:**

data - binary data

---

## AMFDataByteArray

```
public AMFDataByteArray(byte[] data,  
                        int offset,  
                        int size)
```

Deserialize data array starting at offset for size bytes and create AMFDataByteArray object. Note: This is for AMF3 deserialization and cannot be used to create an AMFDataByteArray with the passed in data. To create a new AMDDDataByteArray from either a byte[] or ByteBuffer, use the static wrap method.

**Parameters:**

data - binary data

offset - starting offset into data

size - size of data to deserialize

---

## AMFDataByteArray

```
public AMFDataByteArray(java.nio.ByteBuffer data)
```

Deserialize entire data array and create AMFDataByteArray object. Note: This is for AMF3 deserialization and cannot be used to create an AMFDataByteArray with the passed in data. To create a new AMDDDataByteArray from either a byte[] or ByteBuffer, use the static wrap method.

**Parameters:**

data - binary data

---

## AMFDataByteArray

```
public AMFDataByteArray(java.nio.ByteBuffer data,  
                        AMFDataContextDeserialize context)
```

Deserialize entire data array and create AMFDataByteArray object. Note: This is for AMF3 deserialization and cannot be used to create an AMFDataByteArray with the passed in data. To create a new AMDDDataByteArray from either a byte[] or ByteBuffer, use the static wrap method.

**Parameters:**

data - binary data

context - deserialization context (used for AMF3 decoding)

## Methods

(continued from last page)

## size

```
public int size()
```

Returns the number of bytes in the byte array

**Returns:**

number of bytes in the array

---

## toArray

```
public byte[] toArray()
```

Returns the underlying data buffer (not a copy)

**Returns:**

data buffer (not a copy)

---

## toByteBuffer

```
public java.nio.ByteBuffer toByteBuffer()
```

Wraps the underlying data buffer with a ByteBuffer object.

**Returns:**

byte[] wrapped as ByteBuffer

---

## wrap

```
public static AMFDataByteArray wrap(byte[] data)
```

Wraps a byte[] into a AMFDataByteArray. Note: This method does not copy the array.

**Parameters:**

data - byte[] data

**Returns:**

wrapped byte[]

---

## wrap

```
public static AMFDataByteArray wrap(java.nio.ByteBuffer data)
```

Wraps a ByteBuffer into a AMFDataByteArray. Note: This method only copies the ByteBuffer data if the ByteBuffer.array() method fails.

**Parameters:**

data - ByteBuffer data

**Returns:**

wrapped ByteBuffer

---

## getValue

```
public Object getValue()
```

Returns the underlying byte[] data buffer

## deserialize

```
public void deserialize(java.nio.ByteBuffer data)
```

Deserialize data in byte buffer

---

## deserialize

```
public void deserialize(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Deserialize data in byte buffer

---

## serialize

```
public void serialize(java.io.DataOutputStream out)
```

Serialize object to output stream

---

## serialize

```
public void serialize(java.io.DataOutputStream out,  
    int objectEncoding)
```

Serialize object to output stream

---

## serialize

```
public void serialize(java.io.DataOutputStream out,  
    AMFDataContextSerialize context)
```

Serialize object to output stream

---

## serialize

```
public byte[] serialize()
```

Serial object to byte array

---

## serialize

```
public byte[] serialize(int objectEncoding)
```

Serial object to byte array

---

## serialize

```
public byte[] serialize(AMFDataContextSerialize context)
```

Serial object to byte array

---

## compress

```
public int compress()
```

Compress the internal buffer using the ZLIB compression library

**Returns:**

---

(continued from last page)

size of compressed buffer

---

## decompress

```
public int decompress()
```

Decompress the internal buffer using the ZLIB compression library

**Returns:**

size of decompressed buffer

---

## toString

```
public String toString()
```

Return object as formatted string

## com.wowza.wms.amf

### Class AMFDataContextDeserialize

java.lang.Object

└─com.wowza.wms.amf.AMFDataContextDeserialize

public class **AMFDataContextDeserialize**  
extends Object

AMF context used for deserialization

#### Constructor Summary

public	<a href="#"><u>AMFDataContextDeserialize()</u></a> Constructor
public	<a href="#"><u>AMFDataContextDeserialize(int objectEncoding)</u></a> Constructor with encoding

#### Method Summary

void	<a href="#"><u>addObject(Object obj)</u></a> Add an object to the object cache
void	<a href="#"><u>addString(String str)</u></a> Add a string to the string cache
void	<a href="#"><u>addTrait(AMFDataTrait obj)</u></a> Add a trait to the trait cache
int	<a href="#"><u>clearIntData()</u></a> Internal use, get and clear int data
String	<a href="#"><u>getCharsetName()</u></a> Get charset name used to deserialize strings (default is AMFData.AMF_DEFAULT_DESERIALIZE_CHARSETNAME = UTF-8)
int	<a href="#"><u>getIntData()</u></a> Internal use, get int data
Object	<a href="#"><u>getObject(int index)</u></a> Get an object from the object cache
int	<a href="#"><u>getObjectEncoding()</u></a> Get object encoding, see AMFData.AMF_LEVEL*
String	<a href="#"><u>getString(int index)</u></a> Get a string from the string cache
<a href="#"><u>AMFDataTrait</u></a>	<a href="#"><u>getTrait(int index)</u></a> Get a trait from the trait cache
boolean	<a href="#"><u>isAMF0()</u></a> Is context AMF0

boolean	<a href="#"><code>isAMF3()</code></a> Is context AMF3
boolean	<a href="#"><code>isIntData()</code></a> Internal use, get int data
void	<a href="#"><code>setCharsetName(String charsetName)</code></a> Set charset name used to deserialize strings (default is AMFData.AMF_DEFAULT_DESERIALIZE_CHARSETNAME = UTF-8)
void	<a href="#"><code>setIntData(int intData)</code></a> Internal use, set int data
void	<a href="#"><code>setObjectEncoding(int objectEncoding)</code></a> Set object encoding, see AMFData.AMF_LEVEL*

Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Constructors

### AMFDataContextDeserialize

```
public AMFDataContextDeserialize()
```

Constructor

### AMFDataContextDeserialize

```
public AMFDataContextDeserialize(int objectEncoding)
```

Constructor with encoding

**Parameters:**

`objectEncoding` - object encoding, see AMFData.AMF\_LEVEL\*

## Methods

### isIntData

```
public boolean isIntData()
```

Internal use, get int data

**Returns:**

returns true if pending int data

### setIntData

```
public void setIntData(int intData)
```

Internal use, set int data

**Parameters:**

(continued from last page)

---

intData - int data

---

## getIntData

```
public int getIntData()
```

Internal use, get int data

**Returns:**

int data

---

## clearIntData

```
public int clearIntData()
```

Internal use, get and clear int data

**Returns:**

int data

---

## getObjectEncoding

```
public int getObjectEncoding()
```

Get object encoding, see AMFData.AMF\_LEVEL\*

**Returns:**

object encoding, see AMFData.AMF\_LEVEL\*

---

## setObjectEncoding

```
public void setObjectEncoding(int objectEncoding)
```

Set object encoding, see AMFData.AMF\_LEVEL\*

**Parameters:**

objectEncoding - object encoding, see AMFData.AMF\_LEVEL\*

---

## isAMF3

```
public boolean isAMF3()
```

Is context AMF3

**Returns:**

true, if AMF3

---

## isAMF0

```
public boolean isAMF0()
```

Is context AMF0

**Returns:**

true, if AMF0

---

(continued from last page)

## addString

```
public void addString(String str)
```

Add a string to the string cache

**Parameters:**

str - string value

---

## getString

```
public String getString(int index)  
throws IndexOutOfBoundsException
```

Get a string from the string cache

**Parameters:**

index - index

**Returns:**

string value

**Throws:**

IndexOutOfBoundsException

---

## addObject

```
public void addObject(Object obj)
```

Add an object to the object cache

**Parameters:**

obj - object value

---

## getObject

```
public Object getObject(int index)  
throws IndexOutOfBoundsException
```

Get an object from the object cache

**Parameters:**

index - index

**Returns:**

object value

**Throws:**

IndexOutOfBoundsException

---

## addTrait

```
public void addTrait(AMFDataTrait obj)
```

Add a trait to the trait cache

**Parameters:**

obj - trait object

---

## getTrait

```
public AMFDataTrait getTrait(int index)  
    throws IndexOutOfBoundsException
```

Get a trait from the trait cache

**Parameters:**

index - index

**Returns:**

trait object

**Throws:**

IndexOutOfBoundsException

---

## getCharsetName

```
public String getCharsetName()
```

Get charset name used to deserialize strings (default is AMFData.AMF\_DEFAULT\_DESERIALIZE\_CHARSETNAME = UTF-8)

**Returns:**

charset name used to decode/encode strings

---

## setCharsetName

```
public void setCharsetName(String charsetName)
```

Set charset name used to deserialize strings (default is AMFData.AMF\_DEFAULT\_DESERIALIZE\_CHARSETNAME = UTF-8)

**Parameters:**

charsetName - charset name used to decode/encode strings

---

## com.wowza.wms.amf

### Class AMFDataContextSerialize

java.lang.Object

└─com.wowza.wms.amf.AMFDataContextSerialize

public class **AMFDataContextSerialize**  
extends Object

AMF context used for serialization

#### Constructor Summary

public	<a href="#">AMFDataContextSerialize()</a> Constructor
public	<a href="#">AMFDataContextSerialize(int objectEncoding)</a> Constructor with object encoding, see AMFData.AMF_LEVEL*

#### Method Summary

int	<a href="#">getObjectEncoding()</a> Get object encoding, see AMFData.AMF_LEVEL*
int	<a href="#">getObjectReference(Object obj)</a> Get index of object in object cache
int	<a href="#">getStringReference(String str)</a> Get index of string item in string cache
int	<a href="#">getTargetEncoding()</a> Get target encoding, see AMFData.AMF_LEVEL*
int	<a href="#">getTraitReference(AMFDataTrait obj)</a> Get index of trait object in trait cache
boolean	<a href="#">isAMF0()</a> Is context AMF0
boolean	<a href="#">isAMF3()</a> Is context AMF3
void	<a href="#">setObjectEncoding(int objectEncoding)</a> Set object encoding, see AMFData.AMF_LEVEL*
void	<a href="#">setTargetEncoding(int targetEncoding)</a> Set target encoding, , see AMFData.AMF_LEVEL*
void	<a href="#">writeString(java.io.DataOutputStream out, String str)</a> Write a stream to the output buffer

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

---

## Constructors

### AMFDataContextSerialize

```
public AMFDataContextSerialize()
```

Constructor

---

### AMFDataContextSerialize

```
public AMFDataContextSerialize(int objectEncoding)
```

Constructor with object encoding, see AMFData.AMF\_LEVEL\*

**Parameters:**

objectEncoding - object encoding, see AMFData.AMF\_LEVEL\*

---

## Methods

### getObjectEncoding

```
public int getObjectEncoding()
```

Get object encoding, see AMFData.AMF\_LEVEL\*

**Returns:**

object encoding, see AMFData.AMF\_LEVEL\*

---

### setObjectEncoding

```
public void setObjectEncoding(int objectEncoding)
```

Set object encoding, see AMFData.AMF\_LEVEL\*

**Parameters:**

objectEncoding - object encoding, see AMFData.AMF\_LEVEL\*

---

### getTargetEncoding

```
public int getTargetEncoding()
```

Get target encoding, see AMFData.AMF\_LEVEL\*

**Returns:**

target encoding, see AMFData.AMF\_LEVEL\*

---

### setTargetEncoding

```
public void setTargetEncoding(int targetEncoding)
```

Set target encoding, , see AMFData.AMF\_LEVEL\*

---

(continued from last page)

**Parameters:**

targetEncoding - target encoding, , see AMFData.AMF\_LEVEL\*

---

**isAMF3**

```
public boolean isAMF3()
```

Is context AMF3

**Returns:**

true, if AMF3

---

**isAMF0**

```
public boolean isAMF0()
```

Is context AMF0

**Returns:**

true, if AMF0

---

**getStringReference**

```
public int getStringReference(String str)
```

Get index of string item in string cache

**Parameters:**

str - string value

**Returns:**

index

---

**getObjectReference**

```
public int getObjectReference(Object obj)
```

Get index of object in object cache

**Parameters:**

obj - object value

**Returns:**

index

---

**getTraitReference**

```
public int getTraitReference(AMFDataTrait obj)
```

Get index of trait object in trait cache

**Parameters:**

obj - trait object

**Returns:**

index

(continued from last page)

## writeString

```
public void writeString(java.io.DataOutputStream out,  
    String str)
```

Write a stream to the output buffer

### Parameters:

out - output buffer

str - string value

## com.wowza.wms.amf Class AMFDataItem

```
java.lang.Object
├── com.wowza.wms.amf.AMFData
│   └── com.wowza.wms.amf.AMFDataItem
```

```
public class AMFDataItem
    extends AMFData
```

AMFDataItem: class for marshalling data between Wowza Pro server and Flash client. The type wraps native Java data types.

- DATA\_TYPE\_NUMBER = int, long, short, double, float
- DATA\_TYPE\_STRING = String
- DATA\_TYPE\_BOOLEAN = boolean
- DATA\_TYPE\_DATE = Date
- DATA\_TYPE\_NULL = 'null'

### Create Native Java Types

```
AMFDataItem amfDataString = new AMFDataItem("here is my string"); // String
AMFDataItem amfDataLong = new AMFDataItem(1234L); // long
AMFDataItem amfDataDouble = new AMFDataItem(1.234); // double
AMFDataItem amfDataBoolean = new AMFDataItem(true); // boolean
AMFDataItem amfDataNull = new AMFDataItem(); // null
```

### Get Native Java Types

```
String dataString = amfDataString.getType()==AMFData.DATA_TYPE_LONG_STRING?
    amfDataString.toString():"";

long dataLong = amfDataLong.getType()==AMFData.DATA_TYPE_NUMBER?
    amfDataLong.longValue():0;

double dataDouble = amfDataDouble.getType()==AMFData.DATA_TYPE_NUMBER?
    amfDataLong.doubleValue():0.0;

boolean dataBoolean = amfDataBoolean.getType()==AMFData.DATA_TYPE_BOOLEAN?
    amfDataLong.booleanValue():false;

Object dataNull = amfDataNull.getType()==AMFData.DATA_TYPE_NULL?
    null:null;
```

## Field Summary

public static final	<a href="#">DATEFORMAT</a> Value: <b>EEE, dd MMM yyyy HH:mm:ss</b>
protected	<a href="#">fastDateFormat</a>

## Fields

### DATEFORMAT

`public static final java.lang.String` **DATEFORMAT**

Constant value: **EEE, dd MMM yyyy HH:mm:ss**

### fastDateFormat

`protected org.apache.commons.lang.time.FastDateFormat` **fastDateFormat**

## Constructors

### AMFDataItem

`public` **AMFDataItem**()

Construct AMF type DATA\_TYPE\_NULL object

### AMFDataItem

`public` **AMFDataItem**(String value)

Construct AMF type DATA\_TYPE\_STRING object

#### Parameters:

value - String value

### AMFDataItem

`public` **AMFDataItem**(int value)

Construct AMF type DATA\_TYPE\_NUMBER object

#### Parameters:

value - int value

### AMFDataItem

`public` **AMFDataItem**(long value)

(continued from last page)

Construct AMF type DATA\_TYPE\_NUMBER object

**Parameters:**

value - long value

---

## AMFDataItem

```
public AMFDataItem(double value)
```

Construct AMF type DATA\_TYPE\_NUMBER object

**Parameters:**

value - double value

---

## AMFDataItem

```
public AMFDataItem(boolean value)
```

Construct AMF type DATA\_TYPE\_BOOLEAN

**Parameters:**

value - boolean value

---

## AMFDataItem

```
public AMFDataItem(java.util.Date value)
```

Construct AMF type DATA\_TYPE\_DATE

**Parameters:**

value - Date value

---

## AMFDataItem

```
public AMFDataItem(byte[] data)
```

Deserialize entire data array and create AMFDataItem object

**Parameters:**

data - binary data

---

## AMFDataItem

```
public AMFDataItem(byte[] data,  
                   int offset,  
                   int size)
```

Deserialize data array starting at offset for size bytes and create AMFDataItem object

**Parameters:**

data - binary data

offset - starting offset into data

size - size of data to deserialize

---

## AMFDataItem

```
public AMFDataItem(java.nio.ByteBuffer data)
```

(continued from last page)

Deserialize entire data array and create AMFDataItem object

**Parameters:**

data - binary data

---

## AMFDataItem

```
public AMFDataItem(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

## Methods

### longValue

```
public long longValue()
```

Return object as long. Valid object types are DATA\_TYPE\_NUMBER and DATA\_TYPE\_STRING.

**Returns:**

long value or 0 if failure

---

### intValue

```
public int intValue()
```

Return object as int. Valid object types are DATA\_TYPE\_NUMBER and DATA\_TYPE\_STRING.

**Returns:**

int value or 0 if failure

---

### doubleValue

```
public double doubleValue()
```

Return object as double. Valid object types are DATA\_TYPE\_NUMBER and DATA\_TYPE\_STRING.

**Returns:**

double value or 0 if failure

---

### floatValue

```
public float floatValue()
```

Return object as float. Valid object types are DATA\_TYPE\_NUMBER and DATA\_TYPE\_STRING.

**Returns:**

float value or 0 if failure

---

### shortValue

```
public short shortValue()
```

Return object as short. Valid object types are DATA\_TYPE\_NUMBER and DATA\_TYPE\_STRING.

**Returns:**

short value or 0 if failure

## byteValue

```
public byte byteValue()
```

Return object as byte. Valid object types are DATA\_TYPE\_NUMBER and DATA\_TYPE\_STRING.

**Returns:**

byte value or 0 if failure

---

## dateValue

```
public java.util.Date dateValue()
```

Return object as Date. Valid object types are DATA\_TYPE\_DATE.

**Returns:**

Date value or null if failure

---

## booleanValue

```
public boolean booleanValue()
```

Return object as boolean. Valid object types are DATA\_TYPE\_BOOLEAN and DATA\_TYPE\_STRING.

**Returns:**

boolean value or false if failure

---

## deserialize

```
public void deserialize(java.nio.ByteBuffer data)
```

Deserialize data in byte buffer

---

## deserialize

```
public void deserialize(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Deserialize data in byte buffer

---

## getValue

```
public Object getValue()
```

Return value as Java class

---

## toString

```
public String toString()
```

Return object as formatted string

---

## serialize

```
public void serialize(java.io.DataOutputStream out)
```

Serialize object to output stream

---

**serialize**

```
public void serialize(java.io.DataOutputStream out,  
    int objectEncoding)
```

Serialize object to output stream

---

**serialize**

```
public void serialize(java.io.DataOutputStream out,  
    AMFDataContextSerialize context)
```

Serialize object to output stream

---

**serialize**

```
public byte[] serialize()
```

Serial object to byte array

---

**serialize**

```
public byte[] serialize(int objectEncoding)
```

Serial object to byte array

---

**serialize**

```
public byte[] serialize(AMFDataContextSerialize context)
```

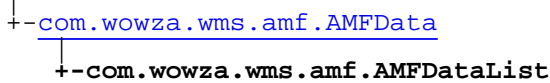

Serial object to byte array

---

## com.wowza.wms.amf

### Class AMFDataList

java.lang.Object

public class **AMFDataList**  
 extends [AMFData](#)

AMFDataList: class for marshalling data between Wowza Pro server and Flash client. This class is for internal server marshalling of AMF event messages between the Flash client and Wowza Pro server.

**NOTE:** There is a slight difference between this class and AMFDataArray. This class when serialized/deserialized does NOT include the DATA\_TYPE\_ARRAY header (byte) and array size (int). AMF formatted functions use this class since they do not include these elements.

#### Fields inherited from class [com.wowza.wms.amf.AMFData](#)

[AMF\\_DEFAULT\\_DESERIALIZE\\_CHARSETNAME](#), [AMF\\_LEVEL0](#), [AMF\\_LEVEL3](#), [DATA\\_TYPE\\_AMF3](#), [DATA\\_TYPE\\_AMF3\\_ARRAY](#), [DATA\\_TYPE\\_AMF3\\_BOOLEAN\\_FALSE](#), [DATA\\_TYPE\\_AMF3\\_BOOLEAN\\_TRUE](#), [DATA\\_TYPE\\_AMF3\\_BYTEARRAY](#), [DATA\\_TYPE\\_AMF3\\_DATE](#), [DATA\\_TYPE\\_AMF3\\_INTEGER](#), [DATA\\_TYPE\\_AMF3\\_NULL](#), [DATA\\_TYPE\\_AMF3\\_NUMBER](#), [DATA\\_TYPE\\_AMF3\\_OBJECT](#), [DATA\\_TYPE\\_AMF3\\_STRING](#), [DATA\\_TYPE\\_AMF3\\_UNDEFINED](#), [DATA\\_TYPE\\_AMF3\\_XML\\_LEGACY](#), [DATA\\_TYPE\\_AMF3\\_XML\\_TOP](#), [DATA\\_TYPE\\_ARRAY](#), [DATA\\_TYPE\\_AS\\_OBJECT](#), [DATA\\_TYPE\\_BOOLEAN](#), [DATA\\_TYPE\\_BYTEARRAY](#), [DATA\\_TYPE\\_CUSTOM\\_CLASS](#), [DATA\\_TYPE\\_DATE](#), [DATA\\_TYPE\\_INTEGER](#), [DATA\\_TYPE\\_LONG\\_STRING](#), [DATA\\_TYPE\\_MIXED\\_ARRAY](#), [DATA\\_TYPE\\_MOVIE\\_CLIP](#), [DATA\\_TYPE\\_NULL](#), [DATA\\_TYPE\\_NUMBER](#), [DATA\\_TYPE\\_OBJECT](#), [DATA\\_TYPE\\_OBJECT\\_END](#), [DATA\\_TYPE\\_RECORDSET](#), [DATA\\_TYPE\\_REFERENCE\\_OBJECT](#), [DATA\\_TYPE\\_STRING](#), [DATA\\_TYPE\\_UNDEFINED](#), [DATA\\_TYPE\\_UNKNOWN](#), [DATA\\_TYPE\\_XML](#), [DATA\\_TYPE\\_XML\\_TOP](#), [MILLS\\_PER\\_HOUR](#), [type](#)

### Constructor Summary

public	<a href="#">AMFDataList()</a> Create empty AMFDataList object
public	<a href="#">AMFDataList</a> (byte[] data) Deserialize entire data array and create AMFDataList object
public	<a href="#">AMFDataList</a> (byte[] data, int offset, int size) Deserialize data array starting at offset for size bytes and create AMFDataList object

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### AMFDataList

```
public AMFDataList()
```

Create empty AMFDataList object

### AMFDataList

```
public AMFDataList(byte[] data)
```

Deserialize entire data array and create AMFDataList object

#### Parameters:

data - binary data

### AMFDataList

```
public AMFDataList(byte[] data,  
                   int offset,  
                   int size)
```

Deserialize data array starting at offset for size bytes and create AMFDataList object

#### Parameters:

data - binary data

offset - starting offset into data

(continued from last page)

size - size of data to deserialize

---

## AMFDataList

```
public AMFDataList(java.nio.ByteBuffer data)
```

Deserialize entire data array and create AMFDataList object

**Parameters:**

data - binary data

---

## AMFDataList

```
public AMFDataList(java.nio.ByteBuffer data,  
                   AMFDataContextDeserialize context)
```

## Methods

### remove

```
public AMFData remove(int index)
```

Remove an element from the AMFDataList object

**Parameters:**

index - index

**Returns:**

removed element

---

### size

```
public int size()
```

Returns the number of items in array

**Returns:**

number of items in array

---

### add

```
public void add(AMFData data)
```

Append a new item onto the array

**Parameters:**

data - AMFData object

---

### add

```
public void add(String data)
```

Append a string (will be wrapped in an AMFDataItem object)

**Parameters:**

data - string value

---

## add

```
public void add(double data)
```

Append a double (will be wrapped in an AMFDataItem object)

**Parameters:**

data - double value

---

## add

```
public void add(int data)
```

Append a int (will be wrapped in an AMFDataItem object)

**Parameters:**

data - int value

---

## add

```
public void add(long data)
```

Append a long (will be wrapped in an AMFDataItem object)

**Parameters:**

data - long value

---

## add

```
public void add(java.util.Date data)
```

Append a date (will be wrapped in an AMFDataItem object)

**Parameters:**

data - date value

---

## add

```
public void add(boolean data)
```

Append a boolean (will be wrapped in an AMFDataItem object)

**Parameters:**

data - boolean value

---

## add

```
public void add(int index,  
    AMFData data)
```

Insert an item into the array

**Parameters:**

index - index

data - AMFData object

---

(continued from last page)

---

## add

```
public void add(int index,  
                String data)
```

Insert a string value (will be wrapped in an AMFDataItem object)

### Parameters:

index - index  
data - string value

---

## add

```
public void add(int index,  
                double data)
```

Insert a double value (will be wrapped in an AMFDataItem object)

### Parameters:

index - index  
data - double value

---

## add

```
public void add(int index,  
                int data)
```

Insert a int value (will be wrapped in an AMFDataItem object)

### Parameters:

index - index  
data - int value

---

## add

```
public void add(int index,  
                long data)
```

Insert a long value (will be wrapped in an AMFDataItem object)

### Parameters:

index - index  
data - long value

---

## add

```
public void add(int index,  
                java.util.Date data)
```

Insert a date value (will be wrapped in an AMFDataItem object)

### Parameters:

index - index  
data - date value

---

## add

```
public void add(int index,  
                boolean data)
```

---

(continued from last page)

Insert a boolean value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - boolean value

---

**set**

```
public void set(int index,  
    AMFData data)
```

Set an array item

**Parameters:**

data - AMFData object

---

**set**

```
public void set(int index,  
    String data)
```

Set an string value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - string value

---

**set**

```
public void set(int index,  
    double data)
```

Set an double value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - double value

---

**set**

```
public void set(int index,  
    int data)
```

Set an int value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - int value

---

**set**

```
public void set(int index,  
    long data)
```

Set an long value (will be wrapped in an AMFDataItem object)

**Parameters:**

index - index  
data - long value

## set

```
public void set(int index,  
                java.util.Date data)
```

Set an date value (will be wrapped in an AMFDataItem object)

### Parameters:

index - index  
data - date value

---

## set

```
public void set(int index,  
                boolean data)
```

Set an boolean value (will be wrapped in an AMFDataItem object)

### Parameters:

index - index  
data - boolean value

---

## getType

```
public int getType(int index)
```

Get type of item at index. Return AMFData.DATA\_TYPE\_UNKNOWN if item does not exist

### Parameters:

index

### Returns:

type of item at index

---

## get

```
public AMFData get(int index)
```

Get item at index

### Parameters:

index

### Returns:

Returns AMFData object or null if out of bounds

---

## getString

```
public String getString(int index)
```

Get item at index return as String

### Parameters:

index

### Returns:

Return item as String or null if out of bounds

---

---

## getInt

```
public int getInt(int index)
```

Get item at index return as int

**Parameters:**

index

**Returns:**

Return item as int or 0 if out of bounds

---

## getLong

```
public long getLong(int index)
```

Get item at index return as long

**Parameters:**

index

**Returns:**

Return item as long or 0 if out of bounds

---

## getDouble

```
public double getDouble(int index)
```

Get item at index return as double

**Parameters:**

index

**Returns:**

Return item as double or 0 if out of bounds

---

## getFloat

```
public float getFloat(int index)
```

Get item at index return as float

**Parameters:**

index

**Returns:**

Return item as float or 0 if out of bounds

---

## getShort

```
public short getShort(int index)
```

Get item at index return as short

**Parameters:**

index

---

(continued from last page)

**Returns:**

Return item as short or 0 if out of bounds

---

## getBytes

```
public byte getBytes(int index)
```

Get item at index return as byte

**Parameters:**

index

**Returns:**

Return item as byte or 0 if out of bounds

---

## getBoolean

```
public boolean getBoolean(int index)
```

Get item at index return as boolean

**Parameters:**

index

**Returns:**

Return item as boolean or false if out of bounds

---

## getDate

```
public java.util.Date getDate(int index)
```

Get item at index return as Date

**Parameters:**

index

**Returns:**

Return item as Date or null if out of bounds

---

## getObject

```
public AMFDataObj getObject(int index)
```

Get item at index return as AMFDataObj

**Parameters:**

index

**Returns:**

Return item as AMFDataObj or null if out of bounds

---

## deserialize

```
public void deserialize(java.nio.ByteBuffer data)
```

Deserialize data in byte buffer

(continued from last page)

---

## deserialize

```
public void deserialize(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

```

---

## getValue

public Object **getValue()**

Convert object to Java native class

---

## toString

public String **toString()**

Return object as formatted string

## com.wowza.wms.amf

### Class AMFDataMixedArray

```

java.lang.Object
  |
  +- com.wowza.wms.amf.AMFData
      |
      +- com.wowza.wms.amf.AMFDataObj
          |
          +- com.wowza.wms.amf.AMFDataMixedArray
  
```

All Implemented Interfaces:

[IAMFDataObj](#)

```

public class AMFDataMixedArray
extends AMFDataObj
  
```

AMFDataMixedArray: class for marshalling data between Wowza Pro server and Flash client. Array of mixed data types. An Array object created in the Flash client is wrapped in this data type when sent to the Wowza Pro server.

### Create Array of Strings

```

AMFDataMixedArray amfDataMixedArray = new AMFDataMixedArray();

amfDataMixedArray.put("0", "item1");
amfDataMixedArray.put("1", "item2");
amfDataMixedArray.put("2", "item3");
  
```

### Iterate Mixed Array

```

AMFDataMixedArray amfDataMixedArray;

int len = amfDataMixedArray.size();
for(int i=0;i<len;i++)
{
    String value = amfDataMixedArray.getString(i);
    int itemType = amfDataMixedArray.getType(i);
    WMSLoggerFactory.getLogger(null).debug("item:
["+i+": "+amfDataMixedArray.getKey(i)+"]="+value+" type:"+itemType);
}
  
```

**NOTE:** A AMFDataMixedArray is exactly the same as a AMFDataObj except its type is DATA\_TYPE\_MIXED\_ARRAY.

This objects acts like a Map and a List at the same time. As items are added by key the order and position of each object is recorded. Objects can be retrieved either by key or by index.

## Constructors

### AMFDataMixedArray

```
public AMFDataMixedArray()
```

Create empty AMFDataMixedArray object

### AMFDataMixedArray

```
public AMFDataMixedArray(byte[] data)
```

Deserialize entire data array and create AMFDataMixedArray object

**Parameters:**

data - binary data

### AMFDataMixedArray

```
public AMFDataMixedArray(byte[] data,  
                           int offset,  
                           int size)
```

Deserialize data array starting at offset for size bytes and create AMFDataMixedArray object

**Parameters:**

data - binary data

(continued from last page)

offset - starting offset into data  
size - size of data to deserialize

---

## AMFDataMixedArray

```
public AMFDataMixedArray( java.nio.ByteBuffer data)
```

Deserialize entire data array and create AMFDataMixedArray object

### Parameters:

data - binary data

---

## AMFDataMixedArray

```
public AMFDataMixedArray( java.nio.ByteBuffer data,  
                           AMFDataContextDeserialize context)
```

---

## Methods

### deserialize

```
public void deserialize( java.nio.ByteBuffer data)
```

Deserialize data in byte buffer

---

### deserialize

```
public void deserialize( java.nio.ByteBuffer data,  
                           AMFDataContextDeserialize context)
```

Deserialize data in byte buffer

---

### serialize

```
public void serialize( java.io.DataOutputStream out)
```

Serialize object to output stream

---

### serialize

```
public void serialize( java.io.DataOutputStream out,  
                       int objectEncoding)
```

Serialize object to output stream

---

### serialize

```
public void serialize( java.io.DataOutputStream out,  
                           AMFDataContextSerialize context)
```

Serialize object to output stream

---

### toString

```
public String toString()
```

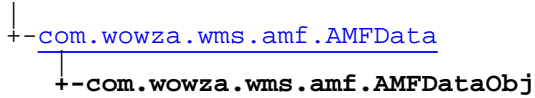

Return object as formatted string

---

## com.wowza.wms.amf

### Class AMFDataObj

java.lang.Object

All Implemented Interfaces:

[IAMFDataObj](#)

Direct Known Subclasses:

[AMFDataMixedArray](#)

```
public class AMFDataObj
extends AMFData
implements IAMFDataObj
```

AMFDataObj: class for marshalling data between Wowza Pro server and Flash client. Object with attributes. Implementation is very similar to a java.util.Map. Each parameter is an item in the map.

### Create AMFDataObj

```
AMFDataObj amfDataObj = new AMFDataObj();

amfDataObj.put("key1", "item1");
amfDataObj.put("key2", "item2");
amfDataObj.put("key3", "item3");
```

### Iterate AMFDataObj

```
AMFDataObj amfDataObj;

List keys = amfDataObj.getKeys();
Iterator iter = keys.iterator();
while(iter.hasNext())
{
    String key = (String)iter.next();
    AMFData value = amfDataObj.get(key);
    int itemType = value.getType();
    WMSLoggerFactory.getLogger(null).debug(key+"="+value.toString()+"
(type:"+itemType+")");
}
```

## Direct Access To Attributes

```
AMFDataObj amfDataObj;

// If you know the type you can access it directly
String dataString = amfDataObj.getString("stringData");
long dataLong = amfDataObj.getLong("longData");
double dataDouble = amfDataObj.getDouble("doubleData");
boolean dataBoolean = amfDataObj.getBoolean("booleanData");

// This illustrate how to decode the value if
// you don't know the type
AMFData myItemKey1 = amfDataObj.get("theData");
switch (myItemKey1.getType())
{
default:
case AMFDataItem.DATA_TYPE_UNDEFINED:
case AMFDataItem.DATA_TYPE_UNKNOWN:
case AMFDataItem.DATA_TYPE_NULL:
    // the value is null or undefined
    break;
case AMFDataItem.DATA_TYPE_NUMBER:
    double amfDataDouble = ((AMFDataItem)myItemKey1).doubleValue();
    break;
case AMFDataItem.DATA_TYPE_BOOLEAN:
    boolean amfDataBoolean = ((AMFDataItem)myItemKey1).booleanValue();
    break;
case AMFDataItem.DATA_TYPE_STRING:
    String amfDataString = ((AMFDataItem)myItemKey1).toString();
    break;
case AMFDataItem.DATA_TYPE_DATE:
    Date amfDataDate = ((AMFDataItem)myItemKey1).dateValue();
    break;
case AMFDataItem.DATA_TYPE_OBJECT:
    AMFDataObj amfDataValObj = (AMFDataObj)myItemKey1;
    break;
case AMFDataItem.DATA_TYPE_MIXED_ARRAY:
    AMFDataMixedArray amfDataMixedArray = (AMFDataMixedArray)myItemKey1;
    break;
case AMFDataItem.DATA_TYPE_ARRAY:
    AMFDataArray amfDataArray = (AMFDataArray)myItemKey1;
    break;
}
```

**NOTE:** A AMFDataObj is exactly the same as a AMFDataMixedArray except its type is DATA\_TYPE\_OBJECT.

## Constructors

### AMFDataObj

```
public AMFDataObj()
```

Create empty AMFDataObj object

### AMFDataObj

```
public AMFDataObj(byte[] data)
```

Deserialize entire data array and create AMFDataObj object

#### Parameters:

data - binary data

(continued from last page)

## AMFDataObj

```
public AMFDataObj(byte[] data,  
                  int offset,  
                  int size)
```

Deserialize data array starting at offset for size bytes and create AMFDataObj object

### Parameters:

data - binary data  
offset - starting offset into data  
size - size of data to deserialize

---

## AMFDataObj

```
public AMFDataObj(java.nio.ByteBuffer data)
```

Deserialize entire data array and create AMFDataObj object

### Parameters:

data - binary data

---

## AMFDataObj

```
public AMFDataObj(java.nio.ByteBuffer data,  
                  AMFDataContextDeserialize context)
```

---

## Methods

### size

```
public int size()
```

Return the number of members of this object/array

### Returns:

number of members

---

### containsKey

```
public boolean containsKey(String name)
```

---

### put

```
public void put(String name,  
               AMFData data)
```

---

### put

```
public void put(String name,

```

---

---

## getDate

```
public java.util.Date getDate(int index)
```

---

---

## getObject

```
public AMFDataObj getObject(int index)
```

---

---

## deserialize

```
public void deserialize(java.nio.ByteBuffer data)
```

Deserialize data in byte buffer

---

---

## deserialize

```
public void deserialize(java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

Deserialize data in byte buffer

---

---

## serialize

```
public void serialize(java.io.DataOutputStream out)
```

Serialize object to output stream

---

---

## serialize

```
public void serialize(java.io.DataOutputStream out,  
    int objectEncoding)
```

Serialize object to output stream

---

---

## serialize

```
public void serialize(java.io.DataOutputStream out,  
    AMFDataContextSerialize context)
```

Serialize object to output stream

---

---

## serialize

```
public byte[] serialize()
```

Serial object to byte array

---

(continued from last page)

---

**serialize**

```
public byte[] serialize(int objectEncoding)
```

Serial object to byte array

---

**serialize**

```
public byte[] serialize(AMFDataContextSerialize context)
```

Serial object to byte array

---

**getValue**

```
public Object getValue()
```

Convert object to Java native class

---

**toString**

```
public String toString()
```

Return object as formatted string

---

**getClassName**

```
public String getClassName()
```

---

**setClassName**

```
public void setClassName(String className)
```

---

**getTrait**

```
public AMFDataTrait getTrait()
```

---

**getSerializer**

```
public IAMFExternalizable getSerializer()
```

---

**setSerializer**

```
public void setSerializer(IAMFExternalizable serializer)
```

---

## com.wowza.wms.amf

### Class AMFDataTrait

java.lang.Object

└─com.wowza.wms.amf.AMFDataTrait

public class **AMFDataTrait**  
extends Object

AMF trait used to describe an AMF class in AMF3

### Constructor Summary

public	<a href="#">AMFDataTrait</a> ( ) Constructor
--------	---

### Method Summary

void	<a href="#">addMember</a> (String member) Add a member
<a href="#">AMFDataTrait</a>	<a href="#">clone</a> ( ) clone the trait
String	<a href="#">getClassName</a> ( ) Get class name
<a href="#">AMFData</a>	<a href="#">getInnerObj</a> ( ) Get inner object
String	<a href="#">getMember</a> (int i) Get member by index
int	<a href="#">getMemberCount</a> ( ) Get the number of members
java.util.List	<a href="#">getMembers</a> ( ) Get a list of trait members
boolean	<a href="#">isDynamic</a> ( ) Is class dynamic
boolean	<a href="#">isMember</a> (String member) Return true if member of this trait
void	<a href="#">setClassName</a> (String className) Set class name
void	<a href="#">setDynamic</a> (boolean isDynamic) Set isDynamic
void	<a href="#">setInnerObj</a> ( <a href="#">AMFData</a> innerObj) Set inner object

**Methods inherited from class** `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Constructors

### AMFDataTrait

```
public AMFDataTrait()
```

Constructor

## Methods

### clone

```
public AMFDataTrait clone()
```

clone the trait

### addMember

```
public void addMember(String member)
```

Add a member

**Parameters:**

member - member name

### isMember

```
public boolean isMember(String member)
```

Return true if member of this trait

**Parameters:**

member - member name

**Returns:**

true, if member

### getMembers

```
public java.util.List getMembers()
```

Get a list of trait members

**Returns:**

list of trait members

### getMemberCount

```
public int getMemberCount()
```

(continued from last page)

Get the number of members

**Returns:**

number of members

---

## getMember

```
public String getMember(int i)
```

Get member by index

**Parameters:**

i - index

**Returns:**

member name

---

## getClassName

```
public String getClassName()
```

Get class name

**Returns:**

class name

---

## setClassName

```
public void setClassName(String className)
```

Set class name

**Parameters:**

className - class name

---

## isDynamic

```
public boolean isDynamic()
```

Is class dynamic

**Returns:**

true, if dynamic

---

## setDynamic

```
public void setDynamic(boolean isDynamic)
```

Set isDynamic

**Parameters:**

isDynamic - true, if dynamic

---

## getInnerObj

```
public AMFData getInnerObj()
```

Get inner object

(continued from last page)

**Returns:**

inner object

---

**setInnerObj**

```
public void setInnerObj(AMFData innerObj)
```

Set inner object

**Parameters:**

innerObj - inner object

## com.wowza.wms.amf

### Class AMFObj

java.lang.Object

└─com.wowza.wms.amf.AMFObj

public class **AMFObj**  
extends Object

AMFObj: class that stores the state of channel between the client and the server.

#### Field Summary

public static final	<a href="#">AMFDEBUGHEADERSIZE</a> Value: <b>false</b>
public static final	<a href="#">WOWZDEBUGHEADERSIZE</a> Value: <b>false</b>

#### Constructor Summary

public	<a href="#">AMFObj</a> (int id) Create new AMFObj for a given channel (id)
public	<a href="#">AMFObj</a> (int id, int objectEncoding) Create new AMFObj for a given channel (id)

#### Method Summary

void	<a href="#">addChunk</a> (byte[] buffer, int offset, int len) Add a chunk to the chunk list
void	<a href="#">clearByteContainer</a> () Clear the byte container
long	<a href="#">getAbsTimecode</a> () Get the absolute time code
int	<a href="#">getByteContainerLevel</a> () Fake container for processing
long	<a href="#">getChunkCounter</a> ()
java.util.List	<a href="#">getChunks</a> () Get the chunks that make up this packet
int	<a href="#">getId</a> () Get channel id
int	<a href="#">getObjectEncoding</a> ()

int	<a href="#"><u>getSize()</u></a> Get packet size
int	<a href="#"><u>getSrc()</u></a> Get stream id (0 if not stream data)
long	<a href="#"><u>getTimecode()</u></a> Get timecode (milliseconds) sometimes relative
int	<a href="#"><u>getType()</u></a> Get content type IVHost.CONTENTTYPE_*
long	<a href="#"><u>incAbsTimecode(long absTimecode)</u></a> Increment the absolute timecode
void	<a href="#"><u>incByteContainerLevel(int byteContainerLevel)</u></a> Fake container for processing
boolean	<a href="#"><u>isByteContainerEmpty()</u></a> Fake container for processing
boolean	<a href="#"><u>isByteContainerFull()</u></a> Fake container for processing
boolean	<a href="#"><u>isLastSentAbsTimecode()</u></a>
boolean	<a href="#"><u>isLongTimecode()</u></a> Get is a 32 bit timecode
boolean	<a href="#"><u>isNew()</u></a> Is this a new packet.
boolean	<a href="#"><u>isObjectEncodingAMF0()</u></a>
boolean	<a href="#"><u>isObjectEncodingAMF3()</u></a>
long	<a href="#"><u>setAbsTimecodeLong(long absTimecode)</u></a> Set the absolute timecode
long	<a href="#"><u>setAbsTimecodeShort(long absTimecode)</u></a> Set the absolute timecode
void	<a href="#"><u>setByteContainerLevel(int byteContainerLevel)</u></a> Fake container for processing
void	<a href="#"><u>setChunkCounter(long chunkCounter)</u></a>
void	<a href="#"><u>setId(int id)</u></a> Set channel id
void	<a href="#"><u>setLastSentAbsTimecode(boolean isLastSentAbsTimecode)</u></a>
void	<a href="#"><u>setLongTimecode(boolean isLongTimecode)</u></a> Set is a 32 bit timecode
void	<a href="#"><u>setNew(boolean isNew)</u></a> Set is new packet

void	<a href="#"><u>setObjectEncoding</u></a> (int objectEncoding)
void	<a href="#"><u>setSize</u></a> (int size) Set packet size
void	<a href="#"><u>setSrc</u></a> (int src) Set stream id (0 if not stream data)
void	<a href="#"><u>setTimecode</u></a> (long timecode) Set timecode (milliseconds) sometimes relative
void	<a href="#"><u>setType</u></a> (int type) Set content type IVHost.CONTENT_TYPE_*
String	<a href="#"><u>toString</u></a> () Return object as formatted string

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### AMFDEBUGHEADERSIZE

public static final boolean **AMFDEBUGHEADERSIZE**

Constant value: **false**

### WOWZDEBUGHEADERSIZE

public static final boolean **WOWZDEBUGHEADERSIZE**

Constant value: **false**

## Constructors

### AMFObj

public **AMFObj**(int id)

Create new AMFObj for a given channel (id)

#### Parameters:

id - channel id

### AMFObj

public **AMFObj**(int id,  
int objectEncoding)

Create new AMFObj for a given channel (id)

(continued from last page)

**Parameters:**

id - channel id  
objectEncoding - object encoding level (AMF0 or AMF3)

## Methods

### getChunks

```
public java.util.List getChunks()
```

Get the chunks that make up this packet

**Returns:**

chunks that make up this packet

---

### addChunk

```
public void addChunk(byte[] buffer,  
    int offset,  
    int len)
```

Add a chunk to the chunk list

**Parameters:**

buffer - buffer  
offset - offset  
len - length

---

### getId

```
public int getId()
```

Get channel id

**Returns:**

channel id

---

### setId

```
public void setId(int id)
```

Set channel id

**Parameters:**

id - channel id

---

### getSize

```
public int getSize()
```

Get packet size

**Returns:**

packet size

---

### setSize

```
public void setSize(int size)
```

---

(continued from last page)

Set packet size

**Parameters:**

size - packet size

---

## getType

```
public int getType()
```

Get content type IVHost.CONTENTTYPE\_\*

**Returns:**

content type

---

## setType

```
public void setType(int type)
```

Set content type IVHost.CONTENTTYPE\_\*

**Parameters:**

type - content type

---

## getSrc

```
public int getSrc()
```

Get stream id (0 if not stream data)

**Returns:**

stream id

---

## setSrc

```
public void setSrc(int src)
```

Set stream id (0 if not stream data)

**Parameters:**

src - stream id

---

## toString

```
public String toString()
```

Return object as formatted string

---

## getTimecode

```
public long getTimecode()
```

Get timecode (milliseconds) sometimes relative

**Returns:**

timecode (milliseconds)

(continued from last page)

## setTimecode

```
public void setTimecode(long timecode)
```

Set timecode (milliseconds) sometimes relative

**Parameters:**

timecode - timecode (milliseconds)

---

## isNew

```
public boolean isNew()
```

Is this a new packet. If new entire packet header needs to be sent

**Returns:**

is new packet

---

## setNew

```
public void setNew(boolean isNew)
```

Set is new packet

**Parameters:**

isNew - is new packet

---

## getAbsTimecode

```
public long getAbsTimecode()
```

Get the absolute time code

**Returns:**

absolute timecode

---

## setAbsTimecodeLong

```
public long setAbsTimecodeLong(long absTimecode)
```

Set the absolute timecode

**Parameters:**

absTimecode - absolute timecode

**Returns:**

absolute timecode

---

## setAbsTimecodeShort

```
public long setAbsTimecodeShort(long absTimecode)
```

Set the absolute timecode

**Parameters:**

absTimecode

**Returns:**

(continued from last page)

absolute timecode

---

## incAbsTimecode

```
public long incAbsTimecode(long absTimecode)
```

Increment the absolute timecode

**Parameters:**

absTimecode - absolute timecode

**Returns:**

absolute timecode

---

## getByteContainerLevel

```
public int getByteContainerLevel()
```

Fake container for processing

**Returns:**

current container level

---

## clearByteContainer

```
public void clearByteContainer()
```

Clear the byte container

---

## setByteContainerLevel

```
public void setByteContainerLevel(int byteContainerLevel)
```

Fake container for processing

**Parameters:**

byteContainerLevel - current container level

---

## incByteContainerLevel

```
public void incByteContainerLevel(int byteContainerLevel)
```

Fake container for processing

**Parameters:**

byteContainerLevel - current container level

---

## isByteContainerEmpty

```
public boolean isByteContainerEmpty()
```

Fake container for processing

**Returns:**

is container full

---

(continued from last page)

## isByteContainerFull

```
public boolean isByteContainerFull()
```

Fake container for processing

**Returns:**

is container full

---

## isLongTimecode

```
public boolean isLongTimecode()
```

Get is a 32 bit timecode

**Returns:**

true if 32 bit timecode

---

## setLongTimecode

```
public void setLongTimecode(boolean isLongTimecode)
```

Set is a 32 bit timecode

**Parameters:**

isLongTimecode - is a 32 bit timecode

---

## isLastSentAbsTimecode

```
public boolean isLastSentAbsTimecode()
```

---

## setLastSentAbsTimecode

```
public void setLastSentAbsTimecode(boolean isLastSentAbsTimecode)
```

---

## isObjectEncodingAMF3

```
public boolean isObjectEncodingAMF3()
```

---

## isObjectEncodingAMF0

```
public boolean isObjectEncodingAMF0()
```

---

## setObjectEncoding

```
public void setObjectEncoding(int objectEncoding)
```

---

(continued from last page)

**getObjectEncoding**

```
public int getObjectEncoding()
```

---

**getChunkCounter**

```
public long getChunkCounter()
```

---

**setChunkCounter**

```
public void setChunkCounter(long chunkCounter)
```

## com.wowza.wms.amf Class AMFObjChunk

java.lang.Object

└─com.wowza.wms.amf.AMFObjChunk

```
public class AMFObjChunk
extends Object
```

### Field Summary

public	<a href="#"><u>buffer</u></a>
public	<a href="#"><u>len</u></a>
public	<a href="#"><u>offset</u></a>

### Constructor Summary

public	<a href="#"><u>AMFObjChunk</u></a> (byte[] buffer, int offset, int len)
--------	---

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Fields

#### buffer

```
public byte buffer
```

#### offset

```
public int offset
```

#### len

```
public int len
```

### Constructors

(continued from last page)

## AMFObjChunk

```
public AMFObjChunk(byte[] buffer,  
                  int offset,  
                  int len)
```

## com.wowza.wms.amf

### Class AMPacket

java.lang.Object

└─com.wowza.wms.amf.AMPacket

```
public class AMPacket
extends Object
```

AMFPacket: data container for data being transferred to and from the server from the Flash client. AMPacket is also used to store data read/written to/from an flv file.

### Constructor Summary

public	<a href="#">AMPacket()</a> Create new empty packet
public	<a href="#">AMPacket(int type, int src, int size)</a> Create new packet with given values
public	<a href="#">AMPacket(int type, int src, byte[] data)</a> Create new packet with given values

### Method Summary

int	<a href="#">addData(byte[] data, int offset, int size)</a> Add data to the packet
int	<a href="#">addDataEx(byte[] srcData, int srcOffset, int destOffset, int srcBytes)</a> Add data to the packet
static int	<a href="#">calcTotalPacketSize(int packetSize, int headerSize, int chunkSize, int amfNumber, boolean isLongTimecode)</a> Calculate the total packet size for given packet parameters
<a href="#">AMPacket</a>	<a href="#">clone()</a>
<a href="#">AMPacket</a>	<a href="#">clone(boolean doCopy)</a>
boolean	<a href="#">containsExtraDataKey(String key)</a> Return true if extra data contains the key
static <a href="#">AMPacket</a>	<a href="#">deserializePacket(byte[] buffer)</a>
java.util.Map	<a href="#">extraDataClone()</a> Deep copy the extra data and return as a Map
static java.util.Map	<a href="#">extraDataClone(java.util.Map extraData)</a>
long	<a href="#">getAbsTimecode()</a> Get absolute timecode (milliseconds)

byte[]	<a href="#"><code>getData()</code></a> Get data as byte[]
java.nio.ByteBuffer	<a href="#"><code>getDataBuffer()</code></a> Get data as ByteBuffer
<a href="#"><code>IAMFPacketExtraData</code></a>	<a href="#"><code>getExtraData(String key)</code></a> Get extra data value
java.util.Set	<a href="#"><code>getExtraDataKeys()</code></a> Get a set of the extra data keys
int	<a href="#"><code>getFirstByte()</code></a> Get first byte of data (used to peek into packet)
Object	<a href="#"><code>getLock()</code></a> Get lock (mostly used for extra data access)
int	<a href="#"><code>getMissing()</code></a> Get the number of bytes remaining unfilled in the packet
int	<a href="#"><code>getSecondByte()</code></a> Get second byte of data (used to peek into packet)
long	<a href="#"><code>getSeq()</code></a> Get packet sequence number.
int	<a href="#"><code>getSize()</code></a> Get packet size
int	<a href="#"><code>getSrc()</code></a> Get stream id (0 if not stream data)
long	<a href="#"><code>getTimecode()</code></a> Get timecode (milliseconds) relative to the <i>previous</i> packet.
int	<a href="#"><code>getType()</code></a> Get content type IVHost.CONTENTTYPE_*
boolean	<a href="#"><code>isAudio()</code></a> Is this an audio packet IVHost.CONTENTTYPE_AUDIO
boolean	<a href="#"><code>isExtraData()</code></a> Returns true if this packet contains any extra data
boolean	<a href="#"><code>isVideo()</code></a> Is this an audio packet IVHost.CONTENTTYPE_VIDEO
void	<a href="#"><code>putAllExtraData(java.util.Map entries)</code></a> Add extra data key value pairs
<a href="#"><code>IAMFPacketExtraData</code></a>	<a href="#"><code>putExtraData(String key, <a href="#"><code>IAMFPacketExtraData</code></a> value)</code></a> Add extra data value
byte[]	<a href="#"><code>serializePacket()</code></a>
void	<a href="#"><code>setAbsTimecode(long absTimecode)</code></a> Set absolute timecode (milliseconds)

void	<a href="#"><code>setDataBuffer</code></a> (byte[] data) Set the data buffer to a byte array
void	<a href="#"><code>setDataBuffer</code></a> (java.nio.ByteBuffer data) Set the data for this packet
void	<a href="#"><code>setSeq</code></a> (long seq) Set packet sequence.
void	<a href="#"><code>setSize</code></a> (int size) Set packet size
void	<a href="#"><code>setSrc</code></a> (int src) Set stream id (0 if not stream data)
void	<a href="#"><code>setTimecode</code></a> (long timecode) Set timecode (milliseconds) relative,
void	<a href="#"><code>setTimecodes</code></a> (long timecode, long absTimecode) Set both relative and absolute timecode in one call (milliseconds)
void	<a href="#"><code>setType</code></a> (int type) Set content type IVHost.CONTENTTYPE_*
String	<a href="#"><code>toString</code></a> () Return object as formatted string
void	<a href="#"><code>truncatePacket</code></a> (int newSize)

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### AMFPacket

```
public AMFPacket()
```

Create new empty packet

### AMFPacket

```
public AMFPacket(int type,
                 int src,
                 int size)
```

Create new packet with given values

#### Parameters:

type - packet content type: IVHost.CONTENTTYPE\_\*  
src - stream id  
size - packet size (bytes)

(continued from last page)

## AMFPacket

```
public AMFPacket(int type,  
                 int src,  
                 byte[] data)
```

Create new packet with given values

### Parameters:

`type` - packet content type: IVHost.CONTENTTYPE\_\*  
`src` - stream id  
`data` - data buffer

## Methods

### clone

```
public AMFPacket clone()
```

### clone

```
public AMFPacket clone(boolean doCopy)
```

### getSize

```
public int getSize()
```

Get packet size

### Returns:

packet size

### setSize

```
public void setSize(int size)
```

Set packet size

### Parameters:

`size` - packet size

### truncatePacket

```
public void truncatePacket(int newSize)
```

### getMissing

```
public int getMissing()
```

Get the number of bytes remaining unfilled in the packet

### Returns:

number of bytes unfilled in packet

## setDataBuffer

```
public void setDataBuffer(java.nio.ByteBuffer data)
```

Set the data for this packet

**Parameters:**

data - byte buffer that holds packet data

---

## setDataBuffer

```
public void setDataBuffer(byte[] data)
```

Set the data buffer to a byte array

**Parameters:**

data - data buffer byte array

---

## addData

```
public int addData(byte[] data,  
                  int offset,  
                  int size)
```

Add data to the packet

**Parameters:**

data - byte buffer with data  
offset - offset in byte buffer  
size - size of data

**Returns:**

number of bytes unfilled in packet

---

## getType

```
public int getType()
```

Get content type IVHost.CONTENTTYPE\_\*

**Returns:**

content type

---

## setType

```
public void setType(int type)
```

Set content type IVHost.CONTENTTYPE\_\*

**Parameters:**

type - content type

---

## getSrc

```
public int getSrc()
```

Get stream id (0 if not stream data)

---

(continued from last page)

**Returns:**

stream id

---

**setSrc**

```
public void setSrc(int src)
```

Set stream id (0 if not stream data)

**Parameters:**

src - stream id

---

**toString**

```
public String toString()
```

Return object as formatted string

---

**getTimecode**

```
public long getTimecode()
```

Get timecode (milliseconds) relative to the *previous* packet.

**Returns:**

timecode (milliseconds)

---

**setTimecodes**

```
public void setTimecodes(long timecode,  
    long absTimecode)
```

Set both relative and absolute timecode in one call (milliseconds)

Note this time is relative to the *previous* packet.

**Parameters:**

timecode - relative timecode (milliseconds)

absTimecode - absolute timecode (milliseconds)

---

**setTimecode**

```
public void setTimecode(long timecode)
```

Set timecode (milliseconds) relative,

Note this time is relative to the *previous* packet.

**Parameters:**

timecode - timecode (milliseconds)

---

**getAbsTimecode**

```
public long getAbsTimecode()
```

Get absolute timecode (milliseconds)

**Returns:**

absolute timecode

## setAbsTimecode

```
public void setAbsTimecode(long absTimecode)
```

Set absolute timecode (milliseconds)

**Parameters:**

absTimecode - absolute timecode

---

## getSeq

```
public long getSeq()
```

Get packet sequence number. Used for live streams to keep track of packet ordering.

**Returns:**

packet sequence

---

## setSeq

```
public void setSeq(long seq)
```

Set packet sequence. Used for live streams to keep track of packet ordering.

**Parameters:**

seq - packet sequence

---

## isAudio

```
public boolean isAudio()
```

Is this an audio packet IVHost.CONTENTTYPE\_AUDIO

**Returns:**

true if audio packet

---

## isVideo

```
public boolean isVideo()
```

Is this an audio packet IVHost.CONTENTTYPE\_VIDEO

**Returns:**

true if video packet

---

## getDataBuffer

```
public java.nio.ByteBuffer getDataBuffer()
```

Get data as ByteBuffer

**Returns:**

data as ByteBuffer

---

## getData

```
public byte[] getData()
```

---

(continued from last page)

Get data as byte[]

**Returns:**

data as byte[] null if no data

---

## getFirstByte

```
public int getFirstByte()
```

Get first byte of data (used to peek into packet)

**Returns:**

first byte of data in packet

---

## getSecondByte

```
public int getSecondByte()
```

Get second byte of data (used to peek into packet)

**Returns:**

second byte of data in packet

---

## calcTotalPacketSize

```
public static int calcTotalPacketSize(int packetSize,  
    int headerSize,  
    int chunkSize,  
    int amfNumber,  
    boolean isLongTimecode)
```

Calculate the total packet size for given packet parameters

**Parameters:**

packetSize - data size  
headerSize - header size  
chunkSize - chunk size  
amfNumber - amf number  
isLongTimecode - is long timecode

**Returns:**

total bytes

---

## addDataEx

```
public int addDataEx(byte[] srcData,  
    int srcOffset,  
    int destOffset,  
    int srcBytes)
```

Add data to the packet

**Parameters:**

srcData -- source byte buffer with data  
srcOffset -- start copying from source buffer at this offset  
destOffset -- copy into destination buffer from this offset  
srcBytes -- size of data to copy

**Returns:**

(continued from last page)

number of bytes unfilled in packet

---

## serializePacket

```
public byte[] serializePacket()
```

---

## deserializePacket

```
public static AMFPacket deserializePacket(byte[] buffer)
```

---

## getLock

```
public Object getLock()
```

Get lock (mostly used for extra data access)

**Returns:**

lock

---

## putExtraData

```
public IAMFPacketExtraData putExtraData(String key,  
    IAMFPacketExtraData value)
```

Add extra data value

**Parameters:**

key - key

value - extra data

**Returns:**

extra data currently at that key

---

## putAllExtraData

```
public void putAllExtraData(java.util.Map entries)
```

Add extra data key value pairs

**Parameters:**

entries - extra data key value pairs

---

## getExtraData

```
public IAMFPacketExtraData getExtraData(String key)
```

Get extra data value

**Parameters:**

key - key

**Returns:**

extra data value

## getExtraDataKeys

```
public java.util.Set getExtraDataKeys()
```

Get a set of the extra data keys

**Returns:**

extra data keys

---

## containsExtraDataKey

```
public boolean containsExtraDataKey(String key)
```

Return true if extra data contains the key

**Parameters:**

key - key

**Returns:**

true if extra data contains the key

---

## isExtraData

```
public boolean isExtraData()
```

Returns true if this packet contains any extra data

**Returns:**

true if this packet contains any extra data

---

## extraDataClone

```
public static java.util.Map extraDataClone(java.util.Map extraData)
```

---

## extraDataClone

```
public java.util.Map extraDataClone()
```

Deep copy the extra data and return as a Map

**Returns:**

deep copy of extra data

---

## com.wowza.wms.amf Interface IAMFDataObj

All Known Implementing Classes:

[AMFDataObj](#)

public interface **IAMFDataObj**  
extends

### Method Summary

boolean	<a href="#"><code>containsKey</code></a> (String name) Return true if the object/array contains key
<a href="#">AMFData</a>	<a href="#"><code>get</code></a> (int index) Return the object at a particular index.
<a href="#">AMFData</a>	<a href="#"><code>get</code></a> (String name) Return the object at a particular key.
boolean	<a href="#"><code>getBoolean</code></a> (int index) Get item at index return as boolean
boolean	<a href="#"><code>getBoolean</code></a> (String name) Get item at key return as boolean
byte	<a href="#"><code>getByte</code></a> (int index) Get item at index return as byte
byte	<a href="#"><code>getByte</code></a> (String name) Get item at key return as byte
java.util.Date	<a href="#"><code>getDate</code></a> (int index) Get item at index return as Date
java.util.Date	<a href="#"><code>getDate</code></a> (String name) Get item at key return as Date
double	<a href="#"><code>getDouble</code></a> (int index) Get item at index return as double
double	<a href="#"><code>getDouble</code></a> (String name) Get item at key return as double
float	<a href="#"><code>getFloat</code></a> (int index) Get item at index return as float
float	<a href="#"><code>getFloat</code></a> (String name) Get item at key return as float
int	<a href="#"><code>getInt</code></a> (int index) Get item at index return as int
int	<a href="#"><code>getInt</code></a> (String name) Get item at key return as int

String	<a href="#"><u>getKey</u></a> (int index) Return the key at a particular index.
java.util.List	<a href="#"><u>getKeys</u></a> () Return a list of all the keys (the list is a copy)
long	<a href="#"><u>getLong</u></a> (int index) Get item at index return as long
long	<a href="#"><u>getLong</u></a> (String name) Get item at key return as long
<a href="#"><u>AMFDataObj</u></a>	<a href="#"><u>getObject</u></a> (int index) Get item at index return as AMFDataObj
<a href="#"><u>AMFDataObj</u></a>	<a href="#"><u>getObject</u></a> (String name) Get item at key return as AMFDataObj
short	<a href="#"><u>getShort</u></a> (int index) Get item at index return as short
short	<a href="#"><u>getShort</u></a> (String name) Get item at key return as short
String	<a href="#"><u>getString</u></a> (int index) Get item at index return as String
String	<a href="#"><u>getString</u></a> (String name) Get item at key return as String
void	<a href="#"><u>put</u></a> (String name, <a href="#"><u>AMFData</u></a> data) Put or replace object at key
void	<a href="#"><u>put</u></a> (String name, boolean data) Put or replace boolean value at key (data will be wrapped in an AMFDataItem object)
void	<a href="#"><u>put</u></a> (String name, java.util.Date data) Put or replace date value at key (data will be wrapped in an AMFDataItem object)
void	<a href="#"><u>put</u></a> (String name, double data) Put or replace double value at key (data will be wrapped in an AMFDataItem object)
void	<a href="#"><u>put</u></a> (String name, int data) Put or replace int value at key (data will be wrapped in an AMFDataItem object)
void	<a href="#"><u>put</u></a> (String name, long data) Put or replace long value at key (data will be wrapped in an AMFDataItem object)
void	<a href="#"><u>put</u></a> (String name, String data) Put or replace string value at key (data will be wrapped in an AMFDataItem object)
<a href="#"><u>AMFData</u></a>	<a href="#"><u>remove</u></a> (int index) Remove element by index
<a href="#"><u>AMFData</u></a>	<a href="#"><u>remove</u></a> (String name) Remove element by key

(continued from last page)

## Methods

### containsKey

```
public boolean containsKey(String name)
```

Return true if the object/array contains key

**Parameters:**

name - key

**Returns:**

Return true the object/array contains key

---

### put

```
public void put(String name,  
    AMFData data)
```

Put or replace object at key

**Parameters:**

name - key

data - object

---

### put

```
public void put(String name,  
    String data)
```

Put or replace string value at key (data will be wrapped in an AMFDataItem object)

**Parameters:**

name - key

data - string value

---

### put

```
public void put(String name,  
    double data)
```

Put or replace double value at key (data will be wrapped in an AMFDataItem object)

**Parameters:**

name - key

data - double value

---

### put

```
public void put(String name,  
    int data)
```

Put or replace int value at key (data will be wrapped in an AMFDataItem object)

**Parameters:**

name - key

data - int value

## put

```
public void put(String name,  
               long data)
```

Put or replace long value at key (data will be wrapped in an AMFDataItem object)

**Parameters:**

name - key  
data - long value

---

## put

```
public void put(String name,  
               java.util.Date data)
```

Put or replace date value at key (data will be wrapped in an AMFDataItem object)

**Parameters:**

name - key  
data - date value

---

## put

```
public void put(String name,  
               boolean data)
```

Put or replace boolean value at key (data will be wrapped in an AMFDataItem object)

**Parameters:**

name - key  
data - boolean value

---

## getKeys

```
public java.util.List getKeys()
```

Return a list of all the keys (the list is a copy)

**Returns:**

new list that contains one entry for each key

---

## getKey

```
public String getKey(int index)
```

Return the key at a particular index.

**Parameters:**

index

**Returns:**

Return key at index or null if out of bounds

---

## get

```
public AMFData get(String name)
```

---

(continued from last page)

Return the object at a particular key.

**Parameters:**

name - key

**Returns:**

Return object or null if out of bounds

---

**get**

```
public AMFData get(int index)
```

Return the object at a particular index.

**Parameters:**

index - index

**Returns:**

Return object or null if out of bounds

---

**remove**

```
public AMFData remove(String name)
```

Remove element by key

**Parameters:**

name - key

**Returns:**

removed object or null if not found

---

**remove**

```
public AMFData remove(int index)
```

Remove element by index

**Parameters:**

index - index

**Returns:**

removed object or null if not found

---

**getString**

```
public String getString(String name)
```

Get item at key return as String

**Parameters:**

name - key

**Returns:**

Return item as String or null if out of bounds

---

(continued from last page)

## getInt

```
public int getInt(String name)
```

Get item at key return as int

**Parameters:**

name - key

**Returns:**

Return item as int or 0 if out of bounds

---

## getLong

```
public long getLong(String name)
```

Get item at key return as long

**Parameters:**

name - key

**Returns:**

Return item as long or 0 if out of bounds

---

## getShort

```
public short getShort(String name)
```

Get item at key return as short

**Parameters:**

name - key

**Returns:**

Return item as short or 0 if out of bounds

---

## getDouble

```
public double getDouble(String name)
```

Get item at key return as double

**Parameters:**

name - key

**Returns:**

Return item as double or 0 if out of bounds

---

## getFloat

```
public float getFloat(String name)
```

Get item at key return as float

**Parameters:**

name - key

**Returns:**

Return item as float or 0 if out of bounds

---

## getBytes

```
public byte getBytes(String name)
```

Get item at key return as byte

**Parameters:**

name - key

**Returns:**

Return item as byte or 0 if out of bounds

---

## getBoolean

```
public boolean getBoolean(String name)
```

Get item at key return as boolean

**Parameters:**

name - key

**Returns:**

Return item as boolean or false if out of bounds

---

## getDate

```
public java.util.Date getDate(String name)
```

Get item at key return as Date

**Parameters:**

name - key

**Returns:**

Return item as Date or null if out of bounds

---

## getObject

```
public AMFDataObj getObject(String name)
```

Get item at key return as AMFDataObj

**Parameters:**

name - key

**Returns:**

Return item as AMFDataObj or null if out of bounds

---

## getString

```
public String getString(int index)
```

Get item at index return as String

**Parameters:**

index - index

---

(continued from last page)

**Returns:**

Return item as String or null if out of bounds

---

## getInt

```
public int getInt(int index)
```

Get item at index return as int

**Parameters:**

index - index

**Returns:**

Return item as int or 0 if out of bounds

---

## getLong

```
public long getLong(int index)
```

Get item at index return as long

**Parameters:**

index - index

**Returns:**

Return item as long or 0 if out of bounds

---

## getShort

```
public short getShort(int index)
```

Get item at index return as short

**Parameters:**

index - index

**Returns:**

Return item as short or 0 if out of bounds

---

## getByte

```
public byte getByte(int index)
```

Get item at index return as byte

**Parameters:**

index - index

**Returns:**

Return item as byte or 0 if out of bounds

---

## getDouble

```
public double getDouble(int index)
```

Get item at index return as double

**Parameters:**

(continued from last page)

index - index

**Returns:**

Return item as double or 0 if out of bounds

---

## getFloat

```
public float getFloat(int index)
```

Get item at index return as float

**Parameters:**

index - index

**Returns:**

Return item as float or 0 if out of bounds

---

## getBoolean

```
public boolean getBoolean(int index)
```

Get item at index return as boolean

**Parameters:**

index - index

**Returns:**

Return item as boolean or false if out of bounds

---

## getDate

```
public java.util.Date getDate(int index)
```

Get item at index return as Date

**Parameters:**

index - index

**Returns:**

Return item as Date or null if out of bounds

---

## getObject

```
public AMFDataObj getObject(int index)
```

Get item at index return as AMFDataObj

**Parameters:**

index - index

**Returns:**

Return item as AMFDataObj or null if out of bounds

## com.wowza.wms.amf Interface IAMFExternalizable

public interface **IAMFExternalizable**  
extends

### Method Summary

void	<a href="#">deserialize</a> ( <a href="#">AMFDataObj</a> amfObj, java.nio.ByteBuffer data, <a href="#">AMFDataContextDeserialize</a> context)
String	<a href="#">getClassName</a> ()
void	<a href="#">serialize</a> ( <a href="#">AMFDataObj</a> amfObj, java.io.DataOutputStream out, <a href="#">AMFDataContextSerialize</a> context)
void	<a href="#">setClassName</a> (String className)

### Methods

#### deserialize

```
public void deserialize(AMFDataObj amfObj,  
    java.nio.ByteBuffer data,  
    AMFDataContextDeserialize context)
```

#### serialize

```
public void serialize(AMFDataObj amfObj,  
    java.io.DataOutputStream out,  
    AMFDataContextSerialize context)
```

#### getClassName

```
public String getClassName()
```

#### setClassName

```
public void setClassName(String className)
```

---

## com.wowza.wms.amf Interface IAMFPacketExtraData

---

public interface **IAMFPacketExtraData**  
extends

---

### Method Summary

<a href="#">IAMFPacketExtraData</a>	<a href="#">clone()</a> Return a deep copy of the extra data item
-------------------------------------	--

---

### Methods

#### clone

public [IAMFPacketExtraData](#) **clone()**

Return a deep copy of the extra data item

**Returns:**

deep copy of the extra data item

---

Package

**com.wowza.wms.application**

## com.wowza.wms.application Interface IApplication

public interface **IApplication**  
extends

IApplication: public interface to Application object

### Field Summary

public static final	<a href="#"><u>DEFAULT_APPLICATION_NAME</u></a> Value: <b>_defapp_</b>
---------------------	---

### Method Summary

void	<a href="#"><u>addApplicationInstanceListener</u></a> ( <a href="#"><u>IApplicationInstanceNotify</u></a> applicationInstanceListener) Add applicationInstance listener.
<a href="#"><u>IApplicationInstance</u></a>	<a href="#"><u>getAppInstance</u></a> (String name) Get applicationInstance object by name
java.util.List	<a href="#"><u>getAppInstanceNames</u></a> ( ) Get a list of application instance names
String	<a href="#"><u>getApplicationPath</u></a> ( ) Get the root path for application
String	<a href="#"><u>getConfigPath</u></a> ( ) Get full path to Application.xml file
<a href="#"><u>ConnectionCounter</u></a>	<a href="#"><u>getConnectionCounter</u></a> ( ) Get the connectionCounter for application
ConnectionCounterSimple	<a href="#"><u>getConnectionCounter</u></a> (int counterIndex) Get the connectionCounter for application for application for a specific technology (see IVHost.COUNTER_*)
String	<a href="#"><u>getDateStarted</u></a> ( ) Get date application started
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getIoPerformanceCounter</u></a> ( ) Get the performance counter for application
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getIoPerformanceCounter</u></a> (int counterIndex) Get the performance counter for application for a specific technology (see IVHost.COUNTER_*)
String	<a href="#"><u>getName</u></a> ( ) Get the name of application
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties</u></a> ( ) Get application properties

void	<a href="#"><u>getProtocolUsage</u></a> (boolean[] protocolsInUse) Get the protocols in use by this application instance (see IApplicationInstance.PROTOCOLUSAGE_*)
String	<a href="#"><u>getTimeRunning</u></a> () Get time application running
double	<a href="#"><u>getTimeRunningSeconds</u></a> () Get time running in seconds
<a href="#"><u>IVHost</u></a>	<a href="#"><u>getVHost</u></a> () Get the parent vHost object
boolean	<a href="#"><u>isAppInstanceLoaded</u></a> (String name) Return true if application instance is loaded
boolean	<a href="#"><u>isRunning</u></a> () Returns true if the application is in running state
String	<a href="#"><u>readAppConfig</u></a> (String sName) Method to read xml config file..
void	<a href="#"><u>removeAppInstance</u></a> ( <a href="#"><u>IApplicationInstance</u></a> appInstance) Disconnect all clients connected to an application instance and remove it from the IApplication application list.
void	<a href="#"><u>removeApplicationInstanceListener</u></a> ( <a href="#"><u>IApplicationInstanceNotify</u></a> applicationInstanceListener) Remove applicationInstance listener.
void	<a href="#"><u>setName</u></a> (String name) Set name of application
void	<a href="#"><u>shutdown</u></a> (boolean isServerShutdown) shutdown application
void	<a href="#"><u>shutdownAppInstance</u></a> (String appInstanceName) Shutdown an application instance by name.
boolean	<a href="#"><u>writeAppConfig</u></a> (String sName, String data) Method to write xml config file..

## Fields

### DEFAULT\_APPLICATION\_NAME

```
public static final java.lang.String DEFAULT_APPLICATION_NAME
```

Constant value: **\_defapp\_**

## Methods

### shutdown

```
public void shutdown(boolean isServerShutdown)
```

shutdown application

(continued from last page)

**Parameters:**

isServerShutdown - true if due to shutdown of server

---

**getApplicationPath**

```
public String getApplicationPath()
```

Get the root path for application

**Returns:**

root path for application

---

**getConfigPath**

```
public String getConfigPath()
```

Get full path to Application.xml file

**Returns:**

full path to Application.xml file

---

**getAppInstance**

```
public IApplicationInstance getAppInstance(String name)
```

Get applicationInstance object by name

**Parameters:**

name - applicationInstance name

**Returns:**

appliationInstance object

---

**isAppInstanceLoaded**

```
public boolean isAppInstanceLoaded(String name)
```

Return true if application instance is loaded

**Parameters:**

name - applicationInstance name

**Returns:**

true if application instance is loaded

---

**getName**

```
public String getName()
```

Get the name of application

**Returns:**

name of application

---

**setName**

```
public void setName(String name)
```

---

(continued from last page)

Set name of application

**Parameters:**

name - name of application

---

## getVHost

```
public IVHost getVHost()
```

Get the parent vHost object

**Returns:**

parent vHost

---

## getProperties

```
public WMSProperties getProperties()
```

Get application properties

**Returns:**

application properties

---

## addApplicationInstanceListener

```
public void addApplicationInstanceListener(IApplicationInstanceNotify  
applicationInstanceListener)
```

Add applicationInstance listener. Will be invoked each time applicationInstance created/deleted

**Parameters:**

applicationInstanceListener - applicationInstance listener

---

## removeApplicationInstanceListener

```
public void removeApplicationInstanceListener(IApplicationInstanceNotify  
applicationInstanceListener)
```

Remove applicationInstance listener. Will be invoked each time applicationInstance created/deleted

**Parameters:**

applicationInstanceListener - applicationInstance listener

---

## getConnectionCounter

```
public ConnectionCounter getConnectionCounter()
```

Get the connectionCounter for application

**Returns:**

connectionCounter for application

---

## getConnectionCounter

```
public ConnectionCounterSimple getConnectionCounter(int counterIndex)
```

Get the connectionCounter for application for application for a specific technology (see IVHost.COUNTER\_\*)

(continued from last page)

**Parameters:**

counterIndex - counter index (see IVHost.COUNTER\_\*)

**Returns:**

connection ocunter

---

## getIoPerformanceCounter

```
public IoPerformanceCounter getIoPerformanceCounter()
```

Get the performance counter for application

**Returns:**

performance counter for application

---

## getIoPerformanceCounter

```
public IoPerformanceCounter getIoPerformanceCounter(int counterIndex)
```

Get the performance counter for application for a specific technology (see IVHost.COUNTER\_\*)

**Parameters:**

counterIndex - counter index (see IVHost.COUNTER\_\*)

**Returns:**

performance counter

---

## getDateStarted

```
public String getDateStarted()
```

Get date application started

**Returns:**

date application started

---

## getTimeRunning

```
public String getTimeRunning()
```

Get time application running

**Returns:**

time application running

---

## getTimeRunningSeconds

```
public double getTimeRunningSeconds()
```

Get time running in seconds

**Returns:**

time running in seconds

---

## getAppInstanceNames

```
public java.util.List getAppInstanceNames()
```

(continued from last page)

Get a list of application instance names

**Returns:**

list of application instance names

---

## removeAppInstance

public void **removeAppInstance**([IApplicationInstance](#) appInstance)

Disconnect all clients connected to an application instance and remove it from the IApplication application list. The proper way to call this is:

```
public void shutdownAppInstance(IApplicationInstance appInstance)
{
    IVHost vhost = appInstance.getVHost();
    IApplication app = appInstance.getApplication();

    WMSReadWriteLock appLock = vhost.getApplicationLock();
    appLock.writeLock().lock();
    try
    {
        app.removeAppInstance(appInstance);
    }
    catch (Exception e)
    {
        WMSLoggerFactory.getLogger(Application.class).error("Application.shutdownAppInstance ",
        e);
    }
    finally
    {
        appLock.writeLock().unlock();
    }
}
```

**Parameters:**

appInstance - application instance to remove

---

## shutdownAppInstance

public void **shutdownAppInstance**(String appInstanceName)

Shutdown an application instance by name. This will disconnect all clients connected to this application instance.

**Parameters:**

appInstanceName - application instance name

---

(continued from last page)

## readAppConfig

```
public String readAppConfig(String sName)
```

Method to read xml config file..

---

## writeAppConfig

```
public boolean writeAppConfig(String sName,  
                               String data)
```

Method to write xml config file..

---

## getProtocolUsage

```
public void getProtocolUsage(boolean[] protocolsInUse)
```

Get the protocols in use by this application instance (see IApplicationInstance.PROTOCOLUSAGE\_\*)

---

## isRunning

```
public boolean isRunning()
```

Returns true if the application is in running state

**Returns:**

true if the application is in running state

## com.wowza.wms.application Interface IApplicationInstance

public interface **IApplicationInstance**  
extends

IApplicationInstance: public interface to ApplicationInstance object

### Field Summary

public static final	<a href="#"><u>DEFAULT_APPINSTANCE_NAME</u></a> Value: <b>_definst_</b>

## Method Summary

void	<a href="#">addClientListener</a> ( <a href="#">IClientNotify</a> clientListener) Add client listener.
void	<a href="#">addDvrRecorderListener</a> ( <a href="#">ILiveStreamDvrRecorderActionNotify</a> listener) Add a Dvr Recorder listener (see: <a href="#">ILiveStreamDvrRecorderActionNotify</a> )
void	<a href="#">addDvrStreamManagerListener</a> ( <a href="#">IDvrStreamManagerActionNotify</a> listener) Add a Dvr Application Store Manager listener (see: <a href="#">IDvrStoreActionNotify</a> )
void	<a href="#">addHTTPListener</a> ( <a href="#">IHTTPSessionNotify</a> httpListener) Add listener to be notified of HTTPSession create and destroy.
void	<a href="#">addHTTPStreamerSession</a> ( <a href="#">IHTTPStreamerSession</a> httpStreamerSession) Add a HTTPStreamerSession to this application instance

void	<a href="#"><u>addLiveStreamPacketizerListener</u></a> ( <a href="#"><u>ILiveStreamPacketizerActionNotify</u></a> <a href="#"><u>liveStreamPacketizerListener</u></a> ) Add a Live Stream Packetizer listener (see: <a href="#"><u>ILiveStreamPacketizerActionNotify</u></a> )
void	<a href="#"><u>addLiveStreamTranscoderListener</u></a> ( <a href="#"><u>ILiveStreamTranscoderNotify</u></a> <a href="#"><u>liveStreamTranscoderListener</u></a> ) Add a live stream transcoder listener
void	<a href="#"><u>addMediaCasterListener</u></a> ( <a href="#"><u>IMediaCasterNotify</u></a> <a href="#"><u>mediaCasterListener</u></a> ) Add mediaCaster listener.
void	<a href="#"><u>addMediaCasterListener</u></a> ( <a href="#"><u>IMediaCasterNotify2</u></a> <a href="#"><u>mediaCasterListener</u></a> ) Add mediaCaster listener.
void	<a href="#"><u>addMediaReaderListener</u></a> ( <a href="#"><u>IMediaReaderActionNotify</u></a> <a href="#"><u>mediaReaderListener</u></a> ) Add media reader listener.
void	<a href="#"><u>addMediaStreamListener</u></a> ( <a href="#"><u>IMediaStreamNotify</u></a> <a href="#"><u>mediaStreamListener</u></a> ) Add mediaStream listener.
void	<a href="#"><u>addMediaWriterListener</u></a> ( <a href="#"><u>IMediaWriterActionNotify</u></a> <a href="#"><u>listener</u></a> ) Add a MediaWriter listener class.
void	<a href="#"><u>addModuleListener</u></a> ( <a href="#"><u>IModuleNotify</u></a> <a href="#"><u>moduleListener</u></a> ) Add module listener.
void	<a href="#"><u>addPlayStreamByName</u></a> ( <a href="#"><u>IMediaStream</u></a> <a href="#"><u>stream</u></a> , <a href="#"><u>String</u></a> <a href="#"><u>name</u></a> ) Add a media stream to the list of streams that are listening for a published stream
void	<a href="#"><u>addPublisher</u></a> ( <a href="#"><u>Publisher</u></a> <a href="#"><u>publisher</u></a> ) Add a server side publisher to this application instance
void	<a href="#"><u>addPushPublishSession</u></a> ( <a href="#"><u>IMediaStream</u></a> <a href="#"><u>stream</u></a> , <a href="#"><u>IPushPublishSession</u></a> <a href="#"><u>pushPublishSession</u></a> ) Add a push publish session to the list of active push publish sessions
void	<a href="#"><u>addPushPublishSessionListener</u></a> ( <a href="#"><u>IPushPublishSessionNotify</u></a> <a href="#"><u>pushPublishSessionListener</u></a> ) Add a push publish session listener (see <a href="#"><u>IPushPublishSessionNotify</u></a> )
void	<a href="#"><u>addRTPIncomingDatagramPortAll</u></a> () Allow all incoming RTP UDP ports for this application instance
void	<a href="#"><u>addRTPIncomingDatagramPortRange</u></a> (int <a href="#"><u>startPort</u></a> , int <a href="#"><u>endPort</u></a> ) Add a port range to the list of valid incoming RTP UDP ports
void	<a href="#"><u>addRTPListener</u></a> ( <a href="#"><u>IRTPSessionNotify</u></a> <a href="#"><u>rtpListener</u></a> ) Add listner to be notified of RTPSession create and destroy.
void	<a href="#"><u>addRTPSession</u></a> ( <a href="#"><u>RTPSession</u></a> <a href="#"><u>rtpSession</u></a> ) Add an RTP session to this application instance
void	<a href="#"><u>addSharedObjectListener</u></a> ( <a href="#"><u>ISharedObjectNotify</u></a> <a href="#"><u>sharedObjectListener</u></a> , boolean <a href="#"><u>isPersistent</u></a> ) Add sharedObject listener.
void	<a href="#"><u>addSourceControlSession</u></a> (String <a href="#"><u>streamName</u></a> , <a href="#"><u>ISourceControlSession</u></a> <a href="#"><u>sourceControlSession</u></a> ) Add a source control session to the list of active source control sessions associated with the given stream name

void	<a href="#"><u>addSourceControlSessionListener</u></a> ( <a href="#"><u>ISourceControlSessionNotify</u></a> sourceControlSessionListener) Add a source control session listener (see ISourceControlSessionNotify)
void	<a href="#"><u>broadcastMsg</u></a> (java.util.List clientList, String handlerName) Broadcast a message to a specific list of clients connected to this application instance
void	<a href="#"><u>broadcastMsg</u></a> (java.util.List clientList, String handlerName, Object[] params) Broadcast a message to a specific list of clients connected to this application instance
void	<a href="#"><u>broadcastMsg</u></a> (String handlerName, Object[] params) Broadcast a message to all clients connected to this applicationInstance
boolean	<a href="#"><u>containsDvrRecorder</u></a> (String dvrRecorder) Does this application instance contain a references to this DVR recorder.
boolean	<a href="#"><u>containsHTTPStreamer</u></a> (String httpStreamer) Does this application instance allow streaming of a given HTTPStreamer
boolean	<a href="#"><u>containsLiveStreamPacketizer</u></a> (String liveStreamPacketizer) Does this application instance contain a references to this live stream packetizer.
boolean	<a href="#"><u>containsLiveStreamTranscoder</u></a> (String liveStreamTranscoder) Return true if this application instance contains the transcoder name
String	<a href="#"><u>decodeStorageDir</u></a> (String storageDir) This function will take a storage path that uses variables and expand the variables based on the context.
String[]	<a href="#"><u>getAllowDomains</u></a> () Get the list of domain names used to control access to this application.
<a href="#"><u>IApplication</u></a>	<a href="#"><u>getApplication</u></a> () Get parent application
int	<a href="#"><u>getApplicationInstanceTouchTimeout</u></a> () Get the application instance touch timeout (milliseconds).
int	<a href="#"><u>getApplicationTimeout</u></a> () Get application timeout (milliseconds)
<a href="#"><u>IClient</u></a>	<a href="#"><u>getClient</u></a> (int index) <b>Deprecated.</b> Get the client connection at index. This method is deprecated. It is best to use <a href="#"><u>getClient()</u></a> to return a List objects.
<a href="#"><u>IClient</u></a>	<a href="#"><u>getClientById</u></a> (int index) Get a client connection by the client Id
int	<a href="#"><u>getClientCount</u></a> () Get number of client connections currently connected to applicationInstance
int	<a href="#"><u>getClientCountTotal</u></a> () Get number of client connections in total that have connected to this applicationInstance
int	<a href="#"><u>getClientIdleFrequency</u></a> () Get default client idle frequency (milliseconds)
java.util.List	<a href="#"><u>getClients</u></a> () Get the set of clients currently connected to this application instance (replaces getClient(index))

edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock	<a href="#"><u>getClientsLockObj()</u></a> Get the read/write lock for this application instance
<a href="#"><u>ConnectionCounter</u></a>	<a href="#"><u>getConnectionCounter()</u></a> Get the connectionCounter for applicationInstance
ConnectionCounterSimple	<a href="#"><u>getConnectionCounter(int counterIndex)</u></a> Get the connectionCounter for applicationInstance for a specific technology (see IVHost.COUNTER_*)
String	<a href="#"><u>getContextStr()</u></a> Returns the application context string in the form [application]/[appInstance].
String	<a href="#"><u>getDateStarted()</u></a> Get date applicationInstance started
DvrApplicationContext	<a href="#"><u>getDvrApplicationContext()</u></a> Get live stream dvr application context
DvrApplicationConverterContext	<a href="#"><u>getDvrConverter()</u></a> Get dvr application converter context
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getDvrProperties()</u></a> Get the property collection of DVR settings that are specific to this application instance.
String	<a href="#"><u>getDvrRecorderList()</u></a> Get the comma separated list of Dvr Recorder names being used by this application (see conf/Dvr.xml)
<a href="#"><u>IHTTPStreamerApplicationContext</u></a>	<a href="#"><u>getHTTPStreamerApplicationContext(String httpStreamName, boolean doCreate)</u></a> Get the HTTPStreamer application context for a given HTTPStreamer adapter
String	<a href="#"><u>getHTTPStreamerList()</u></a> Get the comma separated list of HTTPStreamers names being used by this application (see conf/HTTPStreamers.xml)
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getHTTPStreamerProperties()</u></a> Get the property collection of HTTPStreamer settings that are specific to this application instance
int	<a href="#"><u>getHTTPStreamerSessionCount()</u></a> Get the current number of HTTPStreamerSessions associated with this application instance
int	<a href="#"><u>getHTTPStreamerSessionCount(int protocol)</u></a> Get the current number of HTTPStreamerSessions associated with this application instance by protocol.
int	<a href="#"><u>getHTTPStreamerSessionCount(int protocol, String streamName)</u></a> Get the current number of HTTPStreamerSessions associated with this application instance and stream name by protocol.
int	<a href="#"><u>getHTTPStreamerSessionCount(String streamName)</u></a> Get the current number of HTTPStreamerSessions associated with this application instance and stream name
java.util.Map	<a href="#"><u>getHTTPStreamerSessionCountsByName(int protocol)</u></a> Get a map of session counts by name for a given protocol

java.util.List	<a href="#"><u>getHTTPStreamerSessions()</u></a> Get the HTTPStreamerSessions associated with this application instance
java.util.List	<a href="#"><u>getHTTPStreamerSessions(int protocol)</u></a> Get the HTTPStreamerSessions associated with this application instance by protocol.
java.util.List	<a href="#"><u>getHTTPStreamerSessions(int protocol, String streamName)</u></a> Get the HTTPStreamerSessions associated with this application instance for a stream name by protocol.
java.util.List	<a href="#"><u>getHTTPStreamerSessions(String streamName)</u></a> Get the HTTPStreamerSessions associated with this application instance for a stream name
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getIOPerformanceCounter()</u></a> Get the performance counter for applicationInstance
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getIOPerformanceCounter(int counterIndex)</u></a> Get the performance counter for applicationInstance for a specific technology (see IVHost.COUNTER_*)
long	<a href="#"><u>getLastTouchTime()</u></a> Get the last time the instance was touched (milliseconds)
<a href="#"><u>ILiveStreamDvrRecorderControl</u></a>	<a href="#"><u>getLiveStreamDvrRecorderControl()</u></a> Get the Live Stream DVR Recorder Controller.
<a href="#"><u>ILiveStreamPacketizerControl</u></a>	<a href="#"><u>getLiveStreamPacketizerControl()</u></a> Get the Live Stream Packetizer Controller.
String	<a href="#"><u>getLiveStreamPacketizerList()</u></a> Get the comma separated list of LiveStreamPacketizers names being used by this application (see conf/LiveStreamPacketizers.xml)
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getLiveStreamPacketizerProperties()</u></a> Get the property collection of LiveStreamPacketizer settings that are specific to this application instance
<a href="#"><u>ILiveStreamTranscoderControl</u></a>	<a href="#"><u>getLiveStreamTranscoderControl()</u></a> Get the Live Stream Transcoder Controller.
String	<a href="#"><u>getLiveStreamTranscoderList()</u></a> Get comma separated list of transcoders to use for this application instance
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getManagerProperties()</u></a> Get Application's manager's properties collection
int	<a href="#"><u>getMaximumPendingReadBytes()</u></a> Set maximum number of bytes a client connection can have waiting to be written before the connection is terminated.
int	<a href="#"><u>getMaximumPendingWriteBytes()</u></a> Get maximum number a bytes a client connection can have waiting to be sent before the connection is terminated.
int	<a href="#"><u>getMaximumSetBufferTime()</u></a> Get maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call.
int	<a href="#"><u>getMaxStorageDirDepth()</u></a> Maximum folder depth allowed for the StreamStorageDir and SharedObjectStorageDir paths

java.util.List	<a href="#"><u>getMediaCacheFilters()</u></a> Get the list of allowed MediaCache sources.
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getMediaCasterProperties()</u></a> Get the property collection of media caster settings that are specific to this application instance
int	<a href="#"><u>getMediacasterRTPRTSP RTPTransportMode()</u></a> RTP MediaCaster RTSP/RTP transport mode.
<a href="#"><u>MediaCasterStreamMap</u></a>	<a href="#"><u>getMediaCasterStreams()</u></a> Get the media caster streams attached to this application instance
<a href="#"><u>IMediaCasterValidateMediaCaster</u></a>	<a href="#"><u>getMediaCasterValidator()</u></a> Get the MediaCaster validator interface for this application instance
<a href="#"><u>IMediaListProvider</u></a>	<a href="#"><u>getMediaListProvider()</u></a> Get the current media list provider.
int	<a href="#"><u>getMediaReaderContentType()</u></a> (String mediaType) Get the content type of a media stream name prefix (see IMediaReader.CONTENTTYPE_*)
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getMediaReaderProperties()</u></a> Get the property collection of media reader settings that are specific to this application instance
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getMediaWriterProperties()</u></a> Get the property collection of media reader settings that are specific to this application instance
ModuleFunctions	<a href="#"><u>getModFunctions()</u></a> Get list of application modules
Object	<a href="#"><u>getModuleInstance()</u></a> (String name) Get the instance of the module class for this application instance.
ModuleList	<a href="#"><u>getModuleList()</u></a> Get the list of loaded modules.
String	<a href="#"><u>getName()</u></a> Get applicationInstance name
int	<a href="#"><u>getPingTimeout()</u></a> Get ping timeout (milliseconds)
int	<a href="#"><u>getPlayStreamCount()</u></a> (String streamName) Get the number of Flash players playing a given stream name
java.util.Map	<a href="#"><u>getPlayStreamCountsByName()</u></a> Get a map of stream names to number of Flash players playing the stream name
java.util.List	<a href="#"><u>getPlayStreamsByName()</u></a> (String name) Get a list of media streams that are listening for published stream.
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get applicationInstance properties
boolean[]	<a href="#"><u>getProtocolUsage()</u></a> Get the protocols in use by this application instance (see IApplicationInstance.PROTOCOLUSAGE_*)

void	<a href="#"><u>getProtocolUsage</u></a> (boolean[] protocolsInUse) Get the protocols in use by this application instance (see IApplicationInstance.PROTOCOLUSAGE_*)
int	<a href="#"><u>getPublisherCount</u></a> () Get the current number of server side publishers
java.util.List	<a href="#"><u>getPublishers</u></a> () Get the set of server side publishers
java.util.List	<a href="#"><u>getPublishStreamNames</u></a> () Get the list of live stream names currently being published.
int	<a href="#"><u>getPushPublishSessionCount</u></a> () Get the number of push publishing sessions.
java.util.List	<a href="#"><u>getPushPublishSessions</u></a> () Get all active push publish sessions
java.util.List	<a href="#"><u>getPushPublishSessions</u></a> (IMediaStream stream) Get the current push publish sessions for a given IMediaStream
String	<a href="#"><u>getRepeaterOriginUrl</u></a> () Get the Repeater Origin URL used by the Live Stream Repeater
String	<a href="#"><u>getRepeaterQueryString</u></a> () Get the Repeater query string that is used to connect to the origin.
String	<a href="#"><u>getRsoStorageDir</u></a> () Get remote shared object storage path
String	<a href="#"><u>getRsoStoragePath</u></a> () Get the resolved storage path to the shared objects
int	<a href="#"><u>getRTPAVSyncMethod</u></a> () Get RTP audio/video sync method (RTPStream.AVSYNCMETHODS_SENDERREPORT, RTPStream.AVSYNCMETHODS_SYSTEMCLOCK, RTPStream.AVSYNCMETHODS_RTPTIMECODE)
int	<a href="#"><u>getRTPIdleFrequency</u></a> () Set the default RTP idle frequency (milliseconds)
int	<a href="#"><u>getRTPMaxRTCPWaitTime</u></a> () Get the maximum time to wait for RTCP packets (milliseconds)
String	<a href="#"><u>getRTPPlayAuthenticationMethod</u></a> () Get the RTP play authentication method (as defined in conf/Authentication.xml)
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getRTPProperties</u></a> () Get the property collection of RTP settings that are specific to this application instance
String	<a href="#"><u>getRTPPublishAuthenticationMethod</u></a> () Get the RTP publish authentication method (as defined in conf/Authentication.xml)
int	<a href="#"><u>getRTPSessionCount</u></a> () Get the number of RTP sessions running under this application instance
int	<a href="#"><u>getRTPSessionCount</u></a> (String streamName) Get the number of RTP player streams playing a given stream name

java.util.Map	<a href="#"><u>getRTSPSessionCountsByName()</u></a> Get a map of stream names and session counts of RTP sessions
java.util.List	<a href="#"><u>getRTSPSessions()</u></a> Get a list of RTP sessions running under this application instance
java.util.List	<a href="#"><u>getRTSPSessions(String streamName)</u></a> Get a list of RTP sessions running under this application instance playing a given stream name
String	<a href="#"><u>getRTSPBindIpAddress()</u></a> Set the IP address to which UDP ports will be bound for RTSP/RTP sessions
String	<a href="#"><u>getRTSPConnectionAddressType()</u></a> Get the connection IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session
String	<a href="#"><u>getRTSPConnectionIpAddress()</u></a> Get the connection IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session
int	<a href="#"><u>getRTSPMaximumPendingWriteBytes()</u></a> Get the maximum number of pending write bytes for an RTSP session
String	<a href="#"><u>getRTSPOriginAddressType()</u></a> Get the origin IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session
String	<a href="#"><u>getRTSPOriginIpAddress()</u></a> Get the origin IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session
int	<a href="#"><u>getRTSPSessionTimeout()</u></a> Get the RTSP session timeout (milliseconds)
String	<a href="#"><u>getSharedObjectReadAccess()</u></a> Get the default shared object read access
<a href="#"><u>ISharedObjects</u></a>	<a href="#"><u>getSharedObjects()</u></a> Get non-persistent shared object collection
<a href="#"><u>ISharedObjects</u></a>	<a href="#"><u>getSharedObjects(boolean isPersistent)</u></a> Get either persistent or non-persistent shared object collection
String	<a href="#"><u>getSharedObjectWriteAccess()</u></a> Get the default shared object write access
<a href="#"><u>ISourceControlSession</u></a>	<a href="#"><u>getSourceControlSession(String streamName)</u></a> Get the source control session for the given stream name
int	<a href="#"><u>getSourceControlSessionCount()</u></a> Get the number of source control sessions.
java.util.List	<a href="#"><u>getSourceControlSessions()</u></a> Get all active source control sessions
String	<a href="#"><u>getStreamAudioSampleAccess()</u></a> Get the default stream audio sample access
int	<a href="#"><u>getStreamCount()</u></a> Get the total number of open streams attached to this application instance

<a href="#">IMediaStreamFileMapper</a>	<a href="#">getStreamFileMapper()</a> Get the stream file mapper.
String	<a href="#">getStreamKeyDir()</a> Get the stream key path
String	<a href="#">getStreamKeyPath()</a> Get the resolved key path to the MediaStreams encryption keys
<a href="#">IMediaStreamNameAliasProvider</a>	<a href="#">getStreamNameAliasProvider()</a> Get the stream name alias provider
<a href="#">WMSProperties</a>	<a href="#">getStreamProperties()</a> Get the property collection of stream settings that are specific to this application instance
String	<a href="#">getStreamReadAccess()</a> Get the default stream read access
<a href="#">WMSProperties</a>	<a href="#">getStreamRecorderProperties()</a> Get the property collection of StreamRecorder settings that are specific to this application instance
<a href="#">MediaStreamMap</a>	<a href="#">getStreams()</a> Get all the mediaStream objects attached to this applicationInstance
String	<a href="#">getStreamStorageDir()</a> Get stream storage path
String	<a href="#">getStreamStoragePath()</a> Get the resolved storage path to the MediaStreams
String	<a href="#">getStreamType()</a> Get default streamType for application.
String	<a href="#">getStreamVideoSampleAccess()</a> Get the default stream video sample access
String	<a href="#">getStreamWriteAccess()</a> Get the default stream write access
<a href="#">WMSProperties</a>	<a href="#">getTimedTextProperties()</a> Get the property collection of timed text settings that are specific to this application instance.
String	<a href="#">getTimeRunning()</a> Get time applicationInstance running
double	<a href="#">getTimeRunningSeconds()</a> Get time running in seconds
LiveStreamTranscoderApplicationContext	<a href="#">getTranscoderApplicationContext()</a> Get live stream transcoder application context
<a href="#">WMSProperties</a>	<a href="#">getTranscoderProperties()</a> Get the property collection of Transcoder settings that are specific to this application instance
int	<a href="#">getValidationFrequency()</a> Get time between validation pings (milliseconds)
<a href="#">IVHost</a>	<a href="#">getVHost()</a> Get parent vHost

String	<a href="#"><u>getVODTimedTextProviderList()</u></a> Get the comma separated list of VODTimedTextProvider names being used by this application (see conf/TimedTextProviders.xml)
java.util.List	<a href="#"><u>getVODTimedTextProviderSet()</u></a>
com.wowza.wms.webrtc.model.WebRTCApplicationContext	<a href="#"><u>getWebRTCApplicationContext()</u></a> Get the WebRTC application level context
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getWebRTCProperties()</u></a> Get the property collection of WebRTC settings that are specific to this application instance
int	<a href="#"><u>getWebRTCSessionCount()</u></a> Get count of WebRTC sessions
int	<a href="#"><u>getWebRTCSessionCount(String streamName)</u></a> Get count of WebRTC sessions by stream name
java.util.Map	<a href="#"><u>getWebRTCSessionCountsByName()</u></a> Get a map of WebRTC sessions by stream name
java.util.List	<a href="#"><u>getWebRTCSessions()</u></a> Get list of WebRTC sessions
java.util.List	<a href="#"><u>getWebRTCSessions(String streamName)</u></a> Get list of WebRTC sessions by stream name
void	<a href="#"><u>incClientCountTotal()</u></a> Increment the total number of connected client counter by one
boolean	<a href="#"><u>isAcceptConnection()</u></a> Is auto accept connection on/off
boolean	<a href="#"><u>isDebugAppTimeout()</u></a> If true appTimeout processing will be logged.
boolean	<a href="#"><u>isLive()</u></a> Returns true if the application stream type of the application instance is live
boolean	<a href="#"><u>isMediaCacheSourceAllowed(String sourceName)</u></a> Test to see if a MediaCache source name is allowed
boolean	<a href="#"><u>isRTPIncomingDatagramPortValid(int port)</u></a> Check a port number to be sure it is a valid RTP UDP port for this application instance
boolean	<a href="#"><u>isValidateFMLEConnections()</u></a> Returns true if validating FMLE connection (default is false)
void	<a href="#"><u>notifyDvrStreamManagerCreate(IDvrStreamManager dvrStoreManager, String streamName)</u></a> Notify listeners that Dvr Application Store Manager has been created.
void	<a href="#"><u>notifyDvrStreamManagerDestroy(IDvrStreamManager dvrManager)</u></a> Notify listeners that Dvr Application Store Manager has been destroyed.
void	<a href="#"><u>notifyDvrStreamManagerInit(IDvrStreamManager dvrStoreManager)</u></a> Notify listeners that Dvr Application Store Manager has been initialized.

void	<a href="#"><u>notifyHTTPSessionCreate</u></a> ( <a href="#"><u>IHTTPStreamerSession</u></a> httpSession) Notify HTTP session create
void	<a href="#"><u>notifyHTTPSessionDestroy</u></a> ( <a href="#"><u>IHTTPStreamerSession</u></a> httpSession) Notify HTTP session destroy
void	<a href="#"><u>notifyLiveStreamDvrRecorderCreate</u></a> ( <a href="#"><u>ILiveStreamDvrRecorder</u></a> dvr, String streamName) Notify Dvr Recorder Create
void	<a href="#"><u>notifyLiveStreamDvrRecorderDestroy</u></a> ( <a href="#"><u>ILiveStreamDvrRecorder</u></a> dvr) Notify DVR Recorder has been destroyed.
void	<a href="#"><u>notifyLiveStreamDvrRecorderInit</u></a> ( <a href="#"><u>ILiveStreamDvrRecorder</u></a> dvr, String streamName) Notify DVR Recorder has been initialized.
void	<a href="#"><u>notifyLiveStreamPacketizerCreate</u></a> ( <a href="#"><u>ILiveStreamPacketizer</u></a> liveStreamPacketizer, String streamName) Notify Live Stream Packetizer Create
void	<a href="#"><u>notifyLiveStreamPacketizerDestroy</u></a> ( <a href="#"><u>ILiveStreamPacketizer</u></a> liveStreamPacketizer) Notify Live Stream Packetizer Destory
void	<a href="#"><u>notifyLiveStreamPacketizerInit</u></a> ( <a href="#"><u>ILiveStreamPacketizer</u></a> liveStreamPacketizer, String streamName) Notify Live Stream Packetizer Init
void	<a href="#"><u>notifyLiveStreamTranscoderCreate</u></a> ( <a href="#"><u>ILiveStreamTranscoder</u></a> liveStreamTranscoder, <a href="#"><u>IMediaStream</u></a> stream) Notify live stream transcoder create
void	<a href="#"><u>notifyLiveStreamTranscoderDestroy</u></a> ( <a href="#"><u>ILiveStreamTranscoder</u></a> liveStreamTranscoder, <a href="#"><u>IMediaStream</u></a> stream) Notify live stream transcoder destroy
void	<a href="#"><u>notifyLiveStreamTranscoderInit</u></a> ( <a href="#"><u>ILiveStreamTranscoder</u></a> liveStreamTranscoder, <a href="#"><u>IMediaStream</u></a> stream) Notify live stream transcoder init
void	<a href="#"><u>notifyMediaReaderClose</u></a> ( <a href="#"><u>IMediaReader</u></a> mediaReader, <a href="#"><u>IMediaStream</u></a> stream) Notify media reader notifyMediaReaderClose
void	<a href="#"><u>notifyMediaReaderCreate</u></a> ( <a href="#"><u>IMediaReader</u></a> mediaReader) Notify media reader notifyMediaReaderCreate
void	<a href="#"><u>notifyMediaReaderExtractMetadata</u></a> ( <a href="#"><u>IMediaReader</u></a> mediaReader, <a href="#"><u>IMediaStream</u></a> stream) Notify media reader notifyMediaReaderExtractMetadata
void	<a href="#"><u>notifyMediaReaderInit</u></a> ( <a href="#"><u>IMediaReader</u></a> mediaReader, <a href="#"><u>IMediaStream</u></a> stream) Notify media reader notifyMediaReaderInit
void	<a href="#"><u>notifyMediaReaderOpen</u></a> ( <a href="#"><u>IMediaReader</u></a> mediaReader, <a href="#"><u>IMediaStream</u></a> stream) Notify media reader notifyMediaReaderOpen
void	<a href="#"><u>notifyMediaWriterOnFLVAddMetadata</u></a> ( <a href="#"><u>IMediaStream</u></a> stream, java.util.Map extraMetadata) Notify all MediaWriter listeners of onFLVAddMetadata

void	<a href="#"><u>notifyMediaWriterOnWriteComplete</u></a> ( <a href="#"><u>IMediaStream</u></a> stream, java.io.File file) Notify all MediaWriter listeners of onWriteComplete
void	<a href="#"><u>notifyPushPublishSessionCreate</u></a> (String streamName, <a href="#"><u>IMediaStream</u></a> stream, <a href="#"><u>IPushPublishSession</u></a> pushPublishSession) Notify push publish session create
void	<a href="#"><u>notifyPushPublishSessionDestroy</u></a> (String streamName, <a href="#"><u>IMediaStream</u></a> stream, <a href="#"><u>IPushPublishSession</u></a> pushPublishSession) Notify push publish session destroy
void	<a href="#"><u>notifyRTPSessionCreate</u></a> ( <a href="#"><u>RTPSession</u></a> rtpSession) Notify RTP session create
void	<a href="#"><u>notifyRTPSessionDestroy</u></a> ( <a href="#"><u>RTPSession</u></a> rtpSession) Notify RTP session destroy
void	<a href="#"><u>notifySourceControlSessionCreate</u></a> (String streamName, <a href="#"><u>ISourceControlSession</u></a> sourceControlSession) Notify source control session create
void	<a href="#"><u>notifySourceControlSessionDestroy</u></a> (String streamName, <a href="#"><u>ISourceControlSession</u></a> sourceControlSession) Notify source control session destroy
void	<a href="#"><u>parseAllowDomains</u></a> (String domainFilterStr) Parse a comma delimited list of domain names used to control access to this application.
String	<a href="#"><u>readAppInstConfig</u></a> (String sName) Method to read xml config file..
void	<a href="#"><u>registerPlayRTPSession</u></a> ( <a href="#"><u>RTPSession</u></a> rtpSession) Register an RTP session as a play session
void	<a href="#"><u>removeClientListener</u></a> ( <a href="#"><u>IClientNotify</u></a> clientListener) Remove client listener.
void	<a href="#"><u>removeDvrRecorderListener</u></a> ( <a href="#"><u>ILiveStreamDvrRecorderActionNotify</u></a> listener) Remove a Dvr Recorder listener (see: <a href="#"><u>ILiveStreamDvrRecorderActionNotify</u></a> )
void	<a href="#"><u>removeDvrStreamManagerListener</u></a> ( <a href="#"><u>IDvrStreamManagerActionNotify</u></a> listener) Remove a Dvr Application Store Manager listener (see: <a href="#"><u>IDvrStoreActionNotify</u></a> )
void	<a href="#"><u>removeHTTPListener</u></a> ( <a href="#"><u>IHTTPSessionNotify</u></a> httpListener) Remove listner to be notified of HTTPSession create and destroy.
void	<a href="#"><u>removeHTTPStreamerSession</u></a> ( <a href="#"><u>IHTTPStreamerSession</u></a> httpStreamerSession) Remove a HTTPStreamerSession from this application instance
void	<a href="#"><u>removeLiveStreamPacketizerListener</u></a> ( <a href="#"><u>ILiveStreamPacketizerActionNotify</u></a> <a href="#"><u>LiveStreamPacketizerListener</u></a> ) Remove a Live Stream Packetizer listener (see: <a href="#"><u>ILiveStreamPacketizerActionNotify</u></a> )
void	<a href="#"><u>removeLiveStreamTranscoderListener</u></a> ( <a href="#"><u>ILiveStreamTranscoderNotify</u></a> <a href="#"><u>LiveStreamTranscoderListener</u></a> ) Remove a live stream transcoder listener
void	<a href="#"><u>removeMediaCasterListener</u></a> ( <a href="#"><u>IMediaCasterNotify</u></a> mediaCasterListener) Remove mediaCaster listener.

void	<a href="#"><u>removeMediaReaderListener</u></a> ( <a href="#"><u>IMediaReaderActionNotify</u></a> mediaReaderListener) Remove media reader listener.
void	<a href="#"><u>removeMediaStreamListener</u></a> ( <a href="#"><u>IMediaStreamNotify</u></a> mediaStreamListener) Remove mediaStream listener.
void	<a href="#"><u>removeMediaWriterListener</u></a> ( <a href="#"><u>IMediaWriterActionNotify</u></a> listener) remove MediaWriter listener class.
void	<a href="#"><u>removeModuleListener</u></a> ( <a href="#"><u>IModuleNotify</u></a> moduleListener) Remove module listener
void	<a href="#"><u>removePlayStreamByName</u></a> ( <a href="#"><u>IMediaStream</u></a> stream) Remove media stream from the list of streams that are listening for a published stream
void	<a href="#"><u>removePublisher</u></a> ( <a href="#"><u>Publisher</u></a> publisher) Remove a server side publisher from this application instance
void	<a href="#"><u>removePushPublishSession</u></a> ( <a href="#"><u>IMediaStream</u></a> stream, <a href="#"><u>IPushPublishSession</u></a> pushPublishSession) Remove a push publish session
void	<a href="#"><u>removePushPublishSessionListener</u></a> ( <a href="#"><u>IPushPublishSessionNotify</u></a> pushPublishSessionListener) Remove a push publish session listener (see <a href="#"><u>IPushPublishSessionNotify</u></a> )
void	<a href="#"><u>removePushPublishSessions</u></a> ( <a href="#"><u>IMediaStream</u></a> stream) Remove all push publish sessions for a give stream
void	<a href="#"><u>removeRTPListener</u></a> ( <a href="#"><u>IRTPSessionNotify</u></a> rtpListener) Remove listner to be notified of RTPSession create and destroy.
void	<a href="#"><u>removeRTPSession</u></a> ( <a href="#"><u>RTPSession</u></a> rtpSession) Remove an RTP session from this application instance
void	<a href="#"><u>removeSharedObjectListener</u></a> ( <a href="#"><u>ISharedObjectNotify</u></a> sharedObjectListener, <a href="#"><u>boolean</u></a> isPersistent) Remove sharedObject listener.
void	<a href="#"><u>removeSourceControlSession</u></a> (String streamName) Remove the source control session for the given stream name from the application instance
void	<a href="#"><u>removeSourceControlSessionListener</u></a> ( <a href="#"><u>ISourceControlSessionNotify</u></a> sourceControlSessionListener) Remove the provided source control session listener from the list of source control session listeners (see <a href="#"><u>ISourceControlSessionNotify</u></a> )
boolean	<a href="#"><u>resetMediaCasterStream</u></a> (String streamName) Reset a media caster stream
boolean	<a href="#"><u>resetMediaCasterStream</u></a> (String streamName, String streamExt) Reset a media caster stream
void	<a href="#"><u>setAcceptConnection</u></a> ( <a href="#"><u>boolean</u></a> acceptConnection) Set is auto accept connection
void	<a href="#"><u>setAllowDomains</u></a> (String[] domainFilter) Set the list of domain names used to control access to this application.
void	<a href="#"><u>setApplicationInstanceTouchTimeout</u></a> (int applicationInstanceTouchTimeout) Set the application instance touch timeout (milliseconds).

void	<a href="#"><u>setApplicationTimeout</u></a> (int applicationTimeout) Set application timeout (milliseconds)
void	<a href="#"><u>setClientIdleFrequency</u></a> (int clientIdleFrequency) Set default client idle frequency (milliseconds)
void	<a href="#"><u>setDebugAppTimeout</u></a> (boolean debugAppTimeout) If true appTimeout processing will be logged.
void	<a href="#"><u>setDvrRecorderList</u></a> (String recorderList) Set the comma separated list of Dvr Recorder names being used by this application (see conf/Dvr.xml)
void	<a href="#"><u>setHTTPStreamerList</u></a> (String httpStreamerList) Set the comma separated list of HTTPStreamer names being used by this application (see conf/HTTPStreamers.xml)
void	<a href="#"><u>setLiveStreamDvrRecorderControl</u></a> ( <a href="#"><u>ILiveStreamDvrRecorderControl</u></a> controller) Set the Live Stream DVR Controller.
void	<a href="#"><u>setLiveStreamPacketizerControl</u></a> ( <a href="#"><u>ILiveStreamPacketizerControl</u></a> liveStreamPacketizerControl) Set the Live Stream Packetizer Controller.
void	<a href="#"><u>setLiveStreamPacketizerList</u></a> (String liveStreamPacketizerList) Set the comma separated list of LiveStreamPacketizers names being used by this application (see conf/LiveStreamPacketizers.xml)
void	<a href="#"><u>setLiveStreamTranscoderControl</u></a> ( <a href="#"><u>ILiveStreamTranscoderControl</u></a> liveStreamTranscoderControl) Set the Live Stream Transcoder Controller.
void	<a href="#"><u>setLiveStreamTranscoderList</u></a> (String liveStreamTranscoderList) Set comma separated list of transcoders to use for this application instance
void	<a href="#"><u>setMaximumPendingReadBytes</u></a> (int maximumPendingReaderBytes) Get maximum number of bytes a client connection can have waiting to be written before the connection is terminated.
void	<a href="#"><u>setMaximumPendingWriteBytes</u></a> (int maximumPendingWriteBytes) Set maximum number a bytes a client connection can have waiting to be sent before the connection is terminated.
void	<a href="#"><u>setMaximumSetBufferTime</u></a> (int maximumSetBufferTime) Set maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call.
void	<a href="#"><u>setMaxStorageDirDepth</u></a> (int maxStorageDirDepth) Maximum folder depth allowed for the StreamStorageDir and SharedObjectStorageDir paths
void	<a href="#"><u>setMediacasterRTPRTSPRTPTransportMode</u></a> (int mediacasterRTPRTSPRTPTransportMode) RTP MediaCaster RTSP/RTP transport mode.
void	<a href="#"><u>setMediaCasterValidator</u></a> ( <a href="#"><u>IMediaCasterValidateMediaCaster</u></a> mediaCasterValidator) Set the MediaCaster validator interface for this application instance
void	<a href="#"><u>setMediaListProvider</u></a> ( <a href="#"><u>IMediaListProvider</u></a> mediaListProvider) Set the current media list provider.

void	<a href="#"><u>setName</u></a> (String name) Set applicationInstance name
void	<a href="#"><u>setPingTimeout</u></a> (int pingTimeout) Set ping timeout (milliseconds)
void	<a href="#"><u>setRepeaterOriginUrl</u></a> (String repeaterOriginUrl) Set the Repeater Origin URL used by the Live Stream Repeater
void	<a href="#"><u>setRepeaterQueryString</u></a> (String repeaterQueryString) Set the Repeater query string that is used to connect to the origin.
void	<a href="#"><u>setRsoStorageDir</u></a> (String rsoStorageDir) Set remote shared object storage path
void	<a href="#"><u>setRTPAVSyncMethod</u></a> (int rtpAVSyncMethod) Set RTP audio/video sync method (RTPStream.AVSYNCMETHODS_SENDERREPORT, RTPStream.AVSYNCMETHODS_SYSTEMCLOCK, RTPStream.AVSYNCMETHODS_RTPTIMECODE)
void	<a href="#"><u>setRTPIIdleFrequency</u></a> (int rtspIdleFrequency) Get the default RTP idle frequency (milliseconds)
void	<a href="#"><u>setRTPMaxRTCPWaitTime</u></a> (int rtpMaxRTCPWaitTime) Set the maximum time to wait for RTCP packets (milliseconds)
void	<a href="#"><u>setRTPPlayAuthenticationMethod</u></a> (String rtpPlayAuthenticationMethod) Set the RTP play authentication method (as defined in conf/Authentication.xml)
void	<a href="#"><u>setRTPPublishAuthenticationMethod</u></a> (String rtpPublishAuthenticationMethod) Set the RTP publish authentication method (as defined in conf/Authentication.xml)
void	<a href="#"><u>setRTSPBindIpAddress</u></a> (String rtspBindIpAddress) Get the IP address to which UDP ports will be bound for RTSP/RTP sessions
void	<a href="#"><u>setRTSPConnectionAddressType</u></a> (String rtspConnectionAddressType) Set the connection IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session
void	<a href="#"><u>setRTSPConnectionIpAddress</u></a> (String rtspConnectionIpAddress) Set the connection IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session
void	<a href="#"><u>setRTSPMaximumPendingWriteBytes</u></a> (int rtspMaximumPendingWriteBytes) Set the maximum number of pending write bytes for an RTSP session
void	<a href="#"><u>setRTSPOriginAddressType</u></a> (String rtspOriginAddressType) Set the origin IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session
void	<a href="#"><u>setRTSPOriginIpAddress</u></a> (String rtspOriginIpAddress) Set the origin IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session
void	<a href="#"><u>setRTSPSessionTimeout</u></a> (int rtspSessionTimeout) Set the RTSP session timeout (milliseconds)
void	<a href="#"><u>setSharedObjectReadAccess</u></a> (String sharedObjectReadAccess) Set the default shared object read access

void	<a href="#"><u>setSharedObjectWriteAccess</u></a> (String sharedObjectWriteAccess) Set the default shared object write access
void	<a href="#"><u>setStreamAudioSampleAccess</u></a> (String streamAudioSampleAccess) Set the default stream audio sample access
void	<a href="#"><u>setStreamFileMapper</u></a> ( <a href="#"><u>IMediaStreamFileMapper</u></a> streamFileMapper) Set the stream file mapper.
void	<a href="#"><u>setStreamKeyDir</u></a> (String keyStorageDir) Set the stream key path
void	<a href="#"><u>setStreamNameAliasProvider</u></a> ( <a href="#"><u>IMediaStreamNameAliasProvider</u></a> streamNameAliasProvider) Set the stream name alias provider
void	<a href="#"><u>setStreamReadAccess</u></a> (String streamReadAccess) Set the default stream read access
void	<a href="#"><u>setStreamStorageDir</u></a> (String streamStorageDir) Set stream storage path
void	<a href="#"><u>setStreamType</u></a> (String streamType) Set default stream type for application.
void	<a href="#"><u>setStreamVideoSampleAccess</u></a> (String streamVideoSampleAccess) Set the default stream video sample access
void	<a href="#"><u>setStreamWriteAccess</u></a> (String streamWriteAccess) Set the default stream write access
void	<a href="#"><u>setValidateFMLEConnections</u></a> (boolean validateFMLEConnections) Returns true if validating FMLE connection (default is false)
void	<a href="#"><u>setValidationFrequency</u></a> (int validationFrequency) Set time between validation pings (milliseconds)
void	<a href="#"><u>setVODTimedTextProviderList</u></a> (String timedTextProviderList) Set the comma separated list of VODTimedTextProvider names being used by this application (see conf/TimedTextProviders.xml)
void	<a href="#"><u>shutdown</u></a> (boolean isServerShutdown, boolean isAppShutdown) shutdown applicationInstance
void	<a href="#"><u>shutdownClient</u></a> ( <a href="#"><u>IClient</u></a> client) shutdown a client connection immediately
boolean	<a href="#"><u>startMediaCasterStream</u></a> (String streamName, String mediaCasterType) Start a media caster stream
boolean	<a href="#"><u>startMediaCasterStream</u></a> (String streamName, String streamExt, String mediaCasterType) Start a media caster stream
void	<a href="#"><u>stopMediaCasterStream</u></a> (String streamName) Stop a media caster stream
void	<a href="#"><u>touch</u></a> ( ) Touch the application instance so that it stays loaded for at least applicationInstanceTouchTimeout

boolean	<a href="#">writeAppInstConfig</a> (String sName, String data) Method to write xml config file..

## Methods

### shutdownClient

```
public void shutdownClient(IClient client)
```

shutdown a client connection immediately

**Parameters:**

client - client connection

---

### shutdown

```
public void shutdown(boolean isServerShutdown,  
                     boolean isAppShutdown)
```

---

(continued from last page)

shutdown applicationInstance

**Parameters:**

isServerShutdown - true if due to shutdown of server  
isAppShutdown - true if due to shutdown of application

---

## getApplication

```
public IApplication getApplication()
```

Get parent application

**Returns:**

parent application

---

## getName

```
public String getName()
```

Get applicationInstance name

**Returns:**

applicationInstance name

---

## setName

```
public void setName(String name)
```

Set applicationInstance name

**Parameters:**

name - applicationInstance name

---

## getStreams

```
public MediaStreamMap getStreams()
```

Get all the mediaStream objects attached to this applicationInstance

## Get Stream By StreamId

```
IClient client;  
int streamId;  
  
MediaStreamMap streams = client.getAppInstance().getStreams();  
IMediaStream stream = streams.getStream((IClient)null, streamId);
```

**Returns:**

collection of mediaStream objects

## getVHost

```
public IVHost getVHost()
```

Get parent vHost

**Returns:**

parent vHost

---

## getProperties

```
public WMSProperties getProperties()
```

Get applicationInstance properties

**Returns:**

applicationInstance properties

---

## getManagerProperties

```
public WMSProperties getManagerProperties()
```

Get Application's manager's properties collection

**Returns:**

manager's property collection

---

## getStreamType

```
public String getStreamType()
```

Get default streamType for application.

**Returns:**

streamType name

---

## setStreamType

```
public void setStreamType(String streamType)
```

Set default stream type for application.

**Parameters:**

streamType - streamType name

---

## isAcceptConnection

```
public boolean isAcceptConnection()
```

Is auto accept connection on/off

**Returns:**

auto accept connection

---

## setAcceptConnection

```
public void setAcceptConnection(boolean acceptConnection)
```

---

(continued from last page)

Set is auto accept connection

**Parameters:**

acceptConnection - auto accept connection

---

## getClientCountTotal

```
public int getClientCountTotal()
```

Get number of client connections in total that have connected to this applicationInstance

**Returns:**

number of client connections

---

## incClientCountTotal

```
public void incClientCountTotal()
```

Increment the total number of connected client counter by one

---

## getClientCount

```
public int getClientCount()
```

Get number of client connections currently connected to applicationInstance

**Returns:**

number of client connections

---

## getClientById

```
public IClient getClientById(int index)
```

Get a client connection by the client Id

**Parameters:**

index - client Id

**Returns:**

client connection

---

## getClients

```
public java.util.List getClients()
```

Get the set of clients currently connected to this application instance (replaces getClient(index))

**Returns:**

set of clients

---

## getClient

```
public IClient getClient(int index)
```

**Deprecated.** Get the client connection at index. This method is deprecated. It is best to use getClient() to return a List objects.

(continued from last page)

**Parameters:**

index - index

**Returns:**client connection

---

## getSharedObjects

```
public ISharedObjects getSharedObjects( )
```

Get non-persistent shared object collection

**Returns:**collection of non-persistent shared objects

---

## getSharedObjects

```
public ISharedObjects getSharedObjects(boolean isPersistent)
```

Get either persistent or non-persistent shared object collection

**Parameters:**

isPersistent

**Returns:**collection of shared objects

---

## addClientListener

```
public void addClientListener(IClientNotify clientListener)
```

(continued from last page)

Add client listener. Listens for connects, disconnect, accepts and reject

## Add a Client Listener

```
IApplicationInstance appInstance;

class ClientListener implements IClientNotify
{
    public void onClientConnect(IClient client)
    {
        WMSLoggerFactory.getLogger(null).debug("onClientConnect: "+
            client.getClientId());
    }

    public void onClientDisconnect(IClient client)
    {
        WMSLoggerFactory.getLogger(null).debug("onClientDisconnect: "+
            client.getClientId());
    }

    public void onClientAccept(IClient client)
    {
        WMSLoggerFactory.getLogger(null).debug("onClientAccept: "+
            client.getClientId());
    }

    public void onClientReject(IClient client)
    {
        WMSLoggerFactory.getLogger(null).debug("onClientReject: "+
            client.getClientId());
    }
}

appInstance.addClientListener(new ClientListener());
```

**Parameters:**

clientListener - client listener

---

## removeClientListener

```
public void removeClientListener(IClientNotify clientListener)
```

Remove client listener. Listens for connects, disconnect, accepts and reject

**Parameters:**

clientListener - client listener

## addMediaStreamListener

public void **addMediaStreamListener**([IMediaStreamNotify](#) mediaStreamListener)

Add mediaStream listener. Listens for create and destroy

### Add a MediaStream Listener

```
IApplicationInstance appInstance;

class MediaStreamListener implements IMediaStreamNotify
{
    public void onMediaStreamCreate(IMediaStream stream)
    {
        WMSLoggerFactory.getLogger(null).debug("onMediaStreamCreate: "+
            stream.getSrc());
    }

    public void onMediaStreamDestroy(IMediaStream stream)
    {
        WMSLoggerFactory.getLogger(null).debug("onMediaStreamDestroy: "+
            stream.getSrc());
    }
}

appInstance.addMediaStreamListener(new MediaStreamListener());
```

#### Parameters:

mediaStreamListener - mediaStream listener

---

## removeMediaStreamListener

public void **removeMediaStreamListener**([IMediaStreamNotify](#) mediaStreamListener)

Remove mediaStream listener. Listens for create and destroy

#### Parameters:

mediaStreamListener - mediaStream listener

---

## addSharedObjectListener

public void **addSharedObjectListener**([ISharedObjectNotify](#) sharedObjectListener,  
boolean isPersistent)

(continued from last page)

Add sharedObject listener. Listens for create, destroy, clientConnect, clientDisconnect

## Add SharedObject Listener

```
IApplicationInstance appInstance;

class SharedObjectListener implements ISharedObjectNotify
{
    public void onSharedObjectCreate(ISharedObject sharedObject)
    {
        WMSLoggerFactory.getLogger(null).debug("onSharedObjectCreate: "+
            sharedObject.getName());
    }

    public void onSharedObjectDestroy(ISharedObject sharedObject)
    {
        WMSLoggerFactory.getLogger(null).debug("onSharedObjectDestroy: "+
            sharedObject.getName());
    }

    public void onSharedObjectConnect(ISharedObject sharedObject, IClient client)
    {
        WMSLoggerFactory.getLogger(null).debug("onSharedObjectConnect: "+
            sharedObject.getName());
    }

    public void onSharedObjectDisconnect(ISharedObject sharedObject, IClient client)
    {
        WMSLoggerFactory.getLogger(null).debug("onSharedObjectDisconnect: "+
            sharedObject.getName());
    }
}

appInstance.addSharedObjectListener(new SharedObjectListener(), false);
```

### Parameters:

sharedObjectListener - sharedObject listener  
isPersistent

---

## removeSharedObjectListener

```
public void removeSharedObjectListener(ISharedObjectNotify sharedObjectListener,
    boolean isPersistent)
```

Remove sharedObject listener. Listens for create, destroy, clientConnect, clientDisconnect

### Parameters:

(continued from last page)

sharedObjectListener - sharedObject listener  
isPersistent

---

## addMediaCasterListener

```
public void addMediaCasterListener(IMediaCasterNotify mediaCasterListener)
```

Add mediaCaster listener. Listens for create, destroy, registerPlayer, unregisterPlayer, setSourceStream

### Parameters:

mediaCasterListener

---

## addMediaCasterListener

```
public void addMediaCasterListener(IMediaCasterNotify2 mediaCasterListener)
```

Add mediaCaster listener. Listens for create, destroy, registerPlayer, unregisterPlayer, setSourceStream

### Parameters:

mediaCasterListener

---

## removeMediaCasterListener

```
public void removeMediaCasterListener(IMediaCasterNotify mediaCasterListener)
```

Remove mediaCaster listener. Listens for create, destroy, registerPlayer, unregisterPlayer, setSourceStream

### Parameters:

mediaCasterListener

---

## getConnectionCounter

```
public ConnectionCounter getConnectionCounter( )
```

Get the connectionCounter for applicationInstance

### Returns:

connection counter

---

## getConnectionCounter

```
public ConnectionCounterSimple getConnectionCounter(int counterIndex)
```

Get the connectionCounter for applicationInstance for a specific technology (see IVHost.COUNTER\_\*)

### Parameters:

counterIndex - counter index

### Returns:

connection counter

---

## getDateStarted

```
public String getDateStarted( )
```

Get date applicationInstance started

### Returns:

(continued from last page)

date applicationInstance started

---

## getTimeRunning

```
public String getTimeRunning()
```

Get time applicationInstance running

**Returns:**

time applicationInstance running

---

## getTimeRunningSeconds

```
public double getTimeRunningSeconds()
```

Get time running in seconds

**Returns:**

time running in seconds

---

## broadcastMsg

```
public void broadcastMsg(java.util.List clientList,  
                          String handlerName)
```

Broadcast a message to a specific list of clients connected to this application instance

**Parameters:**

clientList - list of client

handlerName - handler name

---

## broadcastMsg

```
public void broadcastMsg(java.util.List clientList,  
                          String handlerName,  
                          Object[] params)
```

Broadcast a message to a specific list of clients connected to this application instance

**Parameters:**

clientList - list of client

handlerName - handler name

params - parameters

---

## broadcastMsg

```
public void broadcastMsg(String handlerName,  
                          Object[] params)
```

(continued from last page)

Broadcast a message to all clients connected to this applicationInstance

## Broadcast Message to All Clients

```
IApplicationInstance appInstance;
appInstance.broadcastMsg("onNotify", "Hello World", 1.2345, false, new Date());
```

### Parameters:

handlerName - handler name

params - variable list of arguments (Java primitive and Strings will be wrapped in AMFData objects)

---

## getIOPerformanceCounter

```
public IOPerformanceCounter getIOPerformanceCounter()
```

Get the performance counter for applicationInstance

### Returns:

io performance counter

---

## getIOPerformanceCounter

```
public IOPerformanceCounter getIOPerformanceCounter(int counterIndex)
```

Get the performance counter for applicationInstance for a specific technology (see IVHost.COUNTER\_\*)

### Parameters:

counterIndex - counter index (see IVHost.COUNTER\_\*)

### Returns:

connection counter

---

## addPlayStreamByName

```
public void addPlayStreamByName(IMediaStream stream,
    String name)
```

Add a media stream to the list of streams that are listening for a published stream

### Parameters:

stream - media stream

name - stream name

---

## removePlayStreamByName

```
public void removePlayStreamByName(IMediaStream stream)
```

Remove media stream from the list of streams that are listening for a published stream

### Parameters:

(continued from last page)

stream - media stream

---

## getPlayStreamCountsByName

```
public java.util.Map getPlayStreamCountsByName( )
```

Get a map of stream names to number of Flash players playing the stream name

**Returns:**

map of stream names to number of Flash players playing the stream name

---

## getPlayStreamCount

```
public int getPlayStreamCount(String streamName)
```

Get the number of Flash players playing a given stream name

**Parameters:**

streamName - stream name

**Returns:**

number of players

---

## getPlayStreamsByName

```
public java.util.List getPlayStreamsByName(String name)
```

Get a list of media streams that are listening for published stream.

**Parameters:**

name - stream name

**Returns:**

list of streams or null if no listeners

---

## getMediaCasterStreams

```
public MediaCasterStreamMap getMediaCasterStreams( )
```

Get the media caster streams attached to this application instance

**Returns:**

media caster streams attached to this application instance

---

## getStreamCount

```
public int getStreamCount( )
```

Get the total number of open streams attached to this application instance

**Returns:**

the total number of open streams attached to this application instance

---

## getModFunctions

```
public ModuleFunctions getModFunctions( )
```

Get list of application modules

---

(continued from last page)

**Returns:**

list of application modules

---

**addModuleListener**

```
public void addModuleListener(IModuleNotify moduleListener)
```

Add module listener. Listens for onModuleLoad and onModuleUnload events. See IModuleNotify.

**Parameters:**

moduleListener - module listener

---

**removeModuleListener**

```
public void removeModuleListener(IModuleNotify moduleListener)
```

Remove module listener

**Parameters:**

moduleListener - module listener

---

**getModuleList**

```
public ModuleList getModuleList()
```

Get the list of loaded modules.

**Returns:**

list of loaded modules

---

**getModuleInstance**

```
public Object getModuleInstance(String name)
```

Get the instance of the module class for this application instance.

**Parameters:**

name - module name as defined in Application.xml

**Returns:**

instance of class for this application instance

---

**getApplicationTimeout**

```
public int getApplicationTimeout()
```

Get application timeout (milliseconds)

**Returns:**

application timeout (milliseconds)

---

**setApplicationTimeout**

```
public void setApplicationTimeout(int applicationTimeout)
```

Set application timeout (milliseconds)

(continued from last page)

**Parameters:**

applicationTimeout - application timeout (milliseconds)

---

**getPingTimeout**

```
public int getPingTimeout()
```

Get ping timeout (milliseconds)

**Returns:**

ping timeout (milliseconds)

---

**setPingTimeout**

```
public void setPingTimeout(int pingTimeout)
```

Set ping timeout (milliseconds)

**Parameters:**

pingTimeout - ping timeout (milliseconds)

---

**getValidationFrequency**

```
public int getValidationFrequency()
```

Get time between validation pings (milliseconds)

**Returns:**

time between validation pings (milliseconds)

---

**setValidationFrequency**

```
public void setValidationFrequency(int validationFrequency)
```

Set time between validation pings (milliseconds)

**Parameters:**

validationFrequency - time between validation pings (milliseconds)

---

**getMaximumPendingWriteBytes**

```
public int getMaximumPendingWriteBytes()
```

Get maximum number a bytes a client connection can have waiting to be sent before the connection is terminated. If set to zero this feature is turned off.

**Returns:**

maximum number a bytes a client connection can have waiting to be sent before the connection is terminated

---

**setMaximumPendingWriteBytes**

```
public void setMaximumPendingWriteBytes(int maximumPendingWriteBytes)
```

Set maximum number a bytes a client connection can have waiting to be sent before the connection is terminated. If set to zero this feature is turned off.

**Parameters:**

maximumPendingWriteBytes - maximum number a bytes a client connection can have waiting to be sent before the connection is terminated

## getMaximumPendingReadBytes

```
public int getMaximumPendingReadBytes()
```

Set maximum number of bytes a client connection can have waiting to be written before the connection is terminated. If set to zero this feature is off.

**Returns:**

maximum number of bytes a client connection can have waiting to be written before the connection is terminated

---

## setMaximumPendingReadBytes

```
public void setMaximumPendingReadBytes(int maximumPendingReaderBytes)
```

Get maximum number of bytes a client connection can have waiting to be written before the connection is terminated. If set to zero this feature is off.

**Parameters:**

maximumPendingReaderBytes - maximum number of bytes a client connection can have waiting to be written before the connection is terminated

---

## setMaximumSetBufferTime

```
public void setMaximumSetBufferTime(int maximumSetBufferTime)
```

Set maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call. If set to zero this feature is turned off.

**Parameters:**

maximumSetBufferTime - maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call

---

## getMaximumSetBufferTime

```
public int getMaximumSetBufferTime()
```

Get maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call. If set to zero this feature is turned off.

**Returns:**

maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call

---

## getRepeaterOriginUrl

```
public String getRepeaterOriginUrl()
```

Get the Repeater Origin URL used by the Live Stream Repeater

**Returns:**

URL used by the Live Stream Repeater

---

## setRepeaterOriginUrl

```
public void setRepeaterOriginUrl(String repeaterOriginUrl)
```

Set the Repeater Origin URL used by the Live Stream Repeater

**Parameters:**

repeaterOriginUrl - URL used by the Live Stream Repeater

---

## getRepeaterQueryString

```
public String getRepeaterQueryString()
```

Get the Repeater query string that is used to connect to the origin. This value can be used to pass secure URL parameters to the origin for security validation.

**Returns:**

Repeater query string

---

## setRepeaterQueryString

```
public void setRepeaterQueryString(String repeaterQueryString)
```

Set the Repeater query string that is used to connect to the origin. This value can be used to pass secure URL parameters to the origin for security validation.

**Parameters:**

repeaterQueryString - Repeater query string

---

## getAllowDomains

```
public String[] getAllowDomains()
```

Get the list of domain names used to control access to this application. Upon connection, if this list is non-null the client.referrer value is checked to make sure the referrer is from a domain in this list.

**Returns:**

list of domain names used to control access to this application

---

## setAllowDomains

```
public void setAllowDomains(String[] domainFilter)
```

Set the list of domain names used to control access to this application. Upon connection, if this list is non-null the client.referrer value is checked to make sure the referrer is from a domain in this list.

**Parameters:**

domainFilter - list of domain names used to control access to this application

---

## parseAllowDomains

```
public void parseAllowDomains(String domainFilterStr)
```

Parse a comma delimited list of domain names used to control access to this application. Upon connection, if this list is non-null the client.referrer value is checked to make sure the referrer is from a domain in this list.

**Parameters:**

domainFilterStr - comma delimited list of domain names

---

## getClientIdleFrequency

```
public int getClientIdleFrequency()
```

Get default client idle frequency (milliseconds)

**Returns:**

default client idle frequency (milliseconds)

---

---

## setClientIdleFrequency

```
public void setClientIdleFrequency(int clientIdleFrequency)
```

Set default client idle frequency (milliseconds)

**Parameters:**

clientIdleFrequency - default client idle frequency (milliseconds)

---

## getRTPIdeFrequency

```
public int getRTPIdeFrequency( )
```

Set the default RTP idle frequency (milliseconds)

**Returns:**

default RTP idle frequency (milliseconds)

---

## setRTPIdeFrequency

```
public void setRTPIdeFrequency(int rtspIdleFrequency)
```

Get the default RTP idle frequency (milliseconds)

**Parameters:**

rtspIdleFrequency - default RTP idle frequency (milliseconds)

---

## getStreamStorageDir

```
public String getStreamStorageDir( )
```

Get stream storage path

**Returns:**

stream storage path

---

## setStreamStorageDir

```
public void setStreamStorageDir(String streamStorageDir)
```

Set stream storage path

**Parameters:**

streamStorageDir - stream storage path

---

## getStreamKeyDir

```
public String getStreamKeyDir( )
```

Get the stream key path

**Returns:**

stream key path

---

## setStreamKeyDir

```
public void setStreamKeyDir(String keyStorageDir)
```

---

(continued from last page)

Set the stream key path

**Parameters:**

keyStorageDir - stream key path

---

## getRsoStorageDir

```
public String getRsoStorageDir()
```

Get remote shared object storage path

**Returns:**

remote shared object storage path

---

## setRsoStorageDir

```
public void setRsoStorageDir(String rsoStorageDir)
```

Set remote shared object storage path

**Parameters:**

rsoStorageDir - remote shared object storage path

---

## getStreamKeyPath

```
public String getStreamKeyPath()
```

Get the resolved key path to the MediaStreams encryption keys

**Returns:**

resolved key path to the MediaStreams encryption keys

---

## getStreamStoragePath

```
public String getStreamStoragePath()
```

Get the resolved storage path to the MediaStreams

**Returns:**

resolved storage path to the MediaStreams

---

## getRsoStoragePath

```
public String getRsoStoragePath()
```

Get the resolved storage path to the shared objects

**Returns:**

resolved storage path to the shared objects

---

## getStreamVideoSampleAccess

```
public String getStreamVideoSampleAccess()
```

Get the default stream video sample access

**Returns:**

default stream video sample access

(continued from last page)

See Also:

[IClient.getStreamVideoSampleAccess\(\)](#)

---

## setStreamVideoSampleAccess

```
public void setStreamVideoSampleAccess(String streamVideoSampleAccess)
```

Set the default stream video sample access

**Parameters:**

streamVideoSampleAccess - default stream video sample access

See Also:

[IClient.setStreamVideoSampleAccess\(String\)](#)

---

## getStreamAudioSampleAccess

```
public String getStreamAudioSampleAccess()
```

Get the default stream audio sample access

**Returns:**

default stream audio sample access

See Also:

[IClient.getStreamAudioSampleAccess\(\)](#)

---

## setStreamAudioSampleAccess

```
public void setStreamAudioSampleAccess(String streamAudioSampleAccess)
```

Set the default stream audio sample access

**Parameters:**

streamAudioSampleAccess

See Also:

[IClient.setStreamAudioSampleAccess\(String\)](#)

---

## getStreamReadAccess

```
public String getStreamReadAccess()
```

Get the default stream read access

**Returns:**

default stream read access

See Also:

[IClient.getStreamReadAccess\(\)](#)

---

## setStreamReadAccess

```
public void setStreamReadAccess(String streamReadAccess)
```

Set the default stream read access

(continued from last page)

**Parameters:**

streamReadAccess - default stream read access

**See Also:**[IClient.setStreamReadAccess\(String\)](#)

---

## getStreamWriteAccess

```
public String getStreamWriteAccess()
```

Get the default stream write access

**Returns:**

default stream write access

**See Also:**[IClient.getStreamWriteAccess\(\)](#)

---

## setStreamWriteAccess

```
public void setStreamWriteAccess(String streamWriteAccess)
```

Set the default stream write access

**Parameters:**

streamWriteAccess - default stream write access

**See Also:**[IClient.setStreamWriteAccess\(String\)](#)

---

## getSharedObjectReadAccess

```
public String getSharedObjectReadAccess()
```

Get the default shared object read access

**Returns:**

default shared object read access

**See Also:**[IClient.getSharedObjectReadAccess\(\)](#)

---

## setSharedObjectReadAccess

```
public void setSharedObjectReadAccess(String sharedObjectReadAccess)
```

Set the default shared object read access

**Parameters:**

sharedObjectReadAccess - default shared object read access

**See Also:**[IClient.setSharedObjectReadAccess\(String\)](#)

---

## getSharedObjectWriteAccess

```
public String getSharedObjectWriteAccess()
```

(continued from last page)

Get the default shared object write access

**Returns:**

default shared object write access

**See Also:**

[IClient.getSharedObjectWriteAccess\(\)](#)

---

## setSharedObjectWriteAccess

```
public void setSharedObjectWriteAccess(String sharedObjectWriteAccess)
```

Set the default shared object write access

**Parameters:**

sharedObjectWriteAccess - default shared object write access

**See Also:**

[IClient.setSharedObjectWriteAccess\(String\)](#)

---

## getRTPPublishAuthenticationMethod

```
public String getRTPPublishAuthenticationMethod()
```

Get the RTP publish authentication method (as defined in conf/Authentication.xml)

**Returns:**

RTP publish authentication method

---

## setRTPPublishAuthenticationMethod

```
public void setRTPPublishAuthenticationMethod(String rtpPublishAuthenticationMethod)
```

Set the RTP publish authentication method (as defined in conf/Authentication.xml)

**Parameters:**

rtpPublishAuthenticationMethod - RTP publish authentication method

---

## getRTPPlayAuthenticationMethod

```
public String getRTPPlayAuthenticationMethod()
```

Get the RTP play authentication method (as defined in conf/Authentication.xml)

**Returns:**

RTP play authentication method

---

## setRTPPlayAuthenticationMethod

```
public void setRTPPlayAuthenticationMethod(String rtpPlayAuthenticationMethod)
```

Set the RTP play authentication method (as defined in conf/Authentication.xml)

**Parameters:**

rtpPlayAuthenticationMethod - RTP play authentication method

(continued from last page)

## getRTPAVSyncMethod

```
public int getRTPAVSyncMethod( )
```

Get RTP audio/video sync method (RTPStream.AVSYNCMETHODS\_SENDERREPORT, RTPStream.AVSYNCMETHODS\_SYSTEMCLOCK, RTPStream.AVSYNCMETHODS\_RTPTIMECODE)

**Returns:**

RTP audio/video sync method

---

## setRTPAVSyncMethod

```
public void setRTPAVSyncMethod(int rtpAVSyncMethod)
```

Set RTP audio/video sync method (RTPStream.AVSYNCMETHODS\_SENDERREPORT, RTPStream.AVSYNCMETHODS\_SYSTEMCLOCK, RTPStream.AVSYNCMETHODS\_RTPTIMECODE)

**Parameters:**

rtpAVSyncMethod - RTP audio/video sync method

---

## getRTPMaxRTCPWaitTime

```
public int getRTPMaxRTCPWaitTime( )
```

Get the maximum time to wait for RTCP packets (milliseconds)

**Returns:**

maximum time to wait for RTCP packets (milliseconds)

---

## setRTPMaxRTCPWaitTime

```
public void setRTPMaxRTCPWaitTime(int rtpMaxRTCPWaitTime)
```

Set the maximum time to wait for RTCP packets (milliseconds)

**Parameters:**

rtpMaxRTCPWaitTime - maximum time to wait for RTCP packets (milliseconds)

---

## getRTPSessions

```
public java.util.List getRTPSessions(String streamName)
```

Get a list of RTP sessions running under this application instance playing a given stream name

**Parameters:**

streamName - stream name

**Returns:**

list of RTP sessions running under this application instance playing a given stream name

---

## getRTPSessions

```
public java.util.List getRTPSessions( )
```

Get a list of RTP sessions running under this application instance

**Returns:**

list of RTP sessions running under this application instance

## getRTPSessionCountsByName

```
public java.util.Map getRTPSessionCountsByName()
```

Get a map of stream names and session counts of RTP sessions

**Returns:**

map of stream names and session counts

---

## getRTPSessionCount

```
public int getRTPSessionCount(String streamName)
```

Get the number of RTP player streams playing a given stream name

**Parameters:**

streamName - stream name

**Returns:**

the number of RTP sessions

---

## getRTPSessionCount

```
public int getRTPSessionCount()
```

Get the number of RTP sessions running under this application instance

**Returns:**

the number of RTP sessions running under this application instance

---

## addRTPSession

```
public void addRTPSession(RTPSession rtpSession)
```

Add an RTP session to this application instance

**Parameters:**

rtpSession - RTP session to add

---

## registerPlayRTPSession

```
public void registerPlayRTPSession(RTPSession rtpSession)
```

Register an RTP session as a play session

**Parameters:**

rtpSession - RTP session to register

---

## removeRTPSession

```
public void removeRTPSession(RTPSession rtpSession)
```

Remove an RTP session from this application instance

**Parameters:**

rtpSession - RTP session to remove

---

## getClientsLockObj

```
public edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock  
getClientsLockObj()
```

Get the read/write lock for this application instance

**Returns:**

read/write lock for this application instance

---

## getStreamProperties

```
public WMSProperties getStreamProperties()
```

Get the property collection of stream settings that are specific to this application instance

**Returns:**

property collection of stream settings

---

## getMediaCasterProperties

```
public WMSProperties getMediaCasterProperties()
```

Get the property collection of media caster settings that are specific to this application instance

**Returns:**

property collection of media caster settings

---

## getMediaReaderProperties

```
public WMSProperties getMediaReaderProperties()
```

Get the property collection of media reader settings that are specific to this application instance

**Returns:**

property collection of media reader settings

---

## getMediaWriterProperties

```
public WMSProperties getMediaWriterProperties()
```

Get the property collection of media reader settings that are specific to this application instance

**Returns:**

property collection of media reader settings

---

## getRTPProperties

```
public WMSProperties getRTPProperties()
```

Get the property collection of RTP settings that are specific to this application instance

**Returns:**

property collection of RTP settings

---

(continued from last page)

---

## getLiveStreamPacketizerProperties

```
public WMSProperties getLiveStreamPacketizerProperties()
```

Get the property collection of LiveStreamPacketizer settings that are specific to this application instance

**Returns:**

property collection of LiveStreamPacketizer settings

---

## getTranscoderProperties

```
public WMSProperties getTranscoderProperties()
```

Get the property collection of Transcoder settings that are specific to this application instance

**Returns:**

property collection of Transcoder settings

---

## getHTTPStreamerProperties

```
public WMSProperties getHTTPStreamerProperties()
```

Get the property collection of HTTPStreamer settings that are specific to this application instance

**Returns:**

property collection of HTTPStreamer settings

---

## getWebRTCProperties

```
public WMSProperties getWebRTCProperties()
```

Get the property collection of WebRTC settings that are specific to this application instance

**Returns:**

property collection of WebRTC settings

---

## getMaxStorageDirDepth

```
public int getMaxStorageDirDepth()
```

Maximum folder depth allowed for the StreamStorageDir and SharedObjectStorageDir paths

**Returns:**

folder depth

---

## setMaxStorageDirDepth

```
public void setMaxStorageDirDepth(int maxStorageDirDepth)
```

Maximum folder depth allowed for the StreamStorageDir and SharedObjectStorageDir paths

**Parameters:**

maxStorageDirDepth - folder depth

---

## getStreamFileMapper

```
public IMediaStreamFileMapper getStreamFileMapper()
```

(continued from last page)

Get the stream file mapper. See [IMediaStreamFileMapper](#)

**Returns:**

streamFileMapper stream file mapper

**setStreamFileMapper**

```
public void setStreamFileMapper(IMediaStreamFileMapper streamFileMapper)
```

Set the stream file mapper. See [IMediaStreamFileMapper](#)

**Parameters:**

streamFileMapper - stream file mapper

**decodeStorageDir**

```
public String decodeStorageDir(String storageDir)
```

This function will take a storage path that uses variables and expand the variables based on the context. It supports the following variables (as well as any system variables): `${com.wowza.wms.AppHome}`: Application home directory `${com.wowza.wms.ConfigHome}`: Configuration home directory `${com.wowza.wms.context.VHostConfigHome}`: Virtual configuration path `${com.wowza.wms.context.VHost}`: Virtual host name `${com.wowza.wms.context.Application}`: Application name `${com.wowza.wms.context.ApplicationInstance}`: Application instance name

**getLiveStreamPacketizerList**

```
public String getLiveStreamPacketizerList()
```

Get the comma separated list of LiveStreamPacketizers names being used by this application (see [conf/LiveStreamPacketizers.xml](#))

**Returns:**

comma separated list of LiveStreamPacketizers names

**getHTTPStreamerList**

```
public String getHTTPStreamerList()
```

Get the comma separated list of HTTPStreamers names being used by this application (see [conf/HTTPStreamers.xml](#))

**Returns:**

comma separated list of HTTPStreamers names

**setLiveStreamPacketizerList**

```
public void setLiveStreamPacketizerList(String liveStreamPacketizerList)
```

Set the comma separated list of LiveStreamPacketizers names being used by this application (see [conf/LiveStreamPacketizers.xml](#))

**Parameters:**

liveStreamPacketizerList - comma separated list of LiveStreamPacketizers names

**setHTTPStreamerList**

```
public void setHTTPStreamerList(String httpStreamerList)
```

Set the comma separated list of HTTPStreamer names being used by this application (see [conf/HTTPStreamers.xml](#))

**Parameters:**

(continued from last page)

---

httpStreamerList - comma separated list of HTTPStreamer names

---

## containsHTTPStreamer

```
public boolean containsHTTPStreamer(String httpStreamer)
```

Does this application instance allow streaming of a given HTTPStreamer

**Parameters:**

httpStreamer - HTTP Streamer name

**Returns:**

true is this type of streaming is allowed

---

## containsLiveStreamPacketizer

```
public boolean containsLiveStreamPacketizer(String liveStreamPacketizer)
```

Does this application instance contain a references to this live stream packetizer. If it is true we consider this a live stream source for the HTTP streamer. If false then we consider this a video on demand source.

**Parameters:**

liveStreamPacketizer - live stream packetizer name

**Returns:**

true if contains reference to it

---

## containsDvrRecorder

```
public boolean containsDvrRecorder(String dvrRecorder)
```

Does this application instance contain a references to this DVR recorder. If it is true we consider this a DVR source for the HTTP streamer.

**Parameters:**

dvrRecorder - DVR recorder name

**Returns:**

true if contains reference to it

---

## getVODTimedTextProviderList

```
public String getVODTimedTextProviderList()
```

Get the comma separated list of VODTimedTextProvider names being used by this application (see conf/TimedTextProviders.xml)

**Returns:**

comma separated list of VODTimedTextProvider names

---

## setVODTimedTextProviderList

```
public void setVODTimedTextProviderList(String timedTextProviderList)
```

Set the comma separated list of VODTimedTextProvider names being used by this application (see conf/TimedTextProviders.xml)

**Parameters:**

timedTextProviderList - comma separated list of VODTimedTextProvider names

---

## getVODTimedTextProviderSet

```
public java.util.List getVODTimedTextProviderSet()
```

---

## getTimedTextProperties

```
public WMSProperties getTimedTextProperties()
```

Get the property collection of timed text settings that are specific to this application instance. These are defined in Application/TimedText/Properties tag in Application.xml

**Returns:**

property collection of Timed Text settings

---

## getStreamNameAliasProvider

```
public IMediaStreamNameAliasProvider getStreamNameAliasProvider()
```

Get the stream name alias provider

**Returns:**

stream name alias provider

---

## setStreamNameAliasProvider

```
public void setStreamNameAliasProvider(IMediaStreamNameAliasProvider  
streamNameAliasProvider)
```

Set the stream name alias provider

**Parameters:**

streamNameAliasProvider - stream name alias provider

---

## getPublishers

```
public java.util.List getPublishers()
```

Get the set of server side publishers

**Returns:**

set of server side publishers

---

## getPublisherCount

```
public int getPublisherCount()
```

Get the current number of server side publishers

**Returns:**

number of server side publishers

---

## addPublisher

```
public void addPublisher(Publisher publisher)
```

Add a server side publisher to this application instance

(continued from last page)

**Parameters:**

publisher - server side publisher

---

**removePublisher**

```
public void removePublisher(Publisher publisher)
```

Remove a server side publisher from this application instance

**Parameters:**

publisher - server side publisher

---

**getHTTPStreamerSessions**

```
public java.util.List getHTTPStreamerSessions(int protocol,  
String streamName)
```

Get the HTTPStreamerSessions associated with this application instance for a stream name by protocol. See (IHTTPStreamerSession.SESSIONPROTOCOL\_\*) for protocols

**Parameters:**

protocol - streaming protocol (IHTTPStreamerSession.SESSIONPROTOCOL\_\*)

streamName - stream name

**Returns:**

HTTPStreamerSessions associated with this application instance

---

**getHTTPStreamerSessions**

```
public java.util.List getHTTPStreamerSessions(String streamName)
```

Get the HTTPStreamerSessions associated with this application instance for a stream name

**Parameters:**

streamName - stream name

**Returns:**

HTTPStreamerSessions associated with this application instance

---

**getHTTPStreamerSessionCountsByName**

```
public java.util.Map getHTTPStreamerSessionCountsByName(int protocol)
```

Get a map of session counts by name for a given protocol

**Parameters:**

protocol - streaming protocol (IHTTPStreamerSession.SESSIONPROTOCOL\_\*)

**Returns:**

map of session counts by name

---

**getHTTPStreamerSessionCount**

```
public int getHTTPStreamerSessionCount(String streamName)
```

Get the current number of HTTPStreamerSessions associated with this application instance and stream name

**Parameters:**

(continued from last page)

streamName - stream name

**Returns:**

number of HTTPStreamerSessions associated with this application instance

---

## getHTTPStreamerSessionCount

```
public int getHTTPStreamerSessionCount(int protocol,
    String streamName)
```

Get the current number of HTTPStreamerSessions associated with this application instance and stream name by protocol . See (IHTTPStreamerSession.SESSIONPROTOCOL\_\*) for protocols

**Parameters:**

protocol - streaming protocol (IHTTPStreamerSession.SESSIONPROTOCOL\_\*)  
streamName - stream name

**Returns:**

HTTPStreamerSessions associated with this application instance

---

## getHTTPStreamerSessions

```
public java.util.List getHTTPStreamerSessions()
```

Get the HTTPStreamerSessions associated with this application instance

**Returns:**

HTTPStreamerSessions associated with this application instance

---

## getHTTPStreamerSessions

```
public java.util.List getHTTPStreamerSessions(int protocol)
```

Get the HTTPStreamerSessions associated with this application instance by protocol. See (IHTTPStreamerSession.SESSIONPROTOCOL\_\*) for protocols

**Parameters:**

protocol - streaming protocol (IHTTPStreamerSession.SESSIONPROTOCOL\_\*)

**Returns:**

HTTPStreamerSessions associated with this application instance

---

## getHTTPStreamerSessionCount

```
public int getHTTPStreamerSessionCount()
```

Get the current number of HTTPStreamerSessions associated with this application instance

**Returns:**

current number of HTTPStreamerSessions associated with this application instance

---

## getHTTPStreamerSessionCount

```
public int getHTTPStreamerSessionCount(int protocol)
```

Get the current number of HTTPStreamerSessions associated with this application instance by protocol. See (IHTTPStreamerSession.SESSIONPROTOCOL\_\*) for protocols

**Parameters:**

(continued from last page)

protocol - streaming protocol (IHTTPStreamerSession.SESSIONPROTOCOL\_\*)

**Returns:**

current number of HTTPStreamerSessions associated with this application instance

---

## addHTTPStreamerSession

```
public void addHTTPStreamerSession(IHTTPStreamerSession httpStreamerSession)
```

Add a HTTPStreamerSession to this application instance

**Parameters:**

httpStreamerSession - HTTPStreamerSession

---

## removeHTTPStreamerSession

```
public void removeHTTPStreamerSession(IHTTPStreamerSession httpStreamerSession)
```

Remove a HTTPStreamerSession from this application instance

**Parameters:**

httpStreamerSession - HTTPStreamerSession

---

## getHTTPStreamerApplicationContext

```
public IHTTPStreamerApplicationContext getHTTPStreamerApplicationContext(String  
httpStreamName,  
boolean doCreate)
```

Get the HTTPStreamer application context for a given HTTPStreamer adapter

**Parameters:**

httpStreamName - HTTPStreamer adapter name  
doCreate - create if it does not exist

**Returns:**

HTTPStreamer application context

---

## addRTPIncomingDatagramPortRange

```
public void addRTPIncomingDatagramPortRange(int startPort,  
int endPort)
```

Add a port range to the list of valid incoming RTP UDP ports

**Parameters:**

startPort - starting port number  
endPort - end port number

---

## addRTPIncomingDatagramPortAll

```
public void addRTPIncomingDatagramPortAll()
```

Allow all incoming RTP UDP ports for this application instance

---

## isRTPIncomingDatagramPortValid

```
public boolean isRTPIncomingDatagramPortValid(int port)
```

(continued from last page)

Check a port number to be sure it is a valid RTP UDP port for this application instance

**Parameters:**

port - port number

**Returns:**

true if the port is valid

---

## readAppInstConfig

```
public String readAppInstConfig(String sName)
```

Method to read xml config file..

---

## writeAppInstConfig

```
public boolean writeAppInstConfig(String sName,  
    String data)
```

Method to write xml config file..

---

## getLiveStreamPacketizerControl

```
public ILiveStreamPacketizerControl getLiveStreamPacketizerControl()
```

Get the Live Stream Packetizer Controller. This class will get called each time a stream is to be packetized using the LiveStreamPacketizer mechanism.

**Returns:**

Live Stream Packetizer Controller

---

## setLiveStreamPacketizerControl

```
public void setLiveStreamPacketizerControl(ILiveStreamPacketizerControl  
liveStreamPacketizerControl)
```

Set the Live Stream Packetizer Controller. This class will get called each time a stream is to be packetized using the LiveStreamPacketizer mechanism.

**Parameters:**

liveStreamPacketizerControl - Live Stream Packetizer Controller

---

## resetMediaCasterStream

```
public boolean resetMediaCasterStream(String streamName)
```

Reset a media caster stream

**Parameters:**

streamName - stream name

**Returns:**

true if successful

---

## resetMediaCasterStream

```
public boolean resetMediaCasterStream(String streamName,  
    String streamExt)
```

(continued from last page)

Reset a media caster stream

**Parameters:**

streamName - stream name  
streamExt - stream extension

**Returns:**

true if successful

---

**startMediaCasterStream**

```
public boolean startMediaCasterStream(String streamName,  
    String streamExt,  
    String mediaCasterType)
```

Start a media caster stream

**Parameters:**

streamName - stream name  
streamExt - stream extension  
mediaCasterType - media caster stream type

**Returns:**

true if successful

---

**startMediaCasterStream**

```
public boolean startMediaCasterStream(String streamName,  
    String mediaCasterType)
```

Start a media caster stream

**Parameters:**

streamName - stream name  
mediaCasterType - media caster stream type

**Returns:**

true if successful

---

**stopMediaCasterStream**

```
public void stopMediaCasterStream(String streamName)
```

Stop a media caster stream

**Parameters:**

streamName - stream name

---

**getContextStr**

```
public String getContextStr()
```

Returns the application context string in the form [application]/[appInstance].

**Returns:**

application context string

(continued from last page)

## getPublishStreamNames

```
public java.util.List getPublishStreamNames()
```

Get the list of live stream names currently being published.

**Returns:**

list of live stream names currently being published

---

## addMediaWriterListener

```
public void addMediaWriterListener(IMediaWriterActionNotify listener)
```

Add a MediaWriter listener class. See IMediaWriterActionNotify

**Parameters:**

listener - MediaWriter listener class

---

## removeMediaWriterListener

```
public void removeMediaWriterListener(IMediaWriterActionNotify listener)
```

remove MediaWriter listener class. See IMediaWriterActionNotify

**Parameters:**

listener - MediaWriter listener class

---

## notifyMediaWriterOnWriteComplete

```
public void notifyMediaWriterOnWriteComplete(IMediaStream stream,  
java.io.File file)
```

Notify all MediaWriter listeners of onWriteComplete

**Parameters:**

stream - media stream

file - file that was written

---

## notifyMediaWriterOnFLVAddMetadata

```
public void notifyMediaWriterOnFLVAddMetadata(IMediaStream stream,  
java.util.Map extraMetadata)
```

Notify all MediaWriter listeners of onFLVAddMetadata

**Parameters:**

stream - media stream

extraMetadata - meta to add to the file

---

## getMediaCasterValidator

```
public IMediaCasterValidateMediaCaster getMediaCasterValidator()
```

Get the MediaCaster validator interface for this application instance

**Returns:**

MediaCaster validator interface

(continued from last page)

## setMediaCasterValidator

```
public void setMediaCasterValidator(IMediaCasterValidateMediaCaster  
mediaCasterValidator)
```

Set the MediaCaster validator interface for this application instance

### Parameters:

mediaCasterValidator - MediaCaster validator interface

---

## touch

```
public void touch()
```

Touch the application instance so that it stays loaded for at least applicationInstanceTouchTimeout

---

## getLastTouchTime

```
public long getLastTouchTime()
```

Get the last time the instance was touched (milliseconds)

### Returns:

last time the instance was touched (milliseconds)

---

## getApplicationInstanceTouchTimeout

```
public int getApplicationInstanceTouchTimeout()
```

Get the application instance touch timeout (milliseconds). Default is 5000.

### Returns:

application instance touch timeout (milliseconds)

---

## setApplicationInstanceTouchTimeout

```
public void setApplicationInstanceTouchTimeout(int applicationInstanceTouchTimeout)
```

Set the application instance touch timeout (milliseconds). Default is 5000.

### Parameters:

applicationInstanceTouchTimeout - application instance touch timeout (milliseconds)

---

## getRTSPSessionTimeout

```
public int getRTSPSessionTimeout()
```

Get the RTSP session timeout (milliseconds)

### Returns:

RTSP session timeout (milliseconds)

---

## setRTSPSessionTimeout

```
public void setRTSPSessionTimeout(int rtspSessionTimeout)
```

Set the RTSP session timeout (milliseconds)

### Parameters:

(continued from last page)

---

`rtspSessionTimeout` - RTSP session timeout (milliseconds)

---

## **getRTSPMaximumPendingWriteBytes**

```
public int getRTSPMaximumPendingWriteBytes()
```

Get the maximum number of pending write bytes for an RTSP session

**Returns:**

maximum number of pending write bytes for an RTSP session

---

## **setRTSPMaximumPendingWriteBytes**

```
public void setRTSPMaximumPendingWriteBytes(int rtspMaximumPendingWriteBytes)
```

Set the maximum number of pending write bytes for an RTSP session

**Parameters:**

`rtspMaximumPendingWriteBytes` - maximum number of pending write bytes for an RTSP session

---

## **addMediaReaderListener**

```
public void addMediaReaderListener(IMediaReaderActionNotify mediaReaderListener)
```

Add media reader listener. see [IMediaReaderActionNotify](#)

**Parameters:**

`mediaReaderListener` - media reader listener

---

## **removeMediaReaderListener**

```
public void removeMediaReaderListener(IMediaReaderActionNotify mediaReaderListener)
```

Remove media reader listener. see [IMediaReaderActionNotify](#)

**Parameters:**

`mediaReaderListener` - media reader listener

---

## **notifyMediaReaderCreate**

```
public void notifyMediaReaderCreate(IMediaReader mediaReader)
```

Notify media reader `notifyMediaReaderCreate`

**Parameters:**

`mediaReader` - media reader

---

## **notifyMediaReaderInit**

```
public void notifyMediaReaderInit(IMediaReader mediaReader,  
    IMediaStream stream)
```

Notify media reader `notifyMediaReaderInit`

**Parameters:**

`mediaReader` - media reader  
`stream` - media stream

---

## notifyMediaReaderOpen

```
public void notifyMediaReaderOpen(IMediaReader mediaReader,  
    IMediaStream stream)
```

Notify media reader notifyMediaReaderOpen

### Parameters:

mediaReader - media reader  
stream - media stream

---

## notifyMediaReaderExtractMetaData

```
public void notifyMediaReaderExtractMetaData(IMediaReader mediaReader,  
    IMediaStream stream)
```

Notify media reader notifyMediaReaderExtractMetaData

### Parameters:

mediaReader - media reader  
stream - media stream

---

## notifyMediaReaderClose

```
public void notifyMediaReaderClose(IMediaReader mediaReader,  
    IMediaStream stream)
```

Notify media reader notifyMediaReaderClose

### Parameters:

mediaReader - media reader  
stream - media stream

---

## getRTSPBindIpAddress

```
public String getRTSPBindIpAddress()
```

Set the IP address to which UDP ports will be bound for RTSP/RTP sessions

### Returns:

IP address to which UDP ports will be bound for RTSP/RTP sessions

---

## setRTSPBindIpAddress

```
public void setRTSPBindIpAddress(String rtspBindIpAddress)
```

Get the IP address to which UDP ports will be bound for RTSP/RTP sessions

### Parameters:

rtspBindIpAddress - IP address to which UDP ports will be bound for RTSP/RTP sessions

---

## getRTSPConnectionIpAddress

```
public String getRTSPConnectionIpAddress()
```

Get the connection IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session

### Returns:

(continued from last page)

connection IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session

---

## setRTSPConnectionIpAddress

```
public void setRTSPConnectionIpAddress(String rtspConnectionIpAddress)
```

Set the connection IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session

**Parameters:**

rtspConnectionIpAddress - connection IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session

---

## getRTSPConnectionAddressType

```
public String getRTSPConnectionAddressType()
```

Get the connection IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session

**Returns:**

the connection IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session

---

## setRTSPConnectionAddressType

```
public void setRTSPConnectionAddressType(String rtspConnectionAddressType)
```

Set the connection IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session

**Parameters:**

rtspConnectionAddressType

---

## getRTSPOriginIpAddress

```
public String getRTSPOriginIpAddress()
```

Get the origin IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session

**Returns:**

origin IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session

---

## setRTSPOriginIpAddress

```
public void setRTSPOriginIpAddress(String rtspOriginIpAddress)
```

Set the origin IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session

**Parameters:**

rtspOriginIpAddress - origin IP address to used in the Session Description Protocol data exchanged for an RTSP/RTP session

---

## getRTSPOriginAddressType

```
public String getRTSPOriginAddressType()
```

Get the origin IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session

**Returns:**

origin IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session

## setRTSPOriginAddressType

```
public void setRTSPOriginAddressType(String rtspOriginAddressType)
```

Set the origin IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session

**Parameters:**

rtspOriginAddressType - origin IP address type (IP4) to used in the Session Description Protocol data exchanged for an RTSP/RTP session

---

## addLiveStreamPacketizerListener

```
public void addLiveStreamPacketizerListener(ILiveStreamPacketizerActionNotify liveStreamPacketizerListener)
```

Add a Live Stream Packetizer listener (see: [ILiveStreamPacketizerActionNotify](#))

**Parameters:**

liveStreamPacketizerListener - Live Stream Packetizer listener

---

## removeLiveStreamPacketizerListener

```
public void removeLiveStreamPacketizerListener(ILiveStreamPacketizerActionNotify liveStreamPacketizerListener)
```

Remove a Live Stream Packetizer listener (see: [ILiveStreamPacketizerActionNotify](#))

**Parameters:**

liveStreamPacketizerListener - Live Stream Packetizer listener

---

## notifyLiveStreamPacketizerCreate

```
public void notifyLiveStreamPacketizerCreate(ILiveStreamPacketizer liveStreamPacketizer,  
String streamName)
```

Notify Live Stream Packetizer Create

**Parameters:**

liveStreamPacketizer - Live Stream Packetizer listener

---

## notifyLiveStreamPacketizerDestroy

```
public void notifyLiveStreamPacketizerDestroy(ILiveStreamPacketizer liveStreamPacketizer)
```

Notify Live Stream Packetizer Destory

**Parameters:**

liveStreamPacketizer - Live Stream Packetizer listener

---

## notifyLiveStreamPacketizerInit

```
public void notifyLiveStreamPacketizerInit(ILiveStreamPacketizer liveStreamPacketizer,  
String streamName)
```

Notify Live Stream Packetizer Init

**Parameters:**

(continued from last page)

liveStreamPacketizer - Live Stream Packetizer listener

---

## isValidateFMLEConnections

```
public boolean isValidateFMLEConnections()
```

Returns true if validating FMLE connection (default is false)

**Returns:**

true if validating FMLE connection

---

## setValidateFMLEConnections

```
public void setValidateFMLEConnections(boolean validateFMLEConnections)
```

Returns true if validating FMLE connection (default is false)

**Parameters:**

validateFMLEConnections - true if validating FMLE connection

---

## addLiveStreamTranscoderListener

```
public void addLiveStreamTranscoderListener(ILiveStreamTranscoderNotify  
liveStreamTranscoderListener)
```

Add a live stream transcoder listener

**Parameters:**

liveStreamTranscoderListener - live stream transcoder listener

---

## removeLiveStreamTranscoderListener

```
public void removeLiveStreamTranscoderListener(ILiveStreamTranscoderNotify  
liveStreamTranscoderListener)
```

Remove a live stream transcoder listener

**Parameters:**

liveStreamTranscoderListener - live stream transcoder listener

---

## notifyLiveStreamTranscoderCreate

```
public void notifyLiveStreamTranscoderCreate(ILiveStreamTranscoder  
liveStreamTranscoder,  
IMediaStream stream)
```

Notify live stream transcoder create

**Parameters:**

liveStreamTranscoder - live stream transcoder  
stream - stream

---

## notifyLiveStreamTranscoderDestroy

```
public void notifyLiveStreamTranscoderDestroy(ILiveStreamTranscoder  
liveStreamTranscoder,  
IMediaStream stream)
```

Notify live stream transcoder destroy

(continued from last page)

**Parameters:**

liveStreamTranscoder - live stream transcoder  
stream - stream

---

**notifyLiveStreamTranscoderInit**

```
public void notifyLiveStreamTranscoderInit(ILiveStreamTranscoder liveStreamTranscoder,  
      IMediaStream stream)
```

Notify live stream transcoder init

**Parameters:**

liveStreamTranscoder - live stream transcoder  
stream - stream

---

**containsLiveStreamTranscoder**

```
public boolean containsLiveStreamTranscoder(String liveStreamTranscoder)
```

Return true if this application instance contains the transcoder name

**Parameters:**

liveStreamTranscoder - transcoder name

**Returns:**

true if this application instance contains the transcoder name

---

**getLiveStreamTranscoderList**

```
public String getLiveStreamTranscoderList()
```

Get comma separated list of transcoders to use for this application instance

**Returns:**

comma separated list of transcoders

---

**setLiveStreamTranscoderList**

```
public void setLiveStreamTranscoderList(String liveStreamTranscoderList)
```

Set comma separated list of transcoders to use for this application instance

**Parameters:**

liveStreamTranscoderList - comma separated list of transcoders

---

**getLiveStreamTranscoderControl**

```
public ILiveStreamTranscoderControl getLiveStreamTranscoderControl()
```

Get the Live Stream Transcoder Contoller. This class will get called each time a stream is to be transcoded using the LiveStreamTranscoder mechanism.

**Returns:**

Live Stream Transcoder Contoller

---

(continued from last page)

---

## setLiveStreamTranscoderControl

```
public void setLiveStreamTranscoderControl( ILiveStreamTranscoderControl
liveStreamTranscoderControl)
```

Set the Live Stream Transcoder Contoller. This class will get called each time a stream is to be transcoded using the LiveStreamTranscoder mechanism.

**Parameters:**

liveStreamTranscoderControl - Live Stream Transcoder Contoller

---

## getTranscoderApplicationContext

```
public LiveStreamTranscoderApplicationContext getTranscoderApplicationContext()
```

Get live stream transcoder application context

**Returns:**

live stream transcoder application context

---

## getDvrProperties

```
public WMSProperties getDvrProperties()
```

Get the property collection of DVR settings that are specific to this application instance. These are defined in Application/DVR/Properties tag in Application.xml

**Returns:**

property collection of DVR settings

---

## getDvrApplicationContext

```
public DvrApplicationContext getDvrApplicationContext()
```

Get live stream dvr application context

**Returns:**

live stream dvr application context

---

## getDvrConverter

```
public DvrApplicationConverterContext getDvrConverter()
```

Get dvr application converter context

**Returns:**

dvr application converter context

---

## getLiveStreamDvrRecorderControl

```
public ILiveStreamDvrRecorderControl getLiveStreamDvrRecorderControl()
```

Get the Live Stream DVR Recorder Contoller. This class will get called each time a stream is to be DVR-ed.

**Returns:**

Live Stream DVR Contoller

---

(continued from last page)

---

## setLiveStreamDvrRecorderControl

```
public void setLiveStreamDvrRecorderControl(ILiveStreamDvrRecorderControl controller)
```

Set the Live Stream DVR Controller.

**Parameters:**

controller - Live Stream DVR Controller

---

## getDvrRecorderList

```
public String getDvrRecorderList()
```

Get the comma separated list of Dvr Recorder names being used by this application (see conf/Dvr.xml)

**Returns:**

comma separated list of Dvr Recorder names

---

## setDvrRecorderList

```
public void setDvrRecorderList(String recorderList)
```

Set the comma separated list of Dvr Recorder names being used by this application (see conf/Dvr.xml)

**Parameters:**

recorderList - comma separated list of Dvr Recorder names

---

## addDvrRecorderListener

```
public void addDvrRecorderListener(ILiveStreamDvrRecorderActionNotify listener)
```

Add a Dvr Recorder listener (see: [ILiveStreamDvrRecorderActionNotify](#))

**Parameters:**

listener - Dvr Recorder listener

---

## removeDvrRecorderListener

```
public void removeDvrRecorderListener(ILiveStreamDvrRecorderActionNotify listener)
```

Remove a Dvr Recorder listener (see: [ILiveStreamDvrRecorderActionNotify](#))

**Parameters:**

listener - Dvr Recorder listener

---

## notifyLiveStreamDvrRecorderCreate

```
public void notifyLiveStreamDvrRecorderCreate(ILiveStreamDvrRecorder dvr,  
String streamName)
```

Notify Dvr Recorder Create

**Parameters:**

dvr - DVR Recorder listener  
streamName - stream Name

---

(continued from last page)

---

## notifyLiveStreamDvrRecorderInit

```
public void notifyLiveStreamDvrRecorderInit(ILiveStreamDvrRecorder dvr,  
String streamName)
```

Notify DVR Recorder has been initialized.

### Parameters:

dvr - DVR Recorder listener \* @param streamName stream Name

---

## notifyLiveStreamDvrRecorderDestroy

```
public void notifyLiveStreamDvrRecorderDestroy(ILiveStreamDvrRecorder dvr)
```

Notify DVR Recorder has been destroyed.

### Parameters:

dvr - DVR Recorder listener

---

## addDvrStreamManagerListener

```
public void addDvrStreamManagerListener(IDvrStreamManagerActionNotify listener)
```

Add a Dvr Application Store Manager listener (see: IDvrStoreActionNotify)

### Parameters:

listener - Dvr Application Store Manager listener

---

## removeDvrStreamManagerListener

```
public void removeDvrStreamManagerListener(IDvrStreamManagerActionNotify listener)
```

Remove a Dvr Application Store Manager listener (see: IDvrStoreActionNotify)

### Parameters:

listener - Dvr Application Store Manager listener

---

## notifyDvrStreamManagerCreate

```
public void notifyDvrStreamManagerCreate(IDvrStreamManager dvrStoreManager,  
String streamName)
```

Notify listeners that Dvr Application Store Manager has been created.

### Parameters:

dvrStoreManager - Dvr Application Store Manager  
streamName

---

## notifyDvrStreamManagerInit

```
public void notifyDvrStreamManagerInit(IDvrStreamManager dvrStoreManager)
```

Notify listeners that Dvr Application Store Manager has been initialized.

### Parameters:

dvrStoreManager - Dvr Application Store Manager

---

(continued from last page)

## notifyDvrStreamManagerDestroy

```
public void notifyDvrStreamManagerDestroy(IDvrStreamManager dvrManager)
```

Notify listeners that Dvr Application Store Manager has been destroyed.

**Parameters:**

dvrManager - Dvr Application Store Manager

## getMediaReaderContentType

```
public int getMediaReaderContentType(String mediaType)
```

Get the content type of a media stream name prefix (see IMediaReader.CONTENTTYPE\_\*)

**Parameters:**

mediaType - mediaType (such as flv or smil)

**Returns:**

content type (see IMediaReader.CONTENTTYPE\_\*)

## getMediaListProvider

```
public IMediaListProvider getMediaListProvider()
```

Get the current media list provider. The media list provider is used to resolve amlst:streamname requests to a media list (equivalent to a SMIL file).

**Returns:**

media list provider

## setMediaListProvider

```
public void setMediaListProvider(IMediaListProvider mediaListProvider)
```

Set the current media list provider. The media list provider is used to resolve amlst:streamname requests to a media list (equivalent to a SMIL file).

**Parameters:**

mediaListProvider - media list provider

## getMediacasterRTPRTSPRTPTransportMode

```
public int getMediacasterRTPRTSPRTPTransportMode()
```

RTP MediaCaster RTSP/RTP transport mode. See RTPMediaCaster.RTSPTRANSPORTMODE\_\*

**Returns:**

RTP MediaCaster RTSP/RTP transport mode

## setMediacasterRTPRTSPRTPTransportMode

```
public void setMediacasterRTPRTSPRTPTransportMode(int  
mediacasterRTPRTSPRTPTransportMode)
```

RTP MediaCaster RTSP/RTP transport mode. See RTPMediaCaster.RTSPTRANSPORTMODE\_\*

**Parameters:**

mediacasterRTPRTSPRTPTransportMode - RTP MediaCaster RTSP/RTP transport mode

## getProtocolUsage

```
public boolean[] getProtocolUsage()
```

Get the protocols in use by this application instance (see IApplicationInstance.PROTOCOLUSAGE\_\*)

**Returns:**

protocols in use by this application instance (see IApplicationInstance.PROTOCOLUSAGE\_\*)

---

## getProtocolUsage

```
public void getProtocolUsage(boolean[] protocolsInUse)
```

Get the protocols in use by this application instance (see IApplicationInstance.PROTOCOLUSAGE\_\*)

---

## isDebugAppTimeout

```
public boolean isDebugAppTimeout()
```

If true appTimeout processing will be logged.

**Returns:**

true appTimeout processing will be logged

---

## setDebugAppTimeout

```
public void setDebugAppTimeout(boolean debugAppTimeout)
```

If true appTimeout processing will be logged.

**Parameters:**

debugAppTimeout - true appTimeout processing will be logged

---

## addRTPListener

```
public void addRTPListener(IRTPSessionNotify rtpListener)
```

Add listner to be notified of RTPSession create and destroy.

**Parameters:**

rtpListener - RTP listener

---

## removeRTPListener

```
public void removeRTPListener(IRTPSessionNotify rtpListener)
```

Remove listner to be notified of RTPSession create and destroy.

**Parameters:**

rtpListener - RTP listener

---

## notifyRTPSessionCreate

```
public void notifyRTPSessionCreate(RTPSession rtpSession)
```

Notify RTP session create

---

(continued from last page)

**Parameters:**

rtpSession - rtp session

---

**notifyRTPSessionDestroy**

```
public void notifyRTPSessionDestroy(RTPSession rtpSession)
```

Notify RTP session destroy

**Parameters:**

rtpSession - rtp session

---

**addHTTPListener**

```
public void addHTTPListener(IHTTPSessionNotify httpListener)
```

Add listener to be notified of HTTPSession create and destroy.

**Parameters:**

httpListener - http listener

---

**removeHTTPListener**

```
public void removeHTTPListener(IHTTPSessionNotify httpListener)
```

Remove listener to be notified of HTTPSession create and destroy.

**Parameters:**

httpListener - http listener

---

**notifyHTTPSessionCreate**

```
public void notifyHTTPSessionCreate(IHTTPStreamerSession httpSession)
```

Notify HTTP session create

**Parameters:**

httpSession - HTTP session

---

**notifyHTTPSessionDestroy**

```
public void notifyHTTPSessionDestroy(IHTTPStreamerSession httpSession)
```

Notify HTTP session destroy

**Parameters:**

httpSession - HTTP session

---

**getMediaCacheFilters**

```
public java.util.List getMediaCacheFilters()
```

Get the list of allowed MediaCache sources.

**Returns:**

list of allowed MediaCache sources

(continued from last page)

---

## isMediaCacheSourceAllowed

```
public boolean isMediaCacheSourceAllowed(String sourceName)
```

Test to see if a MediaCache source name is allowed

**Parameters:**

sourceName - MediaCache source name

**Returns:**

true if allowed

---

## getPushPublishSessions

```
public java.util.List getPushPublishSessions(IMediaStream stream)
```

Get the current push publish sessions for a given IMediaStream

**Parameters:**

stream - stream

**Returns:**

push publish sessions

---

## getPushPublishSessions

```
public java.util.List getPushPublishSessions()
```

Get all active push publish sessions

**Returns:**

all active push publish sessions

---

## addPushPublishSession

```
public void addPushPublishSession(IMediaStream stream,  
    IPushPublishSession pushPublishSession)
```

Add a push publish session to the list of active push publish sessions

**Parameters:**

stream - stream

pushPublishSession - push publish session

---

## removePushPublishSession

```
public void removePushPublishSession(IMediaStream stream,  
    IPushPublishSession pushPublishSession)
```

Remove a push publish session

**Parameters:**

stream - stream

pushPublishSession - push publish session

---

## removePushPublishSessions

```
public void removePushPublishSessions(IMediaStream stream)
```

---

(continued from last page)

Remove all push publish sessions for a give stream

**Parameters:**

stream - stream

---

## addPushPublishSessionListener

```
public void addPushPublishSessionListener( IPushPublishSessionNotify  
pushPublishSessionListener)
```

Add a push publish session listener (see IPushPublishSessionNotify)

**Parameters:**

pushPublishSessionListener - push publish session

---

## removePushPublishSessionListener

```
public void removePushPublishSessionListener( IPushPublishSessionNotify  
pushPublishSessionListener)
```

Remove a push publish session listener (see IPushPublishSessionNotify)

**Parameters:**

pushPublishSessionListener - push publish session

---

## notifyPushPublishSessionCreate

```
public void notifyPushPublishSessionCreate(String streamName,  
      IMediaStream stream,  
      IPushPublishSession pushPublishSession)
```

Notify push publish session create

**Parameters:**

streamName - stream name

stream - stream

pushPublishSession - push publish session

---

## notifyPushPublishSessionDestroy

```
public void notifyPushPublishSessionDestroy(String streamName,  
      IMediaStream stream,  
      IPushPublishSession pushPublishSession)
```

Notify push publish session destroy

**Parameters:**

streamName - stream name

stream - stream

pushPublishSession - push publish session

---

## getPushPublishSessionCount

```
public int getPushPublishSessionCount( )
```

Get the number of push publishing sessions.

**Returns:**

number of push publishing sessions

## getStreamRecorderProperties

```
public WMSProperties getStreamRecorderProperties()
```

Get the property collection of StreamRecorder settings that are specific to this application instance

**Returns:**

property collection of StreamRecorder settings

---

## isLive

```
public boolean isLive()
```

Returns true if the application stream type of the application instance is live

**Returns:**

true if the application stream type is live

---

## getSourceControlSession

```
public ISourceControlSession getSourceControlSession(String streamName)
```

Get the source control session for the given stream name

**Parameters:**

streamName - the stream name

**Returns:**

an ISourceControlSession for the stream provided or null if it doesn't exist

---

## getSourceControlSessions

```
public java.util.List getSourceControlSessions()
```

Get all active source control sessions

**Returns:**

List all active source control sessions

---

## addSourceControlSession

```
public void addSourceControlSession(String streamName,  
    ISourceControlSession sourceControlSession)
```

Add a source control session to the list of active source control sessions associated with the given stream name

**Parameters:**

streamName - the stream name

sourceControlSession - the source control session

---

## removeSourceControlSession

```
public void removeSourceControlSession(String streamName)
```

Remove the source control session for the given stream name from the application instance

**Parameters:**

streamName - the stream name

---

## addSourceControlSessionListener

```
public void addSourceControlSessionListener( ISourceControlSessionNotify
sourceControlSessionListener)
```

Add a source control session listener (see [ISourceControlSessionNotify](#))

**Parameters:**

sourceControlSessionListener - source control session listener

---

## removeSourceControlSessionListener

```
public void removeSourceControlSessionListener( ISourceControlSessionNotify
sourceControlSessionListener)
```

Remove the provided source control session listener from the list of source control session listeners (see [ISourceControlSessionNotify](#))

**Parameters:**

sourceControlSessionListener - source control session listener

---

## notifySourceControlSessionCreate

```
public void notifySourceControlSessionCreate(String streamName,
ISourceControlSession sourceControlSession)
```

Notify source control session create

**Parameters:**

streamName - stream name

sourceControlSession - the source control session that was just created

---

## notifySourceControlSessionDestroy

```
public void notifySourceControlSessionDestroy(String streamName,
ISourceControlSession sourceControlSession)
```

Notify source control session destroy

**Parameters:**

streamName - stream name

sourceControlSession - the source control session that is being destroyed

---

## getSourceControlSessionCount

```
public int getSourceControlSessionCount()
```

Get the number of source control sessions.

**Returns:**

number of source control sessions

---

## getWebRTCApplicationContext

```
public com.wowza.wms.webrtc.model.WebRTCApplicationContext
getWebRTCApplicationContext()
```

Get the WebRTC application level context

---

(continued from last page)

**Returns:**

WebRTC application level context

---

**getWebRTC Sessions**

```
public java.util.List getWebRTC Sessions( )
```

Get list of WebRTC sessions

**Returns:**

list of WebRTC sessions

---

**getWebRTC Sessions**

```
public java.util.List getWebRTC Sessions(String streamName)
```

Get list of WebRTC sessions by stream name

**Parameters:**

streamName - stream name

**Returns:**

list of WebRTC sessions by stream name

---

**getWebRTC Session Count**

```
public int getWebRTC Session Count( )
```

Get count of WebRTC sessions

**Returns:**

count of WebRTC sessions

---

**getWebRTC Session Count**

```
public int getWebRTC Session Count(String streamName)
```

Get count of WebRTC sessions by stream name

**Parameters:**

streamName - stream name

**Returns:**

count of WebRTC sessions by stream name

---

**getWebRTC Session Counts By Name**

```
public java.util.Map getWebRTC Session Counts By Name( )
```

Get a map of WebRTC sessions by stream name

**Returns:**

map of WebRTC sessions by stream name

## com.wowza.wms.application Interface IApplicationInstanceNotify

All Known Implementing Classes:

[ServerListenerStreamDemoPublisher](#)

---

public interface **IApplicationInstanceNotify**  
extends

IApplicationInstanceNotify: listener interface used by IApplication addApplicationInstanceListener

---

### Method Summary

void	<a href="#">onApplicationInstanceCreate</a> ( <a href="#">IApplicationInstance</a> applicationInstance) Triggered when applicationInstance created
void	<a href="#">onApplicationInstanceDestroy</a> ( <a href="#">IApplicationInstance</a> applicationInstance) Triggered when applicationInstance destroyed

---

### Methods

#### onApplicationInstanceCreate

public void **onApplicationInstanceCreate**([IApplicationInstance](#) applicationInstance)

Triggered when applicationInstance created

**Parameters:**

applicationInstance - applicationInstance

---

#### onApplicationInstanceDestroy

public void **onApplicationInstanceDestroy**([IApplicationInstance](#) applicationInstance)

Triggered when applicationInstance destroyed

**Parameters:**

applicationInstance - applicationInstance

---

## com.wowza.wms.application Interface IApplicationNotify

All Known Implementing Classes:

[ServerListenerStreamDemoPublisher](#)

public interface **IApplicationNotify**  
extends

IApplicationNotify: listener interface used by IVHost addApplicationListener

### Method Summary

void	<a href="#">onApplicationCreate</a> ( <a href="#">IApplication</a> application) Triggered when application created
void	<a href="#">onApplicationDestroy</a> ( <a href="#">IApplication</a> application) Triggered when application destroyed

### Methods

#### onApplicationCreate

public void **onApplicationCreate**([IApplication](#) application)

Triggered when application created

**Parameters:**

application - application

#### onApplicationDestroy

public void **onApplicationDestroy**([IApplication](#) application)

Triggered when application destroyed

**Parameters:**

application - application

## com.wowza.wms.application Class WMSProperties

```

java.lang.Object
  |-- java.util.AbstractMap
        |-- java.util.HashMap
              |-- com.wowza.wms.application.WMSProperties
  
```

### All Implemented Interfaces:

java.util.Map, java.io.Serializable, Cloneable, java.util.Map

```

public class WMSProperties
extends java.util.HashMap
  
```

WMSProperties: generic properties container used by many class to store extended property information. Acts like a simple Map with some simple utilities for performing type conversion.

## Constructor Summary

public	<a href="#">WMSProperties()</a>
--------	---------------------------------

## Method Summary

static void	<a href="#">cloneProperties</a> ( <a href="#">WMSProperties</a> from, <a href="#">WMSProperties</a> to) Copy all properties from "from" properties object to "to" properties object.
String[]	<a href="#">getAllAsStrings</a> () Return all properties as String[].
Object	<a href="#">getProperty</a> (String name) Get property value as generic object.
boolean	<a href="#">getPropertyBoolean</a> (String name, boolean defaultVal) Get property as boolean, return default value if does not exist.
double	<a href="#">getPropertyDouble</a> (String name, double defaultVal) Get property as double, return default value if does not exist.
int	<a href="#">getPropertyInt</a> (String name, int defaultVal) Get property as int, return default value if does not exist.
long	<a href="#">getPropertyLong</a> (String name, long defaultVal) Get property as long, return default value if does not exist.
String	<a href="#">getPropertyStr</a> (String name) Get property as String
String	<a href="#">getPropertyStr</a> (String name, String defaultVal) Get property as String, return default value if does not exist.
void	<a href="#">putAll</a> (java.util.Map m)

void	<a href="#">setProperty</a> (String name, Object value) Set property to generic object.
String	<a href="#">toString</a> ()

#### Methods inherited from class java.util.HashMap

clear, clone, containsKey, containsValue, entrySet, get, isEmpty, keySet, put, putAll, remove, size, values

#### Methods inherited from class java.util.AbstractMap

clear, clone, containsKey, containsValue, entrySet, equals, get, hashCode, isEmpty, keySet, put, putAll, remove, size, toString, values

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

#### Methods inherited from interface java.util.Map

clear, containsKey, containsValue, entrySet, equals, get, hashCode, isEmpty, keySet, put, putAll, remove, size, values

#### Methods inherited from interface java.util.Map

clear, containsKey, containsValue, entrySet, equals, get, hashCode, isEmpty, keySet, put, putAll, remove, size, values

## Constructors

### WMSProperties

```
public WMSProperties()
```

## Methods

### cloneProperties

```
public static void cloneProperties(WMSProperties from,
WMSProperties to)
```

Copy all properties from "from" properties object to "to" properties object.

#### Parameters:

from - source properties  
to - destination properties

### setProperty

```
public void setProperty(String name,
    Object value)
```

(continued from last page)

Set property to generic object.

**Parameters:**

name - property name  
value - value

---

## getProperty

```
public Object getProperty(String name)
```

Get property value as generic object.

**Parameters:**

name - property name

**Returns:**

value, null if does not exist

---

## getPropertyStr

```
public String getPropertyStr(String name)
```

Get property as String

**Parameters:**

name - property name

**Returns:**

value as String, null if does not exist

---

## getPropertyStr

```
public String getPropertyStr(String name,  
    String defaultVal)
```

Get property as String, return default value if does not exist.

**Parameters:**

name - property name  
defaultVal - default value

**Returns:**

value as String, defaultVal if does not exist

---

## getPropertyBoolean

```
public boolean getPropertyBoolean(String name,  
    boolean defaultVal)
```

Get property as boolean, return default value if does not exist.

**Parameters:**

name - property name  
defaultVal - default value

**Returns:**

value as boolean, defaultVal if does not exist

---

## getPropertyInt

```
public int getPropertyInt(String name,  
    int defaultVal)
```

Get property as int, return default value if does not exist.

**Parameters:**

name - property name  
defaultVal - default value

**Returns:**

value as boolean, defaultVal if does not exist

---

## getPropertyLong

```
public long getPropertyLong(String name,  
    long defaultVal)
```

Get property as long, return default value if does not exist.

**Parameters:**

name - property name  
defaultVal - default value

**Returns:**

value as long, defaultVal if does not exist

---

## getPropertyDouble

```
public double getPropertyDouble(String name,  
    double defaultVal)
```

Get property as double, return default value if does not exist.

**Parameters:**

name - property name  
defaultVal - default value

**Returns:**

value as double, defaultVal if does not exist

---

## getAllAsStrings

```
public String[] getAllAsStrings()
```

Return all properties as String[]. Format is "key=value".

**Returns:**

all properties as String[]

---

## toString

```
public String toString()
```

---

(continued from last page)

**putAll**

```
public void putAll(java.util.Map m)
```

---

Package

**com.wowza.wms.authentication**

## com.wowza.wms.authentication

### Class AuthenticateUsernamePasswordProviderBase

java.lang.Object

└--com.wowza.wms.authentication.AuthenticateUsernamePasswordProviderBase

All Implemented Interfaces:

[IAuthenticateUsernamePasswordProvider](#)

public abstract class **AuthenticateUsernamePasswordProviderBase**

extends Object

implements [IAuthenticateUsernamePasswordProvider](#)

Base class for implementing HTTP and RTSP based custom authentication class.

#### Field Summary

protected	<a href="#">client</a>
protected	<a href="#">rtpSession</a>
protected	<a href="#">vhost</a>

#### Constructor Summary

public	<a href="#">AuthenticateUsernamePasswordProviderBase()</a>
--------	--

#### Method Summary

<a href="#">IClient</a>	<a href="#">getClient()</a> Get client
<a href="#">RTPSession</a>	<a href="#">getRTPSession()</a> Get RTP Session
<a href="#">IVHost</a>	<a href="#">getVHost()</a> Get vhost
void	<a href="#">setClient(<a href="#">IClient</a> client)</a> Set client
void	<a href="#">setRTPSession(<a href="#">RTPSession</a> rtpSession)</a> Set RTP Session
void	<a href="#">setVHost(<a href="#">IVHost</a> vhost)</a> Set vhost

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait,

**Methods inherited from interface**[com.wowza.wms.authentication.IAuthenticateUsernamePasswordProvider](#)[getClient](#), [getPassword](#), [getRTPSession](#), [getVHost](#), [setClient](#), [setRTPSession](#), [setVHost](#), [userExists](#)

## Fields

**vhost**protected com.wowza.wms.vhost.IVHost **vhost****client**protected com.wowza.wms.client.IClient **client****rtpSession**protected com.wowza.wms.rtp.model.RTPSession **rtpSession**

## Constructors

**AuthenticateUsernamePasswordProviderBase**public **AuthenticateUsernamePasswordProviderBase**()

## Methods

**getVHost**public [IVHost](#) **getVHost**()

Get vhost

**Returns:**

vhost

**setVHost**public void **setVHost**([IVHost](#) vhost)

Set vhost

**Parameters:**

vhost - vhost

(continued from last page)

## getRTPSession

```
public RTPSession getRTPSession()
```

Get RTP Session

**Returns:**

RTP Session

---

## setRTPSession

```
public void setRTPSession(RTPSession rtpSession)
```

Set RTP Session

**Parameters:**

rtpSession - RTP Session

---

## getClient

```
public IClient getClient()
```

Get client

**Returns:**

client

---

## setClient

```
public void setClient(IClient client)
```

Set client

**Parameters:**

client - client

---

## com.wowza.wms.authentication Interface IAuthenticate

public interface **IAuthenticate**  
extends

IAuthenticate: HTTP and RTSP authentication interface

### Field Summary

public static final	<a href="#">PASSWORDFILEFORMAT_CLEAR</a> Value: <b>1</b>
public static final	<a href="#">PASSWORDFILEFORMAT_UNKNOWN</a> Value: <b>0</b>

### Method Summary

void	<a href="#">init</a> ( <a href="#">IApplicationInstance</a> appInstance, AuthenticationItem authenticationItem) Initialize authentication class when instantiated as part of an application instance
void	<a href="#">init</a> ( <a href="#">IVHost</a> vhost, AuthenticationItem authenticationItem) Initialize authentication class when instantiated as part of a vhost

### Fields

#### PASSWORDFILEFORMAT\_UNKNOWN

public static final int **PASSWORDFILEFORMAT\_UNKNOWN**

Constant value: **0**

#### PASSWORDFILEFORMAT\_CLEAR

public static final int **PASSWORDFILEFORMAT\_CLEAR**

Constant value: **1**

### Methods

#### init

public void **init**([IApplicationInstance](#) appInstance,  
AuthenticationItem authenticationItem)

Initialize authentication class when instantiated as part of an application instance

(continued from last page)

**Parameters:**

appInstance - application instance  
authenticationItem - authentication item

---

**init**

```
public void init(IVHost vhost,  
                AuthenticationItem authenticationItem)
```

Initialize authentication class when instantiated as part of a vhost

**Parameters:**

vhost - vhost  
authenticationItem - authentication item

## com.wowza.wms.authentication Interface IAuthenticate2

public interface **IAuthenticate2**  
extends

IAuthenticate: HTTP and RTSP authentication interface

### Field Summary

public static final	<a href="#">PASSWORDFILEFORMAT_CLEAR</a> Value: <b>1</b>
public static final	<a href="#">PASSWORDFILEFORMAT_UNKNOWN</a> Value: <b>0</b>

### Method Summary

AuthenticationItem	<a href="#">getAuthenticationItem()</a> Return the authentication item object
void	<a href="#">init(IApplicationInstance</a> appInstance, AuthenticationItem authenticationItem) Initialize authentication class when instantiated as part of an application instance
void	<a href="#">init(IVHost</a> vhost, AuthenticationItem authenticationItem) Initialize authentication class when instantiated as part of a vhost

### Fields

#### PASSWORDFILEFORMAT\_UNKNOWN

public static final int **PASSWORDFILEFORMAT\_UNKNOWN**

Constant value: **0**

#### PASSWORDFILEFORMAT\_CLEAR

public static final int **PASSWORDFILEFORMAT\_CLEAR**

Constant value: **1**

### Methods

#### init

public void **init**([IApplicationInstance](#) appInstance, AuthenticationItem authenticationItem)

(continued from last page)

Initialize authentication class when instantiated as part of an application instance

**Parameters:**

appInstance - application instance  
authenticationItem - authentication item

---

## **init**

```
public void init(IVHost vhost,  
    AuthenticationItem authenticationItem)
```

Initialize authentication class when instantiated as part of a vhost

**Parameters:**

vhost - vhost  
authenticationItem - authentication item

---

## **getAuthenticationItem**

```
public AuthenticationItem getAuthenticationItem()
```

Return the authentication item object

**Returns:**

authentication item

---

## com.wowza.wms.authentication Interface IAuthenticate3

public interface **IAuthenticate3**  
extends

IAuthenticate: HTTP and RTSP authentication interface

### Field Summary

public static final	<a href="#">PASSWORDFILEFORMAT_CLEAR</a> Value: <b>1</b>
public static final	<a href="#">PASSWORDFILEFORMAT_UNKNOWN</a> Value: <b>0</b>

### Method Summary

AuthenticationItem	<a href="#">getAuthenticationItem()</a> Return the authentication item object
String	<a href="#">getAuthenticationMethod()</a> Return the authentication method invoked - play or publish
void	<a href="#">init(IApplicationInstance</a> appInstance, AuthenticationItem authenticationItem) Initialize authentication class when instantiated as part of an application instance
void	<a href="#">init(IVHost</a> vhost, AuthenticationItem authenticationItem) Initialize authentication class when instantiated as part of a vhost
void	<a href="#">setAuthenticationMethod</a> (String method) Set the authentication method invoked - play or publish

### Fields

#### PASSWORDFILEFORMAT\_UNKNOWN

public static final int **PASSWORDFILEFORMAT\_UNKNOWN**

Constant value: **0**

#### PASSWORDFILEFORMAT\_CLEAR

public static final int **PASSWORDFILEFORMAT\_CLEAR**

Constant value: **1**

(continued from last page)

## Methods

### init

```
public void init(IApplicationInstance appInstance,  
                AuthenticationItem authenticationItem)
```

Initialize authentication class when instantiated as part of an application instance

**Parameters:**

appInstance - application instance  
authenticationItem - authentication item

### init

```
public void init(IVHost vhost,  
                AuthenticationItem authenticationItem)
```

Initialize authentication class when instantiated as part of a vhost

**Parameters:**

vhost - vhost  
authenticationItem - authentication item

### getAuthenticationItem

```
public AuthenticationItem getAuthenticationItem()
```

Return the authentication item object

**Returns:**

authentication item

### setAuthenticationMethod

```
public void setAuthenticationMethod(String method)
```

Set the authentication method invoked - play or publish

### getAuthenticationMethod

```
public String getAuthenticationMethod()
```

Return the authentication method invoked - play or publish

**Returns:**

authentication item

com.wowza.wms.authentication  
Interface IAuthenticateHTTPProvider

public interface IAuthenticateHTTPProvider  
extends

IAuthenticateHTTPProvider: HTTP authentication provider

Method Summary	
boolean	<a href="#">authenticateHTTPProvider</a> ( <a href="#">IVHost</a> vhost, <a href="#">IHTTPRequest</a> req, <a href="#">IHTTPResponse</a> resp) Called for each HTTP authentication

Methods

authenticateHTTPProvider

public boolean **authenticateHTTPProvider**([IVHost](#) vhost, [IHTTPRequest](#) req, [IHTTPResponse](#) resp)

Called for each HTTP authentication

Parameters:

- vhost - virtual host
- req - HTTP request
- resp - HTTP response

Returns:

true if authentication was successful

## com.wowza.wms.authentication Interface IAuthenticateIPAccessList

public interface **IAuthenticateIPAccessList**  
extends

### Method Summary

boolean	<a href="#"><u>isBlackListSet()</u></a>
boolean	<a href="#"><u>isInPublishBlackList</u></a> (String clientIP)
boolean	<a href="#"><u>isInPublishWhiteList</u></a> (String clientIP)
boolean	<a href="#"><u>isWhiteListSet()</u></a>
void	<a href="#"><u>setIPBlackList</u></a> (String ipBlackList)
void	<a href="#"><u>setIPWhiteList</u></a> (String ipWhiteList) IAuthenticateIPAccessList: Access list provider

### Methods

#### setIPWhiteList

public void **setIPWhiteList**(String ipWhiteList)

IAuthenticateIPAccessList: Access list provider

#### setIPBlackList

public void **setIPBlackList**(String ipBlackList)

#### isWhiteListSet

public boolean **isWhiteListSet**()

#### isBlackListSet

public boolean **isBlackListSet**()

---

### **isInPublishWhiteList**

```
public boolean isInPublishWhiteList(String clientIP)
```

---

### **isInPublishBlackList**

```
public boolean isInPublishBlackList(String clientIP)
```

## com.wowza.wms.authentication Interface IAuthenticateRTSP

public interface **IAuthenticateRTSP**  
extends

IAuthenticateRTSP: RTSP authentication provider

### Method Summary

boolean	<code><a href="#">authenticateRTSP</a>(<a href="#">RTPSession</a> rtspSession, com.wowza.wms.rtsp.RTSPRequestMessage req, com.wowza.wms.rtsp.RTSPResponseMessages resp)</code> Called for each RTSP authentication
---------	---

### Methods

#### **authenticateRTSP**

```
public boolean authenticateRTSP(RTPSession rtspSession,  
    com.wowza.wms.rtsp.RTSPRequestMessage req,  
    com.wowza.wms.rtsp.RTSPResponseMessages resp)
```

Called for each RTSP authentication

##### **Parameters:**

`rtspSession` - RTP session  
`req` - RTSP request  
`resp` - RTSP response

##### **Returns:**

true if authentication was successful

## com.wowza.wms.authentication Interface IAuthenticateSIP

public interface **IAuthenticateSIP**  
extends

IAuthenticateRTSP: RTSP authentication provider

### Method Summary

boolean	<code><a href="#">authenticateSIP</a>(<a href="#">RTPSession</a> rtspSession, com.wowza.wms.sip.SIPRequestMessage req, com.wowza.wms.sip.SIPResponseMessages resp)</code> Called for each RTSP authentication
---------	--

### Methods

#### **authenticateSIP**

```
public boolean authenticateSIP(RTPSession rtspSession,  
    com.wowza.wms.sip.SIPRequestMessage req,  
    com.wowza.wms.sip.SIPResponseMessages resp)
```

Called for each RTSP authentication

##### **Parameters:**

`rtspSession` - RTP session  
`req` - RTSP request  
`resp` - RTSP response

##### **Returns:**

true if authentication was successful

## com.wowza.wms.authentication Interface IAuthenticateUsernamePasswordProvider

All Known Implementing Classes:

[AuthenticateUsernamePasswordProviderBase](#)

public interface **IAuthenticateUsernamePasswordProvider**  
extends

IAuthenticateUsernamePasswordProvider: HTTP and RTSP username/password validator interface

### Method Summary

<a href="#">IClient</a>	<a href="#">getClient()</a> Get client
String	<a href="#">getPassword(String username)</a> Get password for a given user
<a href="#">RTPSession</a>	<a href="#">getRTPSession()</a> Get RTP session
<a href="#">IVHost</a>	<a href="#">getVHost()</a> Get vhost
void	<a href="#">setClient(<a href="#">IClient</a> client)</a> Set client
void	<a href="#">setRTPSession(<a href="#">RTPSession</a> rtpSession)</a> Set RTP session
void	<a href="#">setVHost(<a href="#">IVHost</a> vhost)</a> Set vhost
boolean	<a href="#">userExists(String username)</a> Return true if user exists

### Methods

#### **userExists**

public boolean **userExists**(String username)

Return true if user exists

#### **Parameters:**

username - username

#### **Returns:**

true if user exists

(continued from last page)

## getPassword

```
public String getPassword(String username)
```

Get password for a given user

**Parameters:**

username - username

**Returns:**

password

---

## getVHost

```
public IVHost getVHost()
```

Get vhost

**Returns:**

vhost

---

## setVHost

```
public void setVHost(IVHost vhost)
```

Set vhost

**Parameters:**

vhost - vhost

---

## getClient

```
public IClient getClient()
```

Get client

**Returns:**

client

---

## setClient

```
public void setClient(IClient client)
```

Set client

**Parameters:**

client - client

---

## getRTPSession

```
public RTPSession getRTPSession()
```

Get RTP session

**Returns:**

RTP session

---

(continued from last page)

## setRTPSession

```
public void setRTPSession(RTPSession rtpSession)
```

Set RTP session

### Parameters:

`rtpSession` - RTP session

---

Package

**com.wowza.wms.client**

## com.wowza.wms.client Class ConnectionCounter

```
java.lang.Object
|
+--com.wowza.wms.client.ConnectionCounterBase
|
+--com.wowza.wms.client.ConnectionCounter
```

```
public class ConnectionCounter
extends ConnectionCounterBase
```

### Fields inherited from class com.wowza.wms.client.ConnectionCounterBase

DATEFORMATSTR, NEVERSTR, REJECTREASON\_APPLICATION, REJECTREASON\_COUNT, REJECTREASON\_LICENSE

### Constructor Summary

public	<a href="#">ConnectionCounter()</a> Create empty ConnectionCounter
--------	---

### Method Summary

void	<a href="#">acceptConnection</a> (ConnectionHolder connectionHolder, byte[] license) Accept a new connection.
void	<a href="#">addConnectionListener</a> (IConnectionNotify connectionNotify) Add a connection listener.
void	<a href="#">decrement</a> (ConnectionHolder connectionHolder, boolean isValid, java.util.Date date, long stamp, byte[] license) Decrement connection counters.
void	<a href="#">disconnect</a> (ConnectionHolder connectionHolder, byte[] license) Disconnect connection.
long	<a href="#">getCurrent</a> () Get total number of client currently conencted to this object.
long	<a href="#">getLastConnectAcceptedStamp</a> () Get time (milliseconds) of the last conenction to this object.
String	<a href="#">getLastConnectAcceptedStampString</a> () Get time (milliseconds) of the last conenction to this object as formatted string.
java.util.Date	<a href="#">getLastConnectAcceptedTime</a> () Get time (milliseconds) of the last accepted conenction to this object.
String	<a href="#">getLastConnectAcceptedTimeString</a> () Get time (milliseconds) of the last accepted conenction to this object as formatted string.
long	<a href="#">getLastConnectRejectedByReasonStamp</a> (int reason) Get time (milliseconds) of the last rejected conenction by reason to this object.

String	<a href="#"><u>getLastConnectRejectedByReasonStampString</u></a> (int reason) Get time (milliseconds) of the last rejected connection by reason to this object as formatted string.
java.util.Date	<a href="#"><u>getLastConnectRejectedByReasonTime</u></a> (int reason) Get date and time of last rejected connection by reason to this object as Date object.
String	<a href="#"><u>getLastConnectRejectedByReasonTimeString</u></a> (int reason) Get date and time of last rejected connection by reason to this object as formatted string.
long	<a href="#"><u>getLastConnectRejectedStamp</u></a> () Get time (milliseconds) of the last rejected connection to this object.
String	<a href="#"><u>getLastConnectRejectedStampString</u></a> () Get time (milliseconds) of the last rejected connection to this object as formatted string.
java.util.Date	<a href="#"><u>getLastConnectRejectedTime</u></a> () Get date and time of last rejected connection to this object as Date object.
String	<a href="#"><u>getLastConnectRejectedTimeString</u></a> () Get date and time of last rejected connection to this object as formatted string.
long	<a href="#"><u>getLastDisconnectStamp</u></a> () Get time (milliseconds) of the last disconnected connection to this object.
String	<a href="#"><u>getLastDisconnectStampString</u></a> () Get time (milliseconds) of the last disconnected connection to this object as formatted string.
java.util.Date	<a href="#"><u>getLastDisconnectTime</u></a> () Get date and time of last disconnected connection to this object as Date object.
String	<a href="#"><u>getLastDisconnectTimeString</u></a> () Get date and time of last disconnected connection to this object as Date object as formatted string.
long	<a href="#"><u>getTotal</u></a> () Get total number of connection attempts to this object.
long	<a href="#"><u>getTotalAccepted</u></a> () Get total number of accepted connections to this object.
long	<a href="#"><u>getTotalRejected</u></a> () Get total number of rejected connections to this object.
void	<a href="#"><u>incrementAccept</u></a> (ConnectionHolder connectionHolder, java.util.Date date, long stamp, byte[] license) Increment accepted connections.
void	<a href="#"><u>incrementReject</u></a> (ConnectionHolder connectionHolder, int reason, java.util.Date date, long stamp, byte[] license) Increment reject connection.
void	<a href="#"><u>rejectConnection</u></a> (ConnectionHolder connectionHolder, int reason, byte[] license) Reject connection.
void	<a href="#"><u>removeConnectionListener</u></a> (IConnectionNotify connectionNotify) Remove connection listener
void	<a href="#"><u>setConnectionValidator</u></a> (IConnectionValidator connectionValidator) Set the connection validator.

boolean	<a href="#">validateNewConnection</a> (ConnectionHolder connectionHolder, byte[] license) Validate a new connection.
---------	---

Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Constructors

### ConnectionCounter

```
public ConnectionCounter()
```

Create empty ConnectionCounter

## Methods

### addConnectionListener

```
public void addConnectionListener(IConnectionNotify connectionNotify)
```

Add a connection listener. Receives following events: `onClientConnect`, `onClientDisconnect`, `onClientAccept` and `onClientReject`.

**Parameters:**

`connectionNotify` - connection listener

### removeConnectionListener

```
public void removeConnectionListener(IConnectionNotify connectionNotify)
```

Remove connection listener

**Parameters:**

`connectionNotify` - connection listener

### setConnectionValidator

```
public void setConnectionValidator(IConnectionValidator connectionValidator)
```

Set the connection validator.

**Parameters:**

`connectionValidator` - connection validator

### validateNewConnection

```
public boolean validateNewConnection(ConnectionHolder connectionHolder,  
byte[] license)
```

Validate a new connection.

**NOTE:** This is a private internal call. Server will not work properly if this method is not called properly using internal security mechanism.

(continued from last page)

**Parameters:**

connectionHolder - connection holder  
license - security data

**Returns:**

true if connection is accepted

---

## acceptConnection

```
public void acceptConnection(ConnectionHolder connectionHolder,  
    byte[] license)
```

Accept a new connection.

**NOTE:** This is a private internal call. Server will not work properly if this method is not called properly using internal security mechanism.

**Parameters:**

connectionHolder - connection holder  
license - security data

---

## incrementAccept

```
public void incrementAccept(ConnectionHolder connectionHolder,  
    java.util.Date date,  
    long stamp,  
    byte[] license)
```

Increment accepted connections.

**NOTE:** This is a private internal call. Server will not work properly if this method is not called properly using internal security mechanism.

**Parameters:**

connectionHolder - connection holder  
date - date the connection occurred  
stamp - time stamp connection occurred (milliseconds)  
license - security data

---

## rejectConnection

```
public void rejectConnection(ConnectionHolder connectionHolder,  
    int reason,  
    byte[] license)
```

Reject connection.

**NOTE:** This is a private internal call. Server will not work properly if this method is not called properly using internal security mechanism.

**Parameters:**

connectionHolder - connection holder  
reason - reason the connection was refused. See REJECTREASON\_\*  
license - security data

---

(continued from last page)

## incrementReject

```
public void incrementReject(ConnectionHolder connectionHolder,  
    int reason,  
    java.util.Date date,  
    long stamp,  
    byte[] license)
```

Increment reject connection.

**NOTE:** This is a private internal call. Server will not work properly if this method is not called properly using internal security mechanism.

**Parameters:**

connectionHolder - connection holder  
reason - reason the connection was refused. See REJECTREASON\_\*  
date - date the connection occurred  
stamp - time stamp connection occurred (milliseconds)  
license - security data

---

## disconnect

```
public void disconnect(ConnectionHolder connectionHolder,  
    byte[] license)
```

Disconnect connection.

**NOTE:** This is a private internal call. Server will not work properly if this method is not called properly using internal security mechanism.

**Parameters:**

connectionHolder - connection holder  
license - security data

---

## decrement

```
public void decrement(ConnectionHolder connectionHolder,  
    boolean isValid,  
    java.util.Date date,  
    long stamp,  
    byte[] license)
```

Decrement connection counters.

**NOTE:** This is a private internal call. Server will not work properly if this method is not called properly using internal security mechanism.

**Parameters:**

connectionHolder - connection holder  
isValid - is a valid connection  
date - date the connection occurred  
stamp - time stamp connection occurred (milliseconds)  
license - security data

---

## getCurrent

```
public long getCurrent()
```

Get total number of client currently connected to this object.

**Returns:**

total number of client currently connected to this object

## getLastConnectAcceptedStamp

```
public long getLastConnectAcceptedStamp()
```

Get time (milliseconds) of the last conenction to this object.

**Returns:**

time (milliseconds) of the last conenction to this object

---

## getLastConnectAcceptedStampString

```
public String getLastConnectAcceptedStampString()
```

Get time (milliseconds) of the last conenction to this object as formatted string.

**Returns:**

time (milliseconds) of the last conenction to this object as formatted string

---

## getLastConnectAcceptedTime

```
public java.util.Date getLastConnectAcceptedTime()
```

Get time (milliseconds) of the last accepeted conenction to this object.

**Returns:**

time (milliseconds) of the last accepeted conenction to this object

---

## getLastConnectAcceptedTimeString

```
public String getLastConnectAcceptedTimeString()
```

Get time (milliseconds) of the last accepeted conenction to this object as formatted string.

**Returns:**

time (milliseconds) of the last accepeted conenction to this object as formatted string

---

## getLastConnectRejectedStamp

```
public long getLastConnectRejectedStamp()
```

Get time (milliseconds) of the last rejected conenction to this object.

**Returns:**

time (milliseconds) of the last rejected conenction to this object

---

## getLastConnectRejectedStampString

```
public String getLastConnectRejectedStampString()
```

Get time (milliseconds) of the last rejected conenction to this object as formatted string.

**Returns:**

time (milliseconds) of the last rejected conenction to this object as formatted string

---

## getLastConnectRejectedTime

```
public java.util.Date getLastConnectRejectedTime()
```

---

(continued from last page)

Get date and time of last rejected connection to this object as Date object.

**Returns:**

date and time of last reject connection to this object as Date object

---

## getLastConnectRejectedTimeString

```
public String getLastConnectRejectedTimeString()
```

Get date and time of last rejected connection to this object as formatted string.

**Returns:**

date and time of last reject connection to this object as formatted string

---

## getLastConnectRejectedByReasonStampString

```
public String getLastConnectRejectedByReasonStampString(int reason)
```

Get time (milliseconds) of the last rejected connection by reason to this object as formatted string.

**Parameters:**

reason - reason, see REJECTREASON\_\*

**Returns:**

time (milliseconds) of the last rejected connection by reason to this object as formatted string

---

## getLastConnectRejectedByReasonStamp

```
public long getLastConnectRejectedByReasonStamp(int reason)
```

Get time (milliseconds) of the last rejected connection by reason to this object.

**Parameters:**

reason - reason, see REJECTREASON\_\*

**Returns:**

time (milliseconds) of the last rejected connection by reason to this object

---

## getLastConnectRejectedByReasonTime

```
public java.util.Date getLastConnectRejectedByReasonTime(int reason)
```

Get date and time of last rejected connection by reason to this object as Date object.

**Parameters:**

reason - reason, see REJECTREASON\_\*

**Returns:**

date and time of last reject connection by reason to this object as Date object

---

## getLastConnectRejectedByReasonTimeString

```
public String getLastConnectRejectedByReasonTimeString(int reason)
```

Get date and time of last rejected connection by reason to this object as formatted string.

**Parameters:**

reason - reason, see REJECTREASON\_\*

(continued from last page)

**Returns:**

date and time of last rejected connection by reason to this object as formatted string

---

**getLastDisconnectStampString**

```
public String getLastDisconnectStampString()
```

Get time (milliseconds) of the last disconnected connection to this object as formatted string.

**Returns:**

time (milliseconds) of the last disconnected connection to this object as formatted string

---

**getLastDisconnectStamp**

```
public long getLastDisconnectStamp()
```

Get time (milliseconds) of the last disconnected connection to this object.

**Returns:**

time (milliseconds) of the last disconnected connection to this object

---

**getLastDisconnectTime**

```
public java.util.Date getLastDisconnectTime()
```

Get date and time of last disconnected connection to this object as Date object.

**Returns:**

date and time of last disconnected connection to this object as Date object

---

**getLastDisconnectTimeString**

```
public String getLastDisconnectTimeString()
```

Get date and time of last disconnected connection to this object as Date object as formatted string.

**Returns:**

date and time of last disconnected connection to this object as Date object as formatted string

---

**getTotal**

```
public long getTotal()
```

Get total number of connection attempts to this object.

**Returns:**

total number of connection attempts to this object

---

**getTotalAccepted**

```
public long getTotalAccepted()
```

Get total number of accepted connections to this object.

**Returns:**

total number of accepted connections to this object

## getTotalRejected

```
public long getTotalRejected()
```

Get total number of rejected connections to this object.

**Returns:**

total number of rejected connections to this object

## com.wowza.wms.client Interface IClient

public interface **IClient**  
extends

IClient: public interface to Client object.

### Field Summary

public static final	<a href="#"><u>AUDIOSAMPLE_ACCESS_ALL</u></a> Value: *
public static final	<a href="#"><u>AUDIOSAMPLE_ACCESS_NONE</u></a> Value:
public static final	<a href="#"><u>READ_ACCESS_ALL</u></a> Value: *
public static final	<a href="#"><u>READ_ACCESS_NONE</u></a> Value:
public static final	<a href="#"><u>VIDEOSAMPLE_ACCESS_ALL</u></a> Value: *
public static final	<a href="#"><u>VIDEOSAMPLE_ACCESS_NONE</u></a> Value:
public static final	<a href="#"><u>WRITE_ACCESS_ALL</u></a> Value: *
public static final	<a href="#"><u>WRITE_ACCESS_NONE</u></a> Value:

### Method Summary

void	<a href="#"><u>acceptConnection</u></a> ( ) Accept connection
void	<a href="#"><u>acceptConnection</u></a> ( <a href="#"><u>AMFData</u></a> successObj) Accept connection
void	<a href="#"><u>acceptConnection</u></a> (String successStr) Accept connection
void	<a href="#"><u>addAcceptConnectionAttribute</u></a> (String key, <a href="#"><u>AMFDataObj</u></a> item) Add and attribute to the resultObj that gets passed back to the client on successful connection

void	<a href="#"><u>addAcceptConnectionAttribute</u></a> (String key, String item) Add and attribute to the resultObj that gets passed back to the client on successful connection
void	<a href="#"><u>call</u></a> (String handlerName) Simplified call client method/handler call.
void	<a href="#"><u>call</u></a> (String handlerName, <a href="#"><u>IModuleCallResult</u></a> resultObj, Object[] params) Call client method/handler.
void	<a href="#"><u>clearFastPlaySettings</u></a> ( ) Force clear the fastPlay settings
void	<a href="#"><u>fcSubscribe</u></a> (String streamName) Subscribe to a live stream (for live stream repeater to start start from edge to origin)
void	<a href="#"><u>fcSubscribe</u></a> (String streamName, String mediaCasterType) Subscribe to a live stream (use a particular mediaCasterType)
void	<a href="#"><u>fcUnSubscribe</u></a> (String streamName) UnSubscribe from a stream
void	<a href="#"><u>fcUnSubscribeAll</u></a> ( ) UnSubscribe to all streams that this client is current subscribed to
<a href="#"><u>IApplicationInstance</u></a>	<a href="#"><u>getAppInstance</u></a> ( ) Get parent applicationInstance.
<a href="#"><u>IApplication</u></a>	<a href="#"><u>getApplication</u></a> ( ) Get parent application.
int	<a href="#"><u>getBufferTime</u></a> ( ) Get default buffer time for newly created mediaStream objects
int	<a href="#"><u>getClientId</u></a> ( ) Get client id.
long	<a href="#"><u>getConnectTime</u></a> ( ) Get time in milliseconds the client connected to the server.
String	<a href="#"><u>getDateStarted</u></a> ( ) Get date and time of client connection
<a href="#"><u>ElapsedTimer</u></a>	<a href="#"><u>getElapsedTime</u></a> ( ) Get elapsed time client has been connected.
FastPlaySettings	<a href="#"><u>getFastPlaySettings</u></a> ( ) Get the current fastPlay settings.
String	<a href="#"><u>getFlashVer</u></a> ( ) Get client flash version
String	<a href="#"><u>getForwardedIP</u></a> ( ) Get the forwarded IP of the connected client, if available.
int	<a href="#"><u>getIdleFrequency</u></a> ( ) Get client idle frequency (milliseconds)
String	<a href="#"><u>getIp</u></a> ( ) Client ip address

long	<a href="#"><u>getLastValidateTime()</u></a> Get last time (millisecond) the connection was validated with a ping
int	<a href="#"><u>getLiveRepeaterCapabilities()</u></a> Get the live repeater capabilities of this connection
String	<a href="#"><u>getLiveStreamPacketizerList()</u></a> Get the comma separated list of LiveStreamPacketizers names being used by this client (see conf/LiveStreamPacketizers.xml)
String	<a href="#"><u>getLiveStreamTranscoderList()</u></a> Get the comma separated list of LiveStreamTranscoders names being used by this client (see conf/LiveStreamTranscoders.xml)
int	<a href="#"><u>getMaximumPendingWriteBytes()</u></a> Get maximum number a bytes a client connection can have waiting to be sent before the connection is terminated.
int	<a href="#"><u>getMaximumSetBufferTime()</u></a> Get maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call.
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getMediaIOPerformanceCounter()</u></a> Get performance counter for media bytes transferred to this client.
int	<a href="#"><u>getObjectEncoding()</u></a> Get the object encoding level
String	<a href="#"><u>getPageUrl()</u></a> Get the pageUrl for this connection.
long	<a href="#"><u>getPingRoundTripTime()</u></a> Get turn around time (milliseconds) of last ping request
int	<a href="#"><u>getPingTimeout()</u></a> Get the ping timeout (milliseconds)
int	<a href="#"><u>getPlayStreamCount()</u></a> Get the number of play streams
java.util.List	<a href="#"><u>getPlayStreams()</u></a> Get a collection of all play streams.
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get client properties
int	<a href="#"><u>getProtocol()</u></a> Get connection protocol (1 = RTMP, 3 = RTMPT)
int	<a href="#"><u>getPublishStreamCount()</u></a> Get the number of publish streams
java.util.List	<a href="#"><u>getPublishStreams()</u></a> Get a collection of publish streams.
String	<a href="#"><u>getQueryStr()</u></a> Get the query string part of the connection string.
String	<a href="#"><u>getReferrer()</u></a> Get the referrer data for this connection.

String	<a href="#"><u>getRepeaterOriginUrl()</u></a> Get the origin URL used by the Live Stream Repeater
<a href="#"><u>AMFObj</u></a>	<a href="#"><u>getRespAMFAudioObj()</u></a> ( <a href="#"><u>IMediaStream</u></a> stream) Get the audio response AMFObj for a given mediaStream
<a href="#"><u>AMFObj</u></a>	<a href="#"><u>getRespAMFDataObj()</u></a> ( <a href="#"><u>IMediaStream</u></a> stream) Get the data response AMFObj for a given mediaStream
<a href="#"><u>AMFObj</u></a>	<a href="#"><u>getRespAMFVideoObj()</u></a> ( <a href="#"><u>IMediaStream</u></a> stream) Get the video response AMFObj for a given mediaStream
<a href="#"><u>ResponseFunctions</u></a>	<a href="#"><u>getRespFunctions()</u></a> Get client responseFunctions object.
<a href="#"><u>AMFObj</u></a>	<a href="#"><u>getResponseAMFObj()</u></a> (int index) Get the response channel AMFObj for channel index.
<a href="#"><u>RTPStream</u></a>	<a href="#"><u>getRTPStream()</u></a> If this client was created due to an RTP connection to the server return the underlying RTPStream object
<a href="#"><u>HostPort</u></a>	<a href="#"><u>getServerHostPort()</u></a> Get the hostPort object for the connection that is servicing this client
String	<a href="#"><u>getSharedObjectReadAccess()</u></a> Get the shared object read access value.
String	<a href="#"><u>getSharedObjectWriteAccess()</u></a> Get the shared object write access value.
String	<a href="#"><u>getStreamAudioSampleAccess()</u></a> Get the audio sample access value.
java.io.File	<a href="#"><u>getStreamFile()</u></a> (String streamName) Get File object for stream with given name.
java.io.File	<a href="#"><u>getStreamFile()</u></a> (String streamName, String streamExt) Get File object for stream with given name and extension.
java.io.File	<a href="#"><u>getStreamFile()</u></a> (String streamName, String streamExt, boolean doCreateFolder) Get File object for stream with given name and extension.
String	<a href="#"><u>getStreamReadAccess()</u></a> Get the stream read access value.
String	<a href="#"><u>getStreamType()</u></a> Get default streamType
String	<a href="#"><u>getStreamVideoSampleAccess()</u></a> Get the video sample access value.
String	<a href="#"><u>getStreamWriteAccess()</u></a> Get the stream write access value.
String	<a href="#"><u>getTimeRunning()</u></a> Get elapsed time of connection

double	<a href="#"><u>getTimeRunningSeconds()</u></a> Get time running in seconds
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getTotalIOPerformanceCounter()</u></a> Get performance counter for all bytes transferred to this client.
String	<a href="#"><u>getUri()</u></a> Get the full URI of the connection string
<a href="#"><u>IVHost</u></a>	<a href="#"><u>getVHost()</u></a> Get parent vHost
com.wowza.wms.protocol.WOWZSession	<a href="#"><u>getWowzSession()</u></a>
ClientWriteListener	<a href="#"><u>getWriteListener()</u></a> Object that tracks write operations
boolean	<a href="#"><u>isAcceptConnection()</u></a> Is auto accept connection
boolean	<a href="#"><u>isAcceptConnectionSendClientId()</u></a> Include the client id in the accept connection response
boolean	<a href="#"><u>isConnected()</u></a> Is this client connected
boolean	<a href="#"><u>isEncrypted()</u></a> Is this connection encrypted (RTMPE or RTMPTE)
boolean	<a href="#"><u>isFlashMediaLiveEncoder()</u></a> Returns true if this connection is the Flash Media Live Encoder
boolean	<a href="#"><u>isFlashVersion10()</u></a> Returns true if the Flash version is equal or greater than 10.x.x.x
boolean	<a href="#"><u>isFlashVersion90115()</u></a> Returns true if the Flash version is equal or greater than 9.0.115.x
boolean	<a href="#"><u>isFlashVersionH264Capable()</u></a> Returns true if the connected client is capable of playing H.264 video (Flash player 9.0.45.x or greater)
boolean	<a href="#"><u>isLiveRepeater()</u></a> Returns true if this connection is from the live stream repeater
boolean	<a href="#"><u>isObjectEncodingAMF0()</u></a> Is the object encoding for this client AMF0
boolean	<a href="#"><u>isObjectEncodingAMF3()</u></a> Is the object encoding for this client AMF3
boolean	<a href="#"><u>isSecure()</u></a> Is this connection protected by either SSL or encryption (RTMPE, RTMPTE, RTMPS)
boolean	<a href="#"><u>isSendCloseOnRejectConnection()</u></a>
boolean	<a href="#"><u>isSSL()</u></a> Is this connection SSL (RTMPS)

boolean	<a href="#"><u>isValidFMLEConnections()</u></a> Returns true if validating FMLE connection (default is false)
int	<a href="#"><u>ping(IModulePingResult pingResult)</u></a> Ping client.
void	<a href="#"><u>redirectConnection(String url)</u></a> Redirection connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected and info.ex.code of 302)
void	<a href="#"><u>redirectConnection(String url, String description)</u></a> Redirection connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected and info.ex.code of 302)
void	<a href="#"><u>redirectConnection(String url, String description, AMFData errorObj)</u></a> Redirection connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected and info.ex.code of 302).
void	<a href="#"><u>redirectConnection(String url, String description, String errorStr)</u></a> Redirection connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected and info.ex.code of 302)
void	<a href="#"><u>rejectConnection()</u></a> Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)
void	<a href="#"><u>rejectConnection(AMFData errorObj)</u></a> Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)
void	<a href="#"><u>rejectConnection(String errorStr)</u></a> Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)
void	<a href="#"><u>rejectConnection(String description, AMFData errorObj)</u></a> Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)
void	<a href="#"><u>rejectConnection(String description, String errorStr)</u></a> Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)
void	<a href="#"><u>reparentClient(IVHost vhost)</u></a> Move a client object to a new vhost.
void	<a href="#"><u>setAcceptConnection(boolean acceptConnection)</u></a> Set the default for accept connection
void	<a href="#"><u>setAcceptConnectionDescription(String description)</u></a> Call this method from onConnect to set the info.description property returned in NetConnection onStatus handler
void	<a href="#"><u>setAcceptConnectionExObj(AMFDataObj acceptConnectionExObj)</u></a> Call this method from onConnect to set the info.ex property returned in NetConnection onStatus handler
void	<a href="#"><u>setAcceptConnectionObj(AMFData acceptConnectionObj)</u></a> Call this method from onConnect to add an "application" property to the info object that is passed back to the Flash client in the onStatus handler.

void	<a href="#"><u>setAcceptConnectionSendClientId</u></a> (boolean acceptConnectionSendClientId) Include the client id in the connection response
void	<a href="#"><u>setBufferTime</u></a> (int bufferTime) Set default buffer time for newly created mediaStream objects
void	<a href="#"><u>setFastPlaySettings</u></a> (FastPlaySettings fastPlaySettings) Set fastPlay settings
void	<a href="#"><u>setFlashVer</u></a> (String flashVer) Set client flash version
void	<a href="#"><u>setForwardedIP</u></a> (String IP) Set the forwarded IP of the connected client.
void	<a href="#"><u>setIdleFrequency</u></a> (int idleFrequency) Set client idle frequency (milliseconds)
void	<a href="#"><u>setLastValidateTime</u></a> (long lastValidateTime) Set the last time (milliseconds) the connection was validated with ping
void	<a href="#"><u>setLiveRepeaterCapabilities</u></a> (int liveRepeaterCapabilities) Set the live repeater capabilities of this connection
void	<a href="#"><u>setLiveStreamPacketizerList</u></a> (String liveStreamPacketizerList) Set the comma separated list of LiveStreamPacketizers names being used by this client (see conf/LiveStreamPacketizers.xml)
void	<a href="#"><u>setLiveStreamTranscoderList</u></a> (String liveStreamTranscoderList) Set the comma separated list of LiveStreamTranscoders names being used by this client (see conf/LiveStreamTranscoders.xml)
void	<a href="#"><u>setObjectEncoding</u></a> (int objectEncoding) Set the object encoding level
void	<a href="#"><u>setRepeaterOriginUrl</u></a> (String repeaterOriginUrl) Set the origin URL used by the Live Stream Repeater
void	<a href="#"><u>setSendCloseOnRejectConnection</u></a> (boolean sendCloseOnRejectConnection)
void	<a href="#"><u>setSharedObjectReadAccess</u></a> (String sharedObjectReadAccess) Set the shared object read access value.
void	<a href="#"><u>setSharedObjectWriteAccess</u></a> (String sharedObjectWriteAccess) Set the shared object write access value.
void	<a href="#"><u>setShutdownClient</u></a> (boolean shutdownClient) Gracefully and forcefully shutdown a client.
void	<a href="#"><u>setStreamAudioSampleAccess</u></a> (String audioSampleAccess) Set the stream audio sample access value.
void	<a href="#"><u>setStreamReadAccess</u></a> (String streamReadAccess) Set the stream object read access value.
void	<a href="#"><u>setStreamType</u></a> (String streamType) Set default streamType

void	<a href="#"><code>setStreamVideoSampleAccess</code></a> (String videoSampleAccess) Set the stream video sample access value.
void	<a href="#"><code>setStreamWriteAccess</code></a> (String streamWriteAccess) Set the stream object write access value.
void	<a href="#"><code>setThreadContext</code></a> () Set the thread logging context to this client
void	<a href="#"><code>setValidateFMLEConnections</code></a> (boolean validateFMLEConnections) Returns true if validating FMLE connection (default is false)
void	<a href="#"><code>setWowzSession</code></a> (com.wowza.wms.protocol.wowz.WOWZSession wowzSession)
void	<a href="#"><code>shutdownClient</code></a> () Gracefully shutdown a client.
int	<a href="#"><code>testFlashVersion</code></a> (int[] version) Test to see if the connected client flash version is equal to or greater than a given value.
void	<a href="#"><code>touch</code></a> () Update the last touch time for client

## Fields

### VIDEOSAMPLE\_ACCESS\_ALL

```
public static final java.lang.String VIDEOSAMPLE_ACCESS_ALL
```

Constant value: \*

### VIDEOSAMPLE\_ACCESS\_NONE

```
public static final java.lang.String VIDEOSAMPLE_ACCESS_NONE
```

Constant value:

### AUDIOSAMPLE\_ACCESS\_ALL

```
public static final java.lang.String AUDIOSAMPLE_ACCESS_ALL
```

Constant value: \*

### AUDIOSAMPLE\_ACCESS\_NONE

```
public static final java.lang.String AUDIOSAMPLE_ACCESS_NONE
```

Constant value:

### READ\_ACCESS\_ALL

```
public static final java.lang.String READ_ACCESS_ALL
```

(continued from last page)

Constant value: \*

---

## READ\_ACCESS\_NONE

```
public static final java.lang.String READ_ACCESS_NONE
```

Constant value:

---

## WRITE\_ACCESS\_ALL

```
public static final java.lang.String WRITE_ACCESS_ALL
```

Constant value: \*

---

## WRITE\_ACCESS\_NONE

```
public static final java.lang.String WRITE_ACCESS_NONE
```

Constant value:

## Methods

### getClientId

```
public int getClientId()
```

Get client id. Assigned by server and connection time.

**Returns:**

client id

---

### getFlashVer

```
public String getFlashVer()
```

Get client flash version

**Returns:**

client flash version string

---

### setFlashVer

```
public void setFlashVer(String flashVer)
```

Set client flash version

**Parameters:**

flashVer - client flash version string

---

### getTotalIOPerformanceCounter

```
public IOPerformanceCounter getTotalIOPerformanceCounter()
```

Get performance counter for all bytes transferred to this client. This includes function calls.

(continued from last page)

**Returns:**

performance counter

---

**getMediaIOPerformanceCounter**

```
public IOPerformanceCounter getMediaIOPerformanceCounter()
```

Get performance counter for media bytes transferred to this client. Only includes bytes to mediaStream objects

**Returns:**

performance counter

---

**getAppInstance**

```
public IApplicationInstance getAppInstance()
```

Get parent applicationInstance. Is null if connection reject or before accepted.

**Returns:**

parent applicationInstance

---

**getApplication**

```
public IApplication getApplication()
```

Get parent application. Is null if connection reject or before accepted.

**Returns:**

application

---

**getPlayStreams**

```
public java.util.List getPlayStreams()
```

Get a collection of all play streams. Play streams are streams that are created due to a call to play.

## Iterate Play Streams

```
IClient client;

List playStreams = client.getPlayStreams();
Iterator iter = playStreams.iterator();
while(iter.hasNext())
{
    IMediaStream stream = (IMediaStream)iter.next();
    WMSLoggerFactory.getLogger(null).debug("stream: "+stream.getName());
}
```

(continued from last page)

**Returns:**

collection of play streams

---

## getPublishStreams

```
public java.util.List getPublishStreams()
```

Get a collection of publish streams. Publish streams are streams that are created due to a call to publish.

## Iterate Public Streams

```
IClient client;

List publishStreams = client.getPublishStreams();
Iterator iter = publishStreams.iterator();
while(iter.hasNext())
{
    IMediaStream stream = (IMediaStream)iter.next();
    WMSLoggerFactory.getLogger(null).debug("stream: "+stream.getName());
}
```

**Returns:**

collection of publish stream

---

## getPlayStreamCount

```
public int getPlayStreamCount()
```

Get the number of play streams

**Returns:**

number of play streams

---

## getPublishStreamCount

```
public int getPublishStreamCount()
```

Get the number of publish streams

**Returns:**

number of publish streams

---

## shutdownClient

```
public void shutdownClient()
```

(continued from last page)

Gracefully shutdown a client. Only use this method to shutdown a client if you know the client is connected to Wowza Pro. If the client may be disconnected from Wowza Pro, use `IClient.setShutdownClient(true)`

---

## touch

```
public void touch()
```

Update the last touch time for client

---

## isConnected

```
public boolean isConnected()
```

Is this client connected

**Returns:**

is connected

---

## getProperties

```
public WMSProperties getProperties()
```

Get client properties

**Returns:**

collection of client properties

---

## getStreamType

```
public String getStreamType()
```

Get default streamType

**Returns:**

streamType

---

## setStreamType

```
public void setStreamType(String streamType)
```

Set default streamType

**Parameters:**

streamType - streamType

---

## isAcceptConnection

```
public boolean isAcceptConnection()
```

Is auto accept connection

**Returns:**

auto accept connection

---

## acceptConnection

```
public void acceptConnection()
```

Accept connection

---

## acceptConnection

```
public void acceptConnection(String successStr)
```

Accept connection

**Parameters:**

successStr - application property value added to NetConnection.Connect.Success event object

---

## acceptConnection

```
public void acceptConnection(AMFData successObj)
```

Accept connection

**Parameters:**

successObj - application property value added to NetConnection.Connect.Success event object

---

## rejectConnection

```
public void rejectConnection()
```

Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)

---

## rejectConnection

```
public void rejectConnection(String errorStr)
```

Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)

**Parameters:**

errorStr - error (returned in onStatus handler in info.application parameter)

---

## rejectConnection

```
public void rejectConnection(AMFData errorObj)
```

Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)

**Parameters:**

errorObj - error AMFData (returned in onStatus handler in info.application parameter)

---

## rejectConnection

```
public void rejectConnection(String description,  
    String errorStr)
```

Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)

**Parameters:**

description - description (returned in onStatus handler in info.description parameter)

errorStr - error (returned in onStatus handler in info.application parameter)

---

## rejectConnection

```
public void rejectConnection(String description,  
    AMFData errorObj)
```

---

(continued from last page)

Reject connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected)

**Parameters:**

description - description (returned in onStatus handler in info.description parameter)  
errorObj - error AMFData (returned in onStatus handler in info.application parameter)

---

**redirectConnection**

```
public void redirectConnection(String url)
```

Redirection connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected and info.ex.code of 302)

**Parameters:**

url - url (returned in onStatus handler in info.ex.redirect parameter)

---

**redirectConnection**

```
public void redirectConnection(String url,  
    String description)
```

Redirection connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected and info.ex.code of 302)

**Parameters:**

url - url (returned in onStatus handler in info.ex.redirect parameter)  
description - description (returned in onStatus handler in info.description parameter)

---

**redirectConnection**

```
public void redirectConnection(String url,  
    String description,  
    String errorStr)
```

Redirection connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected and info.ex.code of 302)

**Parameters:**

url - url (returned in onStatus handler in info.ex.redirect parameter)  
description - description (returned in onStatus handler in info.description parameter)  
errorStr - error (returned in onStatus handler in info.application parameter)

---

**redirectConnection**

```
public void redirectConnection(String url,  
    String description,  
    AMFData errorObj)
```

(continued from last page)

Redirection connection (NetConnection.onStatus handler returns info.code of NetConnection.Connect.Rejected and info.ex.code of 302). Code must be added client side to capture the NetConnection.Connect.Rejected message, look for the info.ex.code value of 302 and attempt a reconnect to the info.ex.redirect url. Client side example:

```
public function ncOnStatus(infoObject:NetStatusEvent)
{
    if (infoObject.info.code == "NetConnection.Connect.Rejected")
    {
        if (infoObject.info.ex.code == 302)
        {
            trace("Connection redirected: "+infoObject.info.ex.redirect);
            nc.connect(infoObject.info.ex.redirect);
        }
        else
            trace("Connection rejected");
    }
}
nc.addEventListener(NetStatusEvent.NET_STATUS, ncOnStatus);
```

**Parameters:**

url - url (returned in onStatus handler in info.ex.redirect parameter)  
description - description (returned in onStatus handler in info.description parameter)  
errorObj - error AMFData (returned in onStatus handler in info.application parameter)

---

## isAcceptConnectionSendClientId

```
public boolean isAcceptConnectionSendClientId()
```

Include the client id in the accept connection response

**Returns:**

true if client id is included

---

## setAcceptConnectionSendClientId

```
public void setAcceptConnectionSendClientId(boolean acceptConnectionSendClientId)
```

Include the client id in the connection response

**Parameters:**

acceptConnectionSendClientId - true if client id is included

---

## getVHost

```
public IVHost getVHost()
```

Get parent vHost

**Returns:**

vHost object

---

## call

```
public void call(String handlerName,  
    IModuleCallResult resultObj,  
    Object[] params)
```

Call client method/handler. You can call any method/handler attached to NetConnection object. Such as netConnection.myFunc

## Call Client Handler Method With Result Object

```
IClient client;  
  
class ReturnObj implements IModuleCallResult  
{  
    public void onResult(IClient client, RequestFunction function,  
        AMFDataList params)  
    {  
        WMSLoggerFactory.getLogger(null).debug("onResult");  
    }  
}  
  
client.call("onCustomMethod", new ReturnObj(), "param1", 1.2345, false, new Date());
```

### Parameters:

handlerName - handler name

resultObj - if client method returns data this object will receive callback, null if don't care or no return on client method/handler.

params - variable list of argument. Will be automatically wrapped in AMFData objects

---

## call

```
public void call(String handlerName)
```

Simplified call client method/handler call. No resultObj. No parameters

### Parameters:

handlerName - handler name

---

## ping

```
public int ping(IModulePingResult pingResult)
```

(continued from last page)

Ping client. Unlike FMS this ping is asynchronous. pingResult object will be notified of successful response by client or timeout.

## Ping Client and Kill Connection If Client Has Died

```
class PingResult implements IModulePingResult
{
    public void onResult(IClient client, long pingTime, int pingId, boolean result)
    {
        WMSLogger log = WMSLoggerFactory.getLogger(null);
        log.debug("onResult: result:"+result);
        if (!result)
        {
            // client has died lets kill it
            client.getAppInstance().shutdownClient(client);
        }
        else
            log.debug("lastPingTime: "+client.getPingRoundTripTime());
    }
}
client.ping(new PingResult());
```

### Parameters:

pingResult - ping result object. Will receive callback on result of ping or timeout. Can be null.

### Returns:

ping id

---

## getIp

```
public String getIp()
```

Client ip address

### Returns:

client ip address

---

## getForwardedIP

```
public String getForwardedIP()
```

Get the forwarded IP of the connected client, if available. Default returns null

### Returns:

(continued from last page)

## setForwardedIP

```
public void setForwardedIP(String IP)
```

Set the forwarded IP of the connected client.

### Parameters:

IP

---

## getFastPlaySettings

```
public FastPlaySettings getFastPlaySettings()
```

Get the current fastPlay settings. FastPlay settings when set from the client are immediatly cleared on the next call to seek/unpause/play.

### Returns:

fastPlay settings

---

## setFastPlaySettings

```
public void setFastPlaySettings(FastPlaySettings fastPlaySettings)
```

Set fastPlay settings

### Parameters:

fastPlaySettings - fastPlay settings

---

## clearFastPlaySettings

```
public void clearFastPlaySettings()
```

Force clear the fastPlay settings

---

## getRespFunctions

```
public ResponseFunctions getRespFunctions()
```

(continued from last page)

Get client responseFunctions object. The responseFunctions object is the method by which events are sent to the client. This code snippet shows how to send an onStatus event for a mediaStream (stream) to the client.

## Send Status Message to Client

```
ResponseFunctions respFunctions = client.getRespFunctions();

ResponseFunction resp = new ResponseFunction();
resp.createDefaultMessage("onStatus", 0.0);
resp.setRetAMFObj(stream.getRespAMFDataObj());
resp.setSrc(stream.getSrc());

AMFDataObj data = new AMFDataObj();
data.put("level", new AMFDataItem("status"));
data.put("code", new AMFDataItem("NetStream.Publish.Success"));
data.put("description", new AMFDataItem(stream.getName()+" is now unpublished.));
data.put("clientId", new AMFDataItem(clientID));
resp.addBody(data);

respFunctions.add(resp);
```

**Returns:**

responseFunctions object

---

## getConnectTime

```
public long getConnectTime()
```

Get time in milliseconds the client connected to the server. To get the duration of time in milliseconds that the client has been connected to the server us the following formula: (System.currentTimeMillis() - client.getConnectTime())

**Returns:**

duration connected (milliseconds)

---

## getPingRoundTripTime

```
public long getPingRoundTripTime()
```

Get turn around time (milliseconds) of last ping request

**Returns:**

time (milliseconds)

---

## getDateStarted

```
public String getDateStarted()
```

Get date and time of client connection

---

(continued from last page)

**Returns:**date and time of connection

---

**getTimeRunning**

```
public String getTimeRunning()
```

Get elapsed time of connection

**Returns:**elapsed time of connection

---

**getTimeRunningSeconds**

```
public double getTimeRunningSeconds()
```

Get time running in seconds

**Returns:**time running in seconds

---

**getStreamFile**

```
public java.io.File getStreamFile(String streamName)
```

Get File object for stream with given name. Assumes file extension is .flv.

**Parameters:**

streamName - stream name

**Returns:**file

---

**getStreamFile**

```
public java.io.File getStreamFile(String streamName,  
    String streamExt)
```

(continued from last page)

Get File object for stream with given name and extension. For example test.flv would be `getStreamFile("test", "flv");`

## Get File Descriptor

```
IClient client;
File file = client.getStreamFile("test", "flv");
WMSLogger log = WMSLoggerFactory.getLogger(null);
if (file != null)
{
    if (file.exists())
        log.debug("getStreamFile: " + file.getPath());
}
```

**Parameters:**

streamName - stream name  
streamExt - stream extension

**Returns:**

file

---

## getStreamFile

```
public java.io.File getStreamFile(String streamName,
    String streamExt,
    boolean doCreateFolder)
```

Get File object for stream with given name and extension. If doCreateFolder is true, create folder necessary to make path exist. For example test.flv would be `getStreamFile("test", "flv");`

**Parameters:**

streamName - stream name  
streamExt - stream extension  
doCreateFolder - create folders if needed

**Returns:**

file

---

## getBufferTime

```
public int getBufferTime()
```

Get default buffer time for newly created mediaStream objects

**Returns:**

default buffer time (milliseconds)

---

## setBufferTime

```
public void setBufferTime(int bufferTime)
```

(continued from last page)

Set default buffer time for newly created mediaStream objects

**Parameters:**

bufferTime - bufer time (milliseconds)

---

## getResponseAMFObj

```
public AMFObj getResponseAMFObj(int index)
```

Get the response channel AMFObj for channel index.

**Parameters:**

index - channel index

**Returns:**

AMFObj

---

## getRespAMFAudioObj

```
public AMFObj getRespAMFAudioObj(IMediaStream stream)
```

Get the audio response AMFObj for a given mediaStream

**Parameters:**

stream - mediaStream

**Returns:**

response channel AMFObj

---

## getRespAMFVideoObj

```
public AMFObj getRespAMFVideoObj(IMediaStream stream)
```

Get the video response AMFObj for a given mediaStream

**Parameters:**

stream - mediaStream

**Returns:**

response channel AMFObj

---

## getRespAMFDataObj

```
public AMFObj getRespAMFDataObj(IMediaStream stream)
```

Get the data response AMFObj for a given mediaStream

**Parameters:**

stream - mediaStream

**Returns:**

response channel AMFObj

---

## getQueryStr

```
public String getQueryStr()
```

(continued from last page)

Get the query string part of the connection string. If the connection string where:  
rtmp://localhost/app/appInst?data1=myData1&data2=myData2, then query string would be  
data1=myData1&data2=myData2

**Returns:**query string

---

## getReferrer

```
public String getReferrer()
```

Get the referrer data for this connection. The referrer in Wowza Streaming Engine terms is the full url to the Flash movie that connected to the server. Checking referre upon connection is a great way to secure server connections and only allow your Flash movies to connect to the server.

## Only Allow Your .swf Files to Connect to Wowza Pro server

```
public class MyModule extends ModuleBase
{
    static public void onConnect(IClient client, RequestFunction function,
        AMFDataList params)
    {
        String referrer = client.getReferrer();

        if (referrer.indexOf("www.mycompany.com") >= 0 &&
            referrer.indexOf("mycoolflash.swf") >= 0)
            client.acceptConnection("valid referrer");
        else
            client.rejectConnection("invalid referrer: "+referrer);
    }
}
```

**Returns:**referrer

---

## getPageUrl

```
public String getPageUrl()
```

Get the pageUrl for this connection.

**Returns:**pageUrl for this connection

---

## getUri

```
public String getUri()
```

Get the full URI of the connection string

(continued from last page)

**Returns:**

URI of connection string

---

**getProtocol**

```
public int getProtocol()
```

Get connection protocol (1 = RTMP, 3 = RTMPT)

**Returns:**

connection protocol (1 = RTMP, 3 = RTMPT)

---

**getServerHostPort**

```
public HostPort getServerHostPort()
```

Get the hostPort object for the connection that is servicing this client

**Returns:**

vHost hostPort servicing request

---

**isSecure**

```
public boolean isSecure()
```

Is this connection protected by either SSL or encryption (RTMPE, RTMPTE, RTMPS)

**Returns:**

is connection protected by either SSL or encryption (RTMPE, RTMPTE, RTMPS)

---

**isSSL**

```
public boolean isSSL()
```

Is this connection SSL (RTMPS)

**Returns:**

is connection (RTMPS)

---

**isEncrypted**

```
public boolean isEncrypted()
```

Is this connection encrypted (RTMPE or RTMPTE)

**Returns:**

is connection encrypted (RTMPE or RTMPTE)

---

**getIdleFrequency**

```
public int getIdleFrequency()
```

Get client idle frequency (milliseconds)

**Returns:**

client idle frequency (milliseconds)

## setIdleFrequency

```
public void setIdleFrequency(int idleFrequency)
```

Set client idle frequency (milliseconds)

**Parameters:**

idleFrequency - client idle frequency (milliseconds)

---

## getSharedObjectReadAccess

```
public String getSharedObjectReadAccess()
```

Get the shared object read access value. see setSharedObjectReadAccess for more information.

**Returns:**

shared object read access value

---

## setSharedObjectReadAccess

```
public void setSharedObjectReadAccess(String sharedObjectReadAccess)
```

Set the shared object read access value. This list is a semi-colon delimited list of shared objects that this client has access to. By default the value is set to IClient.READ\_ACCESS\_ALL which indicates this client can read all shared objects. If you want to disable read access to all shared objects set this value to IClient.READ\_ACCESS\_NONE. If this value is set to anything other than IClient.READ\_ACCESS\_ALL or IClient.READ\_ACCESS\_NONE then each item in the semi-color delimited list is compared against incoming shared object read requests. If any item in the list completely matches the shared object name or the start of the shared object name, then access is allowed. For example, if the sharedObjectReadAccess list is set to "testa/testb;testc" then the following requests would be granted the following access:

- testc: Granted Access
- testc/test: Granted Access
- testC/test: Denied Access (incorrect case)
- testa/testb: Granted Access
- testa/testb123: Granted Access
- testa/testb/file123: Granted Access
- testa/test: Denied Access (incomplete match)

Values in this list are always case sensitive.

**Parameters:**

sharedObjectReadAccess - shared object read access value

---

## getSharedObjectWriteAccess

```
public String getSharedObjectWriteAccess()
```

Get the shared object write access value. see setSharedObjectWriteAccess for more information.

**Returns:**

shared object write access value

---

## setSharedObjectWriteAccess

```
public void setSharedObjectWriteAccess(String sharedObjectWriteAccess)
```

(continued from last page)

Set the shared object write access value. This list is a semi-colon delimited list of shared objects that this client has access to. By default the value is set to IClient.WRITE\_ACCESS\_ALL which indicates this client can write all shared objects. If you want to disable write access to all shared objects set this value to IClient.WRITE\_ACCESS\_NONE. If this value is set to anything other than IClient.WRITE\_ACCESS\_ALL or IClient.WRITE\_ACCESS\_NONE then each item in the semi-color delimited list is compared against incoming shared object write requests. If any item in the list completely matches the shared object name or the start of the shared object name, then access is allowed. For example, if the sharedObjectWriteAccess list is set to "testa/testb;testc" then the following requests would be granted the following access:

- testc: Granted Access
- testc/test: Granted Access
- testC/test: Denied Access (incorrect case)
- testa/testb: Granted Access
- testa/testb123: Granted Access
- testa/testb/file123: Granted Access
- testa/test: Denied Access (incomplete match)

Values in this list are always case sensitive.

**Parameters:**

sharedObjectWriteAccess

---

## getStreamVideoSampleAccess

```
public String getStreamVideoSampleAccess()
```

Get the video sample access value. see setVideoStreamAccess for more information.

**Returns:**

video sample access

---

## setStreamVideoSampleAccess

```
public void setStreamVideoSampleAccess(String videoSampleAccess)
```

Set the stream video sample access value. This list is a semi-colon delimited list of stream names that this client has access to. By default the value is set to IClient.VIDEOSTREAM\_ACCESS\_NONE which indicates this client can access no stream data client side. If you want to enable access to all stream names set this value to IClient.VIDEOSTREAM\_ACCESS\_ALL. If this value is set to anything other than IClient.VIDEOSTREAM\_ACCESS\_ALL or IClient.VIDEOSTREAM\_ACCESS\_NONE then each item in the semi-color delimited list is compared against incoming stream play requests. If any item in the list completely matches the stream name or the start of the stream name, then access is allowed. For example, if the streamVideoSampleAccess list is set to "testa/testb;testc" then the following play requests would be granted the following access:

- testc: Granted Access
- testc/test: Granted Access
- testC/test: Denied Access (incorrect case)
- testa/testb: Granted Access
- testa/testb123: Granted Access
- testa/testb/file123: Granted Access
- testa/test: Denied Access (incomplete match)

Values in this list are always case sensitive.

**Parameters:**

videoSampleAccess

---

## getStreamAudioSampleAccess

```
public String getStreamAudioSampleAccess()
```

Get the audio sample access value. see setVideoStreamAccess for more information.

**Returns:**

(continued from last page)

audio sample access

---

## setStreamAudioSampleAccess

```
public void setStreamAudioSampleAccess(String audioSampleAccess)
```

Set the stream audio sample access value. This list is a semi-colon delimited list of stream names that this client has access to. By default the value is set to IClient.AUDIOSTREAM\_ACCESS\_NONE which indicates this client can access no stream data client side. If you want to enable access to all stream names set this value to IClient.AUDIOSTREAM\_ACCESS\_ALL. If this value is set to anything other than IClient.AUDIOSTREAM\_ACCESS\_ALL or IClient.AUDIOSTREAM\_ACCESS\_NONE then each item in the semi-color delimited list is compared against incoming stream play requests. If any item in the list completely matches the stream name or the start of the stream name, then access is allowed. For example, if the streamAudioSampleAccess list is set to "testa/testb;testc" then the following play requests would be granted the following access:

- testc: Granted Access
- testc/test: Granted Access
- testC/test: Denied Access (incorrect case)
- testa/testb: Granted Access
- testa/testb123: Granted Access
- testa/testb/file123: Granted Access
- testa/test: Denied Access (incomplete match)

Values in this list are always case sensitive.

### Parameters:

audioSampleAccess

---

## getStreamReadAccess

```
public String getStreamReadAccess()
```

Get the stream read access value. see setStreamReadAccess for more information.

### Returns:

stream read access value

---

## setStreamReadAccess

```
public void setStreamReadAccess(String streamReadAccess)
```

Set the stream object read access value. This list is a semi-colon delimited list of stream names that this client has access to. By default the value is set to IClient.READ\_ACCESS\_ALL which indicates this client can play all streams. If you want to disable read access to all stream names set this value to IClient.READ\_ACCESS\_NONE. If this value is set to anything other than IClient.READ\_ACCESS\_ALL or IClient.READ\_ACCESS\_NONE then each item in the semi-color delimited list is compared against incoming stream play requests. If any item in the list completely matches the stream name or the start of the stream name, then access is allowed. For example, if the streamReadAccess list is set to "testa/testb;testc" then the following play requests would be granted the following access:

- testc: Granted Access
- testc/test: Granted Access
- testC/test: Denied Access (incorrect case)
- testa/testb: Granted Access
- testa/testb123: Granted Access
- testa/testb/file123: Granted Access
- testa/test: Denied Access (incomplete match)

Values in this list are always case sensitive.

### Parameters:

streamReadAccess - shared object read access value

## getStreamWriteAccess

```
public String getStreamWriteAccess()
```

Get the stream write access value. see setStreamWriteAccess for more information.

**Returns:**

stream write access value

---

## setStreamWriteAccess

```
public void setStreamWriteAccess(String streamWriteAccess)
```

Set the stream object write access value. This list is a semi-colon delimited list of stream names that this client has access to. By default the value is set to IClient.WRITE\_ACCESS\_ALL which indicates this client can play all streams. If you want to disable write access to all stream names set this value to IClient.WRITE\_ACCESS\_NONE. If this value is set to anything other than IClient.WRITE\_ACCESS\_ALL or IClient.WRITE\_ACCESS\_NONE then each item in the semi-color delimited list is compared against incoming stream play requests. If any item in the list completely matches the stream name or the start of the stream name, then access is allowed. For example, if the streamWriteAccess list is set to "testa/testb;testc" then the following play requests would be granted the following access:

- testc: Granted Access
- testc/test: Granted Access
- testC/test: Denied Access (incorrect case)
- testa/testb: Granted Access
- testa/testb123: Granted Access
- testa/testb/file123: Granted Access
- testa/test: Denied Access (incomplete match)

Values in this list are always case sensitive.

**Parameters:**

streamWriteAccess - shared object read access value

---

## getWriteListener

```
public ClientWriteListener getWriteListener()
```

Object that tracks write operations

**Returns:**

Object that tracks write operations

---

## addAcceptConnectionAttribute

```
public void addAcceptConnectionAttribute(String key,  
    AMFDataObj item)
```

Add and attribute to the resultObj that gets passed back to the client on successful connection

**Parameters:**

key - key  
item - item to add

---

## addAcceptConnectionAttribute

```
public void addAcceptConnectionAttribute(String key,  
    String item)
```

Add and attribute to the resultObj that gets passed back to the client on successful connection

---

(continued from last page)

**Parameters:**

key - key  
item - item to add

---

**getRepeaterOriginUrl**

```
public String getRepeaterOriginUrl()
```

Get the origin URL used by the Live Stream Repeater

**Returns:**

URL used by the Live Stream Repeater

---

**setRepeaterOriginUrl**

```
public void setRepeaterOriginUrl(String repeaterOriginUrl)
```

Set the origin URL used by the Live Stream Repeater

**Parameters:**

repeaterOriginUrl - URL used by the Live Stream Repeater

---

**getLastValidateTime**

```
public long getLastValidateTime()
```

Get last time (millisecond) the connection was validated with a ping

**Returns:**

last time (millisecond) the connection was validated with a ping

---

**setLastValidateTime**

```
public void setLastValidateTime(long lastValidateTime)
```

Set the last time (milliseconds) the connection was validated with ping

**Parameters:**

lastValidateTime - last time (milliseconds) the connection was validated with ping

---

**getPingTimeout**

```
public int getPingTimeout()
```

Get the ping timeout (milliseconds)

**Returns:**

ping timeout (milliseconds)

---

**isLiveRepeater**

```
public boolean isLiveRepeater()
```

Returns true if this connection is from the live stream repeater

**Returns:**

true if this connection is from the live stream repeater

## isFlashVersionH264Capable

```
public boolean isFlashVersionH264Capable()
```

Returns true if the connected client is capable of playing H.264 video (Flash player 9.0.45.x or greater)

**Returns:**

returns true if the connected client is capable of playing H.264 video (Flash player 9.0.45.x or greater)

---

## isFlashVersion90115

```
public boolean isFlashVersion90115()
```

Returns true if the Flash version is equal or greater than 9.0.115.x

**Returns:**

returns true if the Flash version is equal or greater than 9.0.115.x

---

## isFlashVersion10

```
public boolean isFlashVersion10()
```

Returns true if the Flash version is equal or greater than 10.x.x.x

**Returns:**

returns true if the Flash version is equal or greater than 10.x.x.x

---

## isFlashMediaLiveEncoder

```
public boolean isFlashMediaLiveEncoder()
```

Returns true if this connection is the Flash Media Live Encoder

**Returns:**

true if this connection is the Flash Media Live Encoder

---

## testFlashVersion

```
public int testFlashVersion(int[] version)
```

Test to see if the connected client flash version is equal to or greater than a given value. Example: int isGood = testFlashVersion( { 9, 0, 5, 12} );

**Parameters:**

version - array of version values

**Returns:**

1 if greater, 0 if equal, -1 if less than

---

## isObjectEncodingAMF3

```
public boolean isObjectEncodingAMF3()
```

Is the object encoding for this client AMF3

**Returns:**

true of the object encoding for this client is AMF3

---

## isObjectEncodingAMF0

```
public boolean isObjectEncodingAMF0()
```

Is the object encoding for this client AMF0

**Returns:**

true of the object encoding for this client is AMF0

---

## setObjectEncoding

```
public void setObjectEncoding(int objectEncoding)
```

Set the object encoding level

**Parameters:**

objectEncoding - object encoding level

---

## getObjectEncoding

```
public int getObjectEncoding()
```

Get the object encoding level

**Returns:**

object encoding level

---

## setAcceptConnectionObj

```
public void setAcceptConnectionObj(AMFData acceptConnectionObj)
```

Call this method from onConnect to add an "application" property to the info object that is passed back to the Flash client in the onStatus handler.

**Parameters:**

acceptConnectionObj - connection object

---

## setAcceptConnectionDescription

```
public void setAcceptConnectionDescription(String description)
```

Call this method from onConnect to set the info.description property returned in NetConnection onStatus handler

**Parameters:**

description - description

---

## setAcceptConnectionExObj

```
public void setAcceptConnectionExObj(AMFDataObj acceptConnectionExObj)
```

Call this method from onConnect to set the info.ex property returned in NetConnection onStatus handler

**Parameters:**

acceptConnectionExObj - exObj AMFData item return in info.ex property of NetConnection onStatus handler

---

(continued from last page)

## getRTPStream

```
public RTPStream getRTPStream( )
```

If this client was created due to an RTP connection to the server return the underlying RTPStream object

**Returns:**

underlying RTPStream object

---

## setAcceptConnection

```
public void setAcceptConnection(boolean acceptConnection)
```

Set the default for accept connection

**Parameters:**

acceptConnection - default for accept connection

---

## setShutdownClient

```
public void setShutdownClient(boolean shutdownClient)
```

Gracefully and forcefully shutdown a client.

**Parameters:**

shutdownClient - set to true to gracefully and forcefully shutdown a client

---

## reparentClient

```
public void reparentClient(IVHost vhost)
```

Move a client object to a new vhost. This can only be done right after the handshake process has completed. See IVHostNotify.onVHostClientConnect.

**Parameters:**

vhost - new vhost

---

## getMaximumSetBufferTime

```
public int getMaximumSetBufferTime( )
```

Get maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call. If set to zero this feature is turned off.

**Returns:**

maximum number of milliseconds allowed for the NetStream.setBufferTime(secs) call

---

## getMaximumPendingWriteBytes

```
public int getMaximumPendingWriteBytes( )
```

Get maximum number a bytes a client connection can have waiting to be sent before the connection is terminated. If set to zero this feature is turned off.

**Returns:**

maximum number a bytes a client connection can have waiting to be sent before the connection is terminated

(continued from last page)

---

## getLiveStreamPacketizerList

```
public String getLiveStreamPacketizerList()
```

Get the comma separated list of LiveStreamPacketizers names being used by this client (see conf/LiveStreamPacketizers.xml)

**Returns:**

comma separated list of LiveStreamPacketizers names

---

## setLiveStreamPacketizerList

```
public void setLiveStreamPacketizerList(String liveStreamPacketizerList)
```

Set the comma separated list of LiveStreamPacketizers names being used by this client (see conf/LiveStreamPacketizers.xml)

**Parameters:**

liveStreamPacketizerList - comma separated list of LiveStreamPacketizers names

---

## getLiveStreamTranscoderList

```
public String getLiveStreamTranscoderList()
```

Get the comma separated list of LiveStreamTranscoders names being used by this client (see conf/LiveStreamTranscoders.xml)

**Returns:**

comma separated list of LiveStreamTranscoders names

---

## setLiveStreamTranscoderList

```
public void setLiveStreamTranscoderList(String liveStreamTranscoderList)
```

Set the comma separated list of LiveStreamTranscoders names being used by this client (see conf/LiveStreamTranscoders.xml)

**Parameters:**

liveStreamTranscoderList - comma separated list of LiveStreamTranscoders names

---

## getElapsedTime

```
public ElapsedTimer getElapsedTime()
```

Get elapsed time client has been connected.

**Returns:**

elapsed time client has been connected.

---

## getLiveRepeaterCapabilities

```
public int getLiveRepeaterCapabilities()
```

Get the live repeater capabilities of this connection

**Returns:**

live repeater capabilities of this connection

---

## setLiveRepeaterCapabilities

```
public void setLiveRepeaterCapabilities(int liveRepeaterCapabilities)
```

---

(continued from last page)

Set the live repeater capabilities of this connection

**Parameters:**

liveRepeaterCapabilities - live repeater capabilities of this connection

---

## fcSubscribe

```
public void fcSubscribe(String streamName)
```

Subscribe to a live stream (for live stream repeater to start start from edge to origin)

**Parameters:**

streamName - stream name

---

## fcSubscribe

```
public void fcSubscribe(String streamName,  
    String mediaCasterType)
```

Subscribe to a live stream (use a particular mediaCasterType)

**Parameters:**

streamName - stream name

mediaCasterType - media caster type name

---

## fcUnSubscribeAll

```
public void fcUnSubscribeAll()
```

UnSubscribe to all streams that this client is current subscribed to

---

## fcUnSubscribe

```
public void fcUnSubscribe(String streamName)
```

UnSubscribe from a stream

**Parameters:**

streamName - stream name

---

## isValidateFMLEConnections

```
public boolean isValidateFMLEConnections()
```

Returns true if validating FMLE connection (default is false)

**Returns:**

true if validating FMLE connection

---

## setValidateFMLEConnections

```
public void setValidateFMLEConnections(boolean validateFMLEConnections)
```

Returns true if validating FMLE connection (default is false)

**Parameters:**

validateFMLEConnections - true if validating FMLE connection

---

(continued from last page)

## setThreadContext

```
public void setThreadContext()
```

Set the thread logging context to this client

---

## getWowzSession

```
public com.wowza.wms.protocol.wowz.WOWZSession getWowzSession()
```

---

## setWowzSession

```
public void setWowzSession(com.wowza.wms.protocol.wowz.WOWZSession wowzSession)
```

---

## isSendCloseOnRejectConnection

```
public boolean isSendCloseOnRejectConnection()
```

---

## setSendCloseOnRejectConnection

```
public void setSendCloseOnRejectConnection(boolean sendCloseOnRejectConnection)
```

---

## com.wowza.wms.client Interface IClientNotify

public interface **IClientNotify**  
extends

IClientNotify: listener interface used by [IApplicationInstance.addClientListener\(IClientNotify\)](#)

See Also:

[IApplicationInstance.addClientListener\(IClientNotify\)](#)

### Method Summary

void	<a href="#">onClientAccept</a> ( <a href="#">IClient</a> client) Triggered when client connection accepted
void	<a href="#">onClientConnect</a> ( <a href="#">IClient</a> client) Triggered when client attempt connection
void	<a href="#">onClientDisconnect</a> ( <a href="#">IClient</a> client) Triggered when client disconnected
void	<a href="#">onClientReject</a> ( <a href="#">IClient</a> client) Triggered when client connection rejected

### Methods

#### onClientConnect

public void **onClientConnect**([IClient](#) client)

Triggered when client attempt connection

**Parameters:**

client - client

#### onClientDisconnect

public void **onClientDisconnect**([IClient](#) client)

Triggered when client disconnected

**Parameters:**

client - client

#### onClientAccept

public void **onClientAccept**([IClient](#) client)

Triggered when client connection accepted

**Parameters:**

client - client

## onClientReject

```
public void onClientReject(IClient client)
```

Triggered when client connection rejected

**Parameters:**

client - client

## com.wowza.wms.client Interface IConnectionNotify

public interface **IConnectionNotify**  
extends

IConnectionNotify: internal class to manage connection counting

### Method Summary

void	<a href="#">onAcceptConnection</a> ( <a href="#">ConnectionCounter</a> connectionCounter, <a href="#">ConnectionHolder</a> connectionHolder, java.util.Date date, long stamp) Triggered when client connection accepted
void	<a href="#">onDisconnect</a> ( <a href="#">ConnectionCounter</a> connectionCounter, <a href="#">ConnectionHolder</a> connectionHolder, boolean isValid, java.util.Date date, long stamp) Triggered when client disconnected
void	<a href="#">onRejectConnection</a> ( <a href="#">ConnectionCounter</a> connectionCounter, <a href="#">ConnectionHolder</a> connectionHolder, int reason, java.util.Date date, long stamp) Triggered when client connection rejected

### Methods

#### onAcceptConnection

```
public void onAcceptConnection(ConnectionCounter connectionCounter,  
    ConnectionHolder connectionHolder,  
    java.util.Date date,  
    long stamp)
```

Triggered when client connection accepted

**Parameters:**

connectionCounter  
connectionHolder  
date  
stamp

#### onRejectConnection

```
public void onRejectConnection(ConnectionCounter connectionCounter,  
    ConnectionHolder connectionHolder,  
    int reason,  
    java.util.Date date,  
    long stamp)
```

Triggered when client connection rejected

**Parameters:**

connectionCounter  
connectionHolder  
reason

(continued from last page)

date  
stamp

---

## onDisconnect

```
public void onDisconnect(ConnectionCounter connectionCounter,  
    ConnectionHolder connectionHolder,  
    boolean isValid,  
    java.util.Date date,  
    long stamp)
```

Triggered when client disconnected

### Parameters:

connectionCounter  
connectionHolder  
isValid  
date  
stamp

---

`getEncIVBytes`, `getEncKeyBytes`

## Fields

### PSSH\_VERSION\_0

```
public static final int PSSH_VERSION_0
```

Constant value: **0**

### PSSH\_VERSION\_1

```
public static final int PSSH_VERSION_1
```

Constant value: **1**

### ALGORITHMID\_NONE

```
public static final int ALGORITHMID_NONE
```

Constant value: **0**

(continued from last page)

## ALGORITHMID\_CTR

```
public static final int ALGORITHMID_CTR
```

Constant value: **1**

## ALGORITHMID\_CBC

```
public static final int ALGORITHMID_CBC
```

Constant value: **2**

## KEY\_ROTATION\_TYPE\_NONE

```
public static final int KEY_ROTATION_TYPE_NONE
```

Constant value: **0**

## KEY\_ROTATION\_TYPE\_INTERNAL\_STATIC

```
public static final int KEY_ROTATION_TYPE_INTERNAL_STATIC
```

Constant value: **1**

## KEY\_ROTATION\_TYPE\_INTERNAL\_RANDOM

```
public static final int KEY_ROTATION_TYPE_INTERNAL_RANDOM
```

Constant value: **2**

## KEY\_ROTATION\_TYPE\_EXTERNAL

```
public static final int KEY_ROTATION_TYPE_EXTERNAL
```

Constant value: **3**

## Constructors

### CencInfo

```
public CencInfo()
```

## Methods

### setEncKeyBytes

```
public void setEncKeyBytes(byte[] keyBytes)
```

Sets the encryption content key as a byte buffer.

**Parameters:**

(continued from last page)

keyBytes - the encryption content key as a byte buffer

---

### setEncKeyBytesList

```
public void setEncKeyBytesList(java.util.List keyBytesList)
```

---

### setKeyRotationType

```
public void setKeyRotationType(int keyRotationType)
```

---

### getKeyRotationType

```
public int getKeyRotationType()
```

---

### getIsRotatingKeys

```
public boolean getIsRotatingKeys()
```

---

### generateRandomKID

```
public String generateRandomKID()
```

---

### updateKey

```
public void updateKey(long chunkId,  
                      int chunkDurationTarget)
```

---

### getKeyPairs

```
public java.util.Map getKeyPairs()
```

---

### setKeyPairs

```
public void setKeyPairs(java.util.Map keyPairs)
```

---

### setKeyRotationInterval

```
public void setKeyRotationInterval(int interval)
```

---

(continued from last page)

---

## getEncKeyBytes

```
public byte[] getEncKeyBytes()
```

---

---

## getEncKeyBytesList

```
public java.util.List getEncKeyBytesList()
```

---

---

## getEncKeyString

```
public String getEncKeyString()
```

---

---

## setIVBytes

```
public void setIVBytes(byte[] encIVBytes)
```

---

---

## getEncIVBytes

```
public byte[] getEncIVBytes()
```

---

---

## swapKIDBytes

```
public static byte[] swapKIDBytes(byte[] KID)
```

---

---

## setKID

```
public void setKID(String KID)
```

Sets the encryption key id. String must be in uuid form "F6005DCF-7F93-4B8E-85C7-F977740DA059" (big endian)

**Parameters:**

KID - key id

---

---

## setKID

```
public void setKID(byte[] KIDbytes)
```

Sets the encryption key id.

**Parameters:**

KIDbytes - key id byte array

---

---

## setKIDsList

```
public void setKIDsList(java.util.List KIDList)
```

---

(continued from last page)

Sets the list of encryption key id strings. Ids must be in uuid form "F6005DCF-7F93-4B8E-85C7-F977740DA059" (big endian)

**Parameters:**

KIDList - list of key id strings

---

**getKID**

```
public String getKID()
```

---

**getKIDBytes**

```
public byte[] getKIDBytes()
```

---

**getKIDBytesSwapped**

```
public byte[] getKIDBytesSwapped()
```

---

**getKIDsList**

```
public java.util.List getKIDsList()
```

---

**getKIDsBytesList**

```
public java.util.List getKIDsBytesList()
```

---

**getKIDsBytesListSwapped**

```
public java.util.List getKIDsBytesListSwapped()
```

---

**getAlgorithm**

```
public int getAlgorithm()
```

---

**getAlgorithmString**

```
public String getAlgorithmString()
```

---

**setAlgorithm**

```
public void setAlgorithm(int algorithm)
```

Sets the encryption algorithm to be used. Currently only CencInfo.ALGORITHMID\_CTR is supported.

---

(continued from last page)

**Parameters:**

algorithm - encryption algorithm

---

**isValid**

```
public boolean isValid()
```

---

**getNameSpaceString**

```
public String getNameSpaceString()
```

---

**getCencMp4ProtSchemeString**

```
public String getCencMp4ProtSchemeString()
```

---

**getCencMpegTsProtSchemeString**

```
public String getCencMpegTsProtSchemeString()
```

---

**addDRM**

```
public void addDRM(String hashKey,  
    ICencDRMInfo drm)
```

Adds a DRM system info instance to the list of DRM systems associated with the stream encryption. The hashKey should be some unique string to identify the DRM System, such as a concatenation of the DRM system's system name and systemId

Example hashKey: "myDRM:12345678-1234-1234-1234-123456789123"

**Parameters:**

hashKey - hash key

drm - the drm info instance

---

**getDRMs**

```
public java.util.Map getDRMs()
```

---

**getEncRepeaterBytes**

```
public byte[] getEncRepeaterBytes()
```

---

**setEncRepeaterBytes**

```
public void setEncRepeaterBytes(byte[] encRepeaterBytes)
```

(continued from last page)

---

## setAppInstance

```
public void setAppInstance(IApplicationInstance appInstance)
```

---

## formatKID

```
public static String formatKID(String KID)
```

---

## loadFromKeyFile

```
public static boolean loadFromKeyFile(IApplicationInstance appInstance,  
    String streamName,  
    CencInfo cencInfo,  
    long chunkId,  
    int chunkDurationTarget,  
    String keyFileParamPrefix)
```

---

## getSerializeSize

```
public int getSerializeSize()
```

---

## serialize

```
public byte[] serialize()
```

---

## serialize

```
public int serialize(byte[] buffer,  
    int pos)
```

---

## deserialize

```
public static CencInfo deserialize(byte[] data)
```

---

## deserialize

```
public static CencInfo deserialize(java.nio.ByteBuffer buffer)
```

---

(continued from last page)

---

**toString**

```
public String toString()
```

---

**getPSSHVersion**

```
public int getPSSHVersion()
```

---

**setPSSHVersion**

```
public void setPSSHVersion(int psshVersion)
```

---

**getPSSHFlags**

```
public int getPSSHFlags()
```

---

**setPSSHFlags**

```
public void setPSSHFlags(int psshFlags)
```

---

**getEncryptionType**

```
public int getEncryptionType()
```

---

**clone**

```
public Object clone()  
    throws CloneNotSupportedException
```

---

## com.wowza.wms.drm.cenc Interface ICencConstants

public interface **ICencConstants**  
extends

### Field Summary

public static final	<a href="#">CENC_DRM_INFO_TYPE_PLAYREADY</a> Value: <b>1</b>
public static final	<a href="#">CENC_DRM_INFO_TYPE_VCAS</a> Value: <b>2</b>
public static final	<a href="#">CENC_DRM_INFO_TYPE_WIDEVINE</a> Value: <b>3</b>

### Fields

#### CENC\_DRM\_INFO\_TYPE\_PLAYREADY

public static final int **CENC\_DRM\_INFO\_TYPE\_PLAYREADY**

Constant value: **1**

#### CENC\_DRM\_INFO\_TYPE\_VCAS

public static final int **CENC\_DRM\_INFO\_TYPE\_VCAS**

Constant value: **2**

#### CENC\_DRM\_INFO\_TYPE\_WIDEVINE

public static final int **CENC\_DRM\_INFO\_TYPE\_WIDEVINE**

Constant value: **3**

## com.wowza.wms.drm.cenc Interface ICencDRMInfo

All Subinterfaces:

[ICencDRMInfo2](#)

public interface **ICencDRMInfo**  
extends

Interface for Common Encryption (CENC) DRM information classes. DRM system-specific metadata can be attached to a stream's CENC data to indicate that a stream or a media segment within that stream is protected by the particular DRM system, and may be authorized and decrypted by a player client using the provided DRM system metadata. The metadata provided by classes implementing ICencDRMInfo is inserted into a stream's manifest and/or fragment files. CENC DRM support is in accordance with the Common Encryption standard (ISO/IEC 23001-7).

### Method Summary

void	<a href="#"><code>deserialize</code></a> (byte[] data) Sets all internal class data by deserializing the data from the provided byte buffer representation of the class.
byte[]	<a href="#"><code>generateKey</code></a> (byte[] KID) Generates a 128-bit content key for use in AES encryption.
String	<a href="#"><code>getMPEGDashCPSubElements</code></a> (boolean keyRotation) Returns a string defining zero or more custom xml elements to be inserted as sub-elements to the ContentProtection element that defines the DRM system in an MPEG-DASH MPD.
String	<a href="#"><code>getNameSpaces</code></a> () Returns a string defining zero or more custom xml name space strings to be inserted into an xml-formatted manifest, such as an MPEG-DASH MPD.
byte[]	<a href="#"><code>getPsshData</code></a> (boolean keyRotation) Returns the DRM system-specific binary data associated with the encryption of the media.
String	<a href="#"><code>getSystemId</code></a> () Returns the DRM system id.
String	<a href="#"><code>getSystemName</code></a> () Returns a string defining the DRM system name.
String	<a href="#"><code>getURL</code></a> () Returns the license acquisition URL.
boolean	<a href="#"><code>isComplete</code></a> () Verifies whether all required class parameters have been set, such as systemId.
byte[]	<a href="#"><code>serialize</code></a> () Returns a byte buffer with a serialized representation of the class, which could later be reconstituted back into the class via the deserialize method.
void	<a href="#"><code>setPsshData</code></a> (byte[] psshData) Sets the DRM system-specific binary data associated with the encryption of the media.

void	<a href="#"><code>setSystemId</code></a> (String systemId) Sets the DRM system id.
void	<a href="#"><code>setURL</code></a> (String url) Sets the license acquisition URL.
boolean	<a href="#"><code>supportsKeyGeneration</code></a> ( ) Verifies whether dynamic key generation is supported.
void	<a href="#"><code>updateKeyInfo</code></a> (byte[] KID, byte[] contentKey) Sets the new key id and a 128-bit content key values for use in AES encryption.

## Methods

### setSystemId

```
public void setSystemId(String systemId)
```

Sets the DRM system id.

Example: "12345678-1234-1234-1234-123456789012"

**Parameters:**

systemId - DRM system id

### getSystemId

```
public String getSystemId()
```

Returns the DRM system id.

**Returns:**

DRM system id string

### getURL

```
public String getURL()
```

Returns the license acquisition URL.

**Returns:**

license acquisition URL string

### setURL

```
public void setURL(String url)
```

Sets the license acquisition URL.

Example: "http://www.mycompany.com/sdrm/rightsmanager.asmx"

**Parameters:**

url - license acquisition URL string

---

## getNameSpaces

```
public String getNameSpaces()
```

Returns a string defining zero or more custom xml name space strings to be inserted into an xml-formatted manifest, such as an MPEG-DASH MPD.

Example: `xmlns:sdrma="urn:mycompany:superdrm:a" xmlns:sdrmb="urn:mycompany:superdrm:b"`

### Returns:

zero or more xml name space strings separate by spaces, with a "" or 'null' return indicating no custom namespaces

---

## getMPEGDashCPSubElements

```
public String getMPEGDashCPSubElements(boolean keyRotation)
```

Returns a string defining zero or more custom xml elements to be inserted as sub-elements to the ContentProtection element that defines the DRM system in an MPEG-DASH MPD. The element would typically contain Base64-encoded system-specific metadata.

Example: `<sdrma:hdr><!-- base64-encoded data --></sdrma:hdr>`

The resulting ContentProtection element would look something like:

```
<ContentProtection schemeIdUri="urn:uuid:12345678-1234-1234-1234-123456789012"
value="SuperDRM">
  <sdrma:hdr><!-- base64-encoded data --></sdrma:hdr>
</ContentProtection>
```

### Parameters:

`keyRotation` - indicates whether key rotation is enabled

### Returns:

string defining the MPEG-DASH ContentProtection sub-elements

---

## getSystemName

```
public String getSystemName()
```

Returns a string defining the DRM system name. This string would be used as the value of the **value** attribute in the ContentProtection element that defines the DRM system in an MPEG-DASH MPD.

Example: `"SuperDRM"`

The resulting ContentProtection element in an MPEG-DASH MPD would look something like:

```
<ContentProtection schemeIdUri="urn:uuid:12345678-1234-1234-1234-123456789012"
value="SuperDRM">
  <sdrma:hdr><!-- base64-encoded data --></sdrma:hdr>
</ContentProtection>
```

### Returns:

string defining the DRM system name

---

## supportsKeyGeneration

```
public boolean supportsKeyGeneration()
```

Verifies whether dynamic key generation is supported. This capability is only required for dynamic random key rotation support.

---

(continued from last page)

**Returns:**

true if dynamic key generation is supported, else false

**See Also:**

[generateKey\(byte\[\]\)](#)

---

## generateKey

```
public byte[] generateKey(byte[] KID)
```

Generates a 128-bit content key for use in AES encryption. Support for this method is only required when dynamic random key generation & rotation is supported.

**Parameters:**

KID - key id for which a content key should be generated

**Returns:**

byte buffer containing the generated content key, or null if not supported

**See Also:**

[supportsKeyGeneration\(\)](#)

---

## updateKeyInfo

```
public void updateKeyInfo(byte[] KID,  
    byte[] contentKey)
```

Sets the new key id and a 128-bit content key values for use in AES encryption. Support for this method is only required in a Common Encryption scenario where dynamic random key generation & rotation is supported.

**Parameters:**

KID - new key id in effect

contentKey - new content key in effect

**See Also:**

[supportsKeyGeneration\(\)](#)

---

## serialize

```
public byte[] serialize()
```

Returns a byte buffer with a serialized representation of the class, which could later be reconstituted back into the class via the deserialize method.

**Returns:**

byte buffer containing a serialized representation of the class

**See Also:**

[deserialize\(byte\[\]\)](#)

---

## deserialize

```
public void deserialize(byte[] data)
```

Sets all internal class data by deserializing the data from the provided byte buffer representation of the class.

**Parameters:**

data - byte buffer containing the serialized representation of the class

(continued from last page)

**See Also:**[serialize\(\)](#)

---

## getPsshData

```
public byte[] getPsshData(boolean keyRotation)
```

Returns the DRM system-specific binary data associated with the encryption of the media. This data will be inserted into an ISOBMFF pssh box and identified by the associated systemId.

**Parameters:**

keyRotation - indicates whether key rotation is enabled

**Returns:**

byte buffer containing the DRM system-specific binary data for the pssh box

---

## setPsshData

```
public void setPsshData(byte[] psshData)
```

Sets the DRM system-specific binary data associated with the encryption of the media. This data will be inserted into an ISOBMFF pssh box and identified by the associated systemId.

**Parameters:**

psshData - DRM system-specific binary data for the pssh box

---

## isComplete

```
public boolean isComplete()
```

Verifies whether all required class parameters have been set, such as systemId.

**Returns:**

true if all required class parameters have been set, else false

## com.wowza.wms.drm.cenc Interface ICencDRMInfo2

All Superinterfaces:

[ICencDRMInfo](#)

public interface **ICencDRMInfo2**  
extends [ICencDRMInfo](#)

Extended interface for Common Encryption (CENC) DRM information classes. Adds extra field not present in ICencDRMInfo.

### Method Summary

Object	<a href="#">clone()</a> Gets a clone of the DRM Information class.
--------	---

Methods inherited from interface [com.wowza.wms.drm.cenc.ICencDRMInfo](#)

[deserialize](#), [generateKey](#), [getMPEGDashCPSubElements](#), [getNameSpaces](#), [getPsshData](#), [getSystemId](#), [getSystemName](#), [getURL](#), [isComplete](#), [serialize](#), [setPsshData](#), [setSystemId](#), [setURL](#), [supportsKeyGeneration](#), [updateKeyInfo](#)

### Methods

#### clone

public Object **clone()**  
throws CloneNotSupportedException

Gets a clone of the DRM Information class. The implementing class should add `@Override` to the method implementation since the default Object clone() method is protected.

## com.wowza.wms.drm.cenc Interface ICencEncryptor

public interface **ICencEncryptor**  
extends

### Method Summary

byte[]	<a href="#"><code>encryptData</code></a> (byte[] data, int offset, int len)
int	<a href="#"><code>getBlockSize</code></a> ()
void	<a href="#"><code>init</code></a> (IEncryptionInfo encInfo)
byte[]	<a href="#"><code>startEncryption</code></a> ()

### Methods

#### **init**

public void **init**(IEncryptionInfo encInfo)

#### **startEncryption**

public byte[] **startEncryption**()

#### **encryptData**

public byte[] **encryptData**(byte[] data,  
    int offset,  
    int len)

#### **getBlockSize**

public int **getBlockSize**()

---

Package

**com.wowza.wms.dvr**

## com.wowza.wms.dvr Class DefaultDvrStreamVersionHandler

java.lang.Object

└─com.wowza.wms.dvr.DefaultDvrStreamVersionHandler

All Implemented Interfaces:

[IDvrStreamVersionHandler](#)

public class **DefaultDvrStreamVersionHandler**  
extends Object  
implements [IDvrStreamVersionHandler](#)

Default stream Version Handler. May be sub-classed

### Constructor Summary

public	<a href="#">DefaultDvrStreamVersionHandler()</a>
--------	--

### Method Summary

<a href="#">IDvrStreamStore</a>	<a href="#">determineExistingStoreForPlaying</a> ( <a href="#">IDvrStreamManager</a> dvrMgr, String baseStreamName)
<a href="#">IDvrStreamStore</a>	<a href="#">determineExistingStoreForRecording</a> ( <a href="#">IDvrStreamManager</a> dvrMgr, String baseStreamName)
String	<a href="#">getArchiveStrategy</a> ( <a href="#">IDvrStreamManager</a> dvrMgr, String baseStreamName)
boolean	<a href="#">handleArchivedStream</a> ( <a href="#">IDvrStreamManager</a> dvrMgr, String baseStreamName, String vStreamName, java.util.SortedSet versions, DvrManifestHolder manifestHolder)
boolean	<a href="#">shouldDeleteArchivedStream</a> ( <a href="#">IDvrStreamManager</a> dvrMgr, <a href="#">IDvrStreamStore</a> store)
boolean	<a href="#">shouldLoadArchivedStream</a> ( <a href="#">IDvrStreamManager</a> dvrMgr, String baseStreamName, String vStreamName, java.util.SortedSet versions, DvrManifestHolder manifest)

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

#### Methods inherited from interface [com.wowza.wms.dvr.IDvrStreamVersionHandler](#)

[determineExistingStoreForPlaying](#), [determineExistingStoreForRecording](#), [getArchiveStrategy](#), [handleArchivedStream](#), [shouldDeleteArchivedStream](#), [shouldLoadArchivedStream](#)

## Constructors

### DefaultDvrStreamVersionHandler

```
public DefaultDvrStreamVersionHandler()
```

## Methods

### getArchiveStrategy

```
public String getArchiveStrategy(IDvrStreamManager dvrMgr,  
    String baseStreamName)
```

### determineExistingStoreForRecording

```
public IDvrStreamStore determineExistingStoreForRecording(IDvrStreamManager dvrMgr,  
    String baseStreamName)
```

### determineExistingStoreForPlaying

```
public IDvrStreamStore determineExistingStoreForPlaying(IDvrStreamManager dvrMgr,  
    String baseStreamName)
```

### handleArchivedStream

```
public boolean handleArchivedStream(IDvrStreamManager dvrMgr,  
    String baseStreamName,  
    String vStreamName,  
    java.util.SortedSet versions,  
    DvrManifestHolder manifestHolder)
```

### shouldLoadArchivedStream

```
public boolean shouldLoadArchivedStream(IDvrStreamManager dvrMgr,  
    String baseStreamName,  
    String vStreamName,  
    java.util.SortedSet versions,  
    DvrManifestHolder manifest)
```

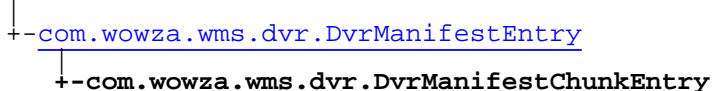

### shouldDeleteArchivedStream

```
public boolean shouldDeleteArchivedStream(IDvrStreamManager dvrMgr,  
    IDvrStreamStore store)
```

## com.wowza.wms.dvr

### Class DvrManifestChunkEntry

java.lang.Object

public class **DvrManifestChunkEntry**  
 extends [DvrManifestEntry](#)

Entry in DVR manifest that contains an associated chunk.

#### Field Summary

protected	<a href="#">artifact</a>
protected	<a href="#">encryptions</a>

#### Fields inherited from class [com.wowza.wms.dvr.DvrManifestEntry](#)

wait

## Fields

### artifact

protected com.wowza.wms.dvr.DvrChunkArtifact **artifact**

### encryptions

protected com.wowza.wms.dvr.DvrEncryptionInfoHolder **encryptions**

## Constructors

### DvrManifestChunkEntry

```
public DvrManifestChunkEntry(int type,
                             long index,
                             long dvrStart,
                             long dvrStop,
                             long packetTime,
                             long utcTime,
                             DvrChunkArtifact artifact)
```

Constructor

#### Parameters:

type - type  
index - manifest index  
dvrStart - start time (ms in DVR time scale)  
dvrStop - stop time (ms in DVR time scale)  
utcTime  
packetTime  
artifact - reference to the chunk artifact

(continued from last page)

## DvrManifestChunkEntry

```
public DvrManifestChunkEntry(int type,  
                             long index,  
                             long dvrStart,  
                             long dvrStop,  
                             long packetTime,  
                             long utcTime,  
                             DvrChunkArtifact artifact,  
                             DvrEncryptionInfoHolder encryptions)
```

Constructor

### Parameters:

type - type  
index - manifest index  
dvrStart - start time (ms in DVR time scale)  
dvrStop - stop time (ms in DVR time scale)  
utcTime  
packetTime  
artifact - reference to the chunk artifact  
encryptions - associated encryptions

## Methods

### getDvrArtifact

```
public DvrChunkArtifact getDvrArtifact()
```

Get DVR artifact reference.

### Returns:

DVR artifact reference.

### setEncryptions

```
public void setEncryptions(DvrEncryptionInfoHolder encryptions)
```

Set associated encryptions.

### Parameters:

encryptions - encryptions

### getEncryptions

```
public DvrEncryptionInfoHolder getEncryptions()
```

Get associated encryptions.

### Returns:

encryptions

### serialize

```
public void serialize(java.io.DataOutputStream out)
```

Serialize manifest record.

---

(continued from last page)

## **getManifestRepresentation**

```
public String getManifestRepresentation()
```

Get textual representation of record for textual manifest usage.

---

## **getEncryptionsTextRepresentation**

```
protected String getEncryptionsTextRepresentation()
```

---

## **getArtifactsTextRepresentation**

```
protected String getArtifactsTextRepresentation()
```

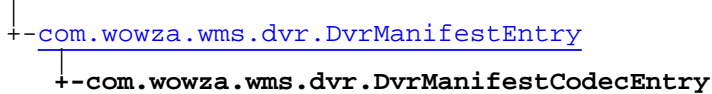

---

## **toString**

```
public String toString()
```

## com.wowza.wms.dvr Class DvrManifestCodecEntry

java.lang.Object

public class **DvrManifestCodecEntry**  
extends [DvrManifestEntry](#)

Entry in DVR manifest that contains codec information

### Fields inherited from class [com.wowza.wms.dvr.DvrManifestEntry](#)

[dvrStart](#), [dvrStop](#), [index](#), [MANIFESTFILE\\_KEY\\_ARTIFACT](#), [MANIFESTFILE\\_KEY\\_AUDIO\\_CODEC](#), [MANIFESTFILE\\_KEY\\_CHUNKINDEX](#), [MANIFESTFILE\\_KEY\\_DVRTIME](#), [MANIFESTFILE\\_KEY\\_ENCRYPTIONS](#), [MANIFESTFILE\\_KEY\\_INDEX](#), [MANIFESTFILE\\_KEY\\_METADATA](#), [MANIFESTFILE\\_KEY\\_NAME](#), [MANIFESTFILE\\_KEY\\_PACKETTIME](#), [MANIFESTFILE\\_KEY\\_SIZE](#), [MANIFESTFILE\\_KEY\\_START](#), [MANIFESTFILE\\_KEY\\_STOP](#), [MANIFESTFILE\\_KEY\\_TYPE](#), [MANIFESTFILE\\_KEY\\_UTCTIME](#), [MANIFESTFILE\\_KEY\\_VIDEO\\_CODEC](#), [packetTime](#), [SERIALIZE\\_CURRENT\\_VERSION](#), [type](#), [utcTime](#)

### Constructor Summary

public	<a href="#">DvrManifestCodecEntry</a> (long index, long dvrStart, long packetTime, long utcTime, com.wowza.wms.media.model.MediaCodecInfoAudio audioCodec, com.wowza.wms.media.model.MediaCodecInfoVideo videoCodec) Constructor
--------	---

### Method Summary

com.wowza.wms.media.model.MediaCodecInfoAudio	<a href="#">getAudioCodec</a> () Get audio codec information
String	<a href="#">getManifestRepresentation</a> ()
com.wowza.wms.media.model.MediaCodecInfoVideo	<a href="#">getVideoCodec</a> () Get video codec information
void	<a href="#">serialize</a> (java.io.DataOutputStream out)
String	<a href="#">toString</a> ()

### Methods inherited from class [com.wowza.wms.dvr.DvrManifestEntry](#)

[encodeBytes](#), [getCommonInitialTextRepString](#), [getDuration](#), [getIndex](#), [getManifestRepresentation](#), [getPacketStartTime](#), [getStartTimecode](#), [getStopTimecode](#), [getType](#), [getUtcStartTime](#), [serialize](#), [serialize](#)

### Methods inherited from class java.lang.Object

```
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait
```

## Constructors

### DvrManifestCodecEntry

```
public DvrManifestCodecEntry(long index,
                             long dvrStart,
                             long packetTime,
                             long utcTime,
                             com.wowza.wms.media.model.MediaCodecInfoAudio audioCodec,
                             com.wowza.wms.media.model.MediaCodecInfoVideo videoCodec)
```

Constructor

#### Parameters:

index - manifest index  
dvrStart - start time (ms in DVR time scale)  
audioCodec - audio codec info  
videoCodec - video codec info

## Methods

### getVideoCodec

```
public com.wowza.wms.media.model.MediaCodecInfoVideo getVideoCodec()
```

Get video codec information

#### Returns:

video codec information

### getAudioCodec

```
public com.wowza.wms.media.model.MediaCodecInfoAudio getAudioCodec()
```

Get audio codec information

#### Returns:

audio codec information

### serialize

```
public void serialize(java.io.DataOutputStream out)
```

Serialize manifest record.

### getManifestRepresentation

```
public String getManifestRepresentation()
```

Get textual representation of record for textual manifest usage.

(continued from last page)

**toString**

```
public String toString()
```

## com.wowza.wms.dvr

# Class DvrManifestEntry

java.lang.Object

└─com.wowza.wms.dvr.DvrManifestEntry

Direct Known Subclasses:

[DvrManifestTimeMapEntry](#), [DvrManifestOnMetadataEntry](#), [DvrManifestCodecEntry](#), [DvrManifestChunkEntry](#)

public abstract class **DvrManifestEntry**  
extends Object

Abstract class representing entry in DVR manifest.

### Field Summary

protected	<a href="#">dvrStart</a>
protected	<a href="#">dvrStop</a>
protected	<a href="#">index</a>
public static final	<a href="#">MANIFESTFILE_KEY_ARTIFACT</a> Value: <b>artifact</b>
public static final	<a href="#">MANIFESTFILE_KEY_AUDIO_CODEC</a> Value: <b>aCodec</b>
public static final	<a href="#">MANIFESTFILE_KEY_CHUNKINDEX</a> Value: <b>chunkIndex</b>
public static final	<a href="#">MANIFESTFILE_KEY_DVRTIME</a> Value: <b>dvrTime</b>
public static final	<a href="#">MANIFESTFILE_KEY_ENCRYPTIONS</a> Value: <b>enc</b>
public static final	<a href="#">MANIFESTFILE_KEY_INDEX</a> Value: <b>index</b>
public static final	<a href="#">MANIFESTFILE_KEY_METADATA</a> Value: <b>metadata</b>
public static final	<a href="#">MANIFESTFILE_KEY_NAME</a> Value: <b>name</b>

public static final	<a href="#">MANIFESTFILE_KEY_PACKETTIME</a> Value: <b>packetTime</b>
public static final	<a href="#">MANIFESTFILE_KEY_SIZE</a> Value: <b>size</b>
public static final	<a href="#">MANIFESTFILE_KEY_START</a> Value: <b>start</b>
public static final	<a href="#">MANIFESTFILE_KEY_STOP</a> Value: <b>stop</b>
public static final	<a href="#">MANIFESTFILE_KEY_TYPE</a> Value: <b>type</b>
public static final	<a href="#">MANIFESTFILE_KEY_UTCTIME</a> Value: <b>utcTime</b>
public static final	<a href="#">MANIFESTFILE_KEY_VIDEO_CODEC</a> Value: <b>vCodec</b>
protected	<a href="#">packetTime</a>
protected static final	<a href="#">SERIALIZE_CURRENT_VERSION</a> Value: <b>3</b>
protected	<a href="#">type</a>
protected	<a href="#">utcTime</a>

## Constructor Summary

public	<a href="#">DvrManifestEntry</a> (int type, long index, long dvrStart, long dvrStop, long packetTime, long utcTime) Constructor Valid types include: <a href="#">IVHost.CONTENTTYPE_AUDIO</a> , <a href="#">IVHost.CONTENTTYPE_VIDEO</a> , <a href="#">IVHost.CONTENTTYPE_DATA</a> , <a href="#">IDvrManifest.ON_METADATA_TYPE</a> , <a href="#">IDvrManifest.CODEC_TYPE</a> , or <a href="#">IDvrManifest.TIME_MAP_TYPE</a>
--------	---

## Method Summary

String	<a href="#">encodeBytes</a> (byte[] bytes) Encode string of bytes as Base64.
String	<a href="#">getCommonInitialTextRepString</a> ()
long	<a href="#">getDuration</a> () Get duration
long	<a href="#">getIndex</a> () Get manifest index.

abstract String	<a href="#"><code>getManifestRepresentation()</code></a> Get textual representation of record for textual manifest usage.
long	<a href="#"><code>getPacketStartTime()</code></a> Get chunk start timecode in packetTime units.
long	<a href="#"><code>getStartTimecode()</code></a> Get start timecode.
long	<a href="#"><code>getStopTimecode()</code></a> Get stop timecode.
int	<a href="#"><code>getType()</code></a> Get type of manifest record.
long	<a href="#"><code>getUtcStartTime()</code></a> Get chunk start timecode in UTC units.
byte[]	<a href="#"><code>serialize()</code></a> Serialize manifest record.
abstract void	<a href="#"><code>serialize(java.io.DataOutputStream out)</code></a> Serialize manifest record.

#### Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Fields

### MANIFESTFILE\_KEY\_INDEX

```
public static final java.lang.String MANIFESTFILE_KEY_INDEX
```

Constant value: **index**

### MANIFESTFILE\_KEY\_TYPE

```
public static final java.lang.String MANIFESTFILE_KEY_TYPE
```

Constant value: **type**

### MANIFESTFILE\_KEY\_START

```
public static final java.lang.String MANIFESTFILE_KEY_START
```

Constant value: **start**

### MANIFESTFILE\_KEY\_STOP

```
public static final java.lang.String MANIFESTFILE_KEY_STOP
```

(continued from last page)

Constant value: **stop**

---

## MANIFESTFILE\_KEY\_SIZE

```
public static final java.lang.String MANIFESTFILE_KEY_SIZE
```

Constant value: **size**

---

## MANIFESTFILE\_KEY\_ARTIFACT

```
public static final java.lang.String MANIFESTFILE_KEY_ARTIFACT
```

Constant value: **artifact**

---

## MANIFESTFILE\_KEY\_DVRTIME

```
public static final java.lang.String MANIFESTFILE_KEY_DVRTIME
```

Constant value: **dvrTime**

---

## MANIFESTFILE\_KEY\_CHUNKINDEX

```
public static final java.lang.String MANIFESTFILE_KEY_CHUNKINDEX
```

Constant value: **chunkIndex**

---

## MANIFESTFILE\_KEY\_PACKETTIME

```
public static final java.lang.String MANIFESTFILE_KEY_PACKETTIME
```

Constant value: **packetTime**

---

## MANIFESTFILE\_KEY\_UTCTIME

```
public static final java.lang.String MANIFESTFILE_KEY_UTCTIME
```

Constant value: **utcTime**

---

## MANIFESTFILE\_KEY\_NAME

```
public static final java.lang.String MANIFESTFILE_KEY_NAME
```

Constant value: **name**

---

## MANIFESTFILE\_KEY\_AUDIO\_CODEC

```
public static final java.lang.String MANIFESTFILE_KEY_AUDIO_CODEC
```

Constant value: **aCodec**

(continued from last page)

---

## MANIFESTFILE\_KEY\_VIDEO\_CODEC

```
public static final java.lang.String MANIFESTFILE_KEY_VIDEO_CODEC
```

Constant value: **vCodec**

---

## MANIFESTFILE\_KEY\_ENCRYPTIONS

```
public static final java.lang.String MANIFESTFILE_KEY_ENCRYPTIONS
```

Constant value: **enc**

---

## MANIFESTFILE\_KEY\_METADATA

```
public static final java.lang.String MANIFESTFILE_KEY_METADATA
```

Constant value: **metadata**

---

## SERIALIZE\_CURRENT\_VERSION

```
protected static final byte SERIALIZE_CURRENT_VERSION
```

Constant value: **3**

---

## dvrStart

```
protected long dvrStart
```

---

## dvrStop

```
protected long dvrStop
```

---

## packetTime

```
protected long packetTime
```

---

## utcTime

```
protected long utcTime
```

---

## index

```
protected long index
```

---

(continued from last page)

## type

protected int **type**

## Constructors

### DvrManifestEntry

```
public DvrManifestEntry(int type,  
                        long index,  
                        long dvrStart,  
                        long dvrStop,  
                        long packetTime,  
                        long utcTime)
```

Constructor Valid types include: [IVHost.CONTENTTYPE\\_AUDIO](#), [IVHost.CONTENTTYPE\\_VIDEO](#), [IVHost.CONTENTTYPE\\_DATA](#), [IDvrManifest.ON\\_METADATA\\_TYPE](#), [IDvrManifest.CODEC\\_TYPE](#), or [IDvrManifest.TIME\\_MAP\\_TYPE](#)

#### Parameters:

type - type  
index - manifest index  
dvrStart - start time (ms in DVR time scale)  
dvrStop - stop time (ms in DVR time scale)  
packetTime  
utcTime

## Methods

### getStartTimecode

```
public long getStartTimecode()
```

Get start timecode. In milliseconds, DVR time base.

#### Returns:

start time

### getStopTimecode

```
public long getStopTimecode()
```

Get stop timecode. In milliseconds, DVR time base.

#### Returns:

stop time

### getPacketStartTime

```
public long getPacketStartTime()
```

Get chunk start timecode in packetTime units. In milliseconds.

#### Returns:

packet start time

(continued from last page)

---

## getUtcStartTime

```
public long getUtcStartTime()
```

Get chunk start timecode in UTC units. In milliseconds.

**Returns:**

UTC start time

---

## getDuration

```
public long getDuration()
```

Get duration

**Returns:**

duration in ms

---

## getType

```
public int getType()
```

Get type of manifest record. Valid types include: [IVHost.CONTENTTYPE\\_AUDIO](#), [IVHost.CONTENTTYPE\\_VIDEO](#), [IVHost.CONTENTTYPE\\_DATA](#), [IDvrManifest.ON\\_METADATA\\_TYPE](#), [IDvrManifest.CODEC\\_TYPE](#), or [IDvrManifest.TIME\\_MAP\\_TYPE](#)

**Returns:**

type

---

## getIndex

```
public long getIndex()
```

Get manifest index.

**Returns:**

index

---

## serialize

```
public abstract void serialize(java.io.DataOutputStream out)
```

Serialize manifest record.

**Parameters:**

out - output stream

---

## serialize

```
public byte[] serialize()
```

Serialize manifest record.

**Returns:**

serialized data

---

---

(continued from last page)

## getManifestRepresentation

```
public abstract String getManifestRepresentation()
```

Get textual representation of record for textual manifest usage.

**Returns:**

textual representation of entry

---

## getCommonInitialTextRepString

```
protected String getCommonInitialTextRepString()
```

---

## encodeBytes

```
protected String encodeBytes(byte[] bytes)
```

Encode string of bytes as Base64. Provides check for null buffer or empty buffer.

**Parameters:**

bytes - buffer to encode.

**Returns:**

Base64 encoding or "".

com.wowza.wms.dvr

# Class DvrManifestEntryFactory

```
public class DvrManifestEntryFactory
extends Object
```

Deserialize manifest entry blobs.

## Constructor Summary

public	<a href="#">DvrManifestEntryFactory()</a>
--------	---

## Method Summary

static <a href="#">DvrManifestEntry</a>	<a href="#">deserialize</a> (byte[] data)
static <a href="#">DvrManifestEntry</a>	<a href="#">deserialize</a> (java.nio.ByteBuffer buffer)

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

**DvrManifestEntryFactory**

```
public DvrManifestEntryFactory()
```

## Methods

**deserialize**

```
public static DvrManifestEntry deserialize(byte[] data)
```

**deserialize**

```
public static DvrManifestEntry deserialize(java.nio.ByteBuffer buffer)
```

## com.wowza.wms.dvr Class DvrManifestEntryRange

java.lang.Object

└─com.wowza.wms.dvr.DvrManifestEntryRange

public class **DvrManifestEntryRange**  
extends Object

Class that compactly represents a range of indices of a certain manifest type.

### Constructor Summary

public	<a href="#"><u>DvrManifestEntryRange</u></a> (int type, long startIndex, long endIndex) Construct a range of a given type.
--------	---

### Method Summary

void	<a href="#"><u>deserialize</u></a> (byte[] data) Deserialize.
long	<a href="#"><u>getEndIndex</u></a> () Get end index.
IndexRange	<a href="#"><u>getRange</u></a> () Get index range.
long	<a href="#"><u>getStartIndex</u></a> () Get start index.
int	<a href="#"><u>getType</u></a> () Get range type
boolean	<a href="#"><u>isEmpty</u></a> ()
boolean	<a href="#"><u>isInRange</u></a> (int index) Is index in range.
byte[]	<a href="#"><u>serialize</u></a> () Serialize range.
void	<a href="#"><u>setRange</u></a> (IndexRange range) Set index range.
String	<a href="#"><u>toString</u></a> ()

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

(continued from last page)

## Constructors

### DvrManifestEntryRange

```
public DvrManifestEntryRange(int type,  
                             long startIndex,  
                             long endIndex)
```

Construct a range of a given type.

**Parameters:**

type - manifest type

startIndex - initial member of range

endIndex - final member of range

## Methods

### getType

```
public int getType()
```

Get range type

**Returns:**

type.

### getRange

```
public IndexRange getRange()
```

Get index range.

**Returns:**

index range

### setRange

```
public void setRange(IndexRange range)
```

Set index range.

**Parameters:**

range - index range.

### getStartIndex

```
public long getStartIndex()
```

Get start index.

**Returns:**

start index (or -1 if undefined)

### getEndIndex

```
public long getEndIndex()
```

Get end index.

---

(continued from last page)

**Returns:**

end index (or -1 if undefined)

---

**isInRange**

```
public boolean isInRange(int index)
```

Is index in range.

**Parameters:**

index - index in question.

**Returns:**

true if part of range.

---

**serialize**

```
public byte[] serialize()
```

Serialize range.

**Returns:**

out buffer containing serialized range.

---

**deserialize**

```
public void deserialize(byte[] data)
```

Deserialize. Called after no-op constructor.

**Parameters:**

data - buffer to deserialize.

---

**isEmpty**

```
public boolean isEmpty()
```

---

**toString**

```
public String toString()
```

---

## com.wowza.wms.dvr Class DvrManifestEntryRangeGroup

java.lang.Object

└─com.wowza.wms.dvr.DvrManifestEntryRangeGroup

```
public class DvrManifestEntryRangeGroup
    extends Object
```

A group of Manifest Ranges. The group may contain ranges of different types.

### Field Summary

public	<a href="#">ranges</a>
--------	------------------------

### Constructor Summary

public	<a href="#">DvrManifestEntryRangeGroup()</a>
--------	--

### Method Summary

void	<a href="#">addRange(DvrManifestEntryRange range)</a> Add an index range to the group.
void	<a href="#">deserialize(byte[] data)</a> Deserialize.
boolean	<a href="#">isEmpty()</a> Determine if group of ranges is empty
boolean	<a href="#">isInRange(int type, int index)</a> Determine if index of given type is contained in the group of ranges.
byte[]	<a href="#">serialize()</a> Serialize range group
String	<a href="#">toString()</a>

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Fields

#### **ranges**

```
public java.util.List ranges
```

## Constructors

### DvrManifestEntryRangeGroup

```
public DvrManifestEntryRangeGroup()
```

## Methods

### addRange

```
public void addRange(DvrManifestEntryRange range)
```

Add an index range to the group.

**Parameters:**

range

---

### isInRange

```
public boolean isInRange(int type,  
                        int index)
```

Determine if index of given type is contained in the group of ranges.

**Parameters:**

type - range type

index - index in question

**Returns:**

true iof in range.

---

### isEmpty

```
public boolean isEmpty()
```

Determine if group of ranges is empty

**Returns:**

true if empty

---

### serialize

```
public byte[] serialize()
```

Serialize range group

**Returns:**

bytes representing range group

---

### deserialize

```
public void deserialize(byte[] data)
```

Deserialize. Called after no-op constructor.

(continued from last page)

**Parameters:**

data - buffer to deserialize.

---

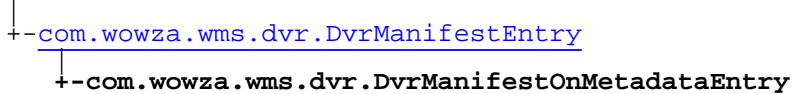

**toString**

```
public String toString()
```

## com.wowza.wms.dvr

### Class DvrManifestOnMetadataEntry

java.lang.Object

public class **DvrManifestOnMetadataEntry**  
 extends [DvrManifestEntry](#)

Entry in DVR manifest that contains onMetadata information and associated onMetadata chunk.

#### Field Summary

protected	<a href="#">artifact</a>
protected	<a href="#">data</a>

#### Fields inherited from class [com.wowza.wms.dvr.DvrManifestEntry](#)

[dvrStart](#), [dvrStop](#), [index](#), [MANIFESTFILE\\_KEY\\_ARTIFACT](#), [MANIFESTFILE\\_KEY\\_AUDIO\\_CODEC](#), [MANIFESTFILE\\_KEY\\_CHUNKINDEX](#), [MANIFESTFILE\\_KEY\\_DVRTIME](#), [MANIFESTFILE\\_KEY\\_ENCRYPTIONS](#), [MANIFESTFILE\\_KEY\\_INDEX](#), [MANIFESTFILE\\_KEY\\_METADATA](#), [MANIFESTFILE\\_KEY\\_NAME](#), [MANIFESTFILE\\_KEY\\_PACKETTIME](#), [MANIFESTFILE\\_KEY\\_SIZE](#), [MANIFESTFILE\\_KEY\\_START](#), [MANIFESTFILE\\_KEY\\_STOP](#), [MANIFESTFILE\\_KEY\\_TYPE](#), [MANIFESTFILE\\_KEY\\_UTCTIME](#), [MANIFESTFILE\\_KEY\\_VIDEO\\_CODEC](#), [packetTime](#), [SERIALIZE\\_CURRENT\\_VERSION](#), [type](#), [utcTime](#)

#### Constructor Summary

public	<a href="#">DvrManifestOnMetadataEntry</a> (long index, long start, long packetTime, long utcTime, DvrChunkArtifact artifact, byte[] data) Constructor
--------	---

#### Method Summary

String	<a href="#">getArtifactsTextRepresentation()</a>
byte[]	<a href="#">getData()</a> Get onMetadata information.
DvrChunkArtifact	<a href="#">getDvrArtifact()</a>
String	<a href="#">getManifestRepresentation()</a>
void	<a href="#">serialize</a> (java.io.DataOutputStream out)
String	<a href="#">toString()</a>

#### Methods inherited from class [com.wowza.wms.dvr.DvrManifestEntry](#)

[getBytes](#), [getCommonInitialTextRepString](#), [getDuration](#), [getIndex](#),  
[getManifestRepresentation](#), [getPacketStartTime](#), [getStartTimecode](#), [getStopTimecode](#),  
[getType](#), [getUtcStartTime](#), [serialize](#), [serialize](#)

Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Fields

### **artifact**

protected `com.wowza.wms.dvr.DvrChunkArtifact` **artifact**

### **data**

protected `byte` **data**

## Constructors

### **DvrManifestOnMetadataEntry**

```
public DvrManifestOnMetadataEntry(long index,  
                                   long start,  
                                   long packetTime,  
                                   long utcTime,  
                                   DvrChunkArtifact artifact,  
                                   byte[] data)
```

Constructor

#### **Parameters:**

`index` - manifest index  
`start` - start time (ms in DVR time scale)  
`utcTime`  
`packetTime`  
`artifact` - reference to the chunk artifact  
`data` - buffer of onMetadata information

## Methods

### **getDvrArtifact**

```
public DvrChunkArtifact getDvrArtifact()
```

### **getData**

```
public byte[] getData()
```

(continued from last page)

Get onMetadata information.

**Returns:**

onMetadata information.

---

## **serialize**

```
public void serialize(java.io.DataOutputStream out)
```

Serialize manifest record.

---

## **getManifestRepresentation**

```
public String getManifestRepresentation()
```

Get textual representation of record for textual manifest usage.

---

## **getArtifactsTextRepresentation**

```
protected String getArtifactsTextRepresentation()
```

---

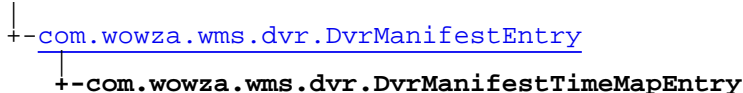

## **toString**

```
public String toString()
```

## com.wowza.wms.dvr

# Class DvrManifestTimeMapEntry

java.lang.Object

public class **DvrManifestTimeMapEntry**  
 extends [DvrManifestEntry](#)

Entry in DVR manifest that contains time map information.

### Fields inherited from class [com.wowza.wms.dvr.DvrManifestEntry](#)

[dvrStart](#), [dvrStop](#), [index](#), [MANIFESTFILE\\_KEY\\_ARTIFACT](#), [MANIFESTFILE\\_KEY\\_AUDIO\\_CODEC](#), [MANIFESTFILE\\_KEY\\_CHUNKINDEX](#), [MANIFESTFILE\\_KEY\\_DVRTIME](#), [MANIFESTFILE\\_KEY\\_ENCRYPTIONS](#), [MANIFESTFILE\\_KEY\\_INDEX](#), [MANIFESTFILE\\_KEY\\_METADATA](#), [MANIFESTFILE\\_KEY\\_NAME](#), [MANIFESTFILE\\_KEY\\_PACKETTIME](#), [MANIFESTFILE\\_KEY\\_SIZE](#), [MANIFESTFILE\\_KEY\\_START](#), [MANIFESTFILE\\_KEY\\_STOP](#), [MANIFESTFILE\\_KEY\\_TYPE](#), [MANIFESTFILE\\_KEY\\_UTCTIME](#), [MANIFESTFILE\\_KEY\\_VIDEO\\_CODEC](#), [packetTime](#), [SERIALIZE\\_CURRENT\\_VERSION](#), [type](#), [utcTime](#)

## Constructor Summary

public	<a href="#">DvrManifestTimeMapEntry</a> (long index, long chunkIndex, long start, long packetTime, long utcTime, TimeMapRecord timeMap) Constructor
--------	--

## Method Summary

long	<a href="#">getChunkIndex</a> () Get chunk index that correlates to this time mapping
String	<a href="#">getManifestRepresentation</a> ()
TimeMapRecord	<a href="#">getTimeMapping</a> () Get time map record.
void	<a href="#">serialize</a> (java.io.DataOutputStream out)
String	<a href="#">toString</a> ()

### Methods inherited from class [com.wowza.wms.dvr.DvrManifestEntry](#)

[encodeBytes](#), [getCommonInitialTextRepString](#), [getDuration](#), [getIndex](#), [getManifestRepresentation](#), [getPacketStartTime](#), [getStartTimecode](#), [getStopTimecode](#), [getType](#), [getUtcStartTime](#), [serialize](#), [serialize](#)

### Methods inherited from class java.lang.Object

[clone](#), [equals](#), [finalize](#), [getClass](#), [hashCode](#), [notify](#), [notifyAll](#), [toString](#), [wait](#), [wait](#), [wait](#)

## Constructors

### DvrManifestTimeMapEntry

```
public DvrManifestTimeMapEntry(long index,
                                long chunkIndex,
                                long start,
                                long packetTime,
                                long utcTime,
                                TimeMapRecord timeMap)
```

Constructor

**Parameters:**

index - manifest index  
start - start time (ms in DVR time scale)  
timeMap - time map record

## Methods

### getTimeMapping

```
public TimeMapRecord getTimeMapping()
```

Get time map record.

**Returns:**

time map record

### getChunkIndex

```
public long getChunkIndex()
```

Get chunk index that correlates to this time mapping

**Returns:**

chunk index

### getManifestRepresentation

```
public String getManifestRepresentation()
```

Get textual representation of record for textual manifest usage.

### serialize

```
public void serialize(java.io.DataOutputStream out)
```

Serialize manifest record.

### toString

```
public String toString()
```

## com.wowza.wms.dvr Interface IDvrApplicationConverterContext

public interface **IDvrApplicationConverterContext**  
extends

### Method Summary

java.util.Map	<a href="#"><u>getDvrConversions</u></a> (boolean force) Get a list of all the single conversions that have not expired
IDvrConverterStore	<a href="#"><u>getDvrConverterStore</u></a> (String dvrStoreName) Gets a nDVR store for conversion If the store name provided is not available the converter has no information about the store.
java.util.Map	<a href="#"><u>getDvrGroups</u></a> (boolean force) Get a list of all the group conversions that have not expired
java.util.SortedMap	<a href="#"><u>getDvrStoresAvailable</u></a> () Get a list of all the nDVR stores available for this application instance
void	<a href="#"><u>shutDownAllConverstions</u></a> () Stops all conversions currently running
IDvrConverter	<a href="#"><u>startConversion</u></a> (IDvrConverterStore store, DvrConverterControlBase dvrControlObject) Start a single conversion
IDvrConverter	<a href="#"><u>startConversion</u></a> (String dvrStoreName, long start, long end) Start a single conversion
IDvrConverterGroupStatus	<a href="#"><u>startGroupConversion</u></a> (DvrConverterControlBase dvrControlObject) Start a group conversion
IDvrConverterGroupStatus	<a href="#"><u>startGroupConversion</u></a> (java.util.List storeNames, long start, long end) Start a group conversion
IDvrConverter	<a href="#"><u>stopConversion</u></a> (IDvrConverterStore store) Stop a single conversion
IDvrConverter	<a href="#"><u>stopConversion</u></a> (String dvrStoreName) Stop a single conversion
IDvrConverterGroupStatus	<a href="#"><u>stopGroupConversion</u></a> (DvrConverterControlBase dvrControlObject) Stop a group conversion
java.util.List	<a href="#"><u>stopGroupConversion</u></a> (java.util.List storeNames) Stop a group conversion

### Methods

(continued from last page)

---

## shutdownAllConverstions

```
public void shutdownAllConverstions()
```

Stops all conversions currently running

---

## getDvrConverterStore

```
public IDvrConverterStore getDvrConverterStore(String dvrStoreName)
```

Gets a nDVR store for conversion If the store name provided is not available the converter has no information about the store. You can present 'myStream' and if there are multiple stores, such as myStream.0, myStream1 then the highest number store will be used.

**Parameters:**

dvrStoreName

---

## getDvrGroups

```
public java.util.Map getDvrGroups(boolean force)
```

Get a list of all the group conversions that have not expired

**Returns:**

Map>Integer,IDvrConverterGroup<

---

## getDvrConversions

```
public java.util.Map getDvrConversions(boolean force)
```

Get a list of all the single conversions that have not expired

**Returns:**

Map<String,IDvrConverter>

---

## getDvrStoresAvailable

```
public java.util.SortedMap getDvrStoresAvailable()
```

Get a list of all the nDVR stores available for this application instance

**Returns:**

SortedMap<String, SortedSet<Integer>>

---

## startGroupConversion

```
public IDvrConverterGroupStatus startGroupConversion(DvrConverterControlBase  
dvrControlObject)
```

Start a group conversion

**Parameters:**

dvrControlObject

**Returns:**

IDvrConverterGroupStatus

---

(continued from last page)

---

## startGroupConversion

```
public IDvrConverterGroupStatus startGroupConversion(java.util.List storeNames,  
    long start,  
    long end)
```

Start a group conversion

**Parameters:**

storeNames  
start  
end

**Returns:**

IDvrConverterGroupStatus

---

## startConversion

```
public IDvrConverter startConversion(String dvrStoreName,  
    long start,  
    long end)
```

Start a single conversion

**Parameters:**

dvrStoreName  
start  
end

**Returns:**

IDvrConverter

---

## startConversion

```
public IDvrConverter startConversion(IDvrConverterStore store,  
    DvrConverterControlBase dvrControlObject)
```

Start a single conversion

**Parameters:**

store  
dvrControlObject

**Returns:**

IDvrConverter

---

## stopConversion

```
public IDvrConverter stopConversion(String dvrStoreName)
```

Stop a single conversion

**Parameters:**

dvrStoreName

**Returns:**

IDvrConverter

---

(continued from last page)

## stopConversion

```
public IDvrConverter stopConversion(IDvrConverterStore store)
```

Stop a single conversion

**Parameters:**

store

**Returns:**

IDvrConverter

---

## stopGroupConversion

```
public IDvrConverterGroupStatus stopGroupConversion(DvrConverterControlBase  
dvrControlObject)
```

Stop a group conversion

**Parameters:**

dvrControlObject

**Returns:**

IDvrConverterGroupStatus

---

## stopGroupConversion

```
public java.util.List stopGroupConversion(java.util.List storeNames)
```

Stop a group conversion

**Parameters:**

storeNames

**Returns:**

List<DvrConverterStatus>

## com.wowza.wms.dvr Interface IDvrChannelManifest

All Subinterfaces:

[IDvrTimeMap](#)

public interface **IDvrChannelManifest**  
extends

int	<a href="#"><u>getType</u></a> ()
boolean	<a href="#"><u>isEmpty</u></a> ()
void	<a href="#"><u>setManifestDebug</u></a> (boolean flag)

## Methods

### isEmpty

public boolean **isEmpty**()

### getType

public int **getType**()

### getLastRecordedIndex

public long **getLastRecordedIndex**()

(continued from last page)

---

## setManifestDebug

```
public void setManifestDebug(boolean flag)
```

---

## getRecordedEntries

```
public java.util.List getRecordedEntries()
```

---

## getRecordedEntriesInRange

```
public java.util.List getRecordedEntriesInRange(long startIndex,  
                                                  long endIndex)
```

---

## getIndexMap

```
public java.util.Map getIndexMap()
```

---

## getRecordedEntryByTimeKey

```
public DvrManifestEntry getRecordedEntryByTimeKey(long t)
```

---

## getRecordedEntryByIndex

```
public DvrManifestEntry getRecordedEntryByIndex(long index)
```

---

## getRecordedEntryStartingBeforeTime

```
public DvrManifestEntry getRecordedEntryStartingBeforeTime(long t,  
                                                             boolean inclusive)
```

---

## getRecordedEntries

```
public java.util.List getRecordedEntries(long dvrStartTime)
```

---

## getRecordedEntries

```
public java.util.List getRecordedEntries(long dvrStartTime,  
                                          long dvrEndTime)
```

---

(continued from last page)

---

**getRecordedEntriesWithLimit**

```
public java.util.List getRecordedEntriesWithLimit(long t,  
                                                    int limit)
```

---

**getRecordedDuration**

```
public long getRecordedDuration()
```

---

**getLiveDuration**

```
public long getLiveDuration()
```

---

**getClosestStartTime**

```
public long getClosestStartTime(long t)
```

---

**getLiveEntries**

```
public java.util.List getLiveEntries()
```

---

**getLiveTailEntries**

```
public java.util.List getLiveTailEntries(long index)
```

---

**getNumberLiveEntries**

```
public int getNumberLiveEntries(long dvrStart)
```

---

**getNumberLiveEntries**

```
public int getNumberLiveEntries(long dvrStart,  
                                long dvrEnd)
```

---

**getNumberRecordedEntries**

```
public int getNumberRecordedEntries(long dvrStart)
```

---

(continued from last page)

---

## getNumberRecordedEntries

```
public int getNumberRecordedEntries(long dvrStart,  
    long dvrEnd)
```

---

## getLiveEntries

```
public java.util.List getLiveEntries(long startTime)
```

---

## getLiveEntriesWithLimit

```
public java.util.List getLiveEntriesWithLimit(long t,  
    int limit)
```

---

## getFirstIndex

```
public long getFirstIndex()
```

---

## getFirstEntry

```
public DvrManifestEntry getFirstEntry()
```

---

## getLastLiveEntry

```
public DvrManifestEntry getLastLiveEntry()
```

---

## getLastRecordedEntry

```
public DvrManifestEntry getLastRecordedEntry()
```

---

## getLiveRangeEndingBeforeTime

```
public DvrManifestEntryRange getLiveRangeEndingBeforeTime(long time)
```

---

## getLiveRangeEndingBeforeTime

```
public DvrManifestEntryRange getLiveRangeEndingBeforeTime(long time,  
    boolean skipFirst)
```

---

(continued from last page)

## **expandStartTime**

```
public long expandStartTime(long dvrStartTime)
```

---

## **expandEndTime**

```
public long expandEndTime(long dvrEndTime)
```

## com.wowza.wms.dvr Interface IDvrChunker

public interface **IDvrChunker**  
extends

### Method Summary

long	<a href="#"><code>calculateChunkGroupTime</code></a> (long dvrTime)
String	<a href="#"><code>determineChunkGroupIdentifier</code></a> (long dvrTime)
int	<a href="#"><code>getChunkGroupDuration</code></a> ()
void	<a href="#"><code>setChunkGroupDuration</code></a> (int chunkGrouping)

### Methods

#### `getChunkGroupDuration`

public int **getChunkGroupDuration**()

#### `determineChunkGroupIdentifier`

public String **determineChunkGroupIdentifier**(long dvrTime)

#### `calculateChunkGroupTime`

public long **calculateChunkGroupTime**(long dvrTime)

#### `setChunkGroupDuration`

public void **setChunkGroupDuration**(int chunkGrouping)

## com.wowza.wms.dvr Interface IDvrChunkIDHandler

All Subinterfaces:

[IDvrChunkIDHandler2](#)

public interface **IDvrChunkIDHandler**  
extends

This interface should no longer be used directly. Please use IDvrChunkIDHandler2

### Method Summary

void	<a href="#"><code>init</code></a> ( <a href="#"><code>IDvrManifest</code></a> dvrManifest) Initialize the chunk ID handler
int	<a href="#"><code>onAssignChunkId</code></a> (String streamName, DvrPacketHolder vPackets, DvrPacketHolder aPackets) This returns the chunkID to use for the nDVR chunk to be stored.
void	<a href="#"><code>setAudioManifest</code></a> (DvrChannelManifest audioManifest) Set the audio manifest for this handler
void	<a href="#"><code>setCodecManifest</code></a> (DvrChannelManifest codecManifest) Set the codec manifest for this handler
void	<a href="#"><code>setDataManifest</code></a> (DvrChannelManifest dataManifest) Set the data manifest for this handler
void	<a href="#"><code>setMetadataManifest</code></a> (DvrChannelManifest onMetaManifest) Set the meta data manifest for this handler
void	<a href="#"><code>setVideoManifest</code></a> (DvrChannelManifest videoManifest) Set the video manifest for this handler

### Methods

#### **init**

public void **init**([`IDvrManifest`](#) dvrManifest)

Initialize the chunk ID handler

#### Parameters:

dvrManifest

#### **setVideoManifest**

public void **setVideoManifest**(DvrChannelManifest videoManifest)

Set the video manifest for this handler

#### Parameters:

(continued from last page)

videoManifest

---

## setAudioManifest

```
public void setAudioManifest(DvrChannelManifest audioManifest)
```

Set the audio manifest for this handler

**Parameters:**

audioManifest

---

## setDataManifest

```
public void setDataManifest(DvrChannelManifest dataManifest)
```

Set the data manifest for this handler

**Parameters:**

dataManifest

---

## setMetadataManifest

```
public void setMetadataManifest(DvrChannelManifest onMetaManifest)
```

Set the meta data manifest for this handler

**Parameters:**

onMetaManifest

---

## setCodecManifest

```
public void setCodecManifest(DvrChannelManifest codecManifest)
```

Set the codec manifest for this handler

**Parameters:**

codecManifest

---

## onAssignChunkId

```
public int onAssignChunkId(String streamName,  
    DvrPacketHolder vPackets,  
    DvrPacketHolder aPackets)
```

This returns the chunkID to use for the nDVR chunk to be stored. It MUST return a consist number based on the state of the manifests/packets provided, i.e. return the same answer if no changes are made between calls.

**Parameters:**

streamName  
vPackets  
aPackets

**Returns:**

## com.wowza.wms.dvr Interface IDvrChunkIDHandler2

All Superinterfaces:

[IDvrChunkIDHandler](#)

public interface **IDvrChunkIDHandler2**

extends [IDvrChunkIDHandler](#)

### Method Summary

int	<a href="#">getLastAssignedChunkId()</a>
int	<a href="#">onAssignChunkId</a> (String streamName, <a href="#">AMFPacket</a> dataPacket)
void	<a href="#">setDVRStore</a> ( <a href="#">IDvrStreamStore</a> dvrStore) Set the DVR Store for this ID Handler

Methods inherited from interface [com.wowza.wms.dvr.IDvrChunkIDHandler](#)

[init](#), [onAssignChunkId](#), [setAudioManifest](#), [setCodecManifest](#), [setDataManifest](#),  
[setMetadataManifest](#), [setVideoManifest](#)

### Methods

#### setDVRStore

public void **setDVRStore**([IDvrStreamStore](#) dvrStore)

Set the DVR Store for this ID Handler

Parameters:

dvrStore

#### onAssignChunkId

public int **onAssignChunkId**(String streamName,  
[AMFPacket](#) dataPacket)

#### getLastAssignedChunkId

public int **getLastAssignedChunkId**()

## com.wowza.wms.dvr Interface IDvrChunkIDHandler3

public interface **IDvrChunkIDHandler3**  
extends

### Method Summary

long	<a href="#"><code>getLastAssignedChunkId()</code></a>
void	<a href="#"><code>init(IDvrManifest dvrManifest)</code></a> Initialize the chunk ID handler
long	<a href="#"><code>onAssignChunkId(String streamName, AMFPacket dataPacket)</code></a>
long	<a href="#"><code>onAssignChunkId(String streamName, DvrPacketHolder vPackets, DvrPacketHolder aPackets)</code></a> This returns the chunkID to use for the nDVR chunk to be stored.
void	<a href="#"><code>setAudioManifest(DvrChannelManifest audioManifest)</code></a> Set the audio manifest for this handler
void	<a href="#"><code>setCodecManifest(DvrChannelManifest codecManifest)</code></a> Set the codec manifest for this handler
void	<a href="#"><code>setDataManifest(DvrChannelManifest dataManifest)</code></a> Set the data manifest for this handler
void	<a href="#"><code>setDVRStore(IDvrStreamStore dvrStore)</code></a>
void	<a href="#"><code>setLastSkippedChunkId(long chunkId)</code></a>
void	<a href="#"><code>setMetadataManifest(DvrChannelManifest onMetaManifest)</code></a> Set the meta data manifest for this handler
void	<a href="#"><code>setVideoManifest(DvrChannelManifest videoManifest)</code></a> Set the video manifest for this handler

### Methods

#### **init**

public void **init**([`IDvrManifest`](#) dvrManifest)

Initialize the chunk ID handler

**Parameters:**

dvrManifest

(continued from last page)

---

## setVideoManifest

```
public void setVideoManifest(DvrChannelManifest videoManifest)
```

Set the video manifest for this handler

**Parameters:**

videoManifest

---

## setAudioManifest

```
public void setAudioManifest(DvrChannelManifest audioManifest)
```

Set the audio manifest for this handler

**Parameters:**

audioManifest

---

## setDataManifest

```
public void setDataManifest(DvrChannelManifest dataManifest)
```

Set the data manifest for this handler

**Parameters:**

dataManifest

---

## setMetadataManifest

```
public void setMetadataManifest(DvrChannelManifest onMetaManifest)
```

Set the meta data manifest for this handler

**Parameters:**

onMetaManifest

---

## setCodecManifest

```
public void setCodecManifest(DvrChannelManifest codecManifest)
```

Set the codec manifest for this handler

**Parameters:**

codecManifest

---

## onAssignChunkId

```
public long onAssignChunkId(String streamName,  
    DvrPacketHolder vPackets,  
    DvrPacketHolder aPackets)
```

This returns the chunkID to use for the nDVR chunk to be stored. It MUST return a consist number based on the state of the manifests/packets provided, i.e. return the same answer if no changes are made between calls.

**Parameters:**

streamName  
vPackets  
aPackets

---

(continued from last page)

**Returns:**

---

**setDVRStore**

```
public void setDVRStore(IDvrStreamStore dvrStore)
```

---

**onAssignChunkId**

```
public long onAssignChunkId(String streamName,  
    AMFPacket dataPacket)
```

---

**getLastAssignedChunkId**

```
public long getLastAssignedChunkId()
```

---

**setLastSkippedChunkId**

```
public void setLastSkippedChunkId(long chunkId)
```

## com.wowza.wms.dvr Interface IDvrChunkMemoryCache

All Superinterfaces:

[IDvrRawChunkProvider](#)

public interface **IDvrChunkMemoryCache**

extends [IDvrRawChunkProvider](#)

Interface for managing in-memory cache of chunks. The implementor is responsible for implementing the desired algorithm for keeping DVR chunks in memory.

### Method Summary

void	<a href="#">addToCache</a> ( <a href="#">DvrManifestChunkEntry</a> entry, DvrChunk chunk) Provide in-memory cache the opportunity to add the DVR chunk to its cache.
void	<a href="#">addToCache</a> (int type, long index, DvrChunk chunk) Provide in-memory cache the opportunity to add the DVR chunk to its cache.
void	<a href="#">closeCache</a> ()
void	<a href="#">init</a> ( <a href="#">IDvrStreamStore</a> store) Called to initialize the in-memory cache.
DvrChunk	<a href="#">retrieveRawChunk</a> ( <a href="#">DvrManifestChunkEntry</a> entry)
DvrChunk	<a href="#">retrieveRawChunk</a> (int type, long index)
void	<a href="#">setContext</a> (String context) Set the full context for this cache

Methods inherited from interface [com.wowza.wms.dvr.IDvrRawChunkProvider](#)

[retrieveRawChunk](#)

### Methods

#### init

public void **init**([IDvrStreamStore](#) store)

Called to initialize the in-memory cache.

#### Parameters:

store - The DVR stream store associated with this cache.

#### setContext

public void **setContext**(String context)

(continued from last page)

Set the full context for this cache

**Parameters:**

context

---

**retrieveRawChunk**

```
public DvrChunk retrieveRawChunk(DvrManifestChunkEntry entry)
```

---

**retrieveRawChunk**

```
public DvrChunk retrieveRawChunk(int type,  
    long index)
```

---

**closeCache**

```
public void closeCache()
```

---

**addToCache**

```
public void addToCache(DvrManifestChunkEntry entry,  
    DvrChunk chunk)
```

Provide in-memory cache the opportunity to add the DVR chunk to its cache. The implementation may choose to cache the chunk or ignore it.

**Parameters:**

entry - DVR manifest entry  
chunk - the chunk.

---

**addToCache**

```
public void addToCache(int type,  
    long index,  
    DvrChunk chunk)
```

Provide in-memory cache the opportunity to add the DVR chunk to its cache. The implementation may choose to cache the chunk or ignore it.

**Parameters:**

int - type  
int - index  
chunk - the chunk.

---

## com.wowza.wms.dvr Interface IDvrChunkUtcDelegate

---

public interface **IDvrChunkUtcDelegate**  
extends

Delegate class for determining utc time of DVR chunk.

---

### Method Summary

long	<a href="#">determineUtcTime</a> (long currentUtc, long aChunkStartUtc, long aFirstPacketUtc, <a href="#">AMFPacket</a> aFirstPacket, long vChunkStartUtc, long vFirstPacketUtc, <a href="#">AMFPacket</a> vFirstPacket)
void	<a href="#">init</a> ( <a href="#">IDvrStreamStore</a> store)

---

### Methods

#### **init**

public void **init**([IDvrStreamStore](#) store)

---

#### **determineUtcTime**

```
public long determineUtcTime(long currentUtc,  
    long aChunkStartUtc,  
    long aFirstPacketUtc,  
    AMFPacket aFirstPacket,  
    long vChunkStartUtc,  
    long vFirstPacketUtc,  
    AMFPacket vFirstPacket)
```

## com.wowza.wms.dvr Interface IDvrConstants

All Superinterfaces:

public static final	<a href="#"><u>PROPERTY_ALLOWABLE_AV_PACKET_DELTA</u></a> DVR Property "dvrAllowableAVPacketDelta": for specifying how much audio and video packets may diverge before triggering an error. Value: <b>dvrAllowableAVPacketDelta</b>
public static final	<a href="#"><u>PROPERTY_APPEND_DISCONTINUITY_DELTA</u></a> DVR Property "dvrAppendDiscontinuityDelta": for specifying how many milliseconds of empty space are put between individual recordings that when in append mode. Value: <b>dvrAppendDiscontinuityDelta</b>
public static final	<a href="#"><u>PROPERTY_ARCHIVE_STRATEGY</u></a> DVR Property "dvrArchiveStrategy": for specifying the DVR archive strategy. Value: <b>dvrArchiveStrategy</b>
public static final	<a href="#"><u>PROPERTY_AUDIO_ONLY_CHUNK_TARGET_DURATION</u></a> DVR Property "dvrAudioOnlyChunkTargetDuration": for target duration when recording audio-only. Value: <b>dvrAudioOnlyChunkTargetDuration</b>
public static final	<a href="#"><u>PROPERTY_BREAK_ON_PTS</u></a> DVR Property "dvrChunkBreakOnPTS": for specifying that DVR should be broken on PTS. Value: <b>dvrChunkBreakOnPTS</b>
public static final	<a href="#"><u>PROPERTY_BREAK_ON_PTS_MANIFEST</u></a> DVR Property "dvrChunkBreakOnPTSManifest": for specifying that DVR manifest should use the PTS when dvrChunkBreakOnPTS is enabled. Value: <b>dvrChunkBreakOnPTSManifest</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_CACHE_CLASS</u></a> DVR Property "dvrChunkMemoryCacheClass": for controlling the class responsible for caching DVR chunks in memory. Value: <b>dvrChunkMemoryCacheClass</b>

public static final	<a href="#"><u>PROPERTY_CHUNK_DURATION_MINIMUM</u></a> DVR Property "dvrChunkDurationMinimum": for minimum chunk duration, in milliseconds. Value: <b>dvrChunkDurationMinimum</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_GROUPING_SECONDS</u></a> DVR Property "dvrChunkGroupingSeconds": for determining how many seconds of DVR are stored in each stores sub-folder. Value: <b>dvrChunkGroupingSeconds</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_ID_CLASS</u></a> The associated class must implement the IDvrChunkIDHandler3 interface Value: <b>dvrChunkIDHandlerClass</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MBR_ALIGNER</u></a> Internal DO NOT USE Value: <b>dvrChunkMbrCustomAligner</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_CACHESIZE</u></a> DVR Property "chunkMemoryCacheSize": used by DvrDefaultChunkMemoryCache to set number of chunks stored in DVR in-memory cache. Value: <b>chunkMemoryCacheSize</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_READ_CACHE_DEBUG</u></a> DVR Property "chunkReadMemoryCacheDebug": used by DvrDefaultChunkMemoryReadCache to set the amount of memory for DVR in-memory read cache. Value: <b>chunkReadMemoryCacheDebug</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_READ_CACHE_ENABLE</u></a> DVR Property "chunkReadMemoryCacheEnable": used by DvrDefaultChunkMemoryReadCache to enable read caching. Value: <b>chunkReadMemoryCacheEnable</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_READ_CACHE_EXPIRE_AGE</u></a> DVR Property "chunkReadMemoryCacheExpireAge": used by DvrDefaultChunkMemoryReadCache to set when a chunk should automatically be purged from the cache. Value: <b>chunkReadMemoryCacheExpireAge</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_READ_CACHE_GC_EXPIRE_FREQUENCY</u></a> DVR Property "chunkReadMemoryCacheGCExpireFrequency": used by DvrDefaultChunkMemoryReadCache to set the how often an expire cycle runs. Value: <b>chunkReadMemoryCacheGCExpireFrequency</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_READ_CACHE_MAX_EXPIRE_COUNT</u></a> DVR Property "chunkReadMemoryCacheMaxExpireCount": used by DvrDefaultChunkMemoryReadCache to set the amount of chunks to expire in each cycle. Value: <b>chunkReadMemoryCacheMaxExpireCount</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_READ_CACHE_STORE</u></a> DVR Property "chunkReadMemoryCacheStore": used by DvrDefaultChunkMemoryReadCache to enable caching for stores. Value: <b>chunkReadMemoryCacheStore</b>

public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_READ_CACHESIZE_AUDIO</u></a> DVR Property "chunkReadMemoryCacheAudioSize": used by DvrDefaultChunkMemoryReadCache to set the amount of memory for DVR in-memory read cache. Value: <b>chunkReadMemoryCacheAudioSize</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_READ_CACHESIZE_DATA</u></a> DVR Property "chunkReadMemoryCacheDataSize": used by DvrDefaultChunkMemoryReadCache to set the amount of memory for DVR in-memory read cache. Value: <b>chunkReadMemoryCacheDataSize</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_MEMORY_READ_CACHESIZE_VIDEO</u></a> DVR Property "chunkReadMemoryCacheVideoSize": used by DvrDefaultChunkMemoryReadCache to set the amount of memory for DVR in-memory read cache. Value: <b>chunkReadMemoryCacheVideoSize</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_READ_CACHE_CLASS</u></a> DVR Property "dvrChunkMemoryReadCacheClass": for controlling the class responsible for caching DVR chunks in memory. Value: <b>dvrChunkMemoryReadCacheClass</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_READER_CLASS</u></a> DVR Property "dvrChunkReaderClass": for controlling the class responsible for reading DVR Chunks. Value: <b>dvrChunkReaderClass</b>
public static final	<a href="#"><u>PROPERTY_CHUNK_WRITER_CLASS</u></a> DVR Property "dvrChunkWriterClass": for controlling the class responsible for writing DVR Chunks. Value: <b>dvrChunkWriterClass</b>
public static final	<a href="#"><u>PROPERTY_CUPERTINO_ENABLE_DATE_EVENTS</u></a> HTTP Streamer Property "dvrCupertinoEnableDataEvents": used to stream ID3 data for HLS DVR streams Value: <b>dvrCupertinoEnableDataEvents</b>
public static final	<a href="#"><u>PROPERTY_CUPERTINO_ON_CHUNK_START_RESET_COUNTER</u></a> DVR Property "dvrCupertinoOnChunkStartResetCounter": when a new chunk starts, reset internal tsPacketizer counters Value: <b>dvrCupertinoOnChunkStartResetCounter</b>
public static final	<a href="#"><u>PROPERTY_CUPERTINO_PLAYLIST_ALLOW_CACHING</u></a> DVR Property "dvrCupertinoPlaylistAllowCaching": used to force Cupertino playlist to set #EXT-X-ALLOW-CACHE: value Value: <b>dvrCupertinoPlaylistAllowCaching</b>
public static final	<a href="#"><u>PROPERTY_CUPERTINO_PLAYLIST_DISC_AT_ALTERNATES</u></a> HTTP Streamer Property "dvrCupertinoPlaylistDiscontinuityAtAlternates": used to insert discontinuity tags into HLS stream if DVR store switches mid-playlist. Value: <b>dvrCupertinoPlaylistDiscontinuityAtAlternates</b>
public static final	<a href="#"><u>PROPERTY_CUPERTINO_PLAYLIST_FORCE_LIVE</u></a> DVR Property "dvrCupertinoPlaylistForceLive": used to override playlist request delegate logic that determines if playlist is live. Value: <b>dvrCupertinoPlaylistForceLive</b>

public static final	<a href="#"><u>PROPERTY_CUPERTINO_PLAYLIST_FORCE_NONLIVE</u></a> DVR Property "dvrCupertinoPlaylistForceLive": used to override playlist request delegate logic that determines if playlist is live versus non-live. Value: <b>dvrCupertinoPlaylistForceNonLive</b>
public static final	<a href="#"><u>PROPERTY_CUPERTINO_PLAYLIST_GZIP_THRESHOLD</u></a> DVR Property "dvrCupertinoPlaylistGzipThreshold": when playlist is larger than this number of bytes, and gzip is enabled and accepted, the playlist will be compressed Value: <b>dvrCupertinoPlaylistGzipThreshold</b>
public static final	<a href="#"><u>PROPERTY_CUPERTINO_PLAYLIST_USE_GZIP</u></a> DVR Property "dvrCupertinoPlaylistUseGzip": used to force Cupertino playlist to use gzip if it is accepted Value: <b>dvrCupertinoPlaylistUseGzip</b>
public static final	<a href="#"><u>PROPERTY_CUPERTINO_PUT_END_TAG_BEFORE_CHUNKS</u></a> DVR Property "dvrCupertinoPutEndTagBeforeChunks": if set to true, puts the EXT-X-ENDLIST before the DVR chunks. Value: <b>dvrCupertinoPutEndTagBeforeChunks</b>
public static final	<a href="#"><u>PROPERTY_CUPERTINO_PUT_END_TAG_IF_PLAYLIST_DURATION_REACHED</u></a> DVR Property "dvrCupertinoPutEndTagIfPlaylistDurationReached": if set to true, puts the EXT-X-ENDLIST tag after DVR chunks only when a DVR playlist's duration has been specified in a request, and it's calculated end time has been reached for streams that are still recording. Value: <b>dvrCupertinoPutEndTagIfPlaylistDurationReached</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_CHANNEL_MANIFEST</u></a> DVR Property "dvrDebugChannelManifest": for turning on logging of DVR channel manifests. Value: <b>dvrDebugChannelManifest</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_CHUNK_RETRIEVALS</u></a> DVR Property "dvrDebugChunkRetrievals": for logging each chunk retrieval Value: <b>dvrDebugChunkRetrievals</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_CUPERTINO_PLAYER_ADAPTER</u></a> HTTP Streamer Property "dvrDebugCupertinoPlayerAdapter": for turning on DVR Player Cupertino Adapter debug logging. Value: <b>dvrDebugCupertinoPlayerAdapter</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_FAILED_CHUNK_RETRIEVALS</u></a> DVR Property "dvrDebugFailedChunkRetrievals": for logging info about each failed chunk retrieval Value: <b>dvrDebugFailedChunkRetrievals</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_LOG_INVALID_CHUNK_DETAILS</u></a> DVR Property "dvrLogInvalidChunkDetails": to control detailed logging information of DVR invalid chunks Value: <b>dvrLogInvalidChunkDetails</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_LOG_INVALID_CHUNK_MATCHER</u></a> DVR Property "dvrLogInvalidChunkMatcher": for matching stream names that will log chunk packets Value: <b>dvrLogInvalidChunkMatcher</b>

public static final	<a href="#">PROPERTY_DEBUG_LOG_VALID_CHUNK_DETAILS</a> DVR Property "dvrLogValidChunkDetails": to control detailed logging information of DVR valid chunks Value: <b>dvrLogValidChunkDetails</b>
public static final	<a href="#">PROPERTY_DEBUG_LOG_VALID_CHUNK_MATCHER</a> DVR Property "dvrLogValidChunkMatcher": for matching stream names that will log chunk packets Value: <b>dvrLogValidChunkMatcher</b>
public static final	<a href="#">PROPERTY_DEBUG_MAX_INVALID_CHUNKS_LOGGED</a> DVR Property "dvrMaxInvalidChunksLogged": for controlling maximum number of invalid DVR chunks logged. Value: <b>dvrMaxInvalidChunksLogged</b>
public static final	<a href="#">PROPERTY_DEBUG_MAX_VALID_CHUNKS_LOGGED</a> DVR Property "dvrMaxValidChunksLogged": for controlling maximum number of valid DVR chunks logged. Value: <b>dvrMaxValidChunksLogged</b>
public static final	<a href="#">PROPERTY_DEBUG_MAXIMUM_RAW_PACKETS</a> DVR Property "dvrDebugMaximumRawPackets": for setting maximum number of logged raw packets. Value: <b>dvrDebugMaximumRawPackets</b>
public static final	<a href="#">PROPERTY_DEBUG_MBR_ALIGNMENT</a> HTTP Streamer or DVR Property "dvrDebugMbrAlignment": for turning on logging of mbr alignment Value: <b>dvrDebugMbrAlignment</b>
public static final	<a href="#">PROPERTY_DEBUG_MBR_ALIGNMENT_RESOLUTION</a> DVR Property "dvrDebugMbrAlignmentResolution": for turning on logging of mbr alignment resolution (requested to actual) Value: <b>dvrDebugMbrAlignmentResolution</b>
public static final	<a href="#">PROPERTY_DEBUG_MBR_DETAILS_WHEN_RECORD_DNE</a> HTTP Streamer or DVR Property "dvrDebugMbrDetailsWhenRecordDNE": for turning on DVR MBR Player Adapter debug logging. Value: <b>dvrDebugMbrDetailsWhenRecordDNE</b>
public static final	<a href="#">PROPERTY_DEBUG_MBR_PLAYER_ADAPTER</a> HTTP Streamer or DVR Property "dvrDebugMbrPlayerAdapter": for turning on DVR MBR Player Adapter debug logging. Value: <b>dvrDebugMbrPlayerAdapter</b>
public static final	<a href="#">PROPERTY_DEBUG_MBR_PLAYER_ADAPTER_IF_SHIFTED_EMPTY</a> HTTP Streamer or DVR Property "dvrDebugMbrPlayerAdapter": for turning on DVR MBR Player Adapter debug logging when null shifted entries is returned. Value: <b>dvrDebugMbrPlayerAdapterWhenShiftedEmpty</b>
public static final	<a href="#">PROPERTY_DEBUG_METHODS</a> DVR Property "dvrDebugManagerLogMethods": for turning on DVR Manager debug logging. Value: <b>dvrDebugManagerLogMethods</b>
public static final	<a href="#">PROPERTY_DEBUG_MPEGDASH_PLAYER_ADAPTER</a> HTTP Streamer Property "dvrDebugMPEGDashPlayerAdapter": for turning on DVR Player MPEG-DASH Adapter debug logging. Value: <b>dvrDebugMPEGDashPlayerAdapter</b>

public static final	<a href="#"><u>PROPERTY_DEBUG_PLAYER_ADAPTER</u></a> HTTP Streamer Property "dvrDebugPlayerAdapter": for turning on DVR Player Adapter debug logging for all streamer types. Value: <b>dvrDebugPlayerAdapter</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_PLAYLIST_REQUEST</u></a> DVR Property "dvrDebugPlaylistRequest": for turning on logging of DVR playlist requests. Value: <b>dvrDebugPlaylistRequest</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_RAW_PACKETS</u></a> DVR Property "dvrDebugRawPackets": for turning on logging of incoming raw packets. Value: <b>dvrDebugRawPackets</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_RAW_PACKETS_MATCHER</u></a> DVR Property "dvrDebugRawPacketsMatcher": for matching stream names that will dump raw packet. Value: <b>dvrDebugRawPacketsMatcher</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_REPEATER</u></a> DVR Property "dvrDebugRepeater": for turning on logging of DVR repeater Value: <b>dvrDebugRepeater</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_SANJOSE_PLAYER_ADAPTER</u></a> HTTP Streamer Property "dvrDebugSanJosePlayerAdapter": for turning on DVR Player San Jose Adapter debug logging. Value: <b>dvrDebugSanJosePlayerAdapter</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_SMOOTH_PLAYER_ADAPTER</u></a> HTTP Streamer Property "dvrDebugSmoothPlayerAdapter": for turning on DVR Player Smooth Adapter debug logging. Value: <b>dvrDebugSmoothPlayerAdapter</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_STATE_CHANGE</u></a> DVR Property "dvrDebugStateChange": for logging state changes of DVR store. Value: <b>dvrDebugStateChange</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_TOSSED_HOLDERS</u></a> DVR Property "dvrDebugTossedHolders": for turning on logging of packets that are being tossed. Value: <b>dvrDebugTossedHolders</b>
public static final	<a href="#"><u>PROPERTY_ENCRYPTION_INFO_DELEGATE</u></a> DVR Property "dvrPlaylistEncryptionInfoDelegate": used to over-ride the encryption info on the playback side. Value: <b>dvrPlaylistEncryptionInfoDelegate</b>
public static final	<a href="#"><u>PROPERTY_FILE_SYSTEM_CLASS</u></a> DVR Property "dvrFileSystemClass": for controlling the class responsible for managing the DVR File System. Value: <b>dvrFileSystemClass</b>
public static final	<a href="#"><u>PROPERTY_MANIFEST_PERSISTER_CLASS</u></a> DVR Property "dvrManifestPersisterClass": for controlling the class responsible for persisting the manifest files. Value: <b>dvrManifestPersisterClass</b>

public static final	<a href="#"><u>PROPERTY_MAX_CHUNK_LOG</u></a> DVR Property "dvrMaxChunkLogCount": for maximum number of DVR chunks to log. Value: <b>dvrMaxChunkLogCount</b>
public static final	<a href="#"><u>PROPERTY_MAX_RECALC_DURATION_LOG</u></a> DVR Property "dvrMaxRecountDurationLogCount": for maximum number of messages to log regarding recalculating DVR chunk duration Value: <b>dvrMaxRecountDurationLogCount</b>
public static final	<a href="#"><u>PROPERTY_MAX_RECORDING_LENGTH</u></a> DVR Property "dvrMaximumRecordingLength": The maximum recording length in seconds. Value: <b>dvrMaximumRecordingLength</b>
public static final	<a href="#"><u>PROPERTY_MBR_ALIGNMENT_ALWAYS_START_AT_ZERO</u></a> DVR Property "abrIndexesAlwaysStartWithZero": when doing mbr alignment, always start the alignment at index 0. Value: <b>abrIndexesAlwaysStartWithZero</b>
public static final	<a href="#"><u>PROPERTY_MBR_ALIGNMENT_CHUNKS_IN_RESERVE</u></a> DVR Property "dvrAbrAlignmentChunksInReserve": when doing mbr alignment, implement code that ignores n chunks in each chunklist and determines a trim time based on the maximum time of all of the non-reserve chunks. Value: <b>dvrAbrAlignmentChunksInReserve</b>
public static final	<a href="#"><u>PROPERTY_MBR_ALTERNATIVE_MATCH_DELTA</u></a> DVR Property "dvrMbrAlternateMatchDelta": when finding alternative for a MBR gap, an alternate is considered a match is within this many ms of the gap in question. Value: <b>dvrMbrAlternateMatchDelta</b>
public static final	<a href="#"><u>PROPERTY_MBR_MINIMUM_PACKETTIME_GAP_SIZE</u></a> DVR Property "dvrMbrMinimumPacketTimeGapSize": when doing mbr alignment gaps smaller than this are ignored. Value: <b>dvrMbrMinimumPacketTimeGapSize</b>
public static final	<a href="#"><u>PROPERTY_MBR_MINIMUM_UTCTIME_GAP_SIZE</u></a> DVR Property "dvrMbrMinimumUtcTimeGapSize": when doing mbr alignment gaps smaller than this are ignored. Value: <b>dvrMbrMinimumUtcTimeGapSize</b>
public static final	<a href="#"><u>PROPERTY_MBR_USE_UTC_FOR_ALIGNMENT</u></a> DVR Property "dvrMbrUseUtcForAlignment": when doing mbr alignment use utc time for alignment Value: <b>dvrMbrUseUtcForAlignment</b>
public static final	<a href="#"><u>PROPERTY_MEDIACACHE_ENABLED</u></a> DVR Property "dvrMediaCacheEnabled" Value: <b>dvrMediaCacheEnabled</b>
public static final	<a href="#"><u>PROPERTY_MEDIACACHE_READER_CLASS</u></a> DVR Property "dvrMediaCacheReaderClass" Value: <b>dvrMediaCacheReaderClass</b>
public static final	<a href="#"><u>PROPERTY_MPEG_DASH_PLAYLIST_GZIP_THRESHOLD</u></a> DVR Property "dvrMPGEDashPlaylistGzipThreshold": when playlist is larger than this number of bytes, and gzip is enabled and accepted by the requesting client, the playlist will be compressed Value: <b>dvrMPGEDashPlaylistGzipThreshold</b>

public static final	<a href="#">PROPERTY_MPEG_DASH_PLAYLIST_USE_GZIP</a> DVR Property "dvrMPEGDashPlaylistUseGzip": used to enable creation MPEG-DASH playlists with GZIP encoding Value: <b>dvrMPEGDashPlaylistUseGzip</b>
public static final	<a href="#">PROPERTY_PACKET_DELTA_TO_NOTIFY</a> Value: <b>dvrPacketDeltaToNotify</b>
public static final	<a href="#">PROPERTY_PACKET_DELTA_TO_RESET_TIME</a> DVR Property "dvrResetTimePacketDelta": for controlling how much Chunk start times must diverge from last chunk's end time before the DVR time gets reset. Value: <b>dvrResetTimePacketDelta</b>
public static final	<a href="#">PROPERTY_PACKET_DURATION_MAXIMUM</a> DVR Property "dvrPacketDurationMaximum": for maximum packet duration, in milliseconds. Value: <b>dvrPacketDurationMaximum</b>
public static final	<a href="#">PROPERTY_PACKET_SORT_TIME</a> DVR Property "dvrPacketSortTime": for sorting incoming packets. Value: <b>dvrPacketSortTime</b>
public static final	<a href="#">PROPERTY_PLAYLIST_REQUEST_DELEGATE</a> DVR Property "dvrPlaylistRequestDelegate": used to over-ride the class that generates a playlist request. Value: <b>dvrPlaylistRequestDelegate</b>
public static final	<a href="#">PROPERTY_RECORD_AUDIO</a> DVR Property "recordAudio": for determining if audio should be recorded. Value: <b>recordAudio</b>
public static final	<a href="#">PROPERTY_RECORD_DATA</a> DVR Property "recordData": for determining if data should be recorded. Value: <b>recordData</b>
public static final	<a href="#">PROPERTY_RECORD_VIDEO</a> DVR Property "recordVideo": for determining if video should be recorded. Value: <b>recordVideo</b>
public static final	<a href="#">PROPERTY_RECORDINGS_LOADER_CLASS</a> DVR Property "dvrRecordingsLoaderClass": for controlling the class responsible for loading DVR recordings. Value: <b>dvrRecordingsLoaderClass</b>
public static final	<a href="#">PROPERTY_REPEATER_HEARTBEAT_DURATION</a> DVR Property "dvrRepeaterHeartbeatDuration": for time in ms that origin pings edges Value: <b>dvrRepeaterHeartbeatDuration</b>
public static final	<a href="#">PROPERTY_REPEATER_SHARED_SECRET</a> DVR Property "dvrEncryptionSharedSecret": for encryption shared secret between origins and edges. Value: <b>dvrEncryptionSharedSecret</b>
public static final	<a href="#">PROPERTY_SANJOSE_ABST_DURATION_TOLERANCE</a> DVR Property "dvrSanJosePlaylistAbstDurationEqualityTolerance": used to over-ride the tolerance when determining equal chunks lengths. Value: <b>dvrSanJosePlaylistAbstDurationTolerance</b>

public static final	<a href="#"><u>PROPERTY_SANJOSE_ABST_TIMESCALE</u></a> DVR Property "dvrSanJosePlaylistAbstTimescale": used to over-ride the time-scale for abst files. Value: <b>dvrSanJosePlaylistAbstTimescale</b>
public static final	<a href="#"><u>PROPERTY_SANJOSE_PLAYLIST_DELIVERYTYPE</u></a> DVR Property "dvrSanJosePlaylistDeliveryType": used to over-ride the mime type for DVR San Jose F4m playlists. Value: <b>dvrSanJosePlaylistDeliveryType</b>
public static final	<a href="#"><u>PROPERTY_SANJOSE_PLAYLIST_LIVE_STREAMTYPE</u></a> DVR Property "dvrSanJosePlaylistLiveStreamType": used to over-ride the stream type for live DVR in San Jose f4m playlists. Value: <b>dvrSanJosePlaylistLiveStreamType</b>
public static final	<a href="#"><u>PROPERTY_SANJOSE_PLAYLIST_MIMETYPE</u></a> DVR Property "dvrSanJosePlaylistMimeType": used to over-ride the mime type for DVR San Jose F4m playlists. Value: <b>dvrSanJosePlaylistMimeType</b>
public static final	<a href="#"><u>PROPERTY_SANJOSE_PLAYLIST_RECORDED_STREAMTYPE</u></a> DVR Property "dvrSanJosePlaylistRecordedStreamType": used to over-ride the stream type for non-live (recorded) DVR in San Jose f4m playlists. Value: <b>dvrSanJosePlaylistRecordedStreamType</b>
public static final	<a href="#"><u>PROPERTY_SANJOSE_PLAYLIST_VERSION</u></a> DVR Property "dvrSanJosePlaylistVersion": used to over-ride the version of the San Jose f4m playlist. Value: <b>dvrSanJosePlaylistVersion</b>
public static final	<a href="#"><u>PROPERTY_SMOOTH_MANIFEST_H264_CODEC</u></a> DVR Property "dvrSmoothManifestH264Codec": used to force Smooth Manifest to use this as its FourCC H264 codec info. Value: <b>dvrSmoothManifestH264Codec</b>
public static final	<a href="#"><u>PROPERTY_SMOOTH_MANIFEST_LIVE_CAN_PAUSE</u></a> DVR Property "dvrSmoothManifestLiveCanPause": used to determine is CanPause is enabled in smooth Manifest. Value: <b>dvrSmoothManifestLiveCanPause</b>
public static final	<a href="#"><u>PROPERTY_SMOOTH_MANIFEST_LIVE_CAN_SEEK</u></a> DVR Property "dvrSmoothManifestLiveCanSeek": used to determine is CanSeek is enabled in smooth Manifest. Value: <b>dvrSmoothManifestLiveCanSeek</b>
public static final	<a href="#"><u>PROPERTY_SMOOTH_MANIFEST_MAJOR_VERSION</u></a> DVR Property "dvrSmoothManifestMajorVersion": used to determine Smooth manifest major version Value: <b>dvrSmoothManifestMajorVersion</b>
public static final	<a href="#"><u>PROPERTY_SMOOTH_MANIFEST_MINOR_VERSION</u></a> DVR Property "dvrSmoothManifestMinorVersion": used to determine Smooth manifest major version Value: <b>dvrSmoothManifestMinorVersion</b>
public static final	<a href="#"><u>PROPERTY_SMOOTH_MANIFEST_RECORDED_CAN_PAUSE</u></a> DVR Property "dvrSmoothManifestRecordedCanPause": used to determine is CanPause is enabled in smooth Manifest. Value: <b>dvrSmoothManifestRecordedCanPause</b>

public static final	<a href="#"><u>PROPERTY_SMOOTH_MANIFEST_RECORDED_CAN_SEEK</u></a> DVR Property "dvrSmoothManifestRecordedCanSeek": used to determine if CanSeek is enabled in smooth Manifest. Value: <b>dvrSmoothManifestRecordedCanSeek</b>
public static final	<a href="#"><u>PROPERTY_SMOOTH_MANIFEST_RECORDED_SPECIFY_DURATION</u></a> DVR Property "dvrSmoothManifestRecordedSpecifyDuration": used to determine if duration is specified. Value: <b>dvrSmoothManifestRecordedSpecifyDuration</b>
public static final	<a href="#"><u>PROPERTY_SMOOTH_MANIFEST_VERBOSE_DURATION</u></a> DVR Property "dvrSmoothManifestVerboseDuration": used to force Smooth Manifest to include durations for each record Value: <b>dvrSmoothManifestVerboseDuration</b>
public static final	<a href="#"><u>PROPERTY_START_RECORDING_ON_STARTUP</u></a> DVR Property "startRecordingOnStartup": for determining if DVR recorder should start recording immediately. Value: <b>startRecordingOnStartup</b>
public static final	<a href="#"><u>PROPERTY_STORAGE_DIRECTORY</u></a> DVR Property "dvrStorageDirectory": for overriding the DVR storage directory location. Typically this is defined application-wide in Application.xml under Application/DVR/StorageDirectory. Value: <b>dvrStorageDirectory</b>
public static final	<a href="#"><u>PROPERTY_STREAM_DATA</u></a> Value: <b>dvrStreamRecordedData</b>
public static final	<a href="#"><u>PROPERTY_STREAM_ONLY_LIVE_STREAMS</u></a> DVR Property "dvrStreamOnlyLiveStreams": used to allow only streaming of 'live' DVR streams. Value: <b>dvrStreamOnlyLiveStreams</b>
public static final	<a href="#"><u>PROPERTY_TEXT_READER_CLASS</u></a> DVR Property "dvrTextReaderClass": for controlling the class responsible for reading DVR text files. Value: <b>dvrTextReaderClass</b>
public static final	<a href="#"><u>PROPERTY_TEXT_WRITER_CLASS</u></a> DVR Property "dvrTextWriterClass": for controlling the class responsible for writing DVR text files. Value: <b>dvrTextWriterClass</b>
public static final	<a href="#"><u>PROPERTY_USE_SAX_PARSER</u></a> DVR Property "dvrUseSAXParser": for controlling the XML parser for DVR container manifests Value: <b>dvrUseSAXParser</b>
public static final	<a href="#"><u>PROPERTY_WINDOW_DURATION</u></a> DVR Property "dvrWindowDuration": for specifying the DVR window duration, in seconds. Value: <b>dvrWindowDuration</b>
public static final	<a href="#"><u>SANJOSE_F4M_STREAMINGTYPE_STREAMING</u></a> Constant for San Jose streaming type "streaming" Value: <b>streaming</b>

public static final	<a href="#">SANJOSE_F4M_STREAMTYPE_DVR</a> Constant for San Jose stream type "dvr". Value: <b>dvr</b>
public static final	<a href="#">SANJOSE_F4M_STREAMTYPE_LIVE</a> Constant for San Jose stream type "live". Value: <b>live</b>

## Fields

### DVR\_STREAMING\_PACKETIZER\_ID

public static final java.lang.String **DVR\_STREAMING\_PACKETIZER\_ID**

The default DVR streaming packetizer ID: "dvrstreamingpacketizer".

See DVR.xml and Application.xml.

Constant value: **dvrstreamingpacketizer**

---

## DVR\_REPEATER\_PACKETIZER\_ID

```
public static final java.lang.String DVR_REPEATER_PACKETIZER_ID
```

The default DVR streaming repeater ID: "dvrstreamingrepeater".

See DVR.xml and Application.xml.

Constant value: **dvrstreamingrepeater**

---

## DVR\_DEFAULT\_RECORDER\_ID

```
public static final java.lang.String DVR_DEFAULT_RECORDER_ID
```

The default DVR recorder ID: "dvrrecorder".

See DVR.xml and Application.xml.

Constant value: **dvrrecorder**

---

## DVR\_DEFAULT\_FILESTORE

```
public static final java.lang.String DVR_DEFAULT_FILESTORE
```

The default DVR store ID: "dvrfilestorage".

See DVR.xml and Application.xml.

Constant value: **dvrfilestorage**

---

## MEDIACACHE\_PREFIX

```
public static final java.lang.String MEDIACACHE_PREFIX
```

The MediaCache prefix for dvr repeater

See MediaCache.xml

Constant value: **dvrorigin**

---

## PROPERTY\_CHUNK\_GROUPING\_SECONDS

```
public static final java.lang.String PROPERTY_CHUNK_GROUPING_SECONDS
```

DVR Property "dvrChunkGroupingSeconds": for determining how many seconds of DVR are stored in each stores sub-folder.

The directory naming convention is HHHH\_MM\_SS with H = hours, M = minutes, S = seconds. Using the defaults, first directory would be named 0000\_00\_00 and the second directory would be named 0000\_10\_00, etc.

Valid values are integers greater than 60. Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrChunkGroupingSeconds**

See Also:

[DEFAULT\\_PROPERTY\\_CHUNK\\_GROUPING\\_SECONDS](#)

---

## DEFAULT\_PROPERTY\_CHUNK\_GROUPING\_SECONDS

```
public static final int DEFAULT_PROPERTY_CHUNK_GROUPING_SECONDS
```

Default value for DVR Property "dvrChunkGroupingSeconds".

Default value is 600 seconds (10 minutes).

Constant value: **600**

---

(continued from last page)

**See Also:**[PROPERTY\\_CHUNK\\_GROUPING\\_SECONDS](#)

---

## PROPERTY\_APPEND\_DISCONTINUITY\_DELTA

```
public static final java.lang.String PROPERTY_APPEND_DISCONTINUITY_DELTA
```

DVR Property "dvrAppendDiscontinuityDelta": for specifying how many milliseconds of empty space are put between individual recordings that when in append mode.

Valid values are integers greater than or equal to 0. Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrAppendDiscontinuityDelta**

**See Also:**[DEFAULT\\_PROPERTY\\_APPEND\\_DISCONTINUITY\\_DELTA](#)

---

## DEFAULT\_PROPERTY\_APPEND\_DISCONTINUITY\_DELTA

```
public static final int DEFAULT_PROPERTY_APPEND_DISCONTINUITY_DELTA
```

Default value for DVR Property "dvrAppendDiscontinuityDelta".

Default value is 0.

Constant value: **0**

**See Also:**[PROPERTY\\_APPEND\\_DISCONTINUITY\\_DELTA](#)

---

## PROPERTY\_WINDOW\_DURATION

```
public static final java.lang.String PROPERTY_WINDOW_DURATION
```

DVR Property "dvrWindowDuration": for specifying the DVR window duration, in seconds.

Typically this is defined application-wide in Application.xml under Application/DVR/WindowDuration. However, to override this on a per stream basis, the property may be set on the IDvrStreamManager after creation and before initialization. Valid values are integers greater than or equal to 0. Add the property to Application/DVR/Properties section of Application.xml. The default is 0, meaning the window size is unlimited.

Constant value: **dvrWindowDuration**

**See Also:**[DVR\\_WINDOW\\_DURATION\\_UNLIMITED](#)

---

## DVR\_WINDOW\_DURATION\_UNLIMITED

```
public static final int DVR_WINDOW_DURATION_UNLIMITED
```

Constant value: **0**

---

## PROPERTY\_STORAGE\_DIRECTORY

```
public static final java.lang.String PROPERTY_STORAGE_DIRECTORY
```

DVR Property "dvrStorageDirectory": for overriding the DVR storage directory location. Typically this is defined application-wide in Application.xml under Application/DVR/StorageDirectory. However, to override this on a per stream basis, the property may be set on the IDvrStreamManager after creation and before initialization.

Constant value: **dvrStorageDirectory**

**See Also:**

(continued from last page)

[DEFAULT\\_PROPERTY\\_STORAGE\\_DIRECTORY](#)

---

## DEFAULT\_PROPERTY\_STORAGE\_DIRECTORY

```
public static final java.lang.String DEFAULT_PROPERTY_STORAGE_DIRECTORY
```

Default value for DVR Property "dvrStorageDirectory".

Default value is "\${com.wowza.wms.context.VHostConfigHome}/dvr".

Constant value: **\${com.wowza.wms.context.VHostConfigHome}/dvr**

See Also:

[PROPERTY\\_STORAGE\\_DIRECTORY](#)

---

## PROPERTY\_ARCHIVE\_STRATEGY

```
public static final java.lang.String PROPERTY_ARCHIVE_STRATEGY
```

DVR Property "dvrArchiveStrategy": for specifying the DVR archive strategy.

Typically this is defined application-wide in Application.xml under Application/DVR/ArchiveStrategy. However, to override this on a per stream basis, the property may be set on the IDvrStreamManager after creation and before initialization. Valid values are:

Constant value: **dvrArchiveStrategy**

See Also:

[ARCHIVE\\_STRATEGY\\_APPEND](#)

[ARCHIVE\\_STRATEGY\\_VERSION](#)

[ARCHIVE\\_STRATEGY\\_APPEND](#)

---

## ARCHIVE\_STRATEGY\_DELETE

```
public static final java.lang.String ARCHIVE_STRATEGY_DELETE
```

Constant value: **delete**

---

## ARCHIVE\_STRATEGY\_VERSION

```
public static final java.lang.String ARCHIVE_STRATEGY_VERSION
```

Constant value: **version**

---

## ARCHIVE\_STRATEGY\_APPEND

```
public static final java.lang.String ARCHIVE_STRATEGY_APPEND
```

Constant value: **append**

---

## PROPERTY\_CHUNK\_READER\_CLASS

```
public static final java.lang.String PROPERTY_CHUNK_READER_CLASS
```

DVR Property "dvrChunkReaderClass": for controlling the class responsible for reading DVR Chunks.

The class must implement IDvrChunkReader

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrChunkReaderClass**

(continued from last page)

**See Also:**

`com.wowza.wms.dvr.io.IDvrChunkReader`  
[DEFAULT\\_PROPERTY\\_CHUNK\\_READER\\_CLASS](#)

---

## DEFAULT\_PROPERTY\_CHUNK\_READER\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_CHUNK_READER_CLASS
```

Default value for DVR Property "dvrChunkReaderClass".

Default value is "com.wowza.wms.dvr.impl.io.DvrFileChunkReader".

Constant value: **com.wowza.wms.dvr.impl.io.DvrFileChunkReader**

**See Also:**

[PROPERTY\\_CHUNK\\_READER\\_CLASS](#)

---

## PROPERTY\_CHUNK\_WRITER\_CLASS

```
public static final java.lang.String PROPERTY_CHUNK_WRITER_CLASS
```

DVR Property "dvrChunkWriterClass": for controlling the class responsible for writing DVR Chunks.

The class must implement IDvrChunkWriter

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrChunkWriterClass**

**See Also:**

`com.wowza.wms.dvr.io.IDvrChunkWriter`  
[DEFAULT\\_PROPERTY\\_CHUNK\\_WRITER\\_CLASS](#)

---

## DEFAULT\_PROPERTY\_CHUNK\_WRITER\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_CHUNK_WRITER_CLASS
```

Default value for DVR Property "dvrChunkWriterClass".

Default value is "com.wowza.wms.dvr.impl.io.DvrFileChunkWriter".

Constant value: **com.wowza.wms.dvr.impl.io.DvrFileChunkWriter**

**See Also:**

[PROPERTY\\_CHUNK\\_WRITER\\_CLASS](#)

---

## PROPERTY\_FILE\_SYSTEM\_CLASS

```
public static final java.lang.String PROPERTY_FILE_SYSTEM_CLASS
```

DVR Property "dvrFileSystemClass": for controlling the class responsible for managing the DVR File System.

The class must implement `com.wowza.wms.dvr.io.IDvrFileSystem` and may sub-class `com.wowza.wms.dvr.impl.io.DvrDefaultFileSystem`

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrFileSystemClass**

**See Also:**

`com.wowza.wms.dvr.io.IDvrFileSystem`  
[DEFAULT\\_PROPERTY\\_FILE\\_SYSTEM\\_CLASS](#)

(continued from last page)

---

## DEFAULT\_PROPERTY\_FILE\_SYSTEM\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_FILE_SYSTEM_CLASS
```

Default value for DVR Property "dvrFileSystemClass".

Default value is "com.wowza.wms.dvr.impl.io.DvrDefaultFileSystem".

Constant value: **com.wowza.wms.dvr.impl.io.DvrDefaultFileSystem**

See Also:

[PROPERTY\\_FILE\\_SYSTEM\\_CLASS](#)

---

## PROPERTY\_MANIFEST\_PERSISTER\_CLASS

```
public static final java.lang.String PROPERTY_MANIFEST_PERSISTER_CLASS
```

DVR Property "dvrManifestPersisterClass": for controlling the class responsible for persisting the manifest files.

The class must implement com.wowza.wms.dvr.io.IDvrManifestPersister

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrManifestPersisterClass**

See Also:

com.wowza.wms.dvr.io.IDvrManifestPersister

[DEFAULT\\_PROPERTY\\_MANIFEST\\_PERSISTER\\_CLASS](#)

---

## DEFAULT\_PROPERTY\_MANIFEST\_PERSISTER\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_MANIFEST_PERSISTER_CLASS
```

Default value for DVR Property "dvrManifestPersisterClass".

Default value is "com.wowza.wms.dvr.impl.DvrManifestPersister".

Constant value: **com.wowza.wms.dvr.impl.DvrManifestPersister**

See Also:

[PROPERTY\\_MANIFEST\\_PERSISTER\\_CLASS](#)

---

## PROPERTY\_CHUNK\_CACHE\_CLASS

```
public static final java.lang.String PROPERTY_CHUNK_CACHE_CLASS
```

DVR Property "dvrChunkMemoryCacheClass": for controlling the class responsible for caching DVR chunks in memory.

The class must implement [IDvrChunkMemoryCache](#) and may sub-class com.wowza.wms.dvr.impl.DvrDefaultChunkMemoryCache

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrChunkMemoryCacheClass**

See Also:

[IDvrChunkMemoryCache](#)

[DEFAULT\\_PROPERTY\\_CHUNK\\_CACHE\\_CLASS](#)

---

## DEFAULT\_PROPERTY\_CHUNK\_CACHE\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_CHUNK_CACHE_CLASS
```

Default value for DVR Property "dvrChunkMemoryCacheClass".

Default value is "com.wowza.wms.dvr.impl.DvrDefaultChunkMemoryCache".

(continued from last page)

Constant value: **com.wowza.wms.dvr.impl.DvrDefaultChunkMemoryCache**

See Also:

[PROPERTY\\_CHUNK\\_CACHE\\_CLASS](#)

---

## PROPERTY\_CHUNK\_READ\_CACHE\_CLASS

```
public static final java.lang.String PROPERTY_CHUNK_READ_CACHE_CLASS
```

DVR Property "dvrChunkMemoryReadCacheClass": for controlling the class responsible for caching DVR chunks in memory.

The class must implement [IDvrChunkMemoryCache](#) and may sub-class `com.wowza.wms.dvr.impl.DvrDefaultChunkMemoryCache`

Add the property to Application/DVR/Properties section of Application.xml.  
Constant value: **dvrChunkMemoryReadCacheClass**

See Also:

[IDvrChunkMemoryCache](#)

[DEFAULT\\_PROPERTY\\_CHUNK\\_READ\\_CACHE\\_CLASS](#)

---

## DEFAULT\_PROPERTY\_CHUNK\_READ\_CACHE\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_CHUNK_READ_CACHE_CLASS
```

Default value for DVR Property "dvrChunkMemoryReadCacheClass".

Default value is "com.wowza.wms.dvr.impl.DvrDefaultChunkMemoryCache".

Constant value: **com.wowza.wms.dvr.impl.DvrDefaultChunkMemoryReadCache**

See Also:

[PROPERTY\\_CHUNK\\_CACHE\\_CLASS](#)

---

## PROPERTY\_RECORDINGS\_LOADER\_CLASS

```
public static final java.lang.String PROPERTY_RECORDINGS_LOADER_CLASS
```

DVR Property "dvrRecordingsLoaderClass": for controlling the class responsible for loading DVR recordings.

The class must implement [IDvrRecordingsLoader](#)

Add the property to Application/DVR/Properties section of Application.xml.  
Constant value: **dvrRecordingsLoaderClass**

See Also:

[IDvrRecordingsLoader](#)

[DEFAULT\\_PROPERTY\\_RECORDINGS\\_LOADER\\_CLASS](#)

---

## DEFAULT\_PROPERTY\_RECORDINGS\_LOADER\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_RECORDINGS_LOADER_CLASS
```

Default value for DVR Property "dvrRecordingsLoaderClass".

Default value is "com.wowza.wms.dvr.DvrRecordingsLoader".

Constant value: **com.wowza.wms.dvr.DvrRecordingsLoader**

See Also:

[PROPERTY\\_RECORDINGS\\_LOADER\\_CLASS](#)

---

(continued from last page)

---

## PROPERTY\_TEXT\_WRITER\_CLASS

```
public static final java.lang.String PROPERTY_TEXT_WRITER_CLASS
```

DVR Property "dvrTextWriterClass": for controlling the class responsible for writing DVR text files.

The class must implement [IDvrTextWriter](#)

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrTextWriterClass**

See Also:

[IDvrTextWriter](#)

[DEFAULT\\_PROPERTY\\_TEXT\\_WRITER\\_CLASS](#)

---

## DEFAULT\_PROPERTY\_TEXT\_WRITER\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_TEXT_WRITER_CLASS
```

Default value for DVR Property "dvrTextWriterClass".

Default value is "com.wowza.wms.dvr.impl.io.DvrTextFileWriter".

Constant value: **com.wowza.wms.dvr.impl.io.DvrTextFileWriter**

See Also:

[PROPERTY\\_TEXT\\_WRITER\\_CLASS](#)

---

## PROPERTY\_TEXT\_READER\_CLASS

```
public static final java.lang.String PROPERTY_TEXT_READER_CLASS
```

DVR Property "dvrTextReaderClass": for controlling the class responsible for reading DVR text files.

The class must implement [IDvrTextReader](#)

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrTextReaderClass**

See Also:

[IDvrTextReader](#)

[DEFAULT\\_PROPERTY\\_TEXT\\_READER\\_CLASS](#)

---

## DEFAULT\_PROPERTY\_TEXT\_READER\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_TEXT_READER_CLASS
```

Default value for DVR Property "dvrTextReaderClass".

Default value is "com.wowza.wms.dvr.impl.io.DvrTextFileReader".

Constant value: **com.wowza.wms.dvr.impl.io.DvrTextFileReader**

See Also:

[PROPERTY\\_TEXT\\_READER\\_CLASS](#)

---

## PROPERTY\_CHUNK\_ID\_CLASS

```
public static final java.lang.String PROPERTY_CHUNK_ID_CLASS
```

The associated class must implement the IDvrChunkIDHandler3 interface

Constant value: **dvrChunkIDHandlerClass**

---

## DEFAULT\_PROPERTY\_CHUNK\_ID\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_CHUNK_ID_CLASS
```

Internal DO NOT USE

Constant value: **com.wowza.wms.dvr.DvrChunkIDHandler3**

---

## PROPERTY\_CHUNK\_MBR\_ALIGNER

```
public static final java.lang.String PROPERTY_CHUNK_MBR_ALIGNER
```

Internal DO NOT USE

Constant value: **dvrChunkMbrCustomAligner**

---

## DEFAULT\_PROPERTY\_MBR\_CLASS\_ALIGNER

```
public static final java.lang.String DEFAULT_PROPERTY_MBR_CLASS_ALIGNER
```

Internal DO NOT USE

Constant value:

---

## DEFAULT\_PROPERTY\_PURGE\_DEFAULT

```
public static final java.lang.String DEFAULT_PROPERTY_PURGE_DEFAULT
```

Internal DO NOT USE

Constant value: **dvrChunkPurgeDefault**

---

## PROPERTY\_USE\_SAX\_PARSER

```
public static final java.lang.String PROPERTY_USE_SAX_PARSER
```

DVR Property "dvrUseSAXParser": for controlling the XML parser for DVR container manifests

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrUseSAXParser**

---

## PROPERTY\_ALLOWABLE\_AV\_PACKET\_DELTA

```
public static final java.lang.String PROPERTY_ALLOWABLE_AV_PACKET_DELTA
```

DVR Property "dvrAllowableAVPacketDelta": for specifying how much audio and video packets may diverge before triggering an error.

Wowza nDVR expects the incoming audio and video to be aligned. Through this parameter, Wowza nDVR will try to compensate for out of alignment issues, but it cannot resolve them. This setting safeguards against audio and data video packets that are not closely aligned. The units are in ms. The default value is 2000 ms. If audio and video are out of alignment by more than this value, the audio and video chunks will be ignored in an attempt to get the streams back into alignment. If you already have an out of alignment issue, increasing the default value is likely to cause more problems. Increasing this value will increase the number of chunks not recorded which may cause the overall quality to be unacceptable.

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrAllowableAVPacketDelta**

See Also:

[DEFAULT\\_PROPERTY\\_ALLOWABLE\\_AV\\_PACKET\\_DELTA](#)

---

## DEFAULT\_PROPERTY\_ALLOWABLE\_AV\_PACKET\_DELTA

```
public static final int DEFAULT_PROPERTY_ALLOWABLE_AV_PACKET_DELTA
```

---

---

(continued from last page)

Default value for DVR Property "dvrAllowableAVPacketDelta".

Default value is 2000 ms.  
Constant value: **2000**

See Also:

[PROPERTY\\_ALLOWABLE\\_AV\\_PACKET\\_DELTA](#)

---

## PROPERTY\_PACKET\_DELTA\_TO\_RESET\_TIME

```
public static final java.lang.String PROPERTY_PACKET_DELTA_TO_RESET_TIME
```

DVR Property "dvrResetTimePacketDelta": for controlling how much Chunk start times must diverge from last chunk's end time before the DVR time gets reset.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrResetTimePacketDelta**

See Also:

[DEFAULT\\_PROPERTY\\_PACKET\\_DELTA\\_TO\\_RESET\\_TIME](#)

---

## DEFAULT\_PROPERTY\_PACKET\_DELTA\_TO\_RESET\_TIME

```
public static final int DEFAULT_PROPERTY_PACKET_DELTA_TO_RESET_TIME
```

Default value for DVR Property "dvrResetTimePacketDelta".

Default value is 200 ms.  
Constant value: **200**

See Also:

[PROPERTY\\_PACKET\\_DELTA\\_TO\\_RESET\\_TIME](#)

---

## PROPERTY\_PACKET\_DELTA\_TO\_NOTIFY

```
public static final java.lang.String PROPERTY_PACKET_DELTA_TO_NOTIFY
```

Constant value: **dvrPacketDeltaToNotify**

---

## DEFAULT\_PROPERTY\_PACKET\_DELTA\_TO\_NOTIFY

```
public static final int DEFAULT_PROPERTY_PACKET_DELTA_TO_NOTIFY
```

Constant value: **200**

---

## PROPERTY\_RECORD\_DATA

```
public static final java.lang.String PROPERTY_RECORD_DATA
```

DVR Property "recordData": for determining if data should be recorded.

Set property to: true to record data of incoming stream. Default is true. Set property to: false to ignore data packets during recording.  
Constant value: **recordData**

---

## PROPERTY\_RECORD\_VIDEO

```
public static final java.lang.String PROPERTY_RECORD_VIDEO
```

---

(continued from last page)

DVR Property "recordVideo": for determining if video should be recorded.

Set property to: true to record video of incoming stream. Default is true. Set property to: false to ignore video packets during recording. Either recordVideo or recordAudio property must be set to: true  
Constant value: **recordVideo**

## PROPERTY\_RECORD\_AUDIO

```
public static final java.lang.String PROPERTY_RECORD_AUDIO
```

DVR Property "recordAudio": for determining if audio should be recorded.

Set property to: true to record audio of incoming stream. Default is true. Set property to: false to ignore audio packets during recording. Either recordVideo or recordAudio property must be set to: true  
Constant value: **recordAudio**

## PROPERTY\_START\_RECORDING\_ON\_STARTUP

```
public static final java.lang.String PROPERTY_START_RECORDING_ON_STARTUP
```

DVR Property "startRecordingOnStartup": for determining if DVR recorder should start recording immediately.

Set property to: true (default) to start recording immediately when stream is detected. Set property to: false to init the DVR recorder but to not start recording immediately when stream starts.  
Constant value: **startRecordingOnStartup**

## PROPERTY\_AUDIO\_ONLY\_CHUNK\_TARGET\_DURATION

```
public static final java.lang.String PROPERTY_AUDIO_ONLY_CHUNK_TARGET_DURATION
```

DVR Property "dvrAudioOnlyChunkTargetDuration": for target duration when recording audio-only.

Applies to recording an audio-only stream and is the target chunk duration. The unit is in ms. The default value is 2000 ms. This setting is ignored if the stream contains video and audio, in which case the keyframe determines the chunk size.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrAudioOnlyChunkTargetDuration**

See Also:

[DEFAULT\\_PROPERTY\\_AUDIO\\_ONLY\\_CHUNK\\_TARGET\\_DURATION](#)

## DEFAULT\_PROPERTY\_AUDIO\_ONLY\_CHUNK\_TARGET\_DURATION

```
public static final int DEFAULT_PROPERTY_AUDIO_ONLY_CHUNK_TARGET_DURATION
```

Default value for DVR Property "dvrAudioOnlyChunkTargetDuration".

Default value is 2000 ms.  
Constant value: **2000**

See Also:

[PROPERTY\\_AUDIO\\_ONLY\\_CHUNK\\_TARGET\\_DURATION](#)

## PROPERTY\_PACKET\_SORT\_TIME

```
public static final java.lang.String PROPERTY_PACKET_SORT_TIME
```

DVR Property "dvrPacketSortTime": for sorting incoming packets. Specified in milliseconds.

Valid values are a integer greater than equal to 0. Zero means no sorting occurs. Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrPacketSortTime**

(continued from last page)

See Also:

[DEFAULT\\_PROPERTY\\_PACKET\\_SORT\\_TIME](#)

---

## DEFAULT\_PROPERTY\_PACKET\_SORT\_TIME

```
public static final int DEFAULT_PROPERTY_PACKET_SORT_TIME
```

Default value for DVR Property "dvrPacketSortTime".

Default value is 0 ms (i.e. no sorting).

Constant value: **0**

See Also:

[PROPERTY\\_PACKET\\_SORT\\_TIME](#)

---

## PROPERTY\_BREAK\_ON\_PTS\_MANIFEST

```
public static final java.lang.String PROPERTY_BREAK_ON_PTS_MANIFEST
```

DVR Property "dvrChunkBreakOnPTSManifest": for specifying that DVR manifest should use the PTS when dvrChunkBreakOnPTS is enabled.

Valid values are "true" or "false" Add the property to Application/DVR/Properties section of Application.xml

Constant value: **dvrChunkBreakOnPTSManifest**

See Also:

[DEFAULT\\_PROPERTY\\_BREAK\\_ON\\_PTS\\_MANIFEST](#)

---

## DEFAULT\_PROPERTY\_BREAK\_ON\_PTS\_MANIFEST

```
public static final boolean DEFAULT_PROPERTY_BREAK_ON_PTS_MANIFEST
```

Default value for DVR Property "dvrChunkBreakOnPTSManifest".

Default value is true.

Constant value: **false**

See Also:

[PROPERTY\\_BREAK\\_ON\\_PTS\\_MANIFEST](#)

---

## PROPERTY\_BREAK\_ON\_PTS

```
public static final java.lang.String PROPERTY_BREAK_ON_PTS
```

DVR Property "dvrChunkBreakOnPTS": for specifying that DVR should be broken on PTS.

Valid values are "true" or "false" Add the property to Application/DVR/Properties section of Application.xml

Constant value: **dvrChunkBreakOnPTS**

See Also:

[DEFAULT\\_PROPERTY\\_BREAK\\_ON\\_PTS](#)

---

## DEFAULT\_PROPERTY\_BREAK\_ON\_PTS

```
public static final boolean DEFAULT_PROPERTY_BREAK_ON_PTS
```

Default value for DVR Property "dvrChunkBreakOnPTS".

Default value is true.

Constant value: **true**

(continued from last page)

See Also:

[PROPERTY\\_BREAK\\_ON\\_PTS](#)

---

## PROPERTY\_REPEATER\_SHARED\_SECRET

```
public static final java.lang.String PROPERTY_REPEATER_SHARED_SECRET
```

DVR Property "dvrEncryptionSharedSecret": for encryption shared secret between origins and edges. In Origin-Edge scenarios when Wowza is using encryption, a shared secret must be defined for both origin and edges to encrypt the information sent between origin and edge so that encryption information is not revealed.

A String values.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrEncryptionSharedSecret**

---

## PROPERTY\_REPEATER\_HEARTBEAT\_DURATION

```
public static final java.lang.String PROPERTY_REPEATER_HEARTBEAT_DURATION
```

DVR Property "dvrRepeaterHeartbeatDuration": for time in ms that origin pings edges

A Integer Value.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrRepeaterHeartbeatDuration**

---

## DEFAULT\_PROPERTY\_REPEATER\_HEARTBEAT\_DURATION

```
public static final int DEFAULT_PROPERTY_REPEATER_HEARTBEAT_DURATION
```

Constant value: **4000**

---

## PROPERTY\_CHUNK\_DURATION\_MINIMUM

```
public static final java.lang.String PROPERTY_CHUNK_DURATION_MINIMUM
```

DVR Property "dvrChunkDurationMinimum": for minimum chunk duration, in milliseconds.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrChunkDurationMinimum**

See Also:

[DEFAULT\\_PROPERTY\\_CHUNK\\_DURATION\\_MINIMUM](#)

---

## DEFAULT\_PROPERTY\_CHUNK\_DURATION\_MINIMUM

```
public static final int DEFAULT_PROPERTY_CHUNK_DURATION_MINIMUM
```

Default value for DVR Property "dvrChunkDurationMinimum".

Default value is 1500 ms.  
Constant value: **1500**

See Also:

[PROPERTY\\_CHUNK\\_DURATION\\_MINIMUM](#)

(continued from last page)

---

## PROPERTY\_CHUNK\_MEMORY\_CACHESIZE

```
public static final java.lang.String PROPERTY_CHUNK_MEMORY_CACHESIZE
```

DVR Property "chunkMemoryCacheSize": used by DvrDefaultChunkMemoryCache to set number of chunks stored in DVR in-memory cache.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_CACHESIZE](#)

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **chunkMemoryCacheSize**

---

## DEFAULT\_CHUNK\_MEMORY\_CACHESIZE

```
public static final int DEFAULT_CHUNK_MEMORY_CACHESIZE
```

Default value for DVR Property "chunkMemoryCacheSize".

Default value is 10 chunks.  
Constant value: **10**

See Also:

[PROPERTY\\_CHUNK\\_MEMORY\\_CACHESIZE](#)

---

## DEFAULT\_CHUNK\_MEMORY\_READ\_CACHE\_STORE

```
public static final java.lang.String DEFAULT_CHUNK_MEMORY_READ_CACHE_STORE
```

Default value for DVR Property "chunkReadMemoryCacheStore".

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_STORE](#)  
Constant value: **\***

See Also:

[DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_STORE](#)

---

## PROPERTY\_CHUNK\_MEMORY\_READ\_CACHE\_STORE

```
public static final java.lang.String PROPERTY_CHUNK_MEMORY_READ_CACHE_STORE
```

DVR Property "chunkReadMemoryCacheStore": used by DvrDefaultChunkMemoryReadCache to enable caching for stores. It is a comma separated list of store names.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_STORE](#)

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **chunkReadMemoryCacheStore**

---

## DEFAULT\_CHUNK\_MEMORY\_READ\_CACHE\_EXPIRE\_AGE

```
public static final long DEFAULT_CHUNK_MEMORY_READ_CACHE_EXPIRE_AGE
```

Default value for DVR Property "chunkReadMemoryCacheExpireAge".

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_EXPIRE\\_AGE](#) Do not put this too high.  
Constant value: **600000**

See Also:

[DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_EXPIRE\\_AGE](#)

---

(continued from last page)

---

## PROPERTY\_CHUNK\_MEMORY\_READ\_CACHE\_EXPIRE\_AGE

```
public static final java.lang.String PROPERTY_CHUNK_MEMORY_READ_CACHE_EXPIRE_AGE
```

DVR Property "chunkReadMemoryCacheExpireAge": used by DvrDefaultChunkMemoryReadCache to set when a chunk should automatically be purged from the cache.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_EXPIRE\\_AGE](#)

Add this to Application/DVR/Properties section of Application.xml

Constant value: **chunkReadMemoryCacheExpireAge**

---

## DEFAULT\_CHUNK\_MEMORY\_READ\_CACHE\_ENABLE

```
public static final boolean DEFAULT_CHUNK_MEMORY_READ_CACHE_ENABLE
```

Default value for DVR Property "chunkReadMemoryCacheEnable".

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_ENABLE](#).

Constant value: **false**

See Also:

[DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_ENABLE](#)

---

## PROPERTY\_CHUNK\_MEMORY\_READ\_CACHE\_ENABLE

```
public static final java.lang.String PROPERTY_CHUNK_MEMORY_READ_CACHE_ENABLE
```

DVR Property "chunkReadMemoryCacheEnable": used by DvrDefaultChunkMemoryReadCache to enable read caching.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_ENABLE](#)

Add this to Application/DVR/Properties section of Application.xml

Constant value: **chunkReadMemoryCacheEnable**

---

## DEFAULT\_CHUNK\_MEMORY\_READ\_CACHE\_GC\_EXPIRE\_FREQUENCY

```
public static final long DEFAULT_CHUNK_MEMORY_READ_CACHE_GC_EXPIRE_FREQUENCY
```

Default value for DVR Property "chunkReadMemoryCacheGCExpireFrequency".

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_GC\\_EXPIRE\\_FREQUENCY](#) Do not put this too high.

Constant value: **10000**

See Also:

[DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_GC\\_EXPIRE\\_FREQUENCY](#)

---

## PROPERTY\_CHUNK\_MEMORY\_READ\_CACHE\_GC\_EXPIRE\_FREQUENCY

```
public static final java.lang.String  
PROPERTY_CHUNK_MEMORY_READ_CACHE_GC_EXPIRE_FREQUENCY
```

DVR Property "chunkReadMemoryCacheGCExpireFrequency": used by DvrDefaultChunkMemoryReadCache to set the how often an expire cycle runs.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_EXPIRE\\_FREQUENCY](#)

Add this to Application/DVR/Properties section of Application.xml

Constant value: **chunkReadMemoryCacheGCExpireFrequency**

---

(continued from last page)

---

## DEFAULT\_CHUNK\_MEMORY\_READ\_CACHE\_MAX\_EXPIRE\_COUNT

```
public static final int DEFAULT_CHUNK_MEMORY_READ_CACHE_MAX_EXPIRE_COUNT
```

Default value for DVR Property "chunkReadMemoryCacheMaxExpireCount".

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_MAX\\_EXPIRE\\_COUNT](#)  
Constant value: **20**

See Also:

[DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_MAX\\_EXPIRE\\_COUNT](#)

---

## PROPERTY\_CHUNK\_MEMORY\_READ\_CACHE\_MAX\_EXPIRE\_COUNT

```
public static final java.lang.String PROPERTY_CHUNK_MEMORY_READ_CACHE_MAX_EXPIRE_COUNT
```

DVR Property "chunkReadMemoryCacheMaxExpireCount": used by DvrDefaultChunkMemoryReadCache to set the amount of chunks to expire in each cycle.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_MAX\\_EXPIRE\\_COUNT](#)

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **chunkReadMemoryCacheMaxExpireCount**

---

## DEFAULT\_CHUNK\_MEMORY\_READ\_CACHE\_DEBUG

```
public static final boolean DEFAULT_CHUNK_MEMORY_READ_CACHE_DEBUG
```

Default value for DVR Property "chunkReadMemoryCacheDebug".

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_DEBUG](#)  
Constant value: **false**

See Also:

[DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_DEBUG](#)

---

## PROPERTY\_CHUNK\_MEMORY\_READ\_CACHE\_DEBUG

```
public static final java.lang.String PROPERTY_CHUNK_MEMORY_READ_CACHE_DEBUG
```

DVR Property "chunkReadMemoryCacheDebug": used by DvrDefaultChunkMemoryReadCache to set the amount of memory for DVR in-memory read cache.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHE\\_DEBUG](#)

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **chunkReadMemoryCacheDebug**

---

## DEFAULT\_CHUNK\_MEMORY\_READ\_CACHESIZE\_VIDEO

```
public static final int DEFAULT_CHUNK_MEMORY_READ_CACHESIZE_VIDEO
```

Default value for DVR Property "chunkReadMemoryCacheVideoSize".

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHESIZE\\_VIDEO](#) This is a buffer size for approximately 10 minutes of video at 500kbps  
Constant value: **41943040**

See Also:

[PROPERTY\\_CHUNK\\_MEMORY\\_READ\\_CACHESIZE](#)

---

(continued from last page)

---

## PROPERTY\_CHUNK\_MEMORY\_READ\_CACHESIZE\_VIDEO

```
public static final java.lang.String PROPERTY_CHUNK_MEMORY_READ_CACHESIZE_VIDEO
```

DVR Property "chunkReadMemoryCacheVideoSize": used by DvrDefaultChunkMemoryReadCache to set the amount of memory for DVR in-memory read cache.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHESIZE\\_VIDEO](#)

Add this to Application/DVR/Properties section of Application.xml

Constant value: **chunkReadMemoryCacheVideoSize**

---

## DEFAULT\_CHUNK\_MEMORY\_READ\_CACHESIZE\_AUDIO

```
public static final int DEFAULT_CHUNK_MEMORY_READ_CACHESIZE_AUDIO
```

Default value for DVR Property "chunkReadMemoryCacheAudioSize".

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHESIZE\\_AUDIO](#) This is a buffer size for approximately 10 minutes of audio at 128kbps

Constant value: **5242880**

See Also:

[PROPERTY\\_CHUNK\\_MEMORY\\_READ\\_CACHESIZE](#)

---

## PROPERTY\_CHUNK\_MEMORY\_READ\_CACHESIZE\_AUDIO

```
public static final java.lang.String PROPERTY_CHUNK_MEMORY_READ_CACHESIZE_AUDIO
```

DVR Property "chunkReadMemoryCacheAudioSize": used by DvrDefaultChunkMemoryReadCache to set the amount of memory for DVR in-memory read cache.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHESIZE\\_AUDIO](#)

Add this to Application/DVR/Properties section of Application.xml

Constant value: **chunkReadMemoryCacheAudioSize**

---

## DEFAULT\_CHUNK\_MEMORY\_READ\_CACHESIZE\_DATA

```
public static final int DEFAULT_CHUNK_MEMORY_READ_CACHESIZE_DATA
```

Default value for DVR Property "chunkReadMemoryCacheDataSize".

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHESIZE\\_DATA](#) This is a buffer size for approximately a random of amount of time based on different encoders sending different amounts of data

Constant value: **1048576**

See Also:

[PROPERTY\\_CHUNK\\_MEMORY\\_READ\\_CACHESIZE](#)

---

## PROPERTY\_CHUNK\_MEMORY\_READ\_CACHESIZE\_DATA

```
public static final java.lang.String PROPERTY_CHUNK_MEMORY_READ_CACHESIZE_DATA
```

DVR Property "chunkReadMemoryCacheDataSize": used by DvrDefaultChunkMemoryReadCache to set the amount of memory for DVR in-memory read cache.

Default value is [DEFAULT\\_CHUNK\\_MEMORY\\_READ\\_CACHESIZE\\_DATA](#)

Add this to Application/DVR/Properties section of Application.xml

Constant value: **chunkReadMemoryCacheDataSize**

---

(continued from last page)

---

## PROPERTY\_MBR\_USE\_UTC\_FOR\_ALIGNMENT

```
public static final java.lang.String PROPERTY_MBR_USE_UTC_FOR_ALIGNMENT
```

DVR Property "dvrMbrUseUtcForAlignment": when doing mbr alignment use utc time for alignment

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrMbrUseUtcForAlignment**

---

## PROPERTY\_MBR\_ALIGNMENT\_ALWAYS\_START\_AT\_ZERO

```
public static final java.lang.String PROPERTY_MBR_ALIGNMENT_ALWAYS_START_AT_ZERO
```

DVR Property "abrIndexesAlwaysStartWithZero": when doing mbr alignment, always start the alignment at index 0.

Previous to 4.1.1.03, when DVR aligns single renditions into an ABR stream, it always starts the ABR rendition at index zero, not matter the indexes of the individual streams. The behavior was changed to better accommodate HTTP Origin, where indexes were innappropriately getting re-used after the session was restarted.

The default is false. Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **abrIndexesAlwaysStartWithZero**

---

## PROPERTY\_MBR\_ALIGNMENT\_CHUNKS\_IN\_RESERVE

```
public static final java.lang.String PROPERTY_MBR_ALIGNMENT_CHUNKS_IN_RESERVE
```

DVR Property "dvrAbrAlignmentChunksInReserve": when doing mbr alignment, implement code that ignores n chunks in each chunklist and determines a trim time based on the maximum time of all of the non-reserve chunks. This prevents some alignment issues when one stream is falling behind others

Introduced in 4.6.0.02

The default is 0. Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrAbrAlignmentChunksInReserve**

---

## PROPERTY\_MBR\_MINIMUM\_PACKETTIME\_GAP\_SIZE

```
public static final java.lang.String PROPERTY_MBR_MINIMUM_PACKETTIME_GAP_SIZE
```

DVR Property "dvrMbrMinimumPacketTimeGapSize": when doing mbr alignment gaps smaller than this are ignored.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrMbrMinimumPacketTimeGapSize**

See Also:

[DEFAULT\\_PROPERTY\\_MBR\\_MINIMUM\\_PACKETTIME\\_GAP\\_SIZE](#)

---

## PROPERTY\_MBR\_ALTERNATIVE\_MATCH\_DELTA

```
public static final java.lang.String PROPERTY_MBR_ALTERNATIVE_MATCH_DELTA
```

DVR Property "dvrMbrAlternateMatchDelta": when finding alternative for a MBR gap, an alternate is considered a match is within this many ms of the gap in question.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrMbrAlternateMatchDelta**

See Also:

[DEFAULT\\_PROPERTY\\_MBR\\_ALTERNATIVE\\_MATCH\\_DELTA](#)

---

(continued from last page)

---

## DEFAULT\_PROPERTY\_MBR\_ALTERNATIVE\_MATCH\_DELTA

```
public static final int DEFAULT_PROPERTY_MBR_ALTERNATIVE_MATCH_DELTA
```

Default value for DVR Property "dvrMbrAlternateMatchDelta".

Default value is 1000 ms.  
Constant value: **1000**

See Also:

[PROPERTY\\_MBR\\_ALTERNATIVE\\_MATCH\\_DELTA](#)

---

## PROPERTY\_PACKET\_DURATION\_MAXIMUM

```
public static final java.lang.String PROPERTY_PACKET_DURATION_MAXIMUM
```

DVR Property "dvrPacketDurationMaximum": for maximum packet duration, in milliseconds.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrPacketDurationMaximum**

See Also:

[DEFAULT\\_PROPERTY\\_PACKET\\_DURATION\\_MAXIMUM](#)

---

## DEFAULT\_PROPERTY\_PACKET\_DURATION\_MAXIMUM

```
public static final int DEFAULT_PROPERTY_PACKET_DURATION_MAXIMUM
```

Default value for DVR Property "dvrChunkDurationMinimum".

Default value is 5000 ms.  
Constant value: **5000**

See Also:

[PROPERTY\\_PACKET\\_DURATION\\_MAXIMUM](#)

---

## DEFAULT\_PROPERTY\_MBR\_MINIMUM\_PACKETTIME\_GAP\_SIZE

```
public static final int DEFAULT_PROPERTY_MBR_MINIMUM_PACKETTIME_GAP_SIZE
```

Default value for DVR Property "dvrMbrMinimumPacketTimeGapSize".

Default value is 100 ms.  
Constant value: **100**

See Also:

[PROPERTY\\_MBR\\_MINIMUM\\_PACKETTIME\\_GAP\\_SIZE](#)

---

## PROPERTY\_MBR\_MINIMUM\_UTCTIME\_GAP\_SIZE

```
public static final java.lang.String PROPERTY_MBR_MINIMUM_UTCTIME_GAP_SIZE
```

DVR Property "dvrMbrMinimumUtcTimeGapSize": when doing mbr alignment gaps smaller than this are ignored.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrMbrMinimumUtcTimeGapSize**

See Also:

[DEFAULT\\_PROPERTY\\_MBR\\_MINIMUM\\_UTCTIME\\_GAP\\_SIZE](#)

---

(continued from last page)

---

## DEFAULT\_PROPERTY\_MBR\_MINIMUM\_UTCTIME\_GAP\_SIZE

```
public static final int DEFAULT_PROPERTY_MBR_MINIMUM_UTCTIME_GAP_SIZE
```

Default value for DVR Property "dvrMbrMinimumPacketTimeGapSize".

Default value is 750 ms.

Constant value: **750**

See Also:

[PROPERTY\\_MBR\\_MINIMUM\\_UTCTIME\\_GAP\\_SIZE](#)

---

## PROPERTY\_MAX\_RECORDING\_LENGTH

```
public static final java.lang.String PROPERTY_MAX_RECORDING_LENGTH
```

DVR Property "dvrMaximumRecordingLength": The maximum recording length in seconds. Recording stops when it reaches this value.

Add the property to Application/DVR/Properties section of Application.xml A value of zero means no maximum recording length is enforced. If used in conjunction with DVRWindow, should be slightly larger (1-2%) than DVRWindow.

Constant value: **dvrMaximumRecordingLength**

See Also:

[DEFAULT\\_PROPERTY\\_MAX\\_RECORDING\\_LENGTH](#)

---

## DEFAULT\_PROPERTY\_MAX\_RECORDING\_LENGTH

```
public static final long DEFAULT_PROPERTY_MAX_RECORDING_LENGTH
```

Default value for DVR Property "dvrMaximumRecordingLength".

Default value is 108000 (30 hours)

Constant value: **108000**

See Also:

[PROPERTY\\_MAX\\_RECORDING\\_LENGTH](#)

---

## PROPERTY\_MEDIACACHE\_ENABLED

```
public static final java.lang.String PROPERTY_MEDIACACHE_ENABLED
```

DVR Property "dvrMediaCacheEnabled"

Add the property to Application/DVR/Properties section of Application.xml Default is false.

Constant value: **dvrMediaCacheEnabled**

---

## PROPERTY\_MEDIACACHE\_READER\_CLASS

```
public static final java.lang.String PROPERTY_MEDIACACHE_READER_CLASS
```

DVR Property "dvrMediaCacheReaderClass"

Add the property to Application/DVR/Properties section of Application.xml

Constant value: **dvrMediaCacheReaderClass**

See Also:

[DEFAULT\\_PROPERTY\\_MEDIACACHE\\_READER\\_CLASS](#)

---

(continued from last page)

---

## DEFAULT\_PROPERTY\_MEDIACACHE\_READER\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_MEDIACACHE_READER_CLASS
```

Default value for DVR Property "dvrMediaCacheReaderClass".

Constant value: **com.wowza.wms.mediache.impl.MediaCacheRandomAccessReader**

See Also:

[PROPERTY\\_MEDIACACHE\\_READER\\_CLASS](#)

---

## PROPERTY\_DEBUG\_LOG\_INVALID\_CHUNK\_DETAILS

```
public static final java.lang.String PROPERTY_DEBUG_LOG_INVALID_CHUNK_DETAILS
```

DVR Property "dvrLogInvalidChunkDetails": to control detailed logging information of DVR invalid chunks

The default is false, meaning do not log invalid chunks. Add the property to Application/DVR/Properties section of Application.xml

Constant value: **dvrLogInvalidChunkDetails**

See Also:

[PROPERTY\\_DEBUG\\_MAX\\_INVALID\\_CHUNKS\\_LOGGED](#)

---

## PROPERTY\_DEBUG\_LOG\_INVALID\_CHUNK\_MATCHER

```
public static final java.lang.String PROPERTY_DEBUG_LOG_INVALID_CHUNK_MATCHER
```

DVR Property "dvrLogInvalidChunkMatcher": for matching stream names that will log chunk packets

Only affects logging if [PROPERTY\\_DEBUG\\_MAX\\_INVALID\\_CHUNKS\\_LOGGED](#) is true.

Constant value: **dvrLogInvalidChunkMatcher**

See Also:

[PROPERTY\\_DEBUG\\_MAX\\_INVALID\\_CHUNKS\\_LOGGED](#)

---

## PROPERTY\_DEBUG\_MAX\_INVALID\_CHUNKS\_LOGGED

```
public static final java.lang.String PROPERTY_DEBUG_MAX_INVALID_CHUNKS_LOGGED
```

DVR Property "dvrMaxInvalidChunksLogged": for controlling maximum number of invalid DVR chunks logged.

The default is 10. Logging only occurs if property [PROPERTY\\_DEBUG\\_LOG\\_INVALID\\_CHUNK\\_DETAILS](#) is true. Add the property to Application/DVR/Properties section of Application.xml

Constant value: **dvrMaxInvalidChunksLogged**

See Also:

[DEFAULT\\_PROPERTY\\_DEBUG\\_MAX\\_INVALID\\_CHUNKS\\_LOGGED](#)

[PROPERTY\\_DEBUG\\_LOG\\_INVALID\\_CHUNK\\_DETAILS](#)

---

## DEFAULT\_PROPERTY\_DEBUG\_MAX\_INVALID\_CHUNKS\_LOGGED

```
public static final int DEFAULT_PROPERTY_DEBUG_MAX_INVALID_CHUNKS_LOGGED
```

Default value for DVR Property "dvrMaxInvalidChunksLogged".

Default value is 10.

Constant value: **10**

See Also:

[PROPERTY\\_DEBUG\\_LOG\\_INVALID\\_CHUNK\\_DETAILS](#)

[PROPERTY\\_DEBUG\\_MAX\\_INVALID\\_CHUNKS\\_LOGGED](#)

---

---

## PROPERTY\_DEBUG\_LOG\_VALID\_CHUNK\_DETAILS

```
public static final java.lang.String PROPERTY_DEBUG_LOG_VALID_CHUNK_DETAILS
```

DVR Property "dvrLogValidChunkDetails": to control detailed logging information of DVR valid chunks

The default is false, meaning do not log valid chunks. Add the property to Application/DVR/Properties section of Application.xml

Constant value: **dvrLogValidChunkDetails**

See Also:

[PROPERTY\\_DEBUG\\_MAX\\_VALID\\_CHUNKS\\_LOGGED](#)

---

## PROPERTY\_DEBUG\_MAX\_VALID\_CHUNKS\_LOGGED

```
public static final java.lang.String PROPERTY_DEBUG_MAX_VALID_CHUNKS_LOGGED
```

DVR Property "dvrMaxValidChunksLogged": for controlling maximum number of valid DVR chunks logged.

The default is 10. Logging only occurs if property [PROPERTY\\_DEBUG\\_LOG\\_VALID\\_CHUNK\\_DETAILS](#) is true. Add the property to Application/DVR/Properties section of Application.xml

Constant value: **dvrMaxValidChunksLogged**

See Also:

[DEFAULT\\_PROPERTY\\_DEBUG\\_MAX\\_VALID\\_CHUNKS\\_LOGGED](#)

[PROPERTY\\_DEBUG\\_LOG\\_VALID\\_CHUNK\\_DETAILS](#)

---

## DEFAULT\_PROPERTY\_DEBUG\_MAX\_VALID\_CHUNKS\_LOGGED

```
public static final int DEFAULT_PROPERTY_DEBUG_MAX_VALID_CHUNKS_LOGGED
```

Default value for DVR Property "dvrMaxValidChunksLogged".

Default value is 10.

Constant value: **10**

See Also:

[PROPERTY\\_DEBUG\\_LOG\\_VALID\\_CHUNK\\_DETAILS](#)

[PROPERTY\\_DEBUG\\_MAX\\_VALID\\_CHUNKS\\_LOGGED](#)

---

## PROPERTY\_DEBUG\_LOG\_VALID\_CHUNK\_MATCHER

```
public static final java.lang.String PROPERTY_DEBUG_LOG_VALID_CHUNK_MATCHER
```

DVR Property "dvrLogValidChunkMatcher": for matching stream names that will log chunk packets

Only affects logging if [PROPERTY\\_DEBUG\\_MAX\\_VALID\\_CHUNKS\\_LOGGED](#) is true.

Constant value: **dvrLogValidChunkMatcher**

See Also:

[PROPERTY\\_DEBUG\\_MAX\\_VALID\\_CHUNKS\\_LOGGED](#)

---

## PROPERTY\_DEBUG\_TOSSED\_HOLDERS

```
public static final java.lang.String PROPERTY_DEBUG_TOSSED_HOLDERS
```

DVR Property "dvrDebugTossedHolders": for turning on logging of packets that are being tossed.

Valid values are "true" or "false". Default is false.

Constant value: **dvrDebugTossedHolders**

---

---

## PROPERTY\_DEBUG\_RAW\_PACKETS

```
public static final java.lang.String PROPERTY_DEBUG_RAW_PACKETS
```

DVR Property "dvrDebugRawPackets": for turning on logging of incoming raw packets.

Valid values are "true" or "false".

Constant value: **dvrDebugRawPackets**

See Also:

[PROPERTY\\_DEBUG\\_MAXIMUM\\_RAW\\_PACKETS](#)

---

## DEFAULT\_PROPERTY\_DEBUG\_RAW\_PACKETS

```
public static final boolean DEFAULT_PROPERTY_DEBUG_RAW_PACKETS
```

Default value for DVR Property "dvrDebugRawPackets".

Default value is false.

Constant value: **false**

See Also:

[PROPERTY\\_DEBUG\\_RAW\\_PACKETS](#)

[PROPERTY\\_DEBUG\\_RAW\\_PACKETS\\_MATCHER](#)

---

## PROPERTY\_DEBUG\_RAW\_PACKETS\_MATCHER

```
public static final java.lang.String PROPERTY_DEBUG_RAW_PACKETS_MATCHER
```

DVR Property "dvrDebugRawPacketsMatcher": for matching stream names that will dump raw packet.

Only affects logging if [PROPERTY\\_DEBUG\\_RAW\\_PACKETS](#) is true.

Constant value: **dvrDebugRawPacketsMatcher**

See Also:

[PROPERTY\\_DEBUG\\_RAW\\_PACKETS](#)

---

## PROPERTY\_DEBUG\_MAXIMUM\_RAW\_PACKETS

```
public static final java.lang.String PROPERTY_DEBUG_MAXIMUM_RAW_PACKETS
```

DVR Property "dvrDebugMaximumRawPackets": for setting maximum number of logged raw packets.

Valid values is an integer. 0 means there is no limit.

Only affects logging if [PROPERTY\\_DEBUG\\_RAW\\_PACKETS](#) is true.

Constant value: **dvrDebugMaximumRawPackets**

See Also:

[PROPERTY\\_DEBUG\\_RAW\\_PACKETS](#)

---

## DEFAULT\_PROPERTY\_DEBUG\_MAX\_RAW\_PACKETS

```
public static final int DEFAULT_PROPERTY_DEBUG_MAX_RAW_PACKETS
```

Default value for DVR Property "dvrDebugMaximumRawPackets".

Default value is 200 log statements.

Constant value: **200**

---

(continued from last page)

**See Also:**[PROPERTY\\_DEBUG\\_MAXIMUM\\_RAW\\_PACKETS](#)

---

## PROPERTY\_DEBUG\_STATE\_CHANGE

```
public static final java.lang.String PROPERTY_DEBUG_STATE_CHANGE
```

DVR Property "dvrDebugStateChange": for logging state changes of DVR store.  
Constant value: **dvrDebugStateChange**

---

## PROPERTY\_DEBUG\_CHUNK\_RETRIEVALS

```
public static final java.lang.String PROPERTY_DEBUG_CHUNK_RETRIEVALS
```

DVR Property "dvrDebugChunkRetrievals": for logging each chunk retrieval  
Constant value: **dvrDebugChunkRetrievals**

---

## PROPERTY\_DEBUG\_FAILED\_CHUNK\_RETRIEVALS

```
public static final java.lang.String PROPERTY_DEBUG_FAILED_CHUNK_RETRIEVALS
```

DVR Property "dvrDebugFailedChunkRetrievals": for logging info about each failed chunk retrieval  
Constant value: **dvrDebugFailedChunkRetrievals**

---

## PROPERTY\_MAX\_CHUNK\_LOG

```
public static final java.lang.String PROPERTY_MAX_CHUNK_LOG
```

DVR Property "dvrMaxChunkLogCount ": for maximum number of DVR chunks to log.

Maximum number of chunks to log recording information about in the wowzamedia\_access.log file. As recording is continued past this value, there is no feedback for normal operation in the log. View directories and files created in [install-dir]/dvr for on-going feedback that recording is occurring. Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrMaxChunkLogCount**

**See Also:**[DEFAULT\\_PROPERTY\\_DVR\\_MAX\\_CHUNK\\_LOG](#)

---

## DEFAULT\_PROPERTY\_DVR\_MAX\_CHUNK\_LOG

```
public static final int DEFAULT_PROPERTY_DVR_MAX_CHUNK_LOG
```

Default value for DVR Property "dvrMaxChunkLogCount ".

Default value is 10 logging statements.  
Constant value: **10**

**See Also:**[PROPERTY\\_MAX\\_CHUNK\\_LOG](#)

---

## PROPERTY\_MAX\_RECALC\_DURATION\_LOG

```
public static final java.lang.String PROPERTY_MAX_RECALC_DURATION_LOG
```

DVR Property "dvrMaxRecountDurationLogCount ": for maximum number of messages to log regarding recalculating DVR chunk duration

Maximum number of log statements recorded regarding chunk duration being recalculated. A value less than 0 means all statements will be logged with no limit.  
Constant value: **dvrMaxRecountDurationLogCount**

---

(continued from last page)

**See Also:**[DEFAULT\\_PROPERTY\\_MAX\\_RECALC\\_DURATION\\_LOG](#)

---

## DEFAULT\_PROPERTY\_MAX\_RECALC\_DURATION\_LOG

```
public static final int DEFAULT_PROPERTY_MAX_RECALC_DURATION_LOG
```

Default value for DVR Property "dvrMaxRecountDurationLogCount".

Default value is 30 logging statements.  
Constant value: **30**

**See Also:**[PROPERTY\\_MAX\\_RECALC\\_DURATION\\_LOG](#)

---

## PROPERTY\_DEBUG\_METHODS

```
public static final java.lang.String PROPERTY_DEBUG_METHODS
```

DVR Property "dvrDebugManagerLogMethods": for turning on DVR Manager debug logging.

Valid values are "true" or "false".

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrDebugManagerLogMethods**

---

## PROPERTY\_DEBUG\_REPEATER

```
public static final java.lang.String PROPERTY_DEBUG_REPEATER
```

DVR Property "dvrDebugRepeater": for turning on logging of DVR repeater

Valid values are "true" or "false".

Constant value: **dvrDebugRepeater**

---

## PROPERTY\_DEBUG\_PLAYER\_ADAPTER

```
public static final java.lang.String PROPERTY_DEBUG_PLAYER_ADAPTER
```

HTTP Streamer Property "dvrDebugPlayerAdapter": for turning on DVR Player Adapter debug logging for all streamer types.

Valid values are "true" or "false". (Default is false)

Add this property to Application/HTTPStreamer/Properties.  
Constant value: **dvrDebugPlayerAdapter**

---

## PROPERTY\_DEBUG\_SMOOTH\_PLAYER\_ADAPTER

```
public static final java.lang.String PROPERTY_DEBUG_SMOOTH_PLAYER_ADAPTER
```

HTTP Streamer Property "dvrDebugSmoothPlayerAdapter": for turning on DVR Player Smooth Adapter debug logging.

Valid values are "true" or "false". (Default is false)

Add this property to Application/HTTPStreamer/Properties.  
Constant value: **dvrDebugSmoothPlayerAdapter**

---

## PROPERTY\_DEBUG\_SANJOSE\_PLAYER\_ADAPTER

```
public static final java.lang.String PROPERTY_DEBUG_SANJOSE_PLAYER_ADAPTER
```

(continued from last page)

HTTP Streamer Property "dvrDebugSanJosePlayerAdapter": for turning on DVR Player San Jose Adapter debug logging.

Valid values are "true" or "false". (Default is false)

Add this property to Application/HTTPStreamer/Properties.  
Constant value: **dvrDebugSanJosePlayerAdapter**

---

## PROPERTY\_DEBUG\_CUPERTINO\_PLAYER\_ADAPTER

```
public static final java.lang.String PROPERTY_DEBUG_CUPERTINO_PLAYER_ADAPTER
```

HTTP Streamer Property "dvrDebugCupertinoPlayerAdapter": for turning on DVR Player Cupertino Adapter debug logging.

Valid values are "true" or "false". (Default is false)

Add this property to Application/HTTPStreamer/Properties.  
Constant value: **dvrDebugCupertinoPlayerAdapter**

---

## PROPERTY\_DEBUG\_MPEGDASH\_PLAYER\_ADAPTER

```
public static final java.lang.String PROPERTY_DEBUG_MPEGDASH_PLAYER_ADAPTER
```

HTTP Streamer Property "dvrDebugMPegDashPlayerAdapter": for turning on DVR Player MPEG-DASH Adapter debug logging.

Valid values are "true" or "false". (Default is false)

Add this property to Application/HTTPStreamer/Properties.  
Constant value: **dvrDebugMPegDashPlayerAdapter**

---

## PROPERTY\_DEBUG\_MBR\_PLAYER\_ADAPTER

```
public static final java.lang.String PROPERTY_DEBUG_MBR_PLAYER_ADAPTER
```

HTTP Streamer or DVR Property "dvrDebugMbrPlayerAdapter": for turning on DVR MBR Player Adapter debug logging.

Valid values are "true" or "false". (Default is false)

Add this property to Application/HTTPStreamer/Properties.  
Constant value: **dvrDebugMbrPlayerAdapter**

---

## PROPERTY\_DEBUG\_MBR\_PLAYER\_ADAPTER\_IF\_SHIFTED\_EMPTY

```
public static final java.lang.String  
PROPERTY_DEBUG_MBR_PLAYER_ADAPTER_IF_SHIFTED_EMPTY
```

HTTP Streamer or DVR Property "dvrDebugMbrPlayerAdapter": for turning on DVR MBR Player Adapter debug logging when null shifted entries is returned.

Valid values are "true" or "false". (Default is false)

Add this property to Application/HTTPStreamer/Properties.  
Constant value: **dvrDebugMbrPlayerAdapterWhenShiftedEmpty**

---

## PROPERTY\_DEBUG\_MBR\_DETAILS\_WHEN\_RECORD\_DNE

```
public static final java.lang.String PROPERTY_DEBUG_MBR_DETAILS_WHEN_RECORD_DNE
```

---

(continued from last page)

HTTP Streamer or DVR Property "dvrDebugMbrDetailsWhenRecordDNE": for turning on DVR MBR Player Adapter debug logging.

Valid values are "true" or "false". (Default is false)

Add this property to Application/HTTPStreamer/Properties.

Constant value: **dvrDebugMbrDetailsWhenRecordDNE**

---

## PROPERTY\_DEBUG\_MBR\_ALIGNMENT

```
public static final java.lang.String PROPERTY_DEBUG_MBR_ALIGNMENT
```

HTTP Streamer or DVR Property "dvrDebugMbrAlignment ": for turning on logging of mbr alignment

Valid values are "true" or "false". Default is false.

Constant value: **dvrDebugMbrAlignment**

---

## PROPERTY\_DEBUG\_MBR\_ALIGNMENT\_RESOLUTION

```
public static final java.lang.String PROPERTY_DEBUG_MBR_ALIGNMENT_RESOLUTION
```

DVR Property "dvrDebugMbrAlignmentResolution": for turning on logging of mbr alignment resolution (requested to actual)

Valid values are "true" or "false". Default is false.

Constant value: **dvrDebugMbrAlignmentResolution**

---

## PROPERTY\_DEBUG\_PLAYLIST\_REQUEST

```
public static final java.lang.String PROPERTY_DEBUG_PLAYLIST_REQUEST
```

DVR Property "dvrDebugPlaylistRequest": for turning on logging of DVR playlist requests.

Valid values are "true" or "false". Default is false.

Constant value: **dvrDebugPlaylistRequest**

---

## PROPERTY\_DEBUG\_CHANNEL\_MANIFEST

```
public static final java.lang.String PROPERTY_DEBUG_CHANNEL_MANIFEST
```

DVR Property "dvrDebugChannelManifest": for turning on logging of DVR channel manifests.

Valid values are "true" or "false". Default is false.

Constant value: **dvrDebugChannelManifest**

---

## DEFAULT\_PROPERTY\_DEBUG\_CHANNEL\_MANIFEST

```
public static final boolean DEFAULT_PROPERTY_DEBUG_CHANNEL_MANIFEST
```

Constant value: **false**

---

## PROPERTY\_PLAYLIST\_REQUEST\_DELEGATE

```
public static final java.lang.String PROPERTY_PLAYLIST_REQUEST_DELEGATE
```

DVR Property "dvrPlaylistRequestDelegate": used to over-ride the class that generates a playlist request.

The delegate should extend DvrBasePlaylistRequestFactory

If unspecified, the standard DVR-time based delegate [DEFAULT\\_PLAYLIST\\_REQUEST\\_DELEGATE](#) is used

Add this to Application/DVR/Properties section of Application.xml

---

(continued from last page)

Constant value: **dvrPlaylistRequestDelegate**

---

## DEFAULT\_PLAYLIST\_REQUEST\_DELEGATE

```
public static final java.lang.String DEFAULT_PLAYLIST_REQUEST_DELEGATE
```

Constant value: **com.wowza.wms.dvr.impl.DvrStartDurationPlaylistRequestDelegate**

---

## PROPERTY\_ENCRYPTION\_INFO\_DELEGATE

```
public static final java.lang.String PROPERTY_ENCRYPTION_INFO_DELEGATE
```

DVR Property "dvrPlaylistEncryptionInfoDelegate": used to over-ride the encryption info on the playback side.

The specified delegate should extend com.wowza.wms.dvr.DvrBaseEncryptionInfoDelegate

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrPlaylistEncryptionInfoDelegate**

---

## PROPERTY\_STREAM\_ONLY\_LIVE\_STREAMS

```
public static final java.lang.String PROPERTY_STREAM_ONLY_LIVE_STREAMS
```

DVR Property "dvrStreamOnlyLiveStreams": used to allow only streaming of 'live' DVR streams. This means the DVR stream must actively be recording to be streamed. If not live, the streaming session will timeout when connecting.

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrStreamOnlyLiveStreams**

---

## PROPERTY\_SANJOSE\_PLAYLIST\_MIMETYPE

```
public static final java.lang.String PROPERTY_SANJOSE_PLAYLIST_MIMETYPE
```

DVR Property "dvrSanJosePlaylistMimeType": used to over-ride the mime type for DVR San Jose F4m playlists.

Default value is "video/mp4"

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrSanJosePlaylistMimeType**

---

## PROPERTY\_SANJOSE\_PLAYLIST\_DELIVERYTYPE

```
public static final java.lang.String PROPERTY_SANJOSE_PLAYLIST_DELIVERYTYPE
```

DVR Property "dvrSanJosePlaylistDeliveryType": used to over-ride the mime type for DVR San Jose F4m playlists.

Default value is "streaming"

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrSanJosePlaylistDeliveryType**

---

## PROPERTY\_SANJOSE\_PLAYLIST\_VERSION

```
public static final java.lang.String PROPERTY_SANJOSE_PLAYLIST_VERSION
```

DVR Property "dvrSanJosePlaylistVersion": used to over-ride the version of the San Jose f4m playlist.

Default value is "2.0". Valid values are "1.0" and "2.0".

Constant value: **dvrSanJosePlaylistVersion**

(continued from last page)

**See Also:**[SANJOSE\\_F4M\\_VERSION\\_1\\_0](#)[Add this to Application/DVR/Properties section of Application.xml](#)

---

## PROPERTY\_SANJOSE\_PLAYLIST\_RECORDED\_STREAMTYPE

```
public static final java.lang.String PROPERTY_SANJOSE_PLAYLIST_RECORDED_STREAMTYPE
```

DVR Property "dvrSanJosePlaylistRecordedStreamType": used to over-ride the stream type for non-live (recorded) DVR in San Jose f4m playlists.

Default value is #SANJOSE\_F4M\_STREAMTYPE\_RECORDED.\*

Constant value: **dvrSanJosePlaylistRecordedStreamType**

**See Also:**[SANJOSE\\_F4M\\_STREAMTYPE\\_DVR](#)[SANJOSE\\_F4M\\_STREAMTYPE\\_LIVE](#)[SANJOSE\\_F4M\\_STREAMTYPE\\_LIVEORRECORDED](#)

Add this to Application/DVR/Properties section of Application.xml

---

## PROPERTY\_SANJOSE\_PLAYLIST\_LIVE\_STREAMTYPE

```
public static final java.lang.String PROPERTY_SANJOSE_PLAYLIST_LIVE_STREAMTYPE
```

DVR Property "dvrSanJosePlaylistLiveStreamType": used to over-ride the stream type for live DVR in San Jose f4m playlists.

Default value is #SANJOSE\_F4M\_STREAMTYPE\_DVR.

Constant value: **dvrSanJosePlaylistLiveStreamType**

**See Also:**[SANJOSE\\_F4M\\_STREAMTYPE\\_DVR](#)[SANJOSE\\_F4M\\_STREAMTYPE\\_LIVE](#)[SANJOSE\\_F4M\\_STREAMTYPE\\_LIVEORRECORDED](#)

Add this to Application/DVR/Properties section of Application.xml

---

## SANJOSE\_F4M\_STREAMTYPE\_DVR

```
public static final java.lang.String SANJOSE_F4M_STREAMTYPE_DVR
```

Constant for San Jose stream type "dvr".

Constant value: **dvr**

---

## SANJOSE\_F4M\_STREAMTYPE\_RECORDED

```
public static final java.lang.String SANJOSE_F4M_STREAMTYPE_RECORDED
```

Constant for San Jose stream type "recorded".

Constant value: **recorded**

---

## SANJOSE\_F4M\_STREAMTYPE\_LIVE

```
public static final java.lang.String SANJOSE_F4M_STREAMTYPE_LIVE
```

Constant for San Jose stream type "live".

Constant value: **live**

## SANJOSE\_F4M\_STREAMTYPE\_LIVEORRECORDED

```
public static final java.lang.String SANJOSE_F4M_STREAMTYPE_LIVEORRECORDED
```

Constant for San Jose stream type "liveOrRecorded".  
Constant value: **liveOrRecorded**

---

## SANJOSE\_F4M\_VERSION\_1\_0

```
public static final java.lang.String SANJOSE_F4M_VERSION_1_0
```

Constant for San Jose f4m version "1.0".  
Constant value: **1.0**

---

## SANJOSE\_F4M\_VERSION\_2\_0

```
public static final java.lang.String SANJOSE_F4M_VERSION_2_0
```

Constant for San Jose f4m version "2.0".  
Constant value: **2.0**

---

## SANJOSE\_F4M\_STREAMINGTYPE\_STREAMING

```
public static final java.lang.String SANJOSE_F4M_STREAMINGTYPE_STREAMING
```

Constant for San Jose streaming type "streaming".  
Constant value: **streaming**

---

## MIMETYPE\_VIDEO\_MP4

```
public static final java.lang.String MIMETYPE_VIDEO_MP4
```

Constant for mime type "video/mp4".  
Constant value: **video/mp4**

---

## PROPERTY\_SANJOSE\_ABST\_TIMESCALE

```
public static final java.lang.String PROPERTY_SANJOSE_ABST_TIMESCALE
```

DVR Property "dvrSanJosePlaylistAbstTimescale": used to over-ride the time-scale for abst files.

Default value is #SANJOSE\_ABST\_DEFAULT\_TIMESCALE (1000), which means milliseconds.

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrSanJosePlaylistAbstTimescale**

---

## PROPERTY\_SANJOSE\_ABST\_DURATION\_TOLERANCE

```
public static final java.lang.String PROPERTY_SANJOSE_ABST_DURATION_TOLERANCE
```

DVR Property "dvrSanJosePlaylistAbstDurationEqualityTolerance": used to over-ride the tolerance when determining equal chunks lengths.

Default value is #SANJOSE\_ABST\_DEFAULT\_DURATION\_EQUALITY\_TOLERANCE (50), which means 50 milliseconds.

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrSanJosePlaylistAbstDurationTolerance**

---

(continued from last page)

---

## DEFAULT\_PROPERTY\_SANJOSE\_ABST\_TIMESCALE

```
public static final int DEFAULT_PROPERTY_SANJOSE_ABST_TIMESCALE
```

Default value for property "dvrSanJosePlaylistAbstTimescale" #see [PROPERTY\\_SANJOSE\\_ABST\\_TIMESCALE](#)  
Constant value: **1000**

---

## DEFAULT\_PROPERTY\_SANJOSE\_ABST\_DURATION\_TOLERANCE

```
public static final int DEFAULT_PROPERTY_SANJOSE_ABST_DURATION_TOLERANCE
```

Default value for property "dvrSanJosePlaylistAbstDurationTolerance" #see [PROPERTY\\_SANJOSE\\_ABST\\_DURATION\\_TOLERANCE](#)  
Constant value: **4**

---

## PROPERTY\_CUPERTINO\_PLAYLIST\_FORCE\_LIVE

```
public static final java.lang.String PROPERTY_CUPERTINO_PLAYLIST_FORCE_LIVE
```

DVR Property "dvrCupertinoPlaylistForceLive": used to override playlist request delegate logic that determines if playlist is live.

Default value is false

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrCupertinoPlaylistForceLive**

---

## PROPERTY\_CUPERTINO\_PLAYLIST\_FORCE\_NONLIVE

```
public static final java.lang.String PROPERTY_CUPERTINO_PLAYLIST_FORCE_NONLIVE
```

DVR Property "dvrCupertinoPlaylistForceLive": used to override playlist request delegate logic that determines if playlist is live versus non-live.

Default value is false

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrCupertinoPlaylistForceNonLive**

---

## PROPERTY\_CUPERTINO\_PLAYLIST\_USE\_GZIP

```
public static final java.lang.String PROPERTY_CUPERTINO_PLAYLIST_USE_GZIP
```

DVR Property "dvrCupertinoPlaylistUseGzip": used to force Cupertino playlist to use gzip if it is accepted

Default value is true

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrCupertinoPlaylistUseGzip**

---

## PROPERTY\_CUPERTINO\_PLAYLIST\_GZIP\_THRESHOLD

```
public static final java.lang.String PROPERTY_CUPERTINO_PLAYLIST_GZIP_THRESHOLD
```

DVR Property "dvrCupertinoPlaylistGzipThreshold": when playlist is larger than this number of bytes, and gzip is enabled and accepted, the playlist will be compressed

Default value is [DEFAULT\\_CUPERTINO\\_PLAYLIST\\_GZIP\\_THRESHOLD](#)

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrCupertinoPlaylistGzipThreshold**

---

(continued from last page)

---

## DEFAULT\_CUPERTINO\_PLAYLIST\_GZIP\_THRESHOLD

```
public static final int DEFAULT_CUPERTINO_PLAYLIST_GZIP_THRESHOLD
```

Default value for property "dvrCupertinoPlaylistGzipThreshold" #see [PROPERTY\\_CUPERTINO\\_PLAYLIST\\_GZIP\\_THRESHOLD](#)  
Constant value: **4000**

---

## PROPERTY\_CUPERTINO\_ON\_CHUNK\_START\_RESET\_COUNTER

```
public static final java.lang.String PROPERTY_CUPERTINO_ON_CHUNK_START_RESET_COUNTER
```

DVR Property "dvrCupertinoOnChunkStartResetCounter": when a new chunk starts, reset internal tsPacketizer counters

Default value is false

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrCupertinoOnChunkStartResetCounter**

---

## PROPERTY\_CUPERTINO\_PLAYLIST\_ALLOW\_CACHING

```
public static final java.lang.String PROPERTY_CUPERTINO_PLAYLIST_ALLOW_CACHING
```

DVR Property "dvrCupertinoPlaylistAllowCaching": used to force Cupertino playlist to set #EXT-X-ALLOW-CACHE: value

Default value is false

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrCupertinoPlaylistAllowCaching**

---

## PROPERTY\_CUPERTINO\_PUT\_END\_TAG\_BEFORE\_CHUNKS

```
public static final java.lang.String PROPERTY_CUPERTINO_PUT_END_TAG_BEFORE_CHUNKS
```

DVR Property "dvrCupertinoPutEndTagBeforeChunks": if set to true, puts the EXT-X-ENDLIST before the DVR chunks.

Default value is false

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrCupertinoPutEndTagBeforeChunks**

---

## PROPERTY\_CUPERTINO\_PUT\_END\_TAG\_IF\_PLAYLIST\_DURATION\_REACHED

```
public static final java.lang.String  
PROPERTY_CUPERTINO_PUT_END_TAG_IF_PLAYLIST_DURATION_REACHED
```

DVR Property "dvrCupertinoPutEndTagIfPlaylistDurationReached": if set to true, puts the EXT-X-ENDLIST tag after DVR chunks only when a DVR playlist's duration has been specified in a request, and it's calculated end time has been reached for streams that are still recording.

Default value is false

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrCupertinoPutEndTagIfPlaylistDurationReached**

---

## DEFAULT\_CUPERTINO\_PUT\_END\_TAG\_IF\_PLAYLIST\_DURATION\_REACHED

```
public static final boolean DEFAULT_CUPERTINO_PUT_END_TAG_IF_PLAYLIST_DURATION_REACHED
```

(continued from last page)

Default value for property "dvrCupertinoPlaylistGzipThreshold" #see [PROPERTY\\_CUPERTINO\\_PUT\\_END\\_TAG\\_IF\\_PLAYLIST\\_DURATION\\_REACHED](#)  
Constant value: **false**

---

## PROPERTY\_SMOOTH\_MANIFEST\_LIVE\_CAN\_SEEK

```
public static final java.lang.String PROPERTY_SMOOTH_MANIFEST_LIVE_CAN_SEEK
```

DVR Property "dvrSmoothManifestLiveCanSeek": used to determine is CanSeek is enabled in smooth Manifest.

Default value is #DEFAULT\_PROPERTY\_SMOOTH\_LIVE\_CAN\_SEEK, which is set to true.

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrSmoothManifestLiveCanSeek**

---

## DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_LIVE\_CAN\_SEEK

```
public static final boolean DEFAULT_PROPERTY_SMOOTH_MANIFEST_LIVE_CAN_SEEK
```

Constant value: **true**

---

## PROPERTY\_SMOOTH\_MANIFEST\_LIVE\_CAN\_PAUSE

```
public static final java.lang.String PROPERTY_SMOOTH_MANIFEST_LIVE_CAN_PAUSE
```

DVR Property "dvrSmoothManifestLiveCanPause": used to determine is CanPause is enabled in smooth Manifest.

Default value is #DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_LIVE\_CAN\_PAUSE, which is set to true.

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrSmoothManifestLiveCanPause**

---

## DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_LIVE\_CAN\_PAUSE

```
public static final boolean DEFAULT_PROPERTY_SMOOTH_MANIFEST_LIVE_CAN_PAUSE
```

Constant value: **true**

---

## PROPERTY\_SMOOTH\_MANIFEST\_RECORDED\_CAN\_SEEK

```
public static final java.lang.String PROPERTY_SMOOTH_MANIFEST_RECORDED_CAN_SEEK
```

DVR Property "dvrSmoothManifestRecordedCanSeek": used to determine is CanSeek is enabled in smooth Manifest.

Default value is #DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_RECORDED\_CAN\_SEEK, which is set to true.

Add this to Application/DVR/Properties section of Application.xml  
Constant value: **dvrSmoothManifestRecordedCanSeek**

---

## DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_RECORDED\_CAN\_SEEK

```
public static final boolean DEFAULT_PROPERTY_SMOOTH_MANIFEST_RECORDED_CAN_SEEK
```

Constant value: **true**

---

## PROPERTY\_SMOOTH\_MANIFEST\_RECORDED\_CAN\_PAUSE

```
public static final java.lang.String PROPERTY_SMOOTH_MANIFEST_RECORDED_CAN_PAUSE
```

(continued from last page)

DVR Property "dvrSmoothManifestRecordedCanPause": used to determine is CanPause is enabled in smooth Manifest.

Default value is #DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_RECORDED\_CAN\_PAUSE, which is set to true.

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrSmoothManifestRecordedCanPause**

---

## DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_RECORDED\_CAN\_PAUSE

```
public static final boolean DEFAULT_PROPERTY_SMOOTH_MANIFEST_RECORDED_CAN_PAUSE
```

Constant value: **true**

---

## PROPERTY\_SMOOTH\_MANIFEST\_RECORDED\_SPECIFY\_DURATION

```
public static final java.lang.String
```

```
PROPERTY_SMOOTH_MANIFEST_RECORDED_SPECIFY_DURATION
```

DVR Property "dvrSmoothManifestRecordedSpecifyDuration": used to determine if duration is specified. If not duration of zero is shown.

Default value is #DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_RECORDED\_SPECIFY\_DURATION, which is set to true.

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrSmoothManifestRecordedSpecifyDuration**

---

## DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_RECORDED\_SPECIFY\_DURATION

```
public static final boolean DEFAULT_PROPERTY_SMOOTH_MANIFEST_RECORDED_SPECIFY_DURATION
```

Constant value: **true**

---

## PROPERTY\_SMOOTH\_MANIFEST\_MAJOR\_VERSION

```
public static final java.lang.String PROPERTY_SMOOTH_MANIFEST_MAJOR_VERSION
```

DVR Property "dvrSmoothManifestMajorVersion": used to determine Smooth manifest major version

Default value is #DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_MAJOR\_VERSION.

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrSmoothManifestMajorVersion**

---

## DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_MAJOR\_VERSION

```
public static final int DEFAULT_PROPERTY_SMOOTH_MANIFEST_MAJOR_VERSION
```

Constant value: **2**

---

## PROPERTY\_SMOOTH\_MANIFEST\_MINOR\_VERSION

```
public static final java.lang.String PROPERTY_SMOOTH_MANIFEST_MINOR_VERSION
```

DVR Property "dvrSmoothManifestMinorVersion": used to determine Smooth manifest major version

Default value is #DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_MINOR\_VERSION.

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrSmoothManifestMinorVersion**

---

## DEFAULT\_PROPERTY\_SMOOTH\_MANIFEST\_MINOR\_VERSION

```
public static final int DEFAULT_PROPERTY_SMOOTH_MANIFEST_MINOR_VERSION
```

Constant value: **1**

---

## PROPERTY\_SMOOTH\_MANIFEST\_VERBOSE\_DURATION

```
public static final java.lang.String PROPERTY_SMOOTH_MANIFEST_VERBOSE_DURATION
```

DVR Property "dvrSmoothManifestVerboseDuration": used to force Smooth Manifest to include durations for each record

Default value is false

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrSmoothManifestVerboseDuration**

---

## PROPERTY\_SMOOTH\_MANIFEST\_H264\_CODEC

```
public static final java.lang.String PROPERTY_SMOOTH_MANIFEST_H264_CODEC
```

DVR Property "dvrSmoothManifestH264Codec": used to force Smooth Manifest to use this as its FourCC H264 codec info.

Default value is set by Smooth Streaming

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrSmoothManifestH264Codec**

---

## PROPERTY\_STREAM\_DATA

```
public static final java.lang.String PROPERTY_STREAM_DATA
```

Constant value: **dvrStreamRecordedData**

---

## PROPERTY\_CUPERTINO\_ENABLE\_DATE\_EVENTS

```
public static final java.lang.String PROPERTY_CUPERTINO_ENABLE_DATE_EVENTS
```

HTTP Streamer Property "dvrCupertinoEnableDataEvents": used to stream ID3 data for HLS DVR streams

Default value is true

Add this to Application/HTTPStreamer/Properties section of Application.xml

Constant value: **dvrCupertinoEnableDataEvents**

---

## PROPERTY\_CUPERTINO\_PLAYLIST\_DISC\_AT\_ALTERNATES

```
public static final java.lang.String PROPERTY_CUPERTINO_PLAYLIST_DISC_AT_ALTERNATES
```

HTTP Streamer Property "dvrCupertinoPlaylistDiscontinuityAtAlternates": used to insert discontinuity tags into HLS stream if DVR store switches mid-playlist. The DVR store switches when alternates are pulled from other renditions to fill gaps.

Default value is true

Add this to Application/HTTPStreamer/Properties section of Application.xml

Constant value: **dvrCupertinoPlaylistDiscontinuityAtAlternates**

---

---

## PROPERTY\_MPEG\_DASH\_PLAYLIST\_USE\_GZIP

```
public static final java.lang.String PROPERTY_MPEG_DASH_PLAYLIST_USE_GZIP
```

DVR Property "dvrMPEDashPlaylistUseGzip": used to enable creation MPEG-DASH playlists with GZIP encoding

Default value is true

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrMPEDashPlaylistUseGzip**

---

## DEFAULT\_PROPERTY\_MPEG\_DASH\_PLAYLIST\_USE\_GZIP

```
public static final boolean DEFAULT_PROPERTY_MPEG_DASH_PLAYLIST_USE_GZIP
```

Constant value: **true**

---

## PROPERTY\_MPEG\_DASH\_PLAYLIST\_GZIP\_THRESHOLD

```
public static final java.lang.String PROPERTY_MPEG_DASH_PLAYLIST_GZIP_THRESHOLD
```

DVR Property "dvrMPEDashPlaylistGzipThreshold": when playlist is larger than this number of bytes, and gzip is enabled and accepted by the requesting client, the playlist will be compressed

Default value is [DEFAULT\\_MPEG\\_DASH\\_PLAYLIST\\_GZIP\\_THRESHOLD](#)

Add this to Application/DVR/Properties section of Application.xml

Constant value: **dvrMPEDashPlaylistGzipThreshold**

---

## DEFAULT\_MPEG\_DASH\_PLAYLIST\_GZIP\_THRESHOLD

```
public static final int DEFAULT_MPEG_DASH_PLAYLIST_GZIP_THRESHOLD
```

Default value for property "dvrMPEDashPlaylistGzipThreshold" #see

[PROPERTY\\_MPEG\\_DASH\\_PLAYLIST\\_GZIP\\_THRESHOLD](#)

Constant value: **4000**

---

## com.wowza.wms.dvr Class IDvrConstants.DvrTimeScale

```

java.lang.Object
  |
  +- java.lang.Enum
        |
        +- com.wowza.wms.dvr.IDvrConstants.DvrTimeScale
  
```

### All Implemented Interfaces:

java.io.Serializable, Comparable

public static final class **IDvrConstants.DvrTimeScale**  
extends Enum

### Field Summary

public static final	<a href="#">DVR_TIME</a>
public static final	<a href="#">PACKET_TIME</a>
public static final	<a href="#">UTC_TIME</a>

### Method Summary

static <a href="#">IDvrConstants.DvrTimeScale</a>	<a href="#">valueOf</a> (String name)
static <a href="#">IDvrConstants.DvrTimeScale[]</a>	<a href="#">values</a> ()

#### Methods inherited from class java.lang.Enum

clone, compareTo, equals, finalize, getDeclaringClass, hashCode, name, ordinal, toString, valueOf

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

```

## com.wowza.wms.dvr Interface IDvrEncryptionInfo

All Known Implementing Classes:

[CencInfo](#)

public interface **IDvrEncryptionInfo**  
extends Cloneable

Interface for persisting encryption information for DVR.

### Field Summary

public static final	<a href="#">ENCRYPTION_TYPE_CENC</a> Common Encryption encryption type. Value: <b>3</b>
public static final	<a href="#">ENCRYPTION_TYPE_CUPERTINO</a> Cupertino AES encryption type. Value: <b>1</b>
public static final	<a href="#">ENCRYPTION_TYPE_PLAYREADY</a> Playready encryption type. Value: <b>2</b>

### Method Summary

Object	<a href="#">clone()</a>
int	<a href="#">getEncryptionType()</a> Serialize encryption info.
int	<a href="#">getSerializeSize()</a> Return number of bytes required to serialize this encryption info.
byte[]	<a href="#">serialize()</a> Serialize the encryption info, returning a byte buffer containing the serialized data.
int	<a href="#">serialize(byte[] buffer, int pos)</a> Serialize the encryption info into buffer starting at position 'pos'.

### Fields

#### ENCRYPTION\_TYPE\_CUPERTINO

public static final int **ENCRYPTION\_TYPE\_CUPERTINO**

Cupertino AES encryption type.  
Constant value: **1**

(continued from last page)

## ENCRYPTION\_TYPE\_PLAYREADY

```
public static final int ENCRYPTION_TYPE_PLAYREADY
```

Playready encryption type.  
Constant value: **2**

## ENCRYPTION\_TYPE\_CENC

```
public static final int ENCRYPTION_TYPE_CENC
```

Common Encryption encryption type.  
Constant value: **3**

## Methods

### getSerializeSize

```
public int getSerializeSize()
```

Return number of bytes required to serialize this encryption info.

**Returns:**

number of bytes to serialize.

### getEncryptionType

```
public int getEncryptionType()
```

Serialize encryption info.

The encryption should consist of the following:

- version (1 byte)
- encryption type (1 byte)
- length of 'blob' (2 bytes)
- byte blob (n bytes)

**Returns:**

encryption type (constants defined in this class)

### serialize

```
public int serialize(byte[] buffer,  
                    int pos)
```

Serialize the encryption info into buffer starting at position 'pos'.

**Parameters:**

buffer - buffer to serialize to  
pos - position to start serializing

**Returns:**

new position into buffer

(continued from last page)

## **serialize**

```
public byte[] serialize()
```

Serialize the encryption info, returning a byte buffer containing the serialized data.

**Returns:**

byte buffer of serialized data

---

## **clone**

```
public Object clone()  
    throws CloneNotSupportedException
```

## com.wowza.wms.dvr Interface IDvrManifest

public interface **IDvrManifest**  
extends

Interface for a DVR Store manifest. A DVR manifest collects type-specific manifest info, including:

- Audio manifest
- Video manifest
- data manifest
- time map manifest, to map DVR, packet and real time
- codec manifest to track codec information
- onMetadata manifest

The difference between retrieving 'recorded entries' and 'live entries' is an important one. Recorded Entries means every current manifest entry. Live Entries refers to a subset of these because a playlist will not include the very last entries, as some chunks must be available for buffering.

Field Summary	
public static final	<a href="#">CODEC_TYPE</a> Constant for codec manifest type. Value: <b>999</b>
public static final	<a href="#">MANIFEST_TAGNAME_CAN_PLAY</a> Value: <b>CanPlay</b>
public static final	<a href="#">MANIFEST_TAGNAME_CAN_RECORD</a> Value: <b>CanRecord</b>

public static final	<a href="#">TIME_MAP_TYPE</a> Constant for time map manifest type. Value: <b>998</b>

## Method Summary

void	<a href="#"><code>addToManifest</code></a> (java.util.List entries) Add manifest entries to the manifest
void	<a href="#"><code>deserialize</code></a> (byte[] bytes) Deserialize the manifest.
long	<a href="#"><code>expandEndTime</code></a> (int type, long dvrEndTime)
long	<a href="#"><code>expandStartTime</code></a> (int type, long dvrStartTime)
<a href="#"><code>IDvrChunkIDHandler3</code></a>	<a href="#"><code>getChunkIDHandler</code></a> ()
long	<a href="#"><code>getClosestStartTime</code></a> (int type, long dvrTime) Given a dvrTime and a manifest type, find the closest chunk starting time.
<a href="#"><code>DvrManifestCodecEntry</code></a>	<a href="#"><code>getCodecEntryForTime</code></a> (long dvrTime) Return most recent codec entry for a given DVR time.
long	<a href="#"><code>getDvrTime</code></a> (int type)
<a href="#"><code>DvrManifestEntryRangeGroup</code></a>	<a href="#"><code>getEntriesToPurge</code></a> (long purgeTime) Given a purge time, return a group of manifest ranges to purge.
<a href="#"><code>DvrManifestEntry</code></a>	<a href="#"><code>getFirstEntry</code></a> (int type) Given manifest type, get the first playlist manifest entry.
<a href="#"><code>DvrManifestEntry</code></a>	<a href="#"><code>getLastLiveEntry</code></a> (int type) Given manifest type, get the last playlist manifest entry.
<a href="#"><code>DvrManifestEntry</code></a>	<a href="#"><code>getLastRecordedEntry</code></a> (int type) Given manifest type and DVR time, get last entry.
long	<a href="#"><code>getLastRecordedIndex</code></a> (int type) Return last index of DVR entry for given type.
long	<a href="#"><code>getLiveDuration</code></a> (int type) Given manifest type, return DVR live duration in seconds
java.util.List	<a href="#"><code>getLiveEntries</code></a> (int type, long dvrStart) Given manifest type and DVR time, get a list of the live entries.
java.util.List	<a href="#"><code>getLiveEntriesWithLimit</code></a> (int type, long dvrTime, int limit) Given manifest type and DVR time, get a list of the live entries limiting number of returned items.
DvrChannelManifest	<a href="#"><code>getManifestChannel</code></a> (int type) For a given manifest type, return the channel manifest.
<a href="#"><code>DvrManifestOnMetadataEntry</code></a>	<a href="#"><code>getMetadataEntryForTime</code></a> (long dvrTime) Return most recent metadataEntry for a given DVR time.
long	<a href="#"><code>getNextChunkIndex</code></a> (String streamName, DvrPacketHolder vPackets, DvrPacketHolder aPackets)
long	<a href="#"><code>getNextCodecIndex</code></a> ()

long	<a href="#"><u>getNextMetadataIndex()</u></a>
long	<a href="#"><u>getNextTimeMapIndex()</u></a>
int	<a href="#"><u>getNumberLiveEntries(int type, long dvrStart)</u></a> Given manifest type and DVR time, get the number of live entries at the given time.
int	<a href="#"><u>getNumberLiveEntries(int type, long dvrStart, long dvrEnd)</u></a> Given manifest type and DVR time, get the number of live entries at the given time.
int	<a href="#"><u>getNumberRecordedEntries(int type, long dvrStart)</u></a> Given manifest type and DVR time, get the number of entries at the given time.
int	<a href="#"><u>getNumberRecordedEntries(int type, long dvrStart, long dvrEnd)</u></a> Given manifest type and DVR time, get the number of live entries at the given time.
long	<a href="#"><u>getRecordedDuration(int type)</u></a> Given manifest type, return DVR recorded duration in seconds
java.util.List	<a href="#"><u>getRecordedEntries(int type)</u></a> Get a copy of all manifest entries of a given type.
java.util.List	<a href="#"><u>getRecordedEntries(int type, long dvrStartTime)</u></a> Given manifest type and DVR time, get a list of recorded entries.
java.util.List	<a href="#"><u>getRecordedEntries(int type, long dvrStartTime, long dvrEndTime)</u></a> Given manifest type and DVR time, get a list of recorded entries.
java.util.List	<a href="#"><u>getRecordedEntriesInRange(DvrManifestEntryRange range)</u></a> Given a DvrManifestEntryRange, get a list of recorded entries in this range.
java.util.Map	<a href="#"><u>getRecordedEntriesMap(int type)</u></a> Get a copy of all manifest entries of a given type as a Map of indices.
java.util.List	<a href="#"><u>getRecordedEntriesWithLimit(int type, long dvrTime, int limit)</u></a> Given manifest type and DVR time, get a list of recorded entries limiting number of returned items.
<a href="#"><u>DvrManifestEntry</u></a>	<a href="#"><u>getRecordedEntryByIndex(int type, long index)</u></a> Get the manifest entry given a manifest type and an index.
<a href="#"><u>DvrManifestEntry</u></a>	<a href="#"><u>getRecordedEntryByTimeKey(int type, long dvrTime)</u></a> Get the manifest entry given a manifest type and a time (in DVR units)
<a href="#"><u>IDvrTimeMap</u></a>	<a href="#"><u>getTimeMap()</u></a>
boolean	<a href="#"><u>hasAudio()</u></a> Does manifest contain audio.
boolean	<a href="#"><u>hasCodecData()</u></a> Does manifest contain codec data.
boolean	<a href="#"><u>hasData()</u></a> Does manifest contain data.
boolean	<a href="#"><u>hasOnMetadata()</u></a> Does manifest contain onMetadata.

boolean	<a href="#"><code>hasTimeMapData()</code></a> Does manifest contain time map info.
boolean	<a href="#"><code>hasVideo()</code></a> Does manifest contain video.
void	<a href="#"><code>importManifest(IDvrManifest manifest, boolean persist)</code></a> Import the specified manifest into this manifest
void	<a href="#"><code>initialize()</code></a> Initialize the manifest.
java.util.List	<a href="#"><code>purgeEntries(DvrManifestEntryRangeGroup ranges)</code></a> Given a group of ranges, purge the manifest entries.
void	<a href="#"><code>refreshManifest()</code></a> Refresh the manifest.
byte[]	<a href="#"><code>serialize(boolean ignoreEntries)</code></a> Serialize the manifest.

## Fields

### ON\_METADATA\_TYPE

public static final int **ON\_METADATA\_TYPE**

Constant for 'onMetadata' manifest type.  
Constant value: **0**

### CODEC\_TYPE

public static final int **CODEC\_TYPE**

Constant for codec manifest type.  
Constant value: **999**

### TIME\_MAP\_TYPE

public static final int **TIME\_MAP\_TYPE**

Constant for time map manifest type.  
Constant value: **998**

### MANIFEST\_TAGNAME\_CAN\_RECORD

public static final java.lang.String **MANIFEST\_TAGNAME\_CAN\_RECORD**

Constant value: **CanRecord**

### MANIFEST\_TAGNAME\_CAN\_PLAY

public static final java.lang.String **MANIFEST\_TAGNAME\_CAN\_PLAY**

Constant value: **CanPlay**

---

## MANIFEST\_TAGNAME\_HAS\_ENCRYPTION

```
public static final java.lang.String MANIFEST_TAGNAME_HAS_ENCRYPTION
```

Constant value: **HasEncryption**

---

## MANIFEST\_TAGNAME\_CHUNK\_GROUPING

```
public static final java.lang.String MANIFEST_TAGNAME_CHUNK_GROUPING
```

Constant value: **ChunkGrouping**

---

## MANIFEST\_TAGNAME\_PURGE\_TIME

```
public static final java.lang.String MANIFEST_TAGNAME_PURGE_TIME
```

Constant value: **PurgeTime**

---

## MANIFEST\_TAGNAME\_CURRENT\_TIME

```
public static final java.lang.String MANIFEST_TAGNAME_CURRENT_TIME
```

Constant value: **CurrentTime**

## Methods

### initialize

```
public void initialize()
```

Initialize the manifest. Called after the previous storage has been loaded but before any chunks are added.

---

### refreshManifest

```
public void refreshManifest()
```

Refresh the manifest.

---

### addToManifest

```
public void addToManifest(java.util.List entries)
```

Add manifest entries to the manifest

**Parameters:**

entries - list of entries.

---

### getRecordedEntries

```
public java.util.List getRecordedEntries(int type)
```

Get a copy of all manifest entries of a given type. Valid types include: [IVHost.CONTENTTYPE\\_AUDIO](#), [IVHost.CONTENTTYPE\\_VIDEO](#), [IVHost.CONTENTTYPE\\_DATA](#), [ON\\_METADATA\\_TYPE](#), [CODEC\\_TYPE](#), or [TIME\\_MAP\\_TYPE](#)

(continued from last page)

**Parameters:**

type - The manifest type.

**Returns:**

list of entries

---

## getRecordedEntriesMap

```
public java.util.Map getRecordedEntriesMap(int type)
```

Get a copy of all manifest entries of a given type as a Map of indices. Valid types include: [IVHost.CONTENTTYPE\\_AUDIO](#), [IVHost.CONTENTTYPE\\_VIDEO](#), [IVHost.CONTENTTYPE\\_DATA](#), [ON\\_METADATA\\_TYPE](#), [CODEC\\_TYPE](#), or [TIME\\_MAP\\_TYPE](#)

**Parameters:**

type - the manifest type.

**Returns:**

map of entries

---

## getRecordedEntriesInRange

```
public java.util.List getRecordedEntriesInRange(DvrManifestEntryRange range)
```

Given a DvrManifestEntryRange, get a list of recorded entries in this range.

**Parameters:**

range - a range (which consists of a manifest type and a start and end index)

**Returns:**

list of entries

---

## getLastRecordedEntry

```
public DvrManifestEntry getLastRecordedEntry(int type)
```

Given manifest type and DVR time, get last entry.

"Recorded Entries" includes those entries after the end of the playlist.

**Parameters:**

type - the manifest type.

**Returns:**

manifest entry

---

## getRecordedEntryByTimeKey

```
public DvrManifestEntry getRecordedEntryByTimeKey(int type,  
long dvrTime)
```

Get the manifest entry given a manifest type and a time (in DVR units)

**Parameters:**

type - the manifest type.

dvrTime - DVR time

**Returns:**

manifest entry

## getRecordedEntryByIndex

```
public DvrManifestEntry getRecordedEntryByIndex(int type,  
long index)
```

Get the manifest entry given a manifest type and an index.

**Parameters:**

type - the manifest type.  
index - the index into the manifest

**Returns:**

manifest entry

---

## getEntriesToPurge

```
public DvrManifestEntryRangeGroup getEntriesToPurge(long purgeTime)
```

Given a purge time, return a group of manifest ranges to purge. This method ensures that the purge entries are aligned by index so that audio and video always remain index aligned.

**Parameters:**

purgeTime - The DVR time to purge

**Returns:**

a group of ranges.

---

## purgeEntries

```
public java.util.List purgeEntries(DvrManifestEntryRangeGroup ranges)
```

Given a group of ranges, purge the manifest entries.

**Parameters:**

ranges - Group of ranges

**Returns:**

A list of the purged items.

---

## getMetadataEntryForTime

```
public DvrManifestOnMetadataEntry getMetadataEntryForTime(long dvrTime)
```

Return most recent metadataEntry for a given DVR time. The manifest for metadata entries is sparse-- it only stores items periodically. So for a given time t, the returned entry will exist at or before time t.

**Parameters:**

dvrTime - DVR time

**Returns:**

onMetadata Entry

---

## getCodecEntryForTime

```
public DvrManifestCodecEntry getCodecEntryForTime(long dvrTime)
```

Return most recent codec entry for a given DVR time. The manifest for codec entries is sparse-- it only stores items periodically. So for a given time t, the returned entry will exist at or before time t.

---

(continued from last page)

**Parameters:**

dvrTime - DVR time

**Returns:**

Codec Entry

---

## getNumberLiveEntries

```
public int getNumberLiveEntries(int type,  
                                long dvrStart)
```

Given manifest type and DVR time, get the number of live entries at the given time.

"Live Entries" means that a couple of the last entries will not be included as they are too close to the live point to be part of the playlist.

**Parameters:**

type - the manifest type.  
dvrStart - DVR time

**Returns:**

number of entries.

---

## getNumberLiveEntries

```
public int getNumberLiveEntries(int type,  
                                long dvrStart,  
                                long dvrEnd)
```

Given manifest type and DVR time, get the number of live entries at the given time.

"Live Entries" means that a couple of the last entries will not be included as they are too close to the live point to be part of the playlist.

**Parameters:**

type - the manifest type.  
dvrStart - DVR time  
dvrEnd - end DVR time

**Returns:**

number of entries.

---

## getNumberRecordedEntries

```
public int getNumberRecordedEntries(int type,  
                                    long dvrStart)
```

Given manifest type and DVR time, get the number of entries at the given time.

"Recorded Entries" includes those entries after the end of the playlist.

**Parameters:**

type - the manifest type.  
dvrStart - DVR time

**Returns:**

number of entries.

(continued from last page)

## getNumberRecordedEntries

```
public int getNumberRecordedEntries(int type,  
    long dvrStart,  
    long dvrEnd)
```

Given manifest type and DVR time, get the number of live entries at the given time.

"Recorded Entries" includes those entries after the end of the playlist.

### Parameters:

type - the manifest type.

dvrStart - DVR time

dvrEnd - end DVR time

### Returns:

number of entries.

---

## getFirstEntry

```
public DvrManifestEntry getFirstEntry(int type)
```

Given manifest type, get the first playlist manifest entry.

### Parameters:

type - the manifest type.

### Returns:

manifest entry

---

## getLastLiveEntry

```
public DvrManifestEntry getLastLiveEntry(int type)
```

Given manifest type, get the last playlist manifest entry.

"Live Entries" means that a couple of the last entries will not be included as they are too close to the live point to be part of the playlist.

### Parameters:

type - the manifest type.

### Returns:

manifest entry

---

## getLiveEntries

```
public java.util.List getLiveEntries(int type,  
    long dvrStart)
```

Given manifest type and DVR time, get a list of the live entries.

"Live Entries" means that a couple of the last entries will not be included as they are too close to the live point to be part of the playlist.

### Parameters:

type - the manifest type.

dvrStart - DVR time

### Returns:

(continued from last page)

list of entries.

---

## **getLiveEntriesWithLimit**

```
public java.util.List getLiveEntriesWithLimit(int type,
        long dvrTime,
        int limit)
```

Given manifest type and DVR time, get a list of the live entries limiting number of returned items.

"Live Entries" means that a couple of the last entries will not be included as they are too close to the live point to be part of the playlist.

### **Parameters:**

type - the manifest type.  
dvrTime - DVR time  
limit - maximum number of returned items

### **Returns:**

list of entries.

---

## **getRecordedEntriesWithLimit**

```
public java.util.List getRecordedEntriesWithLimit(int type,
        long dvrTime,
        int limit)
```

Given manifest type and DVR time, get a list of recorded entries limiting number of returned items.

"Recorded Entries" includes those entries after the end of the playlist.

### **Parameters:**

type - the manifest type.  
dvrTime - DVR time  
limit - maximum number of returned items

### **Returns:**

list of entries.

---

## **getRecordedEntries**

```
public java.util.List getRecordedEntries(int type,
        long dvrStartTime)
```

Given manifest type and DVR time, get a list of recorded entries.

"Recorded Entries" includes those entries after the end of the playlist.

### **Parameters:**

type - the manifest type.  
dvrStartTime - DVR time

### **Returns:**

list of entries.

---

## **getRecordedEntries**

```
public java.util.List getRecordedEntries(int type,
        long dvrStartTime,
        long dvrEndTime)
```

(continued from last page)

Given manifest type and DVR time, get a list of recorded entries.

"Recorded Entries" includes those entries after the end of the playlist.

**Parameters:**

type - the manifest type.  
dvrStartTime - DVR time  
dvrEndTime - DVR end time

**Returns:**

list of entries.

---

## getRecordedDuration

```
public long getRecordedDuration(int type)
```

Given manifest type, return DVR recorded duration in seconds

"Recorded Entries" includes those entries after the end of the "live" playlist.

**Parameters:**

type - the manifest type.

**Returns:**

duration in seconds

---

## getLiveDuration

```
public long getLiveDuration(int type)
```

Given manifest type, return DVR live duration in seconds

"Recorded Entries" includes those entries after the end of the "live" playlist.

**Parameters:**

type - the manifest type.

**Returns:**

duration in seconds

---

## getDvrTime

```
public long getDvrTime(int type)
```

---

## getLastRecordedIndex

```
public long getLastRecordedIndex(int type)
```

Return last index of DVR entry for given type.

**Parameters:**

type

**Returns:**

index, or -1 if type does not exist

---

(continued from last page)

---

## getNextChunkIndex

```
public long getNextChunkIndex(String streamName,  
    DvrPacketHolder vPackets,  
    DvrPacketHolder aPackets)
```

---

## getNextMetadataIndex

```
public long getNextMetadataIndex()
```

---

## getNextCodecIndex

```
public long getNextCodecIndex()
```

---

## getNextTimeMapIndex

```
public long getNextTimeMapIndex()
```

---

## getManifestChannel

```
public DvrChannelManifest getManifestChannel(int type)
```

For a given manifest type, return the channel manifest.

**Parameters:**

type

**Returns:**

channel manifest

---

## importManifest

```
public void importManifest(IDvrManifest manifest,  
    boolean persist)
```

Import the specified manifest into this manifest

**Parameters:**

manifest

persist

---

## getClosestStartTime

```
public long getClosestStartTime(int type,  
    long dvrTime)
```

Given a dvrTime and a manifest type, find the closest chunk starting time.

**Parameters:**

type - manifest type

dvrTime - DVR time

---

(continued from last page)

**Returns:**

time that corresponds to the closest start time of the given manifest type

---

**expandEndTime**

```
public long expandEndTime(int type,  
                           long dvrEndTime)
```

---

**expandStartTime**

```
public long expandStartTime(int type,  
                             long dvrStartTime)
```

---

**hasVideo**

```
public boolean hasVideo()
```

Does manifest contain video.

**Returns:**

true if it contains video.

---

**hasAudio**

```
public boolean hasAudio()
```

Does manifest contain audio.

**Returns:**

true if it contains audio.

---

**hasData**

```
public boolean hasData()
```

Does manifest contain data.

**Returns:**

true if it contains data.

---

**hasOnMetadata**

```
public boolean hasOnMetadata()
```

Does manifest contain onMetadata.

**Returns:**

true if it contains onMetadata.

---

**hasCodecData**

```
public boolean hasCodecData()
```

Does manifest contain codec data.

---

(continued from last page)

**Returns:**

true if it contains codec data

---

**hasTimeMapData**

```
public boolean hasTimeMapData( )
```

Does manifest contain time map info.

**Returns:**

true if it contains time map info.

---

**serialize**

```
public byte[] serialize(boolean ignoreEntries)
```

Serialize the manifest.

**Parameters:**

ignoreEntries - If true, the individual manifest entries are not serialized.

**Returns:**

byte array of serialized data

---

**deserialize**

```
public void deserialize(byte[] bytes)
```

Deserialize the manifest. Should be called after default constructor for manifest has been called.

**Parameters:**

bytes - buffer of bytes to deserialize

---

**getTimeMap**

```
public IDvrTimeMap getTimeMap( )
```

---

**getChunkIDHandler**

```
public IDvrChunkIDHandler3 getChunkIDHandler( )
```

## com.wowza.wms.dvr Interface IDvrPacketConverter

public interface **IDvrPacketConverter**  
extends

Interface for creating DVR chunks from a set of packets.

### Method Summary

DvrChunk	<a href="#">createDvrAudioChunk</a> (long dvrTime, long index, int duration, <a href="#">DvrPacketHolder</a> holder) Create audio chunk from set of packets.
DvrChunk	<a href="#">createDvrDataChunk</a> (long dvrTime, long index, int duration, <a href="#">DvrPacketHolder</a> holder) Create data chunk from set of packets.
DvrChunk	<a href="#">createDvrOnMetadataChunk</a> (long dvrTime, long pt, <a href="#">AMFPacket</a> metaPacket) Create onMetadata chunk from set of packets.
DvrChunk	<a href="#">createDvrVideoChunk</a> (long dvrTime, long index, int duration, <a href="#">DvrPacketHolder</a> holder) Create video chunk from set of packets.

### Methods

#### createDvrAudioChunk

```
public DvrChunk createDvrAudioChunk(long dvrTime,  
    long index,  
    int duration,  
    DvrPacketHolder holder)
```

Create audio chunk from set of packets.

**Parameters:**

dvrTime - DVR start time in milliseconds  
index - index of DVR chunk  
duration - Duration in milliseconds  
holder - packet holder

**Returns:**

the created chunk or null if chunk not created.

#### createDvrVideoChunk

```
public DvrChunk createDvrVideoChunk(long dvrTime,  
    long index,  
    int duration,  
    DvrPacketHolder holder)
```

Create video chunk from set of packets.

**Parameters:**

---

(continued from last page)

dvrTime - DVR start time in milliseconds  
index - index of DVR chunk  
duration - Duration in milliseconds  
holder - packet holder

**Returns:**

the created chunk or null if chunk not created.

---

## createDvrDataChunk

```
public DvrChunk createDvrDataChunk(long dvrTime,  
    long index,  
    int duration,  
    DvrPacketHolder holder)
```

Create data chunk from set of packets.

**Parameters:**

dvrTime - DVR start time in milliseconds  
index - index of DVR chunk  
duration - Duration in milliseconds  
holder - packet holder

**Returns:**

the created chunk or null if chunk not created.

---

## createDvrOnMetadataChunk

```
public DvrChunk createDvrOnMetadataChunk(long dvrTime,  
    long pt,  
    AMFPacket metaPacket)
```

Create onMetadata chunk from set of packets.

**Parameters:**

dvrTime - DVR start time in milliseconds  
pt - Packet time  
metaPacket - metadata packet

**Returns:**

the created chunk or null if chunk not created.

---

## com.wowza.wms.dvr Interface IDvrPacketWriter

public interface **IDvrPacketWriter**  
extends

Interface for chunking and storing packets for DVR.

### Method Summary

void	<a href="#"><u>addToChunk</u></a> (DvrPacketHolder holder)
boolean	<a href="#"><u>canRecordAudio</u></a> ()
boolean	<a href="#"><u>canRecordData</u></a> ()
boolean	<a href="#"><u>canRecordVideo</u></a> ()
void	<a href="#"><u>endChunk</u></a> (long videoEndTime, long audioEndTime)
void	<a href="#"><u>resetStream</u></a> ()
void	<a href="#"><u>sendOnMetadata</u></a> (long pt, <a href="#"><u>AMFPacket</u></a> metaPacket)
void	<a href="#"><u>setCodecInfoAudio</u></a> (com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio)
void	<a href="#"><u>setCodecInfoVideo</u></a> (com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo)
void	<a href="#"><u>startChunk</u></a> (int streamMode, int videoCodecId, int audioCodecId, long timecode, long utcTimecode)

### Methods

#### sendOnMetadata

```
public void sendOnMetadata(long pt,
    AMFPacket metaPacket)
```

#### startChunk

```
public void startChunk(int streamMode,
    int videoCodecId,
    int audioCodecId,
    long timecode,
    long utcTimecode)
```

(continued from last page)

---

## **addToChunk**

```
public void addToChunk(DvrPacketHolder holder)
```

---

## **endChunk**

```
public void endChunk(long videoEndTime,  
    long audioEndTime)
```

---

## **setCodecInfoAudio**

```
public void setCodecInfoAudio(com.wowza.wms.media.model.MediaCodecInfoAudio  
    codecInfoAudio)
```

---

## **setCodecInfoVideo**

```
public void setCodecInfoVideo(com.wowza.wms.media.model.MediaCodecInfoVideo  
    codecInfoVideo)
```

---

## **resetStream**

```
public void resetStream()
```

---

## **canRecordAudio**

```
public boolean canRecordAudio()
```

---

## **canRecordVideo**

```
public boolean canRecordVideo()
```

---

## **canRecordData**

```
public boolean canRecordData()
```

## com.wowza.wms.dvr Interface IDvrPlayerAdapter

public interface **IDvrPlayerAdapter**  
extends

### Field Summary

public static final	<a href="#"><u>QUERY_PARAM_DVR</u></a> Value: <b>DVR</b>
---------------------	---

### Method Summary

int	<a href="#"><u>calcBitrate</u></a> ( <a href="#"><u>IDvrStreamStore</u></a> store, int type, long t)
String	<a href="#"><u>determineStreamVersion</u></a> ( <a href="#"><u>IDvrStreamManager</u></a> dvrMgr, String baseStreamName)
DvrPlaylistRequest	<a href="#"><u>getDvrPlaylistRequest</u></a> ( <a href="#"><u>IHTTPStreamerApplicationContext</u></a> appContext, <a href="#"><u>IDvrStreamStore</u></a> store, java.util.Map queryMap)
DvrPlaylistRequest	<a href="#"><u>getDvrPlaylistRequest</u></a> ( <a href="#"><u>IHTTPStreamerApplicationContext</u></a> appContext, java.util.List stores, java.util.Map queryMap)
IDvrMbrPlaylistAlignment	<a href="#"><u>getPlaylistAlignment</u></a> ( <a href="#"><u>IHTTPStreamerSession</u></a> httpStreamerSession)
boolean	<a href="#"><u>isPlaylistReady</u></a> ( <a href="#"><u>IDvrStreamStore</u></a> store, DvrPlaylistRequest playlistRequest)
boolean	<a href="#"><u>isPlaylistReady</u></a> (java.util.List stores, DvrPlaylistRequest dvrPlaylistRequest)
void	<a href="#"><u>setEnableDataEvents</u></a> (boolean enableDataEvents)

### Fields

#### QUERY\_PARAM\_DVR

public static final java.lang.String **QUERY\_PARAM\_DVR**

Constant value: **DVR**

### Methods

(continued from last page)

---

## isPlaylistReady

```
public boolean isPlaylistReady(IDvrStreamStore store,  
    DvrPlaylistRequest playlistRequest)
```

---

## isPlaylistReady

```
public boolean isPlaylistReady(java.util.List stores,  
    DvrPlaylistRequest dvrPlaylistRequest)
```

---

## determineStreamVersion

```
public String determineStreamVersion(IDvrStreamManager dvrMgr,  
    String baseStreamName)
```

---

## calcBitrate

```
public int calcBitrate(IDvrStreamStore store,  
    int type,  
    long t)
```

---

## getDvrPlaylistRequest

```
public DvrPlaylistRequest getDvrPlaylistRequest(IHTTPStreamerApplicationContext  
appContext,  
    IDvrStreamStore store,  
    java.util.Map queryMap)
```

---

## getDvrPlaylistRequest

```
public DvrPlaylistRequest getDvrPlaylistRequest(IHTTPStreamerApplicationContext  
appContext,  
    java.util.List stores,  
    java.util.Map queryMap)
```

---

## getPlaylistAlignment

```
public IDvrMbrPlaylistAlignment getPlaylistAlignment(IHTTPStreamerSession  
httpStreamerSession)
```

---

## setEnabledDataEvents

```
public void setEnabledDataEvents(boolean enableDataEvents)
```

---

## com.wowza.wms.dvr Interface IDvrPrivateConstants

All Subinterfaces:

[IDvrConstants](#)

public interface **IDvrPrivateConstants**  
extends

Internal and public constants. Public constants are contained in [IDvrConstants](#). Undocumented/Private in this file. To make the constant public (and documented in javadocs, simply move to IDvrConstants)

Field Summary	
public static final	<a href="#">CHUNK_FILENAME_FORMAT_AUDIO</a> Value: <b>A-%04d_%02d_%02d_%03d.m4fa</b>
public static final	<a href="#">CHUNK_FILENAME_FORMAT_DATA</a> Value: <b>D-%04d_%02d_%02d_%03d.m4fd</b>
public static final	<a href="#">CHUNK_FILENAME_FORMAT_METADATA</a> Value: <b>M-%04d_%02d_%02d_%03d.m4fm</b>
public static final	<a href="#">CHUNK_FILENAME_FORMAT_VIDEO</a> Value: <b>V-%04d_%02d_%02d_%03d.m4fv</b>
public static final	<a href="#">CHUNK_FOLDER_FORMAT</a> Value: <b>%04d_%02d_%02d</b>
public static final	<a href="#">DEFAULT_PROPERTY_AUDIO_GROUP_COUNT</a> Default value for DVR Property "dvrAudioGroupCount". Value: <b>3</b>
public static final	<a href="#">DEFAULT_PROPERTY_MANIFEST_PURGE_SIZE</a> Default value for DVR Property "dvrManifestPurgeCacheSize". Value: <b>10</b>
public static final	<a href="#">DEFAULT_PROPERTY_MAX_ALLOWABLE_CHUNK_DURATION</a> Default value for DVR Property "dvrMaxAllowableChunkDuration". Value: <b>120000</b>
public static final	<a href="#">DEFAULT_PROPERTY_MAX_SAVE HOLDER_SIZE</a> Value: <b>500</b>
public static final	<a href="#">DEFAULT_PROPERTY_MINIMUM_AVAILABLE_CHUNKS</a> Default value for DVR Property "dvrMinimumAvailableChunks". Value: <b>3</b>
public static final	<a href="#">DEFAULT_PROPERTY_PLAYLIST_CHUNKS_HELD_BACK</a> Default value for DVR Property "dvrPlaylistChunksHeldBack". Value: <b>2</b>

public static final	<a href="#">DEFAULT_PROPERTY_PURGE_CONTROL_CLASS</a> Default value for DVR Property "dvrPurgeControlClass". Value: <b>com.wowza.wms.dvr.impl.DvrPurgeController</b>
public static final	<a href="#">DEFAULT_PROPERTY_RECALC_DURATION_MAX_AV_DIFFERENCE_TRIGGER</a> Default value for DVR Property "dvrRecalcDurationMaxAVStartDifference". Value: <b>500</b>
public static final	<a href="#">DEFAULT_PROPERTY_RECALC_DURATION_TRIGGER_SIZE</a> Default value for DVR Property "dvrRecalcDurationMaxChunkSize". Value: <b>60000</b>
public static final	<a href="#">DEFAULT_PROPERTY_STREAM_IDLE_TIMEOUT</a> Default value for DVR Property "streamTimeout". Value: <b>300000</b>
public static final	<a href="#">DEFAULT_PROPERTY_STREAM_STARTUP_TIMEOUT</a> Default value for DVR Property "streamStartupTimeout". Value: <b>60000</b>
public static final	<a href="#">DEFAULT_PROPERTY_UTC_ALIGN_TO_AUDIO</a> Default value for DVR Property "dvrUtcAlignToAudio". Value: <b>true</b>
public static final	<a href="#">DEFAULT_PROPERTY_UTC_USE_WOWZA_PACKET_ARRIVAL</a> Default value for DVR Property "dvrUtcUseWowzaPacketArrivalTime". Value: <b>false</b>
public static final	<a href="#">DEFAULT_PROPERTY_WAIT_FOR_CODEC_TIME</a> Default value for DVR Property "dvrWaitForCodecTime". Value: <b>8000</b>
public static final	<a href="#">PROPERTY_AUDIO_GROUP_COUNT</a> DVR Property "dvrAudioGroupCount": for number of audio packets to group together. Value: <b>dvrAudioGroupCount</b>
public static final	<a href="#">PROPERTY_DEBUG_DISCONTINUITY</a> Value: <b>dvrDebugDiscontinuity</b>
public static final	<a href="#">PROPERTY_DEBUG_MBR_RESOLVER</a> Value: <b>dvrDebugMbrResolver</b>
public static final	<a href="#">PROPERTY_DEBUG_MBR_RESOLVER_GAP_DETAILS</a> Value: <b>dvrDebugMbrResolverGapDetails</b>
public static final	<a href="#">PROPERTY_DEBUG_MBR_RESOLVER_INTERSECTION_DETAILS</a> Value: <b>dvrDebugMbrResolverIntersectionDetails</b>
public static final	<a href="#">PROPERTY_INTERCEPTOR_CHUNK_DELEGATE</a> DVR Property "dvrChunkInterceptorDelegate": for specifying a delegate that determines if DVR chunk should be stored or not. Value: <b>dvrChunkInterceptorDelegate</b>

public static final	<a href="#"><u>PROPERTY_MANIFEST_PURGE_CACHE_SIZE</u></a> DVR Property "dvrManifestPurgeCacheSize": for specifying how many purged chunks are kept around just in case they are requested. Value: <b>dvrManifestPurgeCacheSize</b>
public static final	<a href="#"><u>PROPERTY_MAX_ALLOWABLE_CHUNK_DURATION</u></a> DVR Property "dvrMaxAllowableChunkDuration": for setting maximum chunk duration. Value: <b>dvrMaxAllowableChunkDuration</b>
public static final	<a href="#"><u>PROPERTY_MAX_SAVE HOLDER_SIZE</u></a> Value: <b>dvrMaxSaveHolderSize</b>
public static final	<a href="#"><u>PROPERTY_MBR_USE_SIMPLEALIGNMENT</u></a> HTTP Streamer Property "dvrMbrUseSimpleAligner": for defaulting to a simple mbr aligner Value: <b>dvrMbrUseSimpleAligner</b>
public static final	<a href="#"><u>PROPERTY_MINIMUM_AVAILABLE_CHUNKS</u></a> DVR Property "dvrMinimumAvailableChunks": for specifying how many chunks must be available in order to play back the DVR recording. Value: <b>dvrMinimumAvailableChunks</b>
public static final	<a href="#"><u>PROPERTY_PLAYLIST_CHUNKS_HELD_BACK</u></a> DVR Property "dvrPlaylistChunksHeldBack": for specifying how many chunks are held back must be available in order to play back the DVR recording. Value: <b>dvrPlaylistChunksHeldBack</b>
public static final	<a href="#"><u>PROPERTY_PURGE_CONTROL_CLASS</u></a> DVR Property "dvrPurgeControlClass": for controlling the class responsible for determining which chunks to purge Value: <b>dvrPurgeControlClass</b>
public static final	<a href="#"><u>PROPERTY_RECALC_DURATION_MAX_AV_DIFFERENCE_TRIGGER</u></a> DVR Property "dvrRecalcDurationMaxAVStartDifference": for triggering recalculation of DVR chunk duration by examining each packet Value: <b>dvrRecalcDurationMaxAVStartDifference</b>
public static final	<a href="#"><u>PROPERTY_RECALC_DURATION_TRIGGER_SIZE</u></a> DVR Property "dvrRecalcDurationMaxChunkSize": for triggering recalculation of DVR chunk duration by examining each packet Value: <b>dvrRecalcDurationMaxChunkSize</b>
public static final	<a href="#"><u>PROPERTY_UTC_ALIGN_TO_AUDIO</u></a> DVR Property "dvrUtcAlignToAudio": determines if calculated Utc time gets aligned to audio or video. Value: <b>dvrUtcAlignToAudio</b>
public static final	<a href="#"><u>PROPERTY_UTC_DELEGATE_CLASS</u></a> DVR Property "dvrUtcTimeDelegate": for specifying a delegate that the utc time for a given chunk. Value: <b>dvrUtcTimeDelegate</b>
public static final	<a href="#"><u>PROPERTY_UTC_USE_WOWZA_PACKET_ARRIVAL</u></a> DVR Property "dvrUtcUseWowzaPacketArrivalTime": determines if Utc times are based on the time the packet reaches Wowza or the time the chunks reach DVR (default). Value: <b>dvrUtcUseWowzaPacketArrivalTime</b>

public static final	<a href="#">PROPERTY_VERIFY_CHUNK_EXISTENCE_ON_MANIFEST_LOAD</a> Value: <b>dvrVerifyChunkExistenceOnManifestLoad</b>
public static final	<a href="#">PROPERTY_WAIT_FOR_CODEC_TIME</a> DVR Property "dvrWaitForCodecTime": for how long DVR will wait to get the codec information. Value: <b>dvrWaitForCodecTime</b>

## Fields

### PROPERTY\_INTERCEPTOR\_CHUNK\_DELEGATE

```
public static final java.lang.String PROPERTY_INTERCEPTOR_CHUNK_DELEGATE
```

DVR Property "dvrChunkInterceptorDelegate": for specifying a delegate that determines if DVR chunk should be stored or not. It's only here to allow a backdoor method of testing mbr streams that have gaps.  
Constant value: **dvrChunkInterceptorDelegate**

### PROPERTY\_UTC\_DELEGATE\_CLASS

```
public static final java.lang.String PROPERTY_UTC_DELEGATE_CLASS
```

DVR Property "dvrUtcTimeDelegate": for specifying a delegate that the utc time for a given chunk. Currently in private constants until article is written.  
Constant value: **dvrUtcTimeDelegate**

### PROPERTY\_UTC\_ALIGN\_TO\_AUDIO

```
public static final java.lang.String PROPERTY_UTC_ALIGN_TO_AUDIO
```

DVR Property "dvrUtcAlignToAudio": determines if calculated Utc time gets aligned to audio or video. Note: Currently in private constants until article is written.  
Constant value: **dvrUtcAlignToAudio**

### DEFAULT\_PROPERTY\_UTC\_ALIGN\_TO\_AUDIO

```
public static final boolean DEFAULT_PROPERTY_UTC_ALIGN_TO_AUDIO
```

Default value for DVR Property "dvrUtcAlignToAudio". Default value is true.  
Constant value: **true**

See Also:

[PROPERTY\\_UTC\\_ALIGN\\_TO\\_AUDIO](#)

### PROPERTY\_UTC\_USE\_WOWZA\_PACKET\_ARRIVAL

```
public static final java.lang.String PROPERTY_UTC_USE_WOWZA_PACKET_ARRIVAL
```

DVR Property "dvrUtcUseWowzaPacketArrivalTime": determines if Utc times are based on the time the packet reaches Wowza or the time the chunks reach DVR (default). Note: Currently in private constants until article is written.  
Constant value: **dvrUtcUseWowzaPacketArrivalTime**

### DEFAULT\_PROPERTY\_UTC\_USE\_WOWZA\_PACKET\_ARRIVAL

```
public static final boolean DEFAULT_PROPERTY_UTC_USE_WOWZA_PACKET_ARRIVAL
```

Default value for DVR Property "dvrUtcUseWowzaPacketArrivalTime". Default value is false.

(continued from last page)

Constant value: **false**

See Also:

[PROPERTY\\_UTC\\_USE\\_WOWZA\\_PACKET\\_ARRIVAL](#)

---

## PROPERTY\_MINIMUM\_AVAILABLE\_CHUNKS

```
public static final java.lang.String PROPERTY_MINIMUM_AVAILABLE_CHUNKS
```

DVR Property "dvrMinimumAvailableChunks": for specifying how many chunks must be available in order to play back the DVR recording.

It is not recommended to have this set to less than three, as players typically require this many chunks.

Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrMinimumAvailableChunks**

See Also:

[DEFAULT\\_PROPERTY\\_MINIMUM\\_AVAILABLE\\_CHUNKS](#)

---

## DEFAULT\_PROPERTY\_MINIMUM\_AVAILABLE\_CHUNKS

```
public static final int DEFAULT_PROPERTY_MINIMUM_AVAILABLE_CHUNKS
```

Default value for DVR Property "dvrMinimumAvailableChunks".

Default value is 3.

Constant value: **3**

See Also:

[PROPERTY\\_MINIMUM\\_AVAILABLE\\_CHUNKS](#)

---

## PROPERTY\_PLAYLIST\_CHUNKS\_HELD\_BACK

```
public static final java.lang.String PROPERTY_PLAYLIST_CHUNKS_HELD_BACK
```

DVR Property "dvrPlaylistChunksHeldBack": for specifying how many chunks are held back must be available in order to play back the DVR recording. Add the property to Application/DVR/Properties section of Application.xml.

Constant value: **dvrPlaylistChunksHeldBack**

See Also:

[PROPERTY\\_PLAYLIST\\_CHUNKS\\_HELD\\_BACK](#)

---

## DEFAULT\_PROPERTY\_PLAYLIST\_CHUNKS\_HELD\_BACK

```
public static final int DEFAULT_PROPERTY_PLAYLIST_CHUNKS_HELD_BACK
```

Default value for DVR Property "dvrPlaylistChunksHeldBack".

Default value is 2.

Constant value: **2**

See Also:

[PROPERTY\\_PLAYLIST\\_CHUNKS\\_HELD\\_BACK](#)

---

## PROPERTY\_MANIFEST\_PURGE\_CACHE\_SIZE

```
public static final java.lang.String PROPERTY_MANIFEST_PURGE_CACHE_SIZE
```

(continued from last page)

DVR Property "dvrManifestPurgeCacheSize": for specifying how many purged chunks are kept around just in case they are requested.

When purging chunks occurs, the DVR keeps a few chunks around that normally would have been purged just in case they are requested.

Add the property to Application/DVR/Properties section of Application.xml.  
Constant value: **dvrManifestPurgeCacheSize**

See Also:

[DEFAULT\\_PROPERTY\\_MANIFEST\\_PURGE\\_SIZE](#)

---

## DEFAULT\_PROPERTY\_MANIFEST\_PURGE\_SIZE

```
public static final int DEFAULT_PROPERTY_MANIFEST_PURGE_SIZE
```

Default value for DVR Property "dvrManifestPurgeCacheSize".

Default value is 10.  
Constant value: **10**

See Also:

[PROPERTY\\_MANIFEST\\_PURGE\\_CACHE\\_SIZE](#)

---

## PROPERTY\_VERIFY\_CHUNK\_EXISTENCE\_ON\_MANIFEST\_LOAD

```
public static final java.lang.String PROPERTY_VERIFY_CHUNK_EXISTENCE_ON_MANIFEST_LOAD
```

Constant value: **dvrVerifyChunkExistenceOnManifestLoad**

---

## PROPERTY\_PURGE\_CONTROL\_CLASS

```
public static final java.lang.String PROPERTY_PURGE_CONTROL_CLASS
```

DVR Property "dvrPurgeControlClass": for controlling the class responsible for determining which chunks to purge

The class must implement [IDvrPurgeController](#) and may sub-class DvrPurgeControllerBase

Add the property to Application/DVR/Properties section of Application.xml.  
Constant value: **dvrPurgeControlClass**

See Also:

[IDvrPurgeController](#)

[DEFAULT\\_PROPERTY\\_PURGE\\_CONTROL\\_CLASS](#)

---

## DEFAULT\_PROPERTY\_PURGE\_CONTROL\_CLASS

```
public static final java.lang.String DEFAULT_PROPERTY_PURGE_CONTROL_CLASS
```

Default value for DVR Property "dvrPurgeControlClass".

Default value is "com.wowza.wms.dvr.impl.DvrPurgeController".  
Constant value: **com.wowza.wms.dvr.impl.DvrPurgeController**

See Also:

[PROPERTY\\_PURGE\\_CONTROL\\_CLASS](#)

---

## PROPERTY\_MBR\_USE\_SIMPLEALIGNMENT

```
public static final java.lang.String PROPERTY_MBR_USE_SIMPLEALIGNMENT
```

---

(continued from last page)

HTTP Streamer Property "dvrMbrUseSimpleAligner": for defaulting to a simple mbr aligner

Add the property to Application/HTTPStreamer/Properties section of Application.xml.  
Constant value: **dvrMbrUseSimpleAligner**

## PROPERTY\_MAX\_ALLOWABLE\_CHUNK\_DURATION

```
public static final java.lang.String PROPERTY_MAX_ALLOWABLE_CHUNK_DURATION
```

DVR Property "dvrMaxAllowableChunkDuration": for setting maximum chunk duration.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrMaxAllowableChunkDuration**

See Also:

[DEFAULT\\_PROPERTY\\_MAX\\_ALLOWABLE\\_CHUNK\\_DURATION](#)

## DEFAULT\_PROPERTY\_MAX\_ALLOWABLE\_CHUNK\_DURATION

```
public static final int DEFAULT_PROPERTY_MAX_ALLOWABLE_CHUNK_DURATION
```

Default value for DVR Property "dvrMaxAllowableChunkDuration".

Default value is 120000 ms (120 seconds).  
Constant value: **120000**

See Also:

[PROPERTY\\_MAX\\_ALLOWABLE\\_CHUNK\\_DURATION](#)

## PROPERTY\_RECALC\_DURATION\_MAX\_AV\_DIFFERENCE\_TRIGGER

```
public static final java.lang.String  
PROPERTY_RECALC_DURATION_MAX_AV_DIFFERENCE_TRIGGER
```

DVR Property "dvrRecalcDurationMaxAVStartDifference": for triggering recalculation of DVR chunk duration by examining each packet

This is a fallback setting for when the aligned audio and video packets differ their start times. When this happens, fallback logic is triggered which examines the actual packets and tries to adjust the packet times and duration accordingly.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrRecalcDurationMaxAVStartDifference**

See Also:

[DEFAULT\\_PROPERTY\\_RECALC\\_DURATION\\_MAX\\_AV\\_DIFFERENCE\\_TRIGGER](#)

## DEFAULT\_PROPERTY\_RECALC\_DURATION\_MAX\_AV\_DIFFERENCE\_TRIGGER

```
public static final int DEFAULT_PROPERTY_RECALC_DURATION_MAX_AV_DIFFERENCE_TRIGGER
```

Default value for DVR Property "dvrRecalcDurationMaxAVStartDifference".

Default value is 500 ms.  
Constant value: **500**

See Also:

[PROPERTY\\_RECALC\\_DURATION\\_MAX\\_AV\\_DIFFERENCE\\_TRIGGER](#)

## PROPERTY\_RECALC\_DURATION\_TRIGGER\_SIZE

```
public static final java.lang.String PROPERTY_RECALC_DURATION_TRIGGER_SIZE
```

(continued from last page)

DVR Property "dvrRecalcDurationMaxChunkSize": for triggering recalculation of DVR chunk duration by examining each packet

This is a fallback setting for when the DVR packetizer determines the chunk is quite large, usually because the incoming packet times have done something odd like suddenly diverged. When this happens, asome fallback logic is triggered which examines the acual packets and tries to adjust the duration accordingly.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrRecalcDurationMaxChunkSize**

See Also:

[DEFAULT\\_PROPERTY\\_RECALC\\_DURATION\\_TRIGGER\\_SIZE](#)

---

## DEFAULT\_PROPERTY\_RECALC\_DURATION\_TRIGGER\_SIZE

```
public static final int DEFAULT_PROPERTY_RECALC_DURATION_TRIGGER_SIZE
```

Default value for DVR Property "dvrRecalcDurationMaxChunkSize".

Default value is 60000 ms (60 seconds).  
Constant value: **60000**

See Also:

[PROPERTY\\_RECALC\\_DURATION\\_TRIGGER\\_SIZE](#)

---

## PROPERTY\_MAX\_SAVE\_HOLDER\_SIZE

```
public static final java.lang.String PROPERTY_MAX_SAVE_HOLDER_SIZE
```

Constant value: **dvrMaxSaveHolderSize**

---

## DEFAULT\_PROPERTY\_MAX\_SAVE\_HOLDER\_SIZE

```
public static final int DEFAULT_PROPERTY_MAX_SAVE_HOLDER_SIZE
```

Constant value: **500**

---

## PROPERTY\_WAIT\_FOR\_CODEC\_TIME

```
public static final java.lang.String PROPERTY_WAIT_FOR_CODEC_TIME
```

DVR Property "dvrWaitForCodecTime": for how long DVR will wait to get the codec information.

Amount of time Wowza nDVR will wait to receive audio and video codec information after streaming has begun. The unit is in ms. The default value is 8000 ms.

Add the property to Application/DVR/Properties section of Application.xml  
Constant value: **dvrWaitForCodecTime**

See Also:

[DEFAULT\\_PROPERTY\\_WAIT\\_FOR\\_CODEC\\_TIME](#)

---

## DEFAULT\_PROPERTY\_WAIT\_FOR\_CODEC\_TIME

```
public static final int DEFAULT_PROPERTY_WAIT_FOR_CODEC_TIME
```

Default value for DVR Property "dvrWaitForCodecTime".

Default value is 8000 ms.  
Constant value: **8000**

(continued from last page)

See Also:

[PROPERTY\\_WAIT\\_FOR\\_CODEC\\_TIME](#)

---

## PROPERTY\_AUDIO\_GROUP\_COUNT

```
public static final java.lang.String PROPERTY_AUDIO_GROUP_COUNT
```

DVR Property "dvrAudioGroupCount": for number of audio packets to group together.

Default is 3. @see [DEFAULT\\_PROPERTY\\_AUDIO\\_GROUP\\_COUNT](#)

Constant value: **dvrAudioGroupCount**

---

## DEFAULT\_PROPERTY\_AUDIO\_GROUP\_COUNT

```
public static final int DEFAULT_PROPERTY_AUDIO_GROUP_COUNT
```

Default value for DVR Property "dvrAudioGroupCount".

Default value is 3.

Constant value: **3**

See Also:

[PROPERTY\\_AUDIO\\_GROUP\\_COUNT](#)

---

## DEFAULT\_PROPERTY\_STREAM\_IDLE\_TIMEOUT

```
public static final int DEFAULT_PROPERTY_STREAM_IDLE_TIMEOUT
```

Default value for DVR Property "streamTimeout".

Default value is 300000 ms (5 minutes).

Constant value: **300000**

---

## DEFAULT\_PROPERTY\_STREAM\_STARTUP\_TIMEOUT

```
public static final int DEFAULT_PROPERTY_STREAM_STARTUP_TIMEOUT
```

Default value for DVR Property "streamStartupTimeout".

Default value is 60000 ms (60 seconds).

Constant value: **60000**

---

## PROPERTY\_DEBUG\_MBR\_RESOLVER

```
public static final java.lang.String PROPERTY_DEBUG_MBR_RESOLVER
```

Constant value: **dvrDebugMbrResolver**

---

## PROPERTY\_DEBUG\_MBR\_RESOLVER\_GAP\_DETAILS

```
public static final java.lang.String PROPERTY_DEBUG_MBR_RESOLVER_GAP_DETAILS
```

Constant value: **dvrDebugMbrResolverGapDetails**

---

## PROPERTY\_DEBUG\_MBR\_RESOLVER\_INTERSECTION\_DETAILS

```
public static final java.lang.String PROPERTY_DEBUG_MBR_RESOLVER_INTERSECTION_DETAILS
```

(continued from last page)

---

Constant value: **dvrDebugMbrResolverIntersectionDetails**

---

## PROPERTY\_DEBUG\_DISCONTINUITY

```
public static final java.lang.String PROPERTY_DEBUG_DISCONTINUITY
```

Constant value: **dvrDebugDiscontinuity**

---

## CHUNK\_FILENAME\_FORMAT\_METADATA

```
public static final java.lang.String CHUNK_FILENAME_FORMAT_METADATA
```

Constant value: **M-%04d\_%02d\_%02d\_%03d.m4fm**

---

## CHUNK\_FILENAME\_FORMAT\_VIDEO

```
public static final java.lang.String CHUNK_FILENAME_FORMAT_VIDEO
```

Constant value: **V-%04d\_%02d\_%02d\_%03d.m4fv**

---

## CHUNK\_FILENAME\_FORMAT\_AUDIO

```
public static final java.lang.String CHUNK_FILENAME_FORMAT_AUDIO
```

Constant value: **A-%04d\_%02d\_%02d\_%03d.m4fa**

---

## CHUNK\_FILENAME\_FORMAT\_DATA

```
public static final java.lang.String CHUNK_FILENAME_FORMAT_DATA
```

Constant value: **D-%04d\_%02d\_%02d\_%03d.m4fd**

---

## CHUNK\_FOLDER\_FORMAT

```
public static final java.lang.String CHUNK_FOLDER_FORMAT
```

Constant value: **%04d\_%02d\_%02d**

## com.wowza.wms.dvr Interface IDvrPurgeController

public interface **IDvrPurgeController**  
extends

Interface for controlling DVR chunk purging. The purge controller is instantiated using a factory class DvrPurgeControllerFactory.  
**See Also:**

[com.wowza.wms.dvr.impl.DvrPurgeControllerFactory](#),  
[IDvrPrivateConstants.PROPERTY\\_PURGE\\_CONTROL\\_CLASS](#)

### Method Summary

long	<a href="#">getCurrentTime()</a> Get current DVR time.
long	<a href="#">getLastPurgeTime()</a> Get the DVR time when the last purge occurred.
void	<a href="#">init(<a href="#">IDvrStreamStore</a> store)</a> Initialize the controller.
boolean	<a href="#">isPurgingEnabled()</a> Is Purging enabled for this controller.
void	<a href="#">setCurrentDvrTime(long newDvrTime)</a> Set the current DVR time and perform purge if necessary.

### Methods

#### **init**

public void **init**([IDvrStreamStore](#) store)

Initialize the controller.

**Parameters:**

store - the DVR stream store

#### **isPurgingEnabled**

public boolean **isPurgingEnabled**()

Is Purging enabled for this controller.

**Returns:**

true if purging is active, false otherwise.

#### **setCurrentDvrTime**

public void **setCurrentDvrTime**(long newDvrTime)

Set the current DVR time and perform purge if necessary. This method checks the DVR time against its internal rules for purging and performs the purge. It is also responsible for setting the last purge time and the next purge time.

(continued from last page)

**Parameters:**newDvrTime

---

**getCurrentTime**

```
public long getCurrentTime()
```

Get current DVR time. The store is responsible for setting the DVR time via setCurrentDvrTime.

**Returns:**current DVR time.

---

**getLastPurgeTime**

```
public long getLastPurgeTime()
```

Get the DVR time when the last purge occurred.

**Returns:**DVR time of last purge

---

## com.wowza.wms.dvr Interface IDvrRawChunkProvider

All Subinterfaces:

[IDvrChunkMemoryCache](#)

public interface **IDvrRawChunkProvider**  
extends

Interface for providing raw DVR chunks based on a DVR manifest entry.

### Method Summary

DvrChunk	<a href="#">retrieveRawChunk</a> ( <a href="#">DvrManifestChunkEntry</a> entry) Given the specified manifest entry, return the raw DVR chunk.
----------	--

### Methods

#### **retrieveRawChunk**

public DvrChunk **retrieveRawChunk**([DvrManifestChunkEntry](#) entry)

Given the specified manifest entry, return the raw DVR chunk.

**Parameters:**

entry - The DVR manifest entry

**Returns:**

the DVR chunk or null if not able to return the chunk.

## com.wowza.wms.dvr Interface IDvrRecordingListener

public interface **IDvrRecordingListener**  
extends

Listener for DVR Recording events.

**See Also:**

[IDvrStreamManager.addDvrRecordingListener\(IDvrRecordingListener\)](#),  
[IDvrStreamManager.removeDvrRecordingListener\(IDvrRecordingListener\)](#)

### Method Summary

void	<a href="#">recordingPaused</a> ( <a href="#">IDvrStreamStore</a> store) Callback when DVR moves to paused state.
void	<a href="#">recordingReset</a> ( <a href="#">IDvrStreamStore</a> store) Callback when DVR gets reset.
void	<a href="#">recordingResumed</a> ( <a href="#">IDvrStreamStore</a> store) Callback when DVR moves out of paused state.
void	<a href="#">recordingStarted</a> ( <a href="#">IDvrStreamStore</a> store) Callback when DVR moves to recording state.
void	<a href="#">recordingStopped</a> ( <a href="#">IDvrStreamStore</a> store) Callback when DVR recording stops
void	<a href="#">timeReset</a> ( <a href="#">IDvrStreamStore</a> store, long oldDvrTime, long oldPacketTime, TimeMapRecord newTime) Callback when DVR time is adjusted.

### Methods

#### recordingStarted

public void **recordingStarted**([IDvrStreamStore](#) store)

Callback when DVR moves to recording state.

**Parameters:**

store - stream store

#### recordingPaused

public void **recordingPaused**([IDvrStreamStore](#) store)

Callback when DVR moves to paused state.

**Parameters:**

store - stream store

(continued from last page)

## recordingResumed

```
public void recordingResumed(IDvrStreamStore store)
```

Callback when DVR moves out of paused state.

**Parameters:**

store - stream store

---

## recordingReset

```
public void recordingReset(IDvrStreamStore store)
```

Callback when DVR gets reset. For example, if the incoming stream resets.

**Parameters:**

store - stream store

---

## recordingStopped

```
public void recordingStopped(IDvrStreamStore store)
```

Callback when DVR recording stops

**Parameters:**

store - stream store

---

## timeReset

```
public void timeReset(IDvrStreamStore store,  
    long oldDvrTime,  
    long oldPacketTime,  
    TimeMapRecord newTime)
```

Callback when DVR time is adjusted.

**Parameters:**

store - stream store

oldDvrTime

oldPacketTime - old packet time associated to oldDvrTime

newTime

## com.wowza.wms.dvr Interface IDvrRecordingsLoader

public interface **IDvrRecordingsLoader**  
extends

Interface for loading recordings during DVR Stream Manager initialization.

**See Also:**

[com.wowza.wms.dvr.impl.DvrRecordingsLoaderFactory](#),  
[IDvrConstants.PROPERTY\\_RECORDINGS\\_LOADER\\_CLASS](#)

### Method Summary

void	<a href="#">init</a> ( <a href="#">IDvrStreamManager</a> dvrMgr) Initialize recordings loader
void	<a href="#">loadArchivedRecordings</a> () Discover and load archived recording
boolean	<a href="#">shouldLoadStream</a> (String streamName, java.util.SortedSet versions) Should the given archived streams be laoded.
boolean	<a href="#">shouldLoadStreamVersion</a> (String streamName, Integer version, java.util.SortedSet versions) Should the given archived stream of specific version be laoded.

### Methods

#### init

public void **init**([IDvrStreamManager](#) dvrMgr)

Initialize recordings loader

**Parameters:**

dvrMgr - the DVR Stream Manager

#### loadArchivedRecordings

public void **loadArchivedRecordings**()

Discover and load archived recording

#### shouldLoadStream

public boolean **shouldLoadStream**(String streamName,  
java.util.SortedSet versions)

Should the given archived streams be laoded. The method contains logic which determines if all versions of the given stream Name should be loaded or not.

**Parameters:**

streamName - Stream name (unversioned)

versions - sorted set of available versions of this stream

(continued from last page)

**Returns:**

true if one or more of the streams should be loaded, false otherwise.

---

**shouldLoadStreamVersion**

```
public boolean shouldLoadStreamVersion(String streamName,  
    Integer version,  
    java.util.SortedSet versions)
```

Should the given archived stream of specific version be loaded. The method contains logic which determines if all versions of the given stream Name should be loaded or not.

**Parameters:**

streamName - Stream name (unversioned)

version - the specific version of the stream we are determining if we should load

versions - sorted set of all available versions of this stream

**Returns:**

true if one or more of the streams should be loaded, false otherwise.

## com.wowza.wms.dvr Interface IDvrStoreChunkListener

public interface **IDvrStoreChunkListener**  
extends

Listener for DVR Store chunk events.

Note that this listener traffic is very high.

**See Also:**

[IDvrStreamStore.addDvrChunkListener\(IDvrStoreChunkListener\)](#),  
[IDvrStreamStore.removeDvrChunkListener\(IDvrStoreChunkListener\)](#)

### Method Summary

void	<a href="#">postChunkAdded</a> ( <a href="#">IDvrStreamStore</a> store) Callback after a chunk is written to DVR store
void	<a href="#">postChunksPurged</a> ( <a href="#">IDvrStreamStore</a> store, <a href="#">DvrManifestEntryRangeGroup</a> entries, java.util.List deletedEntries) Callback after DVR store performs a purge
void	<a href="#">preChunkAdded</a> ( <a href="#">IDvrStreamStore</a> store) Callback before a chunk is written to DVR store
void	<a href="#">preChunksPurged</a> ( <a href="#">IDvrStreamStore</a> store, <a href="#">DvrManifestEntryRangeGroup</a> entries) Callback before DVR store performs a purge

### Methods

#### preChunkAdded

public void **preChunkAdded**([IDvrStreamStore](#) store)

Callback before a chunk is written to DVR store

**Parameters:**

store - the stream store

#### postChunkAdded

public void **postChunkAdded**([IDvrStreamStore](#) store)

Callback after a chunk is written to DVR store

**Parameters:**

store - the stream store

#### preChunksPurged

public void **preChunksPurged**([IDvrStreamStore](#) store,  
[DvrManifestEntryRangeGroup](#) entries)

(continued from last page)

Callback before DVR store performs a purge

**Parameters:**

store - the stream store

entries - list of DVR chunks to be purged

---

## postChunksPurged

```
public void postChunksPurged(IDvrStreamStore store,  
    DvrManifestEntryRangeGroup entries,  
    java.util.List deletedEntries)
```

Callback after DVR store performs a purge

**Parameters:**

store - the stream store

entries - list of DVR chunks purged

deletedEntries - list of entries deleted

## com.wowza.wms.dvr Interface IDvrStoreListener

public interface **IDvrStoreListener**  
extends

Listener for DVR Store lifecycle events.

See Also:

[IDvrStreamManager.addDvrStoreListener\(IDvrStoreListener\)](#),  
[IDvrStreamManager.removeDvrStoreListener\(IDvrStoreListener\)](#)

### Method Summary

void	<a href="#">dvrStreamStorageDeleted</a> ( <a href="#">IDvrStreamStore</a> store, <a href="#">IDvrFileSystem</a> <a href="#">FileSystem</a> , boolean success) Callback after DVR store is deleted from disk.
void	<a href="#">dvrStreamStorageLoaded</a> ( <a href="#">IDvrStreamManager</a> dvrMgr, <a href="#">IDvrStreamStore</a> store) Callback after DVR store is loaded from disk.
void	<a href="#">dvrStreamStoreCreate</a> ( <a href="#">IDvrStreamStore</a> store) Callback after DVR stream store is created.
void	<a href="#">dvrStreamStoreDestroy</a> ( <a href="#">IDvrStreamStore</a> store) Callback after DVR stream store is destroyed.
void	<a href="#">dvrStreamStoreInit</a> ( <a href="#">IDvrStreamStore</a> store) Callback after DVR stream store is initialized.

### Methods

#### dvrStreamStoreCreate

public void **dvrStreamStoreCreate**([IDvrStreamStore](#) store)

Callback after DVR stream store is created.

**Parameters:**

store - stream store

#### dvrStreamStoreInit

public void **dvrStreamStoreInit**([IDvrStreamStore](#) store)

Callback after DVR stream store is initialized.

**Parameters:**

store - stream store

#### dvrStreamStoreDestroy

public void **dvrStreamStoreDestroy**([IDvrStreamStore](#) store)

Callback after DVR stream store is destroyed.

(continued from last page)

**Parameters:**store - stream store

---

**dvrStreamStorageLoaded**

```
public void dvrStreamStorageLoaded(IDvrStreamManager dvrMgr,  
    IDvrStreamStore store)
```

Callback after DVR store is loaded from disk.

**Parameters:**

dvrMgr - DVR Application Store Manager

store - stream store

---

**dvrStreamStorageDeleted**

```
public void dvrStreamStorageDeleted(IDvrStreamStore store,  
    IDvrFileSystem fileSystem,  
    boolean success)
```

Callback after DVR store is deleted from disk.

**Parameters:**

store

fileSystem - stream store file system

success - whether delete succeeded or failed

## com.wowza.wms.dvr Interface IDvrStreamManager

All Superinterfaces:

[ILiveStreamPacketizer](#)

public interface **IDvrStreamManager**

extends [ILiveStreamPacketizer](#)

DVR Stream manager. Manages a live stream and associated DVR stores.

### Method Summary

void	<a href="#">addDvrRecordingListener</a> ( <a href="#">IDvrRecordingListener</a> listener) Add listener to DVR recording events.
void	<a href="#">addDvrStoreListener</a> ( <a href="#">IDvrStoreListener</a> listener) Add listener to DVR store lifecycle events.
void	<a href="#">addManifestEntries</a> (String vStreamName, java.util.List entries, String serverGuid) Add to stream stores manifest.
void	<a href="#">addRepeaterHeartBeatItem</a> ()
boolean	<a href="#">canRecord</a> () Is this stream able to record.
void	<a href="#">deleteArchivedStore</a> (String vStreamName) Delete archived stream store.
String	<a href="#">getArchiveStrategy</a> () Get the DVR archive strategy.
String	<a href="#">getContextStr</a> () Get stream context string, useful for logging.
<a href="#">IHTTPStreamerCupertinoLivePacketizerDataHandler</a>	<a href="#">getDataHandler</a> ()
<a href="#">IDvrStreamStore</a>	<a href="#">getDefaultStreamingStore</a> () Get the store to be used for streaming.
String	<a href="#">getDvrFileSystemClass</a> () Get the class used for the DVR file system.
String	<a href="#">getDvrStorageDir</a> () Get the storage directory.
int	<a href="#">getDvrStorageWindowSeconds</a> () Get DVR window size.
DvrBaseEncryptionInfo Delegate	<a href="#">getEncryptionDelegate</a> () Get the encryption delegate for providing streaming side encryption info objects.

String	<a href="#"><u>getEncryptionRepeaterSharedSecret()</u></a> Get the DVR encryption shared secret.
<a href="#"><u>IDvrStreamStore</u></a>	<a href="#"><u>getHighestVersionedStore()</u></a> Return stream store that is highest known version.
void	<a href="#"><u>getInitialRepeaterItems()</u></a> (java.util.List items) Get initial repeater items to send to repeater receiver.
int	<a href="#"><u>getMinimumAvailableChunks()</u></a> Return number of chunks that must be available to stream.
String	<a href="#"><u>getPacketizerName()</u></a> Get live stream packetizer name.
<a href="#"><u>IDvrStreamStore</u></a>	<a href="#"><u>getRecordingStreamStore()</u></a> Get current recording store
void	<a href="#"><u>getRepeaterItemsDvr()</u></a> (java.util.List items, long lastSeq)
String	<a href="#"><u>getStreamBaseName()</u></a> Get input streamName (no version info).
<a href="#"><u>IDvrStreamStore</u></a>	<a href="#"><u>getStreamStore()</u></a> (String vStreamName) Given a stream name containing version info, return the associated stream store.
java.util.List	<a href="#"><u>getStreamStores()</u></a> Get list of all stream stores known to this stream manager.
<a href="#"><u>IDvrStreamVersionHandler</u></a>	<a href="#"><u>getStreamVersionHandler()</u></a> Get the stream version handler object.
void	<a href="#"><u>initialAttributes()</u></a> (String vStreamName, int dvrWindow)
void	<a href="#"><u>initialManifest()</u></a> (String vStreamName, <a href="#"><u>IDvrManifest</u></a> manifest)
void	<a href="#"><u>initialManifestEnd()</u></a> (String vStreamName)
boolean	<a href="#"><u>isRecording()</u></a> Is this stream currently recording.
boolean	<a href="#"><u>isRecordingPaused()</u></a> Is this stream currently paused from recording.
<a href="#"><u>IDvrStreamStore</u></a>	<a href="#"><u>loadArchivedStore()</u></a> (String vStreamName, DvrManifestHolder manifestHolder) Load archived stream store.
void	<a href="#"><u>notifyDvrStreamStorageDeleted()</u></a> ( <a href="#"><u>IDvrStreamStore</u></a> store, IDvrFileSystem FileSystem, boolean success)
void	<a href="#"><u>notifyDvrStreamStoreCreate()</u></a> ( <a href="#"><u>IDvrStreamStore</u></a> store)
void	<a href="#"><u>notifyDvrStreamStoreDestroy()</u></a> ( <a href="#"><u>IDvrStreamStore</u></a> store)
void	<a href="#"><u>notifyDvrStreamStoreInit()</u></a> ( <a href="#"><u>IDvrStreamStore</u></a> store)

void	<a href="#">notifyDvrStreamStoreLoaded</a> ( <a href="#">IDvrStreamStore</a> store)
void	<a href="#">notifyTimeReset</a> ( <a href="#">IDvrStreamStore</a> store, long oldDvrTime, long oldPacketTime, <a href="#">TimeMapRecord</a> newTimeMapRecord)
<a href="#">IDvrStreamStore</a>	<a href="#">pauseRecording</a> () Request that stream recording pause.
void	<a href="#">purgeManifestEntries</a> (String vStreamName, <a href="#">DvrManifestEntryRangeGroup</a> rangeGroup) Purge entries from store
void	<a href="#">removeDvrRecordingListener</a> ( <a href="#">IDvrRecordingListener</a> listener) Remove listener to DVR recording events.
void	<a href="#">removeDvrStoreListener</a> ( <a href="#">IDvrStoreListener</a> listener) Remove listener of DVR store lifecycle events.
void	<a href="#">removeStreamStore</a> (String vStreamName)
void	<a href="#">resetStream</a> () Reset the stream.
<a href="#">IDvrStreamStore</a>	<a href="#">resumeRecording</a> () Request that stream recording resume.
void	<a href="#">setDataHandler</a> ( <a href="#">IHTTPStreamerCupertinoLivePacketizerDataHandler</a> dataHandler)
void	<a href="#">setDefaultStreamingStore</a> ( <a href="#">IDvrStreamStore</a> store) Set the store to be used for streaming.
void	<a href="#">setRecordingStreamStore</a> ( <a href="#">IDvrStreamStore</a> store) Set the store used for recording.
void	<a href="#">setStreamVersionHandler</a> ( <a href="#">IDvrStreamVersionHandler</a> handler) Set the stream version handler object.
<a href="#">IDvrStreamStore</a>	<a href="#">startRecording</a> () Request that stream recording start.
void	<a href="#">stateChange</a> (String vStreamName, <a href="#">DvrStreamStoreState</a> state)
<a href="#">IDvrStreamStore</a>	<a href="#">stopRecording</a> () Request that stream recording stop.
<a href="#">DvrChunkStorageInfo</a>	<a href="#">storeChunks</a> (int vDuration, <a href="#">DvrPacketHolder</a> vPackets, int aDuration, <a href="#">DvrPacketHolder</a> aPackets, int dDuration, <a href="#">DvrPacketHolder</a> dPackets)
boolean	<a href="#">storeOnMetadata</a> (long pt, long utc, <a href="#">AMFPacket</a> metaPacket)

Methods inherited from interface [com.wowza.wms.stream.livepacketizer.ILiveStreamPacketizer](#)

```
getAndSetStartStream, getApplicationInstance, getLiveStreamPacketizerId,  
getProperties, getRepeaterLastSequence, handlePacket, init, isActive,  
isPacketizeAudio, isPacketizeData, isPacketizeVideo, isRepeaterEdge, resetStream,  
setLiveStreamPacketizerId, setPacketizeAudio, setPacketizeData, setPacketizeVideo,  
setRepeaterEdge, shutdown, startStream, touch
```

## Methods

### getContextStr

```
public String getContextStr()
```

Get stream context string, useful for logging.

**Returns:**

stream context string

### getStreamBaseName

```
public String getStreamBaseName()
```

Get input streamName (no version info).

**Returns:**

unversioned incoming stream name

### getStreamStore

```
public IDvrStreamStore getStreamStore(String vStreamName)
```

Given a stream name containing version info, return the associated stream store.

**Parameters:**

vStreamName - versioned stream name

**Returns:**

store or null

### getPacketizerName

```
public String getPacketizerName()
```

Get live stream packetizer name.

**Returns:**

live stream packetizer name

### getStreamStores

```
public java.util.List getStreamStores()
```

Get list of all stream stores known to this stream manager.

**Returns:**

list of stream stores.

## getHighestVersionedStore

```
public IDvrStreamStore getHighestVersionedStore()
```

Return stream store that is highest known version.

**Returns:**

stream store

---

## getMinimumAvailableChunks

```
public int getMinimumAvailableChunks()
```

Return number of chunks that must be available to stream.

**Returns:**

minimum available chunks

---

## setRecordingStreamStore

```
public void setRecordingStreamStore(IDvrStreamStore store)
```

Set the store used for recording.

**Parameters:**

store - stream store, or null

---

## getRecordingStreamStore

```
public IDvrStreamStore getRecordingStreamStore()
```

Get current recording store

**Returns:**

current recording store (may be null)

---

## setDefaultStreamingStore

```
public void setDefaultStreamingStore(IDvrStreamStore store)
```

Set the store to be used for streaming.

**Parameters:**

store - store to stream.

---

## getDefaultStreamingStore

```
public IDvrStreamStore getDefaultStreamingStore()
```

Get the store to be used for streaming.

**Returns:**

store to stream.

---

## getDvrStorageWindowSeconds

```
public int getDvrStorageWindowSeconds()
```

---

(continued from last page)

Get DVR window size.

**Returns:**

window size in seconds (0 means infinite window size)

---

## getDvrStorageDir

```
public String getDvrStorageDir()
```

Get the storage directory.

**Returns:**

storage directory

---

## getDvrFileSystemClass

```
public String getDvrFileSystemClass()
```

Get the class used for the DVR file system.

**Returns:**

fully qualified class name

---

## getArchiveStrategy

```
public String getArchiveStrategy()
```

Get the DVR archive strategy.

**Returns:**

The archive strategy

---

## getEncryptionRepeaterSharedSecret

```
public String getEncryptionRepeaterSharedSecret()
```

Get the DVR encryption shared secret.

**Returns:**

shared secret.

---

## getEncryptionDelegate

```
public DvrBaseEncryptionInfoDelegate getEncryptionDelegate()
```

Get the encryption delegate for providing streaming side encryption info objects.

**Returns:**

delegate

---

## getStreamVersionHandler

```
public IDvrStreamVersionHandler getStreamVersionHandler()
```

Get the stream version handler object.

**Returns:**

stream version handler object.

## setStreamVersionHandler

```
public void setStreamVersionHandler(IDvrStreamVersionHandler handler)
```

Set the stream version handler object. Must be called after the stream manager is created and before it is initialized.

**Parameters:**

handler - stream version handler object.

---

## resetStream

```
public void resetStream()
```

Reset the stream.

---

## canRecord

```
public boolean canRecord()
```

Is this stream able to record.

**Returns:**

true if this stream is recordable.

---

## isRecording

```
public boolean isRecording()
```

Is this stream currently recording. If this stream is not recordable, the method returns false.

**Returns:**

true if has a recording stream and it is recording.

---

## isRecordingPaused

```
public boolean isRecordingPaused()
```

Is this stream currently paused from recording. If this stream is not recording and not paused, the method returns false.

**Returns:**

true if has a recording is paused.

---

## startRecording

```
public IDvrStreamStore startRecording()
```

Request that stream recording start.

Used internally. Clients should call [ILiveStreamDvrRecorder.startRecording\(\)](#). Note that this call places the DVR stream store in the recording state. If the stream store is in the paused state, DVR recording will not occur.

If there is not currently a stream store for recording, one will attempt to be created. A successful start will result in registered [IDvrRecordingListeners](#) to have their [IDvrRecordingListener.recordingStarted\(IDvrStreamStore\)](#) method called.

Success only occurs if the stream canRecord [IDvrStreamStore.canRecord\(\)](#) and the stream is not already in the recording state.

**Returns:**

(continued from last page)

store if successful. null otherwise.

---

## stopRecording

```
public IDvrStreamStore stopRecording()
```

Request that stream recording stop.

Used internally. Clients should call [ILiveStreamDvrRecorder.stopRecording\(\)](#). Note that this call places the DVR stream in the *not* recording state.

A successful stop will result in registered [IDvrRecordingListeners](#) to have their [IDvrRecordingListener.recordingStopped\(IDvrStreamStore\)](#) method called.

Success only occurs if the stream is already in the recording state [IDvrStreamStore.isRecording\(\)](#).

### Returns:

store if successful. null otherwise.

---

## pauseRecording

```
public IDvrStreamStore pauseRecording()
```

Request that stream recording pause.

Used internally. Clients should call [ILiveStreamDvrRecorder.pauseRecording\(\)](#). The stream does not have to be actively recording to be paused. For example, it could be paused before packets start flowing.

A successful pause will result in registered [IDvrRecordingListeners](#) to have their [IDvrRecordingListener.recordingPaused\(IDvrStreamStore\)](#) method called.

### Returns:

store if successful. null otherwise.

---

## resumeRecording

```
public IDvrStreamStore resumeRecording()
```

Request that stream recording resume.

Used internally. Clients should call [ILiveStreamDvrRecorder.resumeRecording\(\)](#). The stream does not have to be actively recording to be resumed. For example, it could have been paused before the stream started, and this call would move it out of the paused state.

A successful resume will result in registered [IDvrRecordingListeners](#) to have their [IDvrRecordingListener.recordingResumed\(IDvrStreamStore\)](#) method called.

### Returns:

store if successful. null otherwise.

---

## loadArchivedStore

```
public IDvrStreamStore loadArchivedStore(String vStreamName,  
    DvrManifestHolder manifestHolder)
```

Load archived stream store.

### Parameters:

vStreamName - versioned stream Name (e.g. myStream.0)

manifestHolder - manifest holder containing list of manifest properties

### Returns:

(continued from last page)

stream store

---

## deleteArchivedStore

```
public void deleteArchivedStore(String vStreamName)
```

Delete archived stream store.

### Parameters:

vStreamName - versioned stream Name (e.g. myStream.0)

---

## addManifestEntries

```
public void addManifestEntries(String vStreamName,  
    java.util.List entries,  
    String serverGuid)
```

Add to stream stores manifest.

### Parameters:

vStreamName - versioned stream Name (e.g. myStream.0)  
entries - list of manifest entries.  
serverGuid

---

## purgeManifestEntries

```
public void purgeManifestEntries(String vStreamName,  
    DvrManifestEntryRangeGroup rangeGroup)
```

Purge entries from store

### Parameters:

vStreamName - versioned stream Name (e.g. myStream.0)  
rangeGroup - set of ranges for purging

---

## storeChunks

```
public DvrChunkStorageInfo storeChunks(int vDuration,  
    DvrPacketHolder vPackets,  
    int aDuration,  
    DvrPacketHolder aPackets,  
    int dDuration,  
    DvrPacketHolder dPackets)
```

---

## storeOnMetadata

```
public boolean storeOnMetadata(long pt,  
    long utc,  
    AMFPacket metaPacket)
```

---

## addDvrStoreListener

```
public void addDvrStoreListener(IDvrStoreListener listener)
```

Add listener to DVR store lifecycle events.

---

(continued from last page)

**Parameters:**

listener - listener

---

**removeDvrStoreListener**

```
public void removeDvrStoreListener(IDvrStoreListener listener)
```

Remove listener of DVR store lifecycle events.

**Parameters:**

listener - listener

---

**addDvrRecordingListener**

```
public void addDvrRecordingListener(IDvrRecordingListener listener)
```

Add listener to DVR recording events.

**Parameters:**

listener - listener

---

**removeDvrRecordingListener**

```
public void removeDvrRecordingListener(IDvrRecordingListener listener)
```

Remove listener to DVR recording events.

**Parameters:**

listener - listener

---

**notifyDvrStreamStoreCreate**

```
public void notifyDvrStreamStoreCreate(IDvrStreamStore store)
```

---

**notifyDvrStreamStoreInit**

```
public void notifyDvrStreamStoreInit(IDvrStreamStore store)
```

---

**notifyDvrStreamStoreDestroy**

```
public void notifyDvrStreamStoreDestroy(IDvrStreamStore store)
```

---

**notifyDvrStreamStoreLoaded**

```
public void notifyDvrStreamStoreLoaded(IDvrStreamStore store)
```

---

(continued from last page)

---

## notifyDvrStreamStorageDeleted

```
public void notifyDvrStreamStorageDeleted(IDvrStreamStore store,  
    IDvrFileSystem fileSystem,  
    boolean success)
```

---

## notifyTimeReset

```
public void notifyTimeReset(IDvrStreamStore store,  
    long oldDvrTime,  
    long oldPacketTime,  
    TimeMapRecord newTimeMapRecord)
```

---

## getInitialRepeaterItems

```
public void getInitialRepeaterItems(java.util.List items)
```

Get initial repeater items to send to repeater receiver.

When an edge initially requests the items, instead of sending the entire manifest and all repeater items up until that point, the player sends a `DvrRepeaterHolder.REPEATER_INITIAL_MANIFEST` event followed by several `DvrRepeaterHolder.REPEATER_ADD_MANIFEST_ENTRIES` events.

This allows us to not bother sending any purged manifest entries.

### Parameters:

items

---

## getRepeaterItemsDvr

```
public void getRepeaterItemsDvr(java.util.List items,  
    long lastSeq)
```

---

## initialManifest

```
public void initialManifest(String vStreamName,  
    IDvrManifest manifest)
```

---

## initialManifestEnd

```
public void initialManifestEnd(String vStreamName)
```

---

## initialAttributes

```
public void initialAttributes(String vStreamName,  
    int dvrWindow)
```

---

(continued from last page)

## stateChange

```
public void stateChange(String vStreamName,  
    DvrStreamStoreState state)
```

---

## removeStreamStore

```
public void removeStreamStore(String vStreamName)
```

---

## addRepeaterHeartBeatItem

```
public void addRepeaterHeartBeatItem()
```

---

## setDataHandler

```
public void setDataHandler(IHTTPStreamerCupertinoLivePacketizerDataHandler  
dataHandler)
```

---

## getDataHandler

```
public IHTTPStreamerCupertinoLivePacketizerDataHandler getDataHandler()
```

---

## com.wowza.wms.dvr Interface IDvrStreamStore

public interface **IDvrStreamStore**  
extends

### Method Summary

void	<a href="#"><u>addDvrChunkListener</u></a> ( <a href="#"><u>IDvrStoreChunkListener</u></a> listener) Add (very fine) listener for chunk events.
void	<a href="#"><u>addManifestEntries</u></a> (java.util.List entries)
boolean	<a href="#"><u>canPlay</u></a> () Is this store capable of playing.
boolean	<a href="#"><u>canRecord</u></a> () Is this store capable of recording.
<a href="#"><u>IApplicationInstance</u></a>	<a href="#"><u>getAppInstance</u></a> () Get associated application instance.
<a href="#"><u>IDvrChunker</u></a>	<a href="#"><u>getChunker</u></a> ()
long	<a href="#"><u>getClosestStartTime</u></a> (int type, long t)
String	<a href="#"><u>getContextStr</u></a> () Get stream context string, useful for logging.
DvrChunk	<a href="#"><u>getDvrChunkAtTime</u></a> (int fragmentType, long t)
DvrChunk	<a href="#"><u>getDvrChunkByIndex</u></a> (int fragmentType, long index)
DvrChunk	<a href="#"><u>getDvrChunkNearTime</u></a> (int fragmentType, long t, long delta)
<a href="#"><u>IDvrStreamManager</u></a>	<a href="#"><u>getDvrManager</u></a> () Get DVR Stream Manager
int	<a href="#"><u>getDvrStorageWindowSeconds</u></a> () Get DVR window size.
IDvrFileSystem	<a href="#"><u>getFileSystem</u></a> ()
<a href="#"><u>IDvrManifest</u></a>	<a href="#"><u>getManifest</u></a> () Get manifest
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties</u></a> () Get stream store properties.
<a href="#"><u>IDvrPurgeController</u></a>	<a href="#"><u>getPurgeController</u></a> () Get purge controller for stream store.

java.util.List	<a href="#"><u>getRecordedEntriesWithLimit</u></a> (int fragmentType, long t, int limit)
<a href="#"><u>DvrManifestEntry</u></a>	<a href="#"><u>getRecordedEntryByIndex</u></a> (int fragmentType, long index)
<a href="#"><u>DvrManifestEntry</u></a>	<a href="#"><u>getRecordedEntryByTime</u></a> (int fragmentType, long t)
String	<a href="#"><u>getStreamName</u></a> () Get versioned stream name.
DvrTimeMapper	<a href="#"><u>getTimeMapper</u></a> () Get time mapper, which maps between DVR, real and packet time.
boolean	<a href="#"><u>hasAudio</u></a> () Does this store have audio.
boolean	<a href="#"><u>hasData</u></a> () Does this store have data.
boolean	<a href="#"><u>hasEncryption</u></a> () Does this store contain encryption information
boolean	<a href="#"><u>hasOnMetadata</u></a> () Does this store have on metadata.
boolean	<a href="#"><u>hasVideo</u></a> () Does this store have video.
void	<a href="#"><u>init</u></a> () Initialize DVR stream store.
boolean	<a href="#"><u>isLive</u></a> () Is store currently live For an origin, <a href="#"><u>isRecording()</u></a> and <a href="#"><u>isLive()</u></a> will typically return the same result.
boolean	<a href="#"><u>isLoaded</u></a> ()
boolean	<a href="#"><u>isRecording</u></a> () Is store currently recording.
boolean	<a href="#"><u>isRecordingPaused</u></a> () Is store currently paused while recording.
boolean	<a href="#"><u>pauseRecording</u></a> () Request that stream recording pause.
void	<a href="#"><u>purgeEntries</u></a> ( <a href="#"><u>DvrManifestEntryRangeGroup</u></a> rangeGroup) Purge entries from store
void	<a href="#"><u>removeDvrChunkListener</u></a> ( <a href="#"><u>IDvrStoreChunkListener</u></a> listener) Remove (very fine) listener for chunk events.
void	<a href="#"><u>reset</u></a> ()
boolean	<a href="#"><u>resumeRecording</u></a> () Request that stream recording resume.

void	<a href="#"><code>setCanPlay</code></a> (boolean canPlay) Set the Stream Stores ability to play.
void	<a href="#"><code>setCanRecord</code></a> (boolean canRecord) Set the Stream Stores ability to record.
void	<a href="#"><code>setHasEncryption</code></a> (boolean hasEncryption) Set whether the store has encryption.
void	<a href="#"><code>setReadCacheEnable</code></a> (boolean enable) Set the state of the read cache
void	<a href="#"><code>shutdown</code></a> ( )
void	<a href="#"><code>shutdownReadCache</code></a> ( ) Shutdown the read cache, this should get called when the store shuts down.
boolean	<a href="#"><code>startRecording</code></a> ( ) Request that recording start.
boolean	<a href="#"><code>stopRecording</code></a> ( ) Request that stream recording stop.
DvrChunkStorageInfo	<a href="#"><code>storeChunks</code></a> (int vDuration, DvrPacketHolder vPackets, int aDuration, DvrPacketHolder aPackets, int dDuration, DvrPacketHolder dPackets)
boolean	<a href="#"><code>storeOnMetadata</code></a> (long pt, long utc, <a href="#"><code>AMFPacket</code></a> metaPacket)

## Methods

### **init**

```
public void init()
```

Initialize DVR stream store.

### **reset**

```
public void reset()
```

### **shutdown**

```
public void shutdown()
```

### **setReadCacheEnable**

```
public void setReadCacheEnable(boolean enable)
```

Set the state of the read cache

**Parameters:**

(continued from last page)

---

enable

---

## shutdownReadCache

```
public void shutdownReadCache()
```

Shutdown the read cache, this should get called when the store shuts down.

---

## getProperties

```
public WMSProperties getProperties()
```

Get stream store properties.

**Returns:**

properties

---

## getDvrStorageWindowSeconds

```
public int getDvrStorageWindowSeconds()
```

Get DVR window size. This may be set by setting the IDvrStreamStore's property [IDvrConstants.PROPERTY\\_WINDOW\\_DURATION](#) after the store is created and before it is initialized by using the [IDvrStoreListener.dvrStreamStoreCreate\(IDvrStreamStore\)](#)

**Returns:**

window size in seconds (0 means infinite window size)

---

## getStreamName

```
public String getStreamName()
```

Get versioned stream name.

**Returns:**

(versioned) stream name

---

## getContextStr

```
public String getContextStr()
```

Get stream context string, useful for logging.

**Returns:**

stream context string

---

## getDvrManager

```
public IDvrStreamManager getDvrManager()
```

Get DVR Stream Manager

**Returns:**

DVR Stream Manager

---

## getAppInstance

```
public IApplicationInstance getAppInstance()
```

---

(continued from last page)

Get associated application instance.

**Returns:**

application instance.

---

## getManifest

```
public IDvrManifest getManifest()
```

Get manifest

**Returns:**

manifest

---

## getTimeMapper

```
public DvrTimeMapper getTimeMapper()
```

Get time mapper, which maps between DVR, real and packet time.

**Returns:**

time mapper

---

## getPurgeController

```
public IDvrPurgeController getPurgeController()
```

Get purge controller for stream store.

**Returns:**

purge controller

---

## getFileSystem

```
public IDvrFileSystem getFileSystem()
```

---

## getChunker

```
public IDvrChunker getChunker()
```

---

## canRecord

```
public boolean canRecord()
```

Is this store capable of recording.

**Returns:**

true if store can record

---

## isLoaded

```
public boolean isLoaded()
```

## setCanRecord

```
public void setCanRecord(boolean canRecord)
```

Set the Stream Stores ability to record.

Note: Must be called when stream is not recording.

**Parameters:**

canRecord

---

## canPlay

```
public boolean canPlay()
```

Is this store capable of playing.

**Returns:**

true if store can play

---

## setCanPlay

```
public void setCanPlay(boolean canPlay)
```

Set the Stream Stores ability to play.

Note: Must be called when stream is not playing.

**Parameters:**

canPlay

---

## setHasEncryption

```
public void setHasEncryption(boolean hasEncryption)
```

Set whether the store has encryption. Used internally.

Note: Must be called when stream is not playing.

**Parameters:**

hasEncryption - if store has encryption

---

## hasEncryption

```
public boolean hasEncryption()
```

Does this store contain encryption information

**Returns:**

true if store contains encryption

---

## hasVideo

```
public boolean hasVideo()
```

Does this store have video.

**Returns:**

---

(continued from last page)

true if store contains video, false otherwise.

---

## hasAudio

```
public boolean hasAudio()
```

Does this store have audio.

**Returns:**

true if store contains audio, false otherwise.

---

## hasData

```
public boolean hasData()
```

Does this store have data.

**Returns:**

true if store contains data, false otherwise.

---

## hasOnMetadata

```
public boolean hasOnMetadata()
```

Does this store have on metadata.

**Returns:**

true if store contains on metadata, false otherwise.

---

## startRecording

```
public boolean startRecording()
```

Request that recording start.

Used internally. Clients should call [ILiveStreamDvrRecorder.startRecording\(\)](#).

Success occurs if the stream canRecord [canRecord\(\)](#) and the stream is not already in the recording state [isRecording\(\)](#).

**Returns:**

true if successful.

---

## pauseRecording

```
public boolean pauseRecording()
```

Request that stream recording pause.

Used internally. Clients should call [ILiveStreamDvrRecorder.pauseRecording\(\)](#).

Success occurs if the stream is not already paused.

**Returns:**

true if successful.

---

## resumeRecording

```
public boolean resumeRecording()
```

---

(continued from last page)

Request that stream recording resume.

Used internally. Clients should call [ILiveStreamDvrRecorder.resumeRecording\(\)](#).

Success occurs if the stream was previously paused.

**Returns:**

true if successful.

---

## stopRecording

```
public boolean stopRecording()
```

Request that stream recording stop. This shuts down saving of chunks

Used internally. Clients should call [ILiveStreamDvrRecorder.stopRecording\(\)](#).

Success only occurs if the stream is already in the recording state [isRecording\(\)](#).

**Returns:**

true if successful.

---

## isRecordingPaused

```
public boolean isRecordingPaused()
```

Is store currently paused while recording.

**Returns:**

true if recording is paused.

---

## isRecording

```
public boolean isRecording()
```

Is store currently recording. This will always be false for an edge.

**Returns:**

true if recording

---

## isLive

```
public boolean isLive()
```

Is store currently live For an origin, [isRecording\(\)](#) and [isLive\(\)](#) will typically return the same result. On an origin, [isRecording\(\)](#) will always be false. But [isLive\(\)](#) will reflect the status of the repeated stream.

**Returns:**

true if live

---

## storeChunks

```
public DvrChunkStorageInfo storeChunks(int vDuration,
    DvrPacketHolder vPackets,
    int aDuration,
    DvrPacketHolder aPackets,
    int dDuration,
    DvrPacketHolder dPackets)
```

---

## storeOnMetadata

```
public boolean storeOnMetadata(long pt,  
                                long utc,  
                                AMFPacket metaPacket)
```

---

## purgeEntries

```
public void purgeEntries(DvrManifestEntryRangeGroup rangeGroup)
```

Purge entries from store

**Parameters:**

rangeGroup - s set of ranges for purging

---

## addManifestEntries

```
public void addManifestEntries(java.util.List entries)
```

---

## addDvrChunkListener

```
public void addDvrChunkListener(IDvrStoreChunkListener listener)
```

Add (very fine) listener for chunk events.

**Parameters:**

listener - listener

---

## removeDvrChunkListener

```
public void removeDvrChunkListener(IDvrStoreChunkListener listener)
```

Remove (very fine) listener for chunk events.

**Parameters:**

listener - listener

---

## getRecordedEntriesWithLimit

```
public java.util.List getRecordedEntriesWithLimit(int fragmentType,  
                                                    long t,  
                                                    int limit)
```

---

## getRecordedEntryByIndex

```
public DvrManifestEntry getRecordedEntryByIndex(int fragmentType,  
                                                  long index)
```

---

(continued from last page)

---

## getRecordedEntryByTime

```
public DvrManifestEntry getRecordedEntryByTime(int fragmentType,  
        long t)
```

---

## getDvrChunkByIndex

```
public DvrChunk getDvrChunkByIndex(int fragmentType,  
        long index)
```

---

## getDvrChunkAtTime

```
public DvrChunk getDvrChunkAtTime(int fragmentType,  
        long t)
```

---

## getDvrChunkNearTime

```
public DvrChunk getDvrChunkNearTime(int fragmentType,  
        long t,  
        long delta)
```

---

## getClosestStartTime

```
public long getClosestStartTime(int type,  
        long t)
```

## com.wowza.wms.dvr Interface IDvrStreamVersionHandler

All Known Implementing Classes:

[DefaultDvrStreamVersionHandler](#)

public interface **IDvrStreamVersionHandler**  
extends

Callback to manage (archival) versions of DVR stream stores

### Method Summary

<a href="#">IDvrStreamStore</a>	<a href="#">determineExistingStoreForPlaying</a> ( <a href="#">IDvrStreamManager</a> dvrManager, String baseStreamName) When a session requests a stream store w/o specifying the version, we need gto determine the version of the stream to store.
<a href="#">IDvrStreamStore</a>	<a href="#">determineExistingStoreForRecording</a> ( <a href="#">IDvrStreamManager</a> dvrManager, String baseStreamName) After a set of versioned streams are loaded from disk, one of them may be designated the stream that will be recorded to (i.e.
String	<a href="#">getArchiveStrategy</a> ( <a href="#">IDvrStreamManager</a> dvrManager, String baseStreamName) Determine the archive strategy for a given set of streams.
boolean	<a href="#">handleArchivedStream</a> ( <a href="#">IDvrStreamManager</a> dvrManager, String baseStreamName, String version, java.util.SortedSet versions, DvrManifestHolder manifest) When a stream group inits, the file system is checked for older versions of the streams.
boolean	<a href="#">shouldDeleteArchivedStream</a> ( <a href="#">IDvrStreamManager</a> dvrManager, <a href="#">IDvrStreamStore</a> store) Determine if a given stream store version should be deleted.
boolean	<a href="#">shouldLoadArchivedStream</a> ( <a href="#">IDvrStreamManager</a> dvrManager, String baseStreamName, String version, java.util.SortedSet versions, DvrManifestHolder manifest) Determine if a given stream store version should be loaded into WMS.

### Methods

#### determineExistingStoreForRecording

```
public IDvrStreamStore determineExistingStoreForRecording(IDvrStreamManager
dvrManager,
    String baseStreamName)
```

After a set of versioned streams are loaded from disk, one of them may be designated the stream that will be recorded to (i.e. append mode).

The default implementation says that if append mode, then the highest versioned stream that has canRecord set to true is used. But this API, allows for a more detailed logic.

#### Parameters:

dvrManager - The DVR Stream Manager

(continued from last page)

baseStreamName - The base stream name (no version info). e.g. myStream

**Returns:**

stream store to append to, null if no stream in the stream group is to be appended to.

**See Also:**

[DefaultDvrStreamVersionHandler](#)

---

## determineExistingStoreForPlaying

```
public IDvrStreamStore determineExistingStoreForPlaying(IDvrStreamManager dvrManager,  
String baseStreamName)
```

When a session requests a stream store w/o specifying the version, we need to determine the version of the stream to store.

The default implementation first checks the recording stream. If it 'canPlay()', it is returned. Otherwise, the highest versioned stream that canRecord set to true is used.

**Parameters:**

dvrManager - The DVR Stream Manager

baseStreamName - The base stream name (no version info). e.g. myStream

**Returns:**

stream store to stream, null if no stream in the stream group can be played.

**See Also:**

[DefaultDvrStreamVersionHandler](#)

---

## getArchiveStrategy

```
public String getArchiveStrategy(IDvrStreamManager dvrManager,  
String baseStreamName)
```

Determine the archive strategy for a given set of streams.

Typically, this returns the archive strategy as specified in Application.xml, but this API provides a hook for more detailed logic in determining the strategy.

**Parameters:**

dvrManager - The DVR App Instance Manager

baseStreamName - The base stream name (no version info). e.g. myStream

**Returns:**

the archive strategy

**See Also:**

[DefaultDvrStreamVersionHandler](#)

[IDvrConstants.ARCHIVE\\_STRATEGY\\_APPEND](#)

[IDvrConstants.ARCHIVE\\_STRATEGY\\_DELETE](#)

[IDvrConstants.ARCHIVE\\_STRATEGY\\_VERSION](#)

---

## handleArchivedStream

```
public boolean handleArchivedStream(IDvrStreamManager dvrManager,  
String baseStreamName,  
String version,  
java.util.SortedSet versions,  
DvrManifestHolder manifest)
```

(continued from last page)

When a stream group inits, the file system is checked for older versions of the streams. This method is called to handle the streams.

Typically, 3 things can happen: The stream is ignored, loaded, or deleted.

**Parameters:**

dvrManager - The DVR Stream Manager  
baseStreamName - The base stream name (no version info). e.g. myStream  
version - The version of the stream to be loaded.  
versions - A sorted set of all the versions that are attempting to be loaded  
manifest - The main manifest info of the stream

**Returns:**

true if handled in some manner, false if ignored (unhandled)

**See Also:**

[DefaultDvrStreamVersionHandler](#)

---

## shouldLoadArchivedStream

```
public boolean shouldLoadArchivedStream(IDvrStreamManager dvrManager,  
    String baseStreamName,  
    String version,  
    java.util.SortedSet versions,  
    DvrManifestHolder manifest)
```

Determine if a given stream store version should be loaded into WMS.

**Parameters:**

dvrManager - The DVR Stream Manager  
baseStreamName - The base stream name (no version info). e.g. myStream  
version - The version of the stream to be loaded.  
versions - A sorted set of all the versions that are attempting to be loaded  
manifest - The main manifest info of the stream

**Returns:**

true if should be loaded. false if not.

**See Also:**

[DefaultDvrStreamVersionHandler](#)

---

## shouldDeleteArchivedStream

```
public boolean shouldDeleteArchivedStream(IDvrStreamManager dvrManager,  
    IDvrStreamStore store)
```

Determine if a given stream store version should be deleted.

**Parameters:**

dvrManager - The DVR Stream Manager  
store - The DVR store

**Returns:**

true if should be deleted. false if not.

**See Also:**

[DefaultDvrStreamVersionHandler](#)

Package

**com.wowza.wms.http**

## com.wowza.wms.http Class HTTPProvider2Base

```
java.lang.Object
  |
  +--com.wowza.wms.http.HTTPProvider2Base
        |
        +--com.wowza.wms.http.HTTPProvider2Base
```

All Implemented Interfaces:

[IHTTPProvider2](#)

---

public abstract class **HTTPProvider2Base**  
extends HTTPProvider2Base

HTTPProvider2Base: public base class for implementing HTTP Providers.

Simple HTTPProvider class

```

package com.wowza.wms.plugin.test.http;

public class HTTPHelloWowza extends HTTPProvider2Base
{
    public void onBind(IVHost vhost, HostPort hostPort)
    {
        super.onBind(vhost, hostPort);
        // Called when the HTTP Provider is added to the VHost it is configured for.
    }

    public void onUnbind(IVHost vhost, HostPort hostPort)
    {
        // Called when the VHost is shutting down for the hostPort configured
    }

    public void onHTTPRequest(IVHost vhost, IHTTPRequest req, IHTTPResponse resp)
    {
        // If you omit this no authentication is checked regardless of the
configuration
        if (!doHTTPAuthentication(vhost, req, resp))
            return;

        String retStr = "<head><title>Hello Wowza</title></head><body>Hello
Wowza</body>";
        try
        {
            OutputStream out = resp.getOutputStream();
            byte[] outBytes = retStr.getBytes();
            out.write(outBytes);
        }
        catch (Exception e)
        {
            WMSLoggerFactory.getLogger(HTTPHelloWowza.class).error("HTTPHelloWowza ", e);
        }
    }
}

```

Can be added with the following HTTPProvider XML configuration

```

<httpprovider>

<baseclass>com.wowza.wms.plugin.test.http.HTTPHelloWowza</baseclass>
    <requestfilters>helloworld*</requestfilters>
    <authenticationmethod>none</authenticationmethod>

</httpprovider>

```

**Fields inherited from class** `com.wowza.wms.http.HTTPProvider2Base`

## com.wowza.wms.http Interface IHTTPProvider

All Subinterfaces:

[IHTTPProvider2](#)

public interface **IHTTPProvider**  
extends

IHTTPProvider: HTTP provider class for a given HostPort definition. Receive all HTTP requests that are not RTMPT requests. See IHTTPProvider2 for the extended version of this interface.

### Method Summary

void	<a href="#">addCORSHeaders</a> ( <a href="#">IHTTPRequest</a> req, <a href="#">IHTTPResponse</a> resp) Called to provide CORS Headers to the output
void	<a href="#">addCORSHeaders</a> ( <a href="#">IHTTPResponse</a> resp) Called to provide CORS Headers to the output, no dynamic CORS output
void	<a href="#">addDateHeader</a> ( <a href="#">IHTTPResponse</a> resp) Called to provide Date Header to the output
void	<a href="#">addWebSocketSession</a> ( <a href="#">IWebSocketSession</a> webSocketSession) Add WebSocket session
int	<a href="#">broadcastWebSocketMessage</a> ( <a href="#">WebSocketMessage</a> message) Broadcast a WebSocket message to all connected WebSocket sessions.
int	<a href="#">getWebSocketSessionCount</a> () Get total count of WebSocket sessions for this HTTPProvider
java.util.List	<a href="#">getWebSocketSessions</a> () Get a list of all WebSocket sessions for this HTTPProvider
void	<a href="#">onBind</a> ( <a href="#">IVHost</a> vhost, <a href="#">HostPort</a> hostPort) Triggered after hostPort binds to socket
void	<a href="#">onHTTPRequest</a> ( <a href="#">IVHost</a> vhost, <a href="#">IHTTPRequest</a> req, <a href="#">IHTTPResponse</a> resp) Triggered for each HTTP request to the given hostPort that is not an RTMPT request.
void	<a href="#">onUnbind</a> ( <a href="#">IVHost</a> vhost, <a href="#">HostPort</a> hostPort) Triggered after hostPort unbinds
boolean	<a href="#">removeWebSocketSession</a> ( <a href="#">IWebSocketSession</a> webSocketSession) Remove WebSocket session
void	<a href="#">setProperties</a> ( <a href="#">WMSProperties</a> properties) Called to provide properties set in configuration files
boolean	<a href="#">validatePath</a> (String path) Called to check path request is within scope

(continued from last page)

## Methods

### onBind

```
public void onBind(IVHost vhost,  
                  HostPort hostPort)
```

Triggered after hostPort binds to socket

**Parameters:**

vhost - parent vhost  
hostPort - host port definition

### onHTTPRequest

```
public void onHTTPRequest(IVHost vhost,  
                          IHTTPRequest req,  
                          IHTTPResponse resp)
```

Triggered for each HTTP request to the given hostPort that is not an RTMPT request.

**Parameters:**

vhost - parent vhost  
req - HTML request object  
resp - HTML response object

### onUnbind

```
public void onUnbind(IVHost vhost,  
                    HostPort hostPort)
```

Triggered after hostPort unbinds

**Parameters:**

vhost - parent vhost  
hostPort - host port definition

### setProperties

```
public void setProperties(WMSProperties properties)
```

Called to provide properties set in configuration files

### addCORSHeaders

```
public void addCORSHeaders(IHTTPResponse resp)
```

Called to provide CORS Headers to the output, no dynamic CORS output

**Parameters:**

resp

### addCORSHeaders

```
public void addCORSHeaders(IHTTPRequest req,  
                          IHTTPResponse resp)
```

Called to provide CORS Headers to the output

(continued from last page)

**Parameters:**resp

---

**addDateHeader**

```
public void addDateHeader(IHTTPResponse resp)
```

Called to provide Date Header to the output

**Parameters:**resp

---

**validatePath**

```
public boolean validatePath(String path)
```

Called to check path request is within scope

**Parameters:**

path

**Returns:**

---

**addWebSocketSession**

```
public void addWebSocketSession(IWebSocketSession websocketSession)
```

Add WebSocket session

**Parameters:**websocketSession - WebSocket session

---

**removeWebSocketSession**

```
public boolean removeWebSocketSession(IWebSocketSession websocketSession)
```

Remove WebSocket session

**Parameters:**

websocketSession - WebSocket session

**Returns:**true, if session removed

---

**getWebSocketSessions**

```
public java.util.List getWebSocketSessions()
```

Get a list of all WebSocket sessions for this HTTPProvider

**Returns:**list of all WebSocket sessions

---

**getWebSocketSessionCount**

```
public int getWebSocketSessionCount()
```

---

(continued from last page)

Get total count of WebSocket sessions for this HTTPProvider

**Returns:**

total count of WebSocket sessions for this HTTPProvider

---

## **broadcastWebSocketMessage**

```
public int broadcastWebSocketMessage(WebSocketMessage message)
```

Broadcast a WebSocket message to all connected WebSocket sessions.

**Parameters:**

message - message to broadcast

**Returns:**

number of sessions the message was sent to

## com.wowza.wms.http Interface IHTTPProvider2

All Superinterfaces:  
[IHTTPProvider](#)

---

public interface **IHTTPProvider2**  
extends [IHTTPProvider](#)

IHTTPProvider2: Extension of IHTTPProvider that adds support for multiple HTTPProviders attached to a single HostPort along with authentication. Multiple HTTPProviders can be added to a HostPort definition. They are configured as follows:

```
<HTTPProvider>
  <BaseClass>com.wowza.wms.http.HTTPServerVersion</BaseClass>
  <RequestFilters>*serverversion</RequestFilters>
  <AuthenticationMethod>none</AuthenticationMethod>
</HTTPProvider>
```

Below is an sample implementation of the HTTPServerVersion provider:

```

import java.io.*;

import com.wowza.wms.server.*;
import com.wowza.wms.stream.*;
import com.wowza.wms.vhost.*;
import com.wowza.wms.logging.*;

public class HTTPServerVersion extends HTTPProvider2Base
{
    public void onHTTPRequest(IVHost vhost, IHTTPRequest req, IHTTPResponse resp)
    {
        if (!doHTTPAuthentication(vhost, req, resp))
            return;

        String version = MediaStreamBase.p+" "+ReleaseInfo.getVersion()+"
build"+ReleaseInfo.getBuildNumber();
        String retStr =
"<html><head><title>"+version+"</title></head><body>"+version+"</body></html>";
        try
        {
            OutputStream out = resp.getOutputStream();
            byte[] outBytes = retStr.getBytes();
            out.write(outBytes);
        }
        catch (Exception e)
        {
            WMSLoggerFactory.getLogger(HTTPServerVersion.class).error("HTMLServerVersion ", e);
        }
    }
}

```

## Method Summary

## Methods

### canHandle

```
public boolean canHandle(String path)
```

---

### setRequestFilters

```
public void setRequestFilters(String requestFilters)
```

---

### getRequestFilters

```
public String getRequestFilters()
```

---

### init

```
public void init()
```

---

### getAuthenticationMethod

```
public String getAuthenticationMethod()
```

---

### setAuthenticationMethod

```
public void setAuthenticationMethod(String authenticationMethod)
```

## com.wowza.wms.http Interface IHttpRequest

public interface **IHttpRequest**  
extends

### Field Summary

public static final	<a href="#">HTTP_HEADER_X_FORWARDED_FOR</a> Value: <b>x-forwarded-for</b>
public static final	<a href="#">HTTP_HEADER_X_REAL_IP</a> Value: <b>x-real-ip</b>
public static final	<a href="#">PROPERTY_X_FORWARDED_LIST</a> Value: <b>httpForwardedProxyList</b>

### Method Summary

int	<a href="#">getContentLength()</a> Get the content length of the body of the message
String	<a href="#">getContentType()</a> Get the request content type
String	<a href="#">getForwardedIP(String excludeAddresses)</a> Get X-[real-forwarded] address
String	<a href="#">getHeader(String name)</a> Get a HTTP header value such as 'Content-Length'
byte[]	<a href="#">getHeaderBytes()</a> Returns the header as bytes
java.util.Map	<a href="#">getHeaderMap()</a> Get a copy of the HTTP request header map
java.util.Set	<a href="#">getHeaderNames()</a> Get a Set of the header names
java.io.InputStream	<a href="#">getInputStream()</a> Get the body of the message as an input stream
int	<a href="#">getIntHeader(String name)</a> Get a HTTP header value such as 'Content-Length' and return as int
java.util.Locale	<a href="#">getLocale()</a> Get locale of request (Example: en-us)
String	<a href="#">getMethod()</a> Get the method invocation method: GET, POST, HEAD

byte[]	<a href="#"><u>getMsgBytes()</u></a> Return the message bytes
String	<a href="#"><u>getParameter(String name)</u></a> Get a parameter value
java.util.Map	<a href="#"><u>getParameterMap()</u></a> Get the entire parameter Map
java.util.Set	<a href="#"><u>getParameterNames()</u></a> Get a Set of parameter names
String[]	<a href="#"><u>getParameterValues(String name)</u></a> Get a multi-value parameter as an array of String
String	<a href="#"><u>getPath()</u></a> Returns the HTTP path element of the request
String	<a href="#"><u>getProtocol()</u></a> Get the request protocol (example: HTTP/1.1)
String	<a href="#"><u>getQueryString()</u></a> Get the query string part of the url (everything after the ?)
String	<a href="#"><u>getRemoteAddr()</u></a> Get the remote ip address of the request
String	<a href="#"><u>getRemoteHost()</u></a> Get the remote host name (if known) if not return ip address
String	<a href="#"><u>getRequestURI()</u></a> Get the full request URI
String	<a href="#"><u>getRequestURL()</u></a> Get the request url (same as URI minus the query string)
String	<a href="#"><u>getScheme()</u></a> Get the request scheme (Example "http")
String	<a href="#"><u>getServerName()</u></a> Get the name of the server (Example: "Wowza Streaming Engine")
int	<a href="#"><u>getServerPort()</u></a> Get the port this request was received on
boolean	<a href="#"><u>isHeadRequest()</u></a> Returns true if the request is a HEAD request
boolean	<a href="#"><u>isSecure()</u></a> Returns true is the request is protected by SSL
boolean	<a href="#"><u>isUpgradeRequest()</u></a> Returns true if upgrade request (WebSocket,...)
void	<a href="#"><u>parseBodyForParams()</u></a> If the body of the message contains parameter data (data in name value pairs separated by & character) call this routine to decode those parameters and add them to the parameter map.

void

[parseBodyForParams](#)(boolean doDecode)

If the body of the message contains parameter data (data in name value pairs separated by & character) call this routine to decode those parameters and add them to the parameter map.

## Fields

### HTTP\_HEADER\_X\_REAL\_IP

```
public static final java.lang.String HTTP_HEADER_X_REAL_IP
```

Constant value: **x-real-ip**

### HTTP\_HEADER\_X\_FORWARDED\_FOR

```
public static final java.lang.String HTTP_HEADER_X_FORWARDED_FOR
```

Constant value: **x-forwarded-for**

### PROPERTY\_X\_FORWARDED\_LIST

```
public static final java.lang.String PROPERTY_X_FORWARDED_LIST
```

Constant value: **httpForwardedProxyList**

## Methods

### getHeaderMap

```
public java.util.Map getHeaderMap()
```

Get a copy of the HTTP request header map

**Returns:**

copy of the HTTP request header map

### getHeader

```
public String getHeader(String name)
```

Get a HTTP header value such as 'Content-Length'

**Parameters:**

name - header name

**Returns:**

header value

### getIntHeader

```
public int getIntHeader(String name)
```

Get a HTTP header value such as 'Content-Length' and return as int

(continued from last page)

**Parameters:**

name - header name

**Returns:**header value

---

## getHeaderNames

```
public java.util.Set getHeaderNames()
```

Get a Set of the header names

**Returns:**Set of header names

---

## getMethod

```
public String getMethod()
```

Get the method invocation method: GET, POST, HEAD

**Returns:**method

---

## getQueryString

```
public String getQueryString()
```

Get the query string part of the url (everything after the ?)

**Returns:**query string

---

## getContentLength

```
public int getContentLength()
```

Get the content length of the body of the message

**Returns:**content length of the body of the message

---

## getRequestURI

```
public String getRequestURI()
```

Get the full request URI

**Returns:**full request URI

---

## getRequestURL

```
public String getRequestURL()
```

Get the request url (same as URI minus the query string)

**Returns:**

(continued from last page)

request url

---

## getContentType

```
public String getContentType()
```

Get the request content type

**Returns:**

request content type

---

## parseBodyForParams

```
public void parseBodyForParams(boolean doDecode)
```

If the body of the message contains parameter data (data in name value pairs separated by & character) call this routine to decode those parameters and add them to the parameter map.

**Parameters:**

doDecode - true to decode the params as though they are url params

---

## parseBodyForParams

```
public void parseBodyForParams()
```

If the body of the message contains parameter data (data in name value pairs separated by & character) call this routine to decode those parameters and add them to the parameter map.

---

## getParameter

```
public String getParameter(String name)
```

Get a parameter value

**Parameters:**

name - parameter name

**Returns:**

parameter value

---

## getParameterNames

```
public java.util.Set getParameterNames()
```

Get a Set of parameter names

**Returns:**

Set of parameter names

---

## getParameterValues

```
public String[] getParameterValues(String name)
```

Get a multi-value parameter as an array of String

**Parameters:**

name - parameter name

**Returns:**

(continued from last page)

multi-value parameter as an array of String

---

## getParameterMap

```
public java.util.Map getParameterMap()
```

Get the entire parameter Map

**Returns:**

parameter Map

---

## getInputStream

```
public java.io.InputStream getInputStream()
```

Get the body of the message as an input stream

**Returns:**

body of the message as an input stream

---

## getProtocol

```
public String getProtocol()
```

Get the request protocol (example: HTTP/1.1)

**Returns:**

request protocol

---

## getScheme

```
public String getScheme()
```

Get the request scheme (Example "http")

**Returns:**

request scheme

---

## getServerName

```
public String getServerName()
```

Get the name of the server (Example: "Wowza Streaming Engine")

**Returns:**

name of the server

---

## getServerPort

```
public int getServerPort()
```

Get the port this request was received on

**Returns:**

the port this request was received on

---

(continued from last page)

---

## getRemoteAddr

```
public String getRemoteAddr()
```

Get the remote ip address of the request

**Returns:**

remote ip address of the request

---

## getForwardedIP

```
public String getForwardedIP(String excludeAddresses)
```

Get X-[real-forwarded] address

---

## getRemoteHost

```
public String getRemoteHost()
```

Get the remote host name (if known) if not return ip address

**Returns:**

remote host name

---

## getLocale

```
public java.util.Locale getLocale()
```

Get locale of request (Example: en-us)

**Returns:**

locale of request

---

## isSecure

```
public boolean isSecure()
```

Returns true is the request is protected by SSL

**Returns:**

true is the request is protected by SSL

---

## getPath

```
public String getPath()
```

Returns the HTTP path element of the request

**Returns:**

HTTP path element of the request

---

## getHeaderBytes

```
public byte[] getHeaderBytes()
```

Returns the header as bytes

**Returns:**

(continued from last page)

header as bytes

---

## **getMsgBytes**

```
public byte[] getMsgBytes()
```

Return the message bytes

**Returns:**

message bytes

---

## **isHeadRequest**

```
public boolean isHeadRequest()
```

Returns true if the request is a HEAD request

**Returns:**

true if the request is a HEAD request

---

## **isUpgradeRequest**

```
public boolean isUpgradeRequest()
```

Returns true if upgrade request (WebSocket,...)

**Returns:**

Returns true if upgrade request

---

## com.wowza.wms.http Interface IHTTPResponse

public interface **IHTTPResponse**  
extends

### Field Summary

public static final	<a href="#"><u>UPGRADE_PROTOCOL_WEBSOCKETS</u></a> Value: <b>1</b>
---------------------	---

### Method Summary

boolean	<a href="#"><u>containsHeader</u></a> (String name) Returns true if response header contains parameter name
String	<a href="#"><u>getHeader</u></a> (String name) Get header value
java.util.Map	<a href="#"><u>getHeaders</u></a> ( ) Get the current response headers as a map
int	<a href="#"><u>getHeaderSize</u></a> ( ) Get the size in bytes of the HTTP header
int	<a href="#"><u>getIntHeader</u></a> (String name) Get header value as int
java.io.OutputStream	<a href="#"><u>getOutputStream</u></a> ( ) Get the output stream for the response.
int	<a href="#"><u>getUpgradeRequestProtocol</u></a> ( ) Get the upgrade request protocol, -1 means no upgrade, see UPGRADE_PROTOCOL_*
boolean	<a href="#"><u>isHeadResponse</u></a> ( ) returns true if the response is due to a HEAD request
void	<a href="#"><u>removeHeader</u></a> (String name) Remove header value
void	<a href="#"><u>setHeader</u></a> (String name, String value) Set header value
void	<a href="#"><u>setHeadResponse</u></a> (boolean isHeadResponse) indicates if the response is a response to a HEAD request
void	<a href="#"><u>setIntHeader</u></a> (String name, int value) Set header value as int
void	<a href="#"><u>setResponseCode</u></a> (int responseCode) Set the HTTP response code

void

```
setUpgradeRequestProtocol(int upgradeRequestProtocol,  
IWebSocketEventNotify listener)
```

Set the upgrade request protocol, -1 means no upgrade, see UPGRADE\_PROTOCOL\_\*

## Fields

### UPGRADE\_PROTOCOL\_WEBSOCKETS

```
public static final int UPGRADE_PROTOCOL_WEBSOCKETS
```

Constant value: **1**

## Methods

### getOutputStream

```
public java.io.OutputStream getOutputStream()
```

Get the output stream for the response. You can then write directly into the output stream.

**Returns:**

output stream for the response

### containsHeader

```
public boolean containsHeader(String name)
```

Returns true if response header contains parameter name

**Parameters:**

name - header parameter name

**Returns:**

true if header contains value

### setHeader

```
public void setHeader(String name,  
String value)
```

Set header value

**Parameters:**

name - header parameter name

value - parameter value

### removeHeader

```
public void removeHeader(String name)
```

Remove header value

**Parameters:**

name - name

## setIntHeader

```
public void setIntHeader(String name,  
                        int value)
```

Set header value as int

### Parameters:

name - header parameter name  
value - parameter value

---

## getHeaders

```
public java.util.Map getHeaders()
```

Get the current response headers as a map

### Returns:

current response headers as a map

---

## getHeader

```
public String getHeader(String name)
```

Get header value

### Parameters:

name - header parameter name

### Returns:

parameter value

---

## getIntHeader

```
public int getIntHeader(String name)
```

Get header value as int

### Parameters:

name - header parameter name

### Returns:

parameter value

---

## setResponseCode

```
public void setResponseCode(int responseCode)
```

Set the HTTP response code

### Parameters:

responseCode - HTTP response code

---

## getHeaderSize

```
public int getHeaderSize()
```

Get the size in bytes of the HTTP header

---

(continued from last page)

**Returns:**header size in bytes

---

**setHeadResponse**

```
public void setHeadResponse(boolean isHeadResponse)
```

indicates if the response is a response to a HEAD request

**Parameters:**isHeadResponse - indicating if this is a response to a HEAD request

---

**isHeadResponse**

```
public boolean isHeadResponse()
```

returns true if the response is due to a HEAD request

**Returns:**true if the response is due to a HEAD request

---

**getUpgradeRequestProtocol**

```
public int getUpgradeRequestProtocol()
```

Get the upgrade request protocol, -1 means no upgrade, see UPGRADE\_PROTOCOL\_\*

**Returns:**upgrade request protocol

---

**setUpgradeRequestProtocol**

```
public void setUpgradeRequestProtocol(int upgradeRequestProtocol,  
    IWebSocketEventNotify listener)
```

Set the upgrade request protocol, -1 means no upgrade, see UPGRADE\_PROTOCOL\_\*

**Parameters:**

upgradeRequestProtocol - upgrade request protocol

listener - event listener

---

---

## Methods

### getPlaylistStr

public String **getPlaylistStr**(CupertinoStreamingRendition rendition)

### init

```
public void init(IHTTPStreamerApplicationContext appContext,
    IHTTPStreamerSession httpStreamerSession,
    String rawStreamName,
    String streamExt,
    String streamName,
    long playStart,
    long playDuration,
    long playSeek,
    TimedTextRequest timedTextRequest,
    String vodTranscodeNGRP)
```

(continued from last page)

## indexFile

```
public void indexFile(IHTTPStreamerSession httpStreamerSession)
```

---

## close

```
public void close()
```

---

## open

```
public void open()
```

---

## addIndexItem

```
public int addIndexItem(IHTTPStreamerCupertinoIndexItem item)
```

---

## addIndexKeyFrameItem

```
public int addIndexKeyFrameItem(IHTTPStreamerCupertinoIndexItem item)
```

---

## getIndexCount

```
public int getIndexCount()
```

---

## getIndexKeyFrameCount

```
public int getIndexKeyFrameCount()
```

---

## getIndexItem

```
public IHTTPStreamerCupertinoIndexItem getIndexItem(int index)
```

---

## getIndexKeyFrameItem

```
public IHTTPStreamerCupertinoIndexItem getIndexKeyFrameItem(int index)
```

---

## getTitleStr

```
public String getTitleStr()
```

---

(continued from last page)

---

## setTitleStr

```
public void setTitleStr(String titleStr)
```

---

## isDoEncryption

```
public boolean isDoEncryption()
```

---

## isDoKeyFrameEncryption

```
public boolean isDoKeyFrameEncryption()
```

---

## getEncURL

```
public String getEncURL()
```

---

## getEncKeyFrameURL

```
public String getEncKeyFrameURL()
```

---

## getEncInfo

```
public CupertinoEncInfo getEncInfo()
```

---

## getEncKeyFrameInfo

```
public CupertinoEncInfo getEncKeyFrameInfo()
```

---

## getChunk

```
public LiveStreamPacketizerCupertinoChunk getChunk(String filename,  
    CupertinoStreamingRendition rendition,  
    long bitrate,  
    boolean isByteRangeRequest)
```

(continued from last page)

## fillChunk

```
public void fillChunk(IHTTPStreamerCupertinoIndexItem item,  
    LiveStreamPacketizerCupertinoChunk chunk,  
    CupertinoStreamingRendition rendition,  
    long bitrate,  
    boolean isByteRangeRequest)
```

---

## getApplicationContext

```
public IHTTPStreamerApplicationContext getApplicationContext()
```

---

## getHttpStreamerSession

```
public IHTTPStreamerSession getHttpStreamerSession()
```

---

## getStreamName

```
public String getStreamName()
```

---

## getStreamNames

```
public java.util.List getStreamNames()
```

---

## getStreamBitrates

```
public java.util.List getStreamBitrates()
```

---

## getStreamNamesRaw

```
public java.util.List getStreamNamesRaw()
```

---

## getStreamMode

```
public int getStreamMode()
```

---

## setStreamMode

```
public void setStreamMode(int streamMode)
```

---

(continued from last page)

---

## getAudioBitrate

```
public int getAudioBitrate()
```

---

## setAudioBitrate

```
public void setAudioBitrate(int audioBitrate)
```

---

## getVideoBitrateAverage

```
public int getVideoBitrateAverage()
```

---

## setVideoBitrateAverage

```
public void setVideoBitrateAverage(int videoBitrate)
```

---

## getVideoBitratePeak

```
public int getVideoBitratePeak()
```

---

## setVideoBitratePeak

```
public void setVideoBitratePeak(int videoBitrate)
```

---

## getAudioCodec

```
public int getAudioCodec()
```

---

## setAudioCodec

```
public void setAudioCodec(int audioCodec)
```

---

## getID3Bitrate

```
public int getID3Bitrate(CupertinoStreamingRendition rendition)
```

---

## getID3FramesHeader

```
public ID3Frames getID3FramesHeader()
```

---

(continued from last page)

---

### getID3FramesFooter

```
public ID3Frames getID3FramesFooter()
```

---

### getID3FramesHeaderAudio

```
public ID3Frames getID3FramesHeaderAudio()
```

---

### getID3FramesFooterAudio

```
public ID3Frames getID3FramesFooterAudio()
```

---

### getCodecInfoVideo

```
public com.wowza.wms.media.model.MediaCodecInfoVideo getCodecInfoVideo()
```

---

### getCodecInfoAudio

```

## com.wowza.wms.httpstreamer.cupertinostreaming.httpstreamer Interface IHTTPStreamerCupertinoVODActionNotify

All Subinterfaces:

[IHTTPStreamerCupertinoVODActionNotify2](#), [IHTTPStreamerCupertinoVODActionNotify3](#)

public interface **IHTTPStreamerCupertinoVODActionNotify**

extends

IHTTPStreamerCupertinoVODActionNotify: listener interface for video on demand iOS streaming. See

HTTPStreamerApplicationContextCupertinoStreamer.addVODActionListener(IHTTPStreamerCupertinoVODActionNotify listener)

### Method Summary

void	<a href="#">onCreate</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerApplicationContext</a> appContext, <a href="#">IHTTPStreamerSession</a> httpStreamerSession, String rawStreamName, String streamExt, String streamName) Called when file index created
void	<a href="#">onDestroy</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex) Called after file index is destroyed
void	<a href="#">onFillChunkEnd</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerCupertinoIndexItem</a> item, <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk, boolean audioOnly) Called after each chunk is filled.
void	<a href="#">onFillChunkStart</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerCupertinoIndexItem</a> item, <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk, boolean audioOnly) Called each time a chunk is filled.
void	<a href="#">onIndex</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerApplicationContext</a> appContext, <a href="#">IHTTPStreamerSession</a> httpStreamerSession, String rawStreamName, String streamExt, String streamName) Called after file is indexed
void	<a href="#">onInit</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerApplicationContext</a> appContext, <a href="#">IHTTPStreamerSession</a> httpStreamerSession, String rawStreamName, String streamExt, String streamName) Called after initialized
void	<a href="#">onOpen</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerApplicationContext</a> appContext, <a href="#">IHTTPStreamerSession</a> httpStreamerSession, String rawStreamName, String streamExt, String streamName) Called after open

### Methods

(continued from last page)

## onCreate

```
public void onCreate(IHTTPStreamerCupertinoIndex fileIndex,  
    IHTTPStreamerApplicationContext appContext,  
    IHTTPStreamerSession httpStreamerSession,  
    String rawStreamName,  
    String streamExt,  
    String streamName)
```

Called when file index created

### Parameters:

`fileIndex` - file index  
`appContext` - HTTP application context  
`httpStreamerSession` - HTTP streaming session  
`rawStreamName` - stream name  
`streamExt` - stream extension  
`streamName` - adjusted stream name

---

## onInit

```
public void onInit(IHTTPStreamerCupertinoIndex fileIndex,  
    IHTTPStreamerApplicationContext appContext,  
    IHTTPStreamerSession httpStreamerSession,  
    String rawStreamName,  
    String streamExt,  
    String streamName)
```

Called after initialized

### Parameters:

`fileIndex` - file index  
`appContext` - HTTP application context  
`httpStreamerSession` - HTTP streaming session  
`rawStreamName` - stream name  
`streamExt` - stream extension  
`streamName` - adjusted stream name

---

## onOpen

```
public void onOpen(IHTTPStreamerCupertinoIndex fileIndex,  
    IHTTPStreamerApplicationContext appContext,  
    IHTTPStreamerSession httpStreamerSession,  
    String rawStreamName,  
    String streamExt,  
    String streamName)
```

Called after open

### Parameters:

`fileIndex` - file index  
`appContext` - HTTP application context  
`httpStreamerSession` - HTTP streaming session  
`rawStreamName` - stream name  
`streamExt` - stream extension  
`streamName` - adjusted stream name

---

(continued from last page)

## onIndex

```
public void onIndex(IHTTPStreamerCupertinoIndex fileIndex,  
    IHTTPStreamerApplicationContext appContext,  
    IHTTPStreamerSession httpStreamerSession,  
    String rawStreamName,  
    String streamExt,  
    String streamName)
```

Called after file is indexed

### Parameters:

fileIndex - file index  
appContext - HTTP application context  
httpStreamerSession - HTTP streaming session  
rawStreamName - stream name  
streamExt - stream extension  
streamName - adjusted stream name

---

## onFillChunkStart

```
public void onFillChunkStart(IHTTPStreamerCupertinoIndex fileIndex,  
    IHTTPStreamerCupertinoIndexItem item,  
    LiveStreamPacketizerCupertinoChunk chunk,  
    boolean audioOnly)
```

Called each time a chunk is filled. Can be used to add ID3 data to the header of a chunk.

### Parameters:

fileIndex - file index  
item - index item  
chunk - chunk being filled  
audioOnly - is audio-only chunk

---

## onFillChunkEnd

```
public void onFillChunkEnd(IHTTPStreamerCupertinoIndex fileIndex,  
    IHTTPStreamerCupertinoIndexItem item,  
    LiveStreamPacketizerCupertinoChunk chunk,  
    boolean audioOnly)
```

Called after each chunk is filled. Can be used to add ID3 data to the end of a chunk.

### Parameters:

fileIndex - file index  
item - index item  
chunk - chunk being filled  
audioOnly - is audio-only chunk

---

## onDestroy

```
public void onDestroy(IHTTPStreamerCupertinoIndex fileIndex)
```

Called after file index is destroyed

### Parameters:

fileIndex - file index

## com.wowza.wms.httpstreamer.cupertinostreaming.httpstreamer Interface IHTTPStreamerCupertinoVODActionNotify2

All Superinterfaces:

[IHTTPStreamerCupertinoVODActionNotify](#)

All Subinterfaces:

[IHTTPStreamerCupertinoVODActionNotify3](#)

public interface **IHTTPStreamerCupertinoVODActionNotify2**

extends [IHTTPStreamerCupertinoVODActionNotify](#)

### Method Summary

void	<a href="#">onFillChunkDataPacket</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerCupertinoIndexItem</a> item, <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk, boolean audioOnly, <a href="#">AMFPacket</a> packet, <a href="#">ID3Frames</a> id3Frames) Called when data packet is encountered.
------	---

#### Methods inherited from interface

[com.wowza.wms.httpstreamer.cupertinostreaming.httpstreamer.IHTTPStreamerCupertinoVODActionNotify](#)

[onCreate](#), [onDestroy](#), [onFillChunkEnd](#), [onFillChunkStart](#), [onIndex](#), [onInit](#), [onOpen](#)

### Methods

#### onFillChunkDataPacket

```
public void onFillChunkDataPacket(IHTTPStreamerCupertinoIndex fileIndex,
    IHTTPStreamerCupertinoIndexItem item,
    LiveStreamPacketizerCupertinoChunk chunk,
    boolean audioOnly,
    AMFPacket packet,
    ID3Frames id3Frames)
```

Called when data packet is encountered. Used to convert AMF events into ID3 tags for iOS streaming

#### Parameters:

fileIndex - file index  
item - item  
chunk - chunk  
audioOnly - is audio-only chunk  
packet - amf packet  
id3Frames - ID3 frames

## com.wowza.wms.httpstreamer.cupertinostreaming.httpstreamer Interface IHTTPStreamerCupertinoVODActionNotify3

All Superinterfaces:

[IHTTPStreamerCupertinoVODActionNotify2](#), [IHTTPStreamerCupertinoVODActionNotify](#)

public interface **IHTTPStreamerCupertinoVODActionNotify3**

extends [IHTTPStreamerCupertinoVODActionNotify2](#)

### Method Summary

void	<a href="#">onFillChunkDataPacket</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerCupertinoIndexItem</a> item, <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk, CupertinoStreamingRendition rendition, <a href="#">AMFPacket</a> packet, <a href="#">ID3Frames</a> id3Frames) Called when data packet is encountered.
void	<a href="#">onFillChunkEnd</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerCupertinoIndexItem</a> item, <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk, CupertinoStreamingRendition rendition) Called after each chunk is filled.
void	<a href="#">onFillChunkStart</a> ( <a href="#">IHTTPStreamerCupertinoIndex</a> fileIndex, <a href="#">IHTTPStreamerCupertinoIndexItem</a> item, <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk, CupertinoStreamingRendition rendition) Called each time a chunk is filled.

#### Methods inherited from interface

[com.wowza.wms.httpstreamer.cupertinostreaming.httpstreamer.IHTTPStreamerCupertinoVODActionNotify](#)

[onCreate](#), [onDestroy](#), [onFillChunkEnd](#), [onFillChunkStart](#), [onIndex](#), [onInit](#), [onOpen](#)

### Methods

#### onFillChunkStart

```
public void onFillChunkStart(IHTTPStreamerCupertinoIndex fileIndex,
    IHTTPStreamerCupertinoIndexItem item,
    LiveStreamPacketizerCupertinoChunk chunk,
    CupertinoStreamingRendition rendition)
```

Called each time a chunk is filled. Can be used to add ID3 data to the header of a chunk.

##### Parameters:

fileIndex - file index

item - index item

(continued from last page)

chunk - chunk being filled

rendition - rendition (audioOnly, videoOnly...)

---

## onFillChunkEnd

```
public void onFillChunkEnd(IHTTPStreamerCupertinoIndex fileIndex,  
    IHTTPStreamerCupertinoIndexItem item,  
    LiveStreamPacketizerCupertinoChunk chunk,  
    CupertinoStreamingRendition rendition)
```

Called after each chunk is filled. Can be used to add ID3 data to the end of a chunk.

### Parameters:

fileIndex - file index

item - index item

chunk - chunk being filled

rendition - rendition (audioOnly, videoOnly...)

---

## onFillChunkDataPacket

```
public void onFillChunkDataPacket(IHTTPStreamerCupertinoIndex fileIndex,  
    IHTTPStreamerCupertinoIndexItem item,  
    LiveStreamPacketizerCupertinoChunk chunk,  
    CupertinoStreamingRendition rendition,  
    AMFPacket packet,  
    ID3Frames id3Frames)
```

Called when data packet is encountered. Used to convert AMF events into ID3 tags for iOS streaming

### Parameters:

fileIndex - file index

item - index item

chunk - chunk being filled

rendition - rendition (audioOnly, videoOnly...)

packet - amf packet

id3Frames - ID3 frames

---

---

### Method Summary

void	<a href="#">addToChunk</a> (CupertinoPacketHolder holder)
void	<a href="#">endChunk</a> (long timecode)
boolean	<a href="#">isPacketizeAudio</a> ()
boolean	<a href="#">isPacketizeData</a> ()
boolean	<a href="#">isPacketizeVideo</a> ()
void	<a href="#">resetStream</a> ()
void	<a href="#">setCodecInfoAudio</a> (com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio)
void	<a href="#">setCodecInfoVideo</a> (com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo)
void	<a href="#">startChunk</a> (int streamMode, int videoCodecId, com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo, int audioCodecId, com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio, long timecode, long timecode90)

### Methods

#### startChunk

```
public void startChunk(int streamMode,
    int videoCodecId,
    com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo,
    int audioCodecId,
    com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio,
    long timecode,
    long timecode90)
```

(continued from last page)

## **endChunk**

```
public void endChunk(long timecode)
```

---

## **addToChunk**

```
public void addToChunk(CupertinoPacketHolder holder)
```

---

## **setCodecInfoAudio**

```
public void setCodecInfoAudio(com.wowza.wms.media.model.MediaCodecInfoAudio  
codecInfoAudio)
```

---

## **setCodecInfoVideo**

```
public void setCodecInfoVideo(com.wowza.wms.media.model.MediaCodecInfoVideo  
codecInfoVideo)
```

---

## **resetStream**

```
public void resetStream()
```

---

## **isPacketizeAudio**

```
public boolean isPacketizeAudio()
```

---

## **isPacketizeVideo**

```
public boolean isPacketizeVideo()
```

---

## **isPacketizeData**

```
public boolean isPacketizeData()
```

---

---

public void **makeChunk**(java.util.List tsList)

## com.wowza.wms.httpstreamer.cupertinostreaming.livestreampacketizer Interface IHTTPStreamerCupertinoLivePacketizerDataHandler

---

public interface IHTTPStreamerCupertinoLivePacketizerDataHandler  
extends

Interface for Cupertino live packetizer data events

This interface provides access to data being added to a chunk.

**IHTTPStreamerCupertinoLivePacketizerDataHandler2** should be used in preference to this interface

Example implementation

```
public class Control extends ModuleBase
{

    public void onAppStart(IApplicationInstance appInstance)
    {
        appInstance.addLiveStreamPacketizerListener(new LiveStreamPacketizer());
    }

    class LiveStreamPacketizer implements ILiveStreamPacketizerActionNotify
    {
        public void onLiveStreamPacketizerCreate(ILiveStreamPacketizer
liveStreamPacketizer,
                                String streamName) { }

        public void onLiveStreamPacketizerDestroy(ILiveStreamPacketizer
liveStreamPacketizer) { }

        public void onLiveStreamPacketizerInit(ILiveStreamPacketizer
liveStreamPacketizer,
                                String streamName)
        {
            if ( liveStreamPacketizer instanceof LiveStreamPacketizerCupertino )
            {
                LiveStreamPacketizerCupertino cupertinoPacketizer =
                    (LiveStreamPacketizerCupertino)liveStreamPacketizer;
                cupertinoPacketizer.setDataHandler(new
CupertinoLivePacketizerDataHandler());
            }
        }

        class CupertinoLivePacketizerDataHandler implements
IHTTPStreamerCupertinoLivePacketizerDataHandler
        {
            public void onFillChunkDataPacket(CupertinoPacketHolder arg0, AMFPacket arg1,
ID3Frames arg2) { }
        }
    }
}
```

Method Summary

void	<a href="#">onFillChunkDataPacket</a> (CupertinoPacketHolder holder, <a href="#">AMFPacket</a> packet, <a href="#">ID3Frames</a> id3Frames) This is called when a data packet is being processed.
------	--

Methods

(continued from last page)

## onFillChunkDataPacket

```
public void onFillChunkDataPacket(CupertinoPacketHolder holder,  
    AMFPacket packet,  
    ID3Frames id3Frames)
```

This is called when a data packet is being processed. This provides access to the packet and ID3 frame object being populated with data

**Parameters:**

- holder
- packet
- id3Frames

## **com.wowza.wms.httpstreamer.cupertinostreaming.livestreampacketizer Interface IHTTPStreamerCupertinoLivePacketizerDataHandler2**

---

public interface **IHTTPStreamerCupertinoLivePacketizerDataHandler2**  
extends

Interface for Cupertino live packetizer data events

This interface provides access to chunk start, end, data packet and media packet events when Cupertino chunks are being created.

It supersedes and should be used in preference to **IHTTPStreamerCupertinoLivePacketizerDataHandler**

Example implementation

```

public class Control extends ModuleBase
{

    public void onAppStart(IApplicationInstance appInstance)
    {
        appInstance.addLiveStreamPacketizerListener(new LiveStreamPacketizer());
    }

    class LiveStreamPacketizer implements ILiveStreamPacketizerActionNotify
    {
        public void onLiveStreamPacketizerCreate(ILiveStreamPacketizer
liveStreamPacketizer,
                                String streamName) { }

        public void onLiveStreamPacketizerDestroy(ILiveStreamPacketizer
liveStreamPacketizer) { }

        public void onLiveStreamPacketizerInit(ILiveStreamPacketizer
liveStreamPacketizer,
                                String streamName)
        {
            if ( liveStreamPacketizer instanceof LiveStreamPacketizerCupertino )
            {
                LiveStreamPacketizerCupertino cupertinoPacketizer =
                    (LiveStreamPacketizerCupertino)liveStreamPacketizer;
                cupertinoPacketizer.setDataHandler(new
CupertinoLivePacketizerDataHandler2());
            }
        }

        class CupertinoLivePacketizerDataHandler2 implements
IHTTPStreamerCupertinoLivePacketizerDataHandler2
        {
            public void onFillChunkDataPacket( LiveStreamPacketizerCupertinoChunk arg0,
                                CupertinoPacketHolder arg1, AMFPacket arg2, ID3Frames
arg3) { }

            public void onFillChunkEnd(LiveStreamPacketizerCupertinoChunk arg0, long
arg1) { }

            public void onFillChunkMediaPacket(LiveStreamPacketizerCupertinoChunk arg0,
                                CupertinoPacketHolder arg1, AMFPacket arg2) { }

            public void onFillChunkStart(LiveStreamPacketizerCupertinoChunk arg0) { }
        }
    }
}

```

## Method Summary

void	<a href="#">onFillChunkDataPacket</a> ( <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk, <a href="#">CupertinoPacketHolder</a> holder, <a href="#">AMFPacket</a> packet, <a href="#">ID3Frames</a> id3Frames) This is called when a data packet is being processed.
void	<a href="#">onFillChunkEnd</a> ( <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk, long timecode) This is called when a chunk has been filled with data.
void	<a href="#">onFillChunkMediaPacket</a> ( <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk, <a href="#">CupertinoPacketHolder</a> holder, <a href="#">AMFPacket</a> packet) This is called when a media packet is being processed.
void	<a href="#">onFillChunkStart</a> ( <a href="#">LiveStreamPacketizerCupertinoChunk</a> chunk) This is called when a chunk is about to be filled with data.

Methods

onFillChunkStart

```
public void onFillChunkStart(LiveStreamPacketizerCupertinoChunk chunk)
```

This is called when a chunk is about to be filled with data. The chunk could have audio or video or both. At this point there is no data in the chunk.

Parameters:  
chunk

onFillChunkEnd

```
public void onFillChunkEnd(LiveStreamPacketizerCupertinoChunk chunk,  
long timecode)
```

This is called when a chunk has been filled with data. The chunk could have audio or video or both. In addition to the chunk the timecode for the chunk is accessible.

Parameters:  
chunk  
timecode

onFillChunkDataPacket

```
public void onFillChunkDataPacket(LiveStreamPacketizerCupertinoChunk chunk,  
CupertinoPacketHolder holder,  
AMFPacket packet,  
ID3Frames id3Frames)
```

This is called when a data packet is being processed. This provides access to the packet and ID3 frame object being populated with data

Parameters:  
chunk  
holder  
packet  
id3Frames

(continued from last page)

## onFillChunkMediaPacket

```
public void onFillChunkMediaPacket(LiveStreamPacketizerCupertinoChunk chunk,  
    CupertinoPacketHolder holder,  
    AMFPacket packet)
```

This is called when a media packet is being processed. This provides access to the packets being pushed into this chunk from the stream.

### Parameters:

- chunk
- holder
- packet

## Fields

### AUDIO\_PACKET\_MIN\_DURATION

```
public static final int AUDIO_PACKET_MIN_DURATION
```

Constant value: **-500**

### AUDIO\_PACKET\_MAX\_DURATION

```
public static final int AUDIO_PACKET_MAX_DURATION
```

Constant value: **2000**

### AUDIO\_PACKET\_DEFAULT\_DURATION

```
public static final int AUDIO_PACKET_DEFAULT_DURATION
```

Constant value: **21**

(continued from last page)

## VIDEO\_PACKET\_MIN\_DURATION

```
public static final int VIDEO_PACKET_MIN_DURATION
```

Constant value: **0**

## VIDEO\_PACKET\_MAX\_DURATION

```
public static final int VIDEO_PACKET_MAX_DURATION
```

Constant value: **2000**

## VIDEO\_PACKET\_DEFAULT\_DURATION

```
public static final int VIDEO_PACKET_DEFAULT_DURATION
```

Constant value: **33**

## Constructors

### LiveStreamPacketizerCupertinoChunk

```
public LiveStreamPacketizerCupertinoChunk(long chunkIndex,  
                                           int rendition)
```

## Methods

### getChunkIndex

```
public long getChunkIndex()
```

### addBlock

```
public int addBlock(byte[] buffer,  
                   int offset,  
                   int len,  
                   CupertinoTSHolder tsHolder)
```

### addBlock

```
public int addBlock(byte[] buffer,  
                   int offset,  
                   int len)
```

(continued from last page)

---

## insertBlock

```
public int insertBlock(int index,  
    byte[] buffer,  
    int offset,  
    int len,  
    CupertinoTSHolder tsHolder)
```

---

## insertBlock

```
public int insertBlock(int index,  
    byte[] buffer,  
    int offset,  
    int len)
```

---

## getSize

```
public int getSize()
```

---

## getStartTimecode

```
public long getStartTimecode()
```

---

## setStartTimecode

```
public void setStartTimecode(long startTimecode)
```

---

## getDuration

```
public long getDuration()
```

---

## setDuration

```
public void setDuration(long duration)
```

---

## getBlockList

```
public java.util.List getBlockList()
```

---

## setBlockList

```
public void setBlockList(java.util.List blocks)
```

---

(continued from last page)

---

## isCacheable

```
public boolean isCacheable()
```

---

## setCacheable

```
public void setCacheable(boolean cacheable)
```

---

## getBlockCount

```
public int getBlockCount()
```

---

## getEncUrl

```
public String getEncUrl()
```

---

## setEncUrl

```
public void setEncUrl(String encUrl)
```

---

## getEncRepeaterBytes

```
public byte[] getEncRepeaterBytes()
```

---

## setEncRepeaterBytes

```
public void setEncRepeaterBytes(byte[] encRepeaterBytes)
```

---

## getDataSize

```
public int getDataSize()
```

---

## setDataSize

```
public void setDataSize(int dataSize)
```

---

(continued from last page)

---

## incDataSize

```
public void incDataSize(int incSize)
```

---

## isWritePAT

```
public boolean isWritePAT()
```

---

## setWritePAT

```
public void setWritePAT(boolean writePAT)
```

---

## incAudioCount

```
public void incAudioCount()
```

---

## incVideoCount

```
public void incVideoCount()
```

---

## incVideoKeyCount

```
public void incVideoKeyCount()
```

---

## getAudioCount

```
public int getAudioCount()
```

---

## setAudioCount

```
public void setAudioCount(int audioCount)
```

---

## getVideoCount

```
public int getVideoCount()
```

---

## setVideoCount

```
public void setVideoCount(int videoCount)
```

---

(continued from last page)

---

## getVideoKeyCount

```
public int getVideoKeyCount()
```

---

## setVideoKeyCount

```
public void setVideoKeyCount(int videoKeyCount)
```

---

## getStreamMode

```
public int getStreamMode()
```

---

## setStreamMode

```
public void setStreamMode(int streamMode)
```

---

## getCodecInfoVideo

```
public com.wowza.wms.media.model.MediaCodecInfoVideo getCodecInfoVideo()
```

---

## setCodecInfoVideo

```
public void setCodecInfoVideo(com.wowza.wms.media.model.MediaCodecInfoVideo  
codecInfoVideo)
```

---

## getCodecInfoAudio

```
public com.wowza.wms.media.model.MediaCodecInfoAudio getCodecInfoAudio()
```

---

## setCodecInfoAudio

```
public void setCodecInfoAudio(com.wowza.wms.media.model.MediaCodecInfoAudio  
codecInfoAudio)
```

---

## isNewCodecInfo

```
public boolean isNewCodecInfo()
```

---

## setNewCodecInfo

```
public void setNewCodecInfo(boolean isNewCodecInfo)
```

---

## getEncMethod

```
public int getEncMethod()
```

---

## setEncMethod

```
public void setEncMethod(int encMethod)
```

---

## getEncIVBytes

```
public byte[] getEncIVBytes()
```

---

## setEncIVBytes

```
public void setEncIVBytes(byte[] encIVBytes)
```

---

## getEncKeyFormat

```
public String getEncKeyFormat()
```

---

## setEncKeyFormat

```
public void setEncKeyFormat(String encKeyFormat)
```

---

## getEncKeyFormatVersion

```
public String getEncKeyFormatVersion()
```

---

## setEncKeyFormatVersion

```
public void setEncKeyFormatVersion(String encKeyFormatVersion)
```

---

## getEncPlayReadyHeader

```
public String getEncPlayReadyHeader()
```

---

(continued from last page)

---

## setEncPlayReadyHeader

```
public void setEncPlayReadyHeader(String encPlayReadyHeader)
```

---

---

## getFirstAudioTimecode

```
public long getFirstAudioTimecode()
```

---

---

## setFirstAudioTimecode

```
public void setFirstAudioTimecode(long firstAudioTimecode)
```

---

---

## getFirstVideoTimecode

```
public long getFirstVideoTimecode()
```

---

---

## setFirstVideoTimecode

```
public void setFirstVideoTimecode(long firstVideoTimecode)
```

---

---

## newAudioTimecode

```
public void newAudioTimecode(long timecode)
```

---

---

## newVideoTimecode

```
public void newVideoTimecode(long timecode)
```

---

---

## setChunkIndex

```
public void setChunkIndex(int chunkIndex)
```

---

---

## getChunkIndexByTime

```
public long getChunkIndexByTime()
```

---

(continued from last page)

---

## setChunkIndexByTime

```
public void setChunkIndexByTime(long chunkIndexByTime)
```

---

## getChunkIndexForPlaylist

```
public long getChunkIndexForPlaylist()
```

---

## isFillSuccessful

```
public boolean isFillSuccessful()
```

---

## setFillSuccessful

```
public void setFillSuccessful(boolean fillSuccessful)
```

---

## getRendition

```
public CupertinoStreamingRendition getRendition()
```

---

## getUserManifestHeaders

```
public CupertinoUserManifestHeaders getUserManifestHeaders()
```

---

## isDurationDiscontinuity

```
public boolean isDurationDiscontinuity()
```

---

## setDurationDiscontinuity

```
public void setDurationDiscontinuity(boolean isDurationDiscontinuity)
```

---

## getDiscontinuitySequence

```
public long getDiscontinuitySequence()
```

---

## setDiscontinuitySequence

```
public void setDiscontinuitySequence(long discontinuitySequence)
```

---

(continued from last page)

---

## **forceDiscontinuity**

```
public void forceDiscontinuity(boolean value)
```

---

## **isDiscontinuity**

```
public boolean isDiscontinuity()
```

---

## **getCalcDurationAudio**

```
public long getCalcDurationAudio()
```

---

## **getCalcDurationVideo**

```
public long getCalcDurationVideo()
```

---

## **getCalcDuration**

```
public long getCalcDuration()
```

---

## **getProgramDateTime**

```
public String getProgramDateTime()
```

---

## **setProgramDateTime**

```
public void setProgramDateTime(String programDateTime)
```

---

## **getChunkMap**

```
public CupertinoChunkMap getChunkMap()
```

---

## **getLastAudioTimecode**

```
public long getLastAudioTimecode()
```

---

(continued from last page)

---

## setLastAudioTimecode

```
public void setLastAudioTimecode(long lastAudioTimecode)
```

---

## getLastVideoTimecode

```
public long getLastVideoTimecode()
```

---

## setLastVideoTimecode

```
public void setLastVideoTimecode(long lastVideoTimecode)
```

---

## getProperties

```
public WMSProperties getProperties()
```

---

## addDataPacket

```
public void addDataPacket(AMFPacket packet)
```

---

## getDataPackets

```
public java.util.List getDataPackets()
```

---

## isEncIVBytesInChunklist

```
public boolean isEncIVBytesInChunklist()
```

---

## setEncIVBytesInChunklist

```
public void setEncIVBytesInChunklist(boolean encIVBytesInChunklist)
```

---

---

Package

**com.wowza.wms.httpstreamer.cupertinostrea  
ming.util**

## com.wowza.wms.httpstreamer.cupertinostreaming.util Interface ICupertinoEncInfoFrame

public interface **ICupertinoEncInfoFrame**  
extends

### Method Summary

int	<a href="#">getFrameType()</a>
long	<a href="#">getPTS()</a>
void	<a href="#">setFrameType(int frameType)</a>
void	<a href="#">setPTS(long pts)</a>

### Methods

#### getFrameType

public int **getFrameType()**

#### setFrameType

public void **setFrameType**(int frameType)

#### getPTS

public long **getPTS()**

#### setPTS

public void **setPTS**(long pts)

## com.wowza.wms.httpstreamer.cupertinostreaming.util Interface ICupertinoEncryptor

public interface **ICupertinoEncryptor**  
extends

### Method Summary

void	<a href="#"><u>close()</u></a>
byte[]	<a href="#"><u>encryptAudioFrame</u></a> (int codec, byte[] data, int offset, int len, int frameOffset)
void	<a href="#"><u>encryptAudioFrames</u></a> (int codec, long pts, java.util.List fragments)
byte[]	<a href="#"><u>encryptChunk</u></a> (byte[] data, int offset, int len, boolean isLast)
void	<a href="#"><u>encryptVideoFrame</u></a> (int codec, long pts, long dts, java.util.List fragments)
java.util.List	<a href="#"><u>getECMPESBytes</u></a> (CupertinoTransportStreamPIDContext pidContextECM, int videoPID, int audioPID, int dataPID, int ecmPID)
IEncryptionInfoPlayReady	<a href="#"><u>getEncInfo()</u></a>
byte[]	<a href="#"><u>getPMTDescriptorForEncryption</u></a> (int mediaPID, int ecmPID, int contentType)
void	<a href="#"><u>init</u></a> (IEncryptionInfoPlayReady encInfo, long chunkIndex)
boolean	<a href="#"><u>isAES128SampleEncryptor</u></a> ()
boolean	<a href="#"><u>isChunkEncryptor</u></a> ()
boolean	<a href="#"><u>isPlayReadySampleEncryptor</u></a> ()
boolean	<a href="#"><u>isSampleEncryptor</u></a> ()
void	<a href="#"><u>setEncryptorContextStr</u></a> (String encryptorContextStr)
void	<a href="#"><u>setupPIDContextForEncryption</u></a> (CupertinoTransportStreamPIDContext pidContext, int contentType)

### Methods

(continued from last page)

## **init**

```
public void init(IEncryptionInfoPlayReady encInfo,  
                long chunkIndex)
```

---

## **close**

```
public void close()
```

---

## **encryptChunk**

```
public byte[] encryptChunk(byte[] data,  
                            int offset,  
                            int len,  
                            boolean isLast)
```

---

## **encryptVideoFrame**

```
public void encryptVideoFrame(int codec,  
                               long pts,  
                               long dts,  
                               java.util.List fragments)
```

---

## **encryptAudioFrames**

```
public void encryptAudioFrames(int codec,  
                                long pts,  
                                java.util.List fragments)
```

---

## **encryptAudioFrame**

```
public byte[] encryptAudioFrame(int codec,  
                                 byte[] data,  
                                 int offset,  
                                 int len,  
                                 int frameOffset)
```

---

## **isChunkEncryptor**

```
public boolean isChunkEncryptor()
```

---

## **isSampleEncryptor**

```
public boolean isSampleEncryptor()
```

---

---

### isAES128SampleEncryptor

```
public boolean isAES128SampleEncryptor()
```

---

### isPlayReadySampleEncryptor

```
public boolean isPlayReadySampleEncryptor()
```

---

### setEncryptorContextStr

```
public void setEncryptorContextStr(String encryptorContextStr)
```

---

### getEncInfo

```
public IEncryptionInfoPlayReady getEncInfo()
```

---

### setupPIDContextForEncryption

```
public void setupPIDContextForEncryption(CupertinoTransportStreamPIDContext  
pidContext,  
    int contentType)
```

---

### getPMTDescriptorForEncryption

```
public byte[] getPMTDescriptorForEncryption(int mediaPID,  
    int ecmPID,  
    int contentType)
```

---

### getECMPESBytes

```
public java.util.List getECMPESBytes(CupertinoTransportStreamPIDContext pidContextECM,  
    int videoPID,  
    int audioPID,  
    int dataPID,  
    int ecmPID)
```

---

## com.wowza.wms.httpstreamer.cupertinostreaming.util Class LiveStreamPacketizerCupertinoUtils

java.lang.Object

com.wowza.wms.httpstreamer.cupertinostreaming.util.LiveStreamPacketizerCupertinoUtils

public class **LiveStreamPacketizerCupertinoUtils**

## Fields

### initProvider

public static boolean **initProvider**

### CODEC\_H264\_ID

public static final java.lang.String **CODEC\_H264\_ID**

(continued from last page)

Constant value: **avc1**

---

## PROGRAMDATETIME\_DATEFORMAT

```
public static final java.lang.String PROGRAMDATETIME_DATEFORMAT
```

Constant value: **yyyy-MM-dd'T'HH:mm:ss.SSSZ**

---

## CRLF\_STR

```
public static final java.lang.String CRLF_STR
```

Constant value:

---

## EMPTYPLAYLISTSTR

```
public static final java.lang.String EMPTYPLAYLISTSTR
```

Constant value: **#EXTM3U**  
**#EXT-X-ENDLIST**

---

## PLAYLISTSTARTSTR

```
public static final java.lang.String PLAYLISTSTARTSTR
```

Constant value: **#EXTM3U**

---

## EXTXVERSIONPLACEHOLDER

```
public static final java.lang.String EXTXVERSIONPLACEHOLDER
```

Constant value: **{ext-x-version}**

---

## EXTXVERSIONSTR

```
public static final java.lang.String EXTXVERSIONSTR
```

Constant value: **#EXT-X-VERSION:{ext-x-version}**

---

## PLAYLISTSTOPSTR

```
public static final java.lang.String PLAYLISTSTOPSTR
```

Constant value: **#EXT-X-ENDLIST**

---

## PLAYLISTTARGETDURATIONSTR

```
public static final java.lang.String PLAYLISTTARGETDURATIONSTR
```

Constant value: **#EXT-X-TARGETDURATION**

---

## PLAYLISTINDEPENDENTSEGMENTSSTR

```
public static final java.lang.String PLAYLISTINDEPENDENTSEGMENTSSTR
```

Constant value: **#EXT-X-INDEPENDENT-SEGMENTS**

---

## PLAYLISTIFRAMESONLY

```
public static final java.lang.String PLAYLISTIFRAMESONLY
```

Constant value: **#EXT-X-I-FRAMES-ONLY**

---

## PLAYLISTMEDIASEQSTR

```
public static final java.lang.String PLAYLISTMEDIASEQSTR
```

Constant value: **#EXT-X-MEDIA-SEQUENCE**

---

## PLAYLISTDISCONTINUITYSEQSTR

```
public static final java.lang.String PLAYLISTDISCONTINUITYSEQSTR
```

Constant value: **#EXT-X-DISCONTINUITY-SEQUENCE**

---

## PLAYLISTITEMSTR

```
public static final java.lang.String PLAYLISTITEMSTR
```

Constant value: **#EXTINF**

---

## CACHECONTROLSTR

```
public static final java.lang.String CACHECONTROLSTR
```

Constant value: **#EXT-X-ALLOW-CACHE**

---

## PLAYLISTPLAYLISTTYPESTR

```
public static final java.lang.String PLAYLISTPLAYLISTTYPESTR
```

Constant value: **#EXT-X-PLAYLIST-TYPE**

---

## PLAYLISTSTART

```
public static final java.lang.String PLAYLISTSTART
```

Constant value: **#EXT-X-START**

---

(continued from last page)

---

## PLAYLISTBYTERANGE

```
public static final java.lang.String PLAYLISTBYTERANGE
```

Constant value: **#EXT-X-BYTERANGE**

---

## PLAYLISTSTREAMINF

```
public static final java.lang.String PLAYLISTSTREAMINF
```

Constant value: **#EXT-X-STREAM-INF**

---

## PLAYLISTIFRAMESTREAMINF

```
public static final java.lang.String PLAYLISTIFRAMESTREAMINF
```

Constant value: **#EXT-X-I-FRAME-STREAM-INF**

---

## PLAYLISTMEDIA

```
public static final java.lang.String PLAYLISTMEDIA
```

Constant value: **#EXT-X-MEDIA**

---

## PLAYLIST\_GROUPID\_AUDIO

```
public static final java.lang.String PLAYLIST_GROUPID_AUDIO
```

Constant value: **audioGroup**

---

## PLAYLIST\_GROUPID\_VIDEO

```
public static final java.lang.String PLAYLIST_GROUPID_VIDEO
```

Constant value: **videoGroup**

---

## DOMAINPLACHOLDER

```
public static final java.lang.String DOMAINPLACHOLDER
```

Constant value: **{domain}**

---

## HOSTPLACHOLDER

```
public static final java.lang.String HOSTPLACHOLDER
```

Constant value: **{host}**

---

## APPLICATIONPLACHOLDER

```
public static final java.lang.String APPLICATIONPLACHOLDER
```

---

(continued from last page)

Constant value: **{application}**

---

## APPINSTANCEPLACHOLDER

public static final java.lang.String **APPINSTANCEPLACHOLDER**

Constant value: **{appInstance}**

---

## STREAMPLACHOLDER

public static final java.lang.String **STREAMPLACHOLDER**

Constant value: **{stream}**

---

## FILENAMEPLACHOLDER

public static final java.lang.String **FILENAMEPLACHOLDER**

Constant value: **{filename}**

---

## INDEXPLACHOLDER

public static final java.lang.String **INDEXPLACHOLDER**

Constant value: **{index}**

---

## EXTPLACEHOLDER

public static final java.lang.String **EXTPLACEHOLDER**

Constant value: **{ext}**

---

## QUERYSTRPLACHOLDER

public static final java.lang.String **QUERYSTRPLACHOLDER**

Constant value: **{query}**

---

## RESOLUTIONPLACEHOLDER

public static final java.lang.String **RESOLUTIONPLACEHOLDER**

Constant value: **{resolution}**

---

## RESOLUTIONWIDTHPLACEHOLDER

public static final java.lang.String **RESOLUTIONWIDTHPLACEHOLDER**

Constant value: **{resolution-width}**

---

## RESOLUTIONHEIGHTPLACEHOLDER

```
public static final java.lang.String RESOLUTIONHEIGHTPLACEHOLDER
```

Constant value: **{resolution-height}**

---

## RENDITIONPLACHOLDER

```
public static final java.lang.String RENDITIONPLACHOLDER
```

Constant value: **{rendition}**

---

## LANGUAGEPLACHOLDER

```
public static final java.lang.String LANGUAGEPLACHOLDER
```

Constant value: **{language}**

---

## TITLEPLACHOLDER

```
public static final java.lang.String TITLEPLACHOLDER
```

Constant value: **{title}**

---

## PLAYSTARTPLACEHOLDER

```
public static final java.lang.String PLAYSTARTPLACEHOLDER
```

Constant value: **{playStart}**

---

## PLAYDURATIONPLACEHOLDER

```
public static final java.lang.String PLAYDURATIONPLACEHOLDER
```

Constant value: **{playDuration}**

---

## PLAYSEEKPLACEHOLDER

```
public static final java.lang.String PLAYSEEKPLACEHOLDER
```

Constant value: **{playSeek}**

---

## NGRPEPLACHOLDER

```
public static final java.lang.String NGRPEPLACHOLDER
```

Constant value: **{ngrp}**

---

(continued from last page)

---

## ENCKEYPLACEHOLDERPLACHOLDER

```
public static final java.lang.String ENCKEYPLACEHOLDERPLACHOLDER
```

Constant value: `{enckeyurl}`

---

## ENCMETHODPLACEHOLDERPLACHOLDER

```
public static final java.lang.String ENCMETHODPLACEHOLDERPLACHOLDER
```

Constant value: `{encmethod}`

---

## ENCIVPLACEHOLDER

```
public static final java.lang.String ENCIVPLACEHOLDER
```

Constant value: `{enciv}`

---

## ENCPLAYREADYHEADERPLACEHOLDER

```
public static final java.lang.String ENCPLAYREADYHEADERPLACEHOLDER
```

Constant value: `{playReadyHeader}`

---

## SESSIONIDPLACEHOLDER

```
public static final java.lang.String SESSIONIDPLACEHOLDER
```

Constant value: `{sessionid}`

---

## DVRPLACEHOLDER

```
public static final java.lang.String DVRPLACEHOLDER
```

Constant value: `{dvr}`

---

## SECURETOKENPLACEHOLDER

```
public static final java.lang.String SECURETOKENPLACEHOLDER
```

Constant value: `{secureToken}`

---

## CAPTIONFILEPLACEHOLDER

```
public static final java.lang.String CAPTIONFILEPLACEHOLDER
```

Constant value: `{captionFile}`

---

## PARAMETERDELIMITERKEY

```
public static final java.lang.String PARAMETERDELIMITERKEY
```

---

(continued from last page)

Constant value: `_`

---

## DVRKEY

```
public static final java.lang.String DVRKEY
```

Constant value: `DVR`

---

## PLAYSTARTKEY

```
public static final java.lang.String PLAYSTARTKEY
```

Constant value: `ps`

---

## PLAYDURATIONKEY

```
public static final java.lang.String PLAYDURATIONKEY
```

Constant value: `pd`

---

## PLAYSEEKKEY

```
public static final java.lang.String PLAYSEEKKEY
```

Constant value: `pk`

---

## SESSIONIDKEY

```
public static final java.lang.String SESSIONIDKEY
```

Constant value: `w`

---

## BITRATEKEY

```
public static final java.lang.String BITRATEKEY
```

Constant value: `b`

---

## NGRPKEY

```
public static final java.lang.String NGRPKEY
```

Constant value: `ngrp`

---

## AUDIOONLYKEY

```
public static final java.lang.String AUDIOONLYKEY
```

Constant value: `ao`

---

## VIDEOONLYKEY

```
public static final java.lang.String VIDEOONLYKEY
```

Constant value: **vo**

---

## KEYFRAMEONLYKEY

```
public static final java.lang.String KEYFRAMEONLYKEY
```

Constant value: **ko**

---

## LANGUAGEIDKEY

```
public static final java.lang.String LANGUAGEIDKEY
```

Constant value: **l**

---

## SYSTEMLANGUAGEIDKEY

```
public static final java.lang.String SYSTEMLANGUAGEIDKEY
```

Constant value: **sl**

---

## TITLEKEY

```
public static final java.lang.String TITLEKEY
```

Constant value: **t64**

---

## SECURETOKENKEY

```
public static final java.lang.String SECURETOKENKEY
```

Constant value: **tk**

---

## CAPTIONFILEKEY

```
public static final java.lang.String CAPTIONFILEKEY
```

Constant value: **cf**

---

## ENCKEYSTR

```
public static final java.lang.String ENCKEYSTR
```

Constant value: **#EXT-X-KEY:METHOD={encmethod},{enckeyurl}**

## Constructors

### HTTPStreamerSessionDirect

```
public HTTPStreamerSessionDirect()
```

---

Package

**com.wowza.wms.httpstreamer.model**

## com.wowza.wms.httpstreamer.model Interface IHTTPCryptoHolder

public interface IHTTPCryptoHolder  
extends

### Method Summary

byte[]	<a href="#">getBuffer()</a>
int	<a href="#">getOffset()</a>
int	<a href="#">getPacketType()</a>
long	<a href="#">getSample()</a>
int	<a href="#">getSize()</a>
void	<a href="#">setBuffer</a> (byte[] buffer)
void	<a href="#">setOffset</a> (int offset)
void	<a href="#">setPacketType</a> (int packetType)
void	<a href="#">setSample</a> (long sample)
void	<a href="#">setSize</a> (int size)

### Methods

#### getBuffer

public byte[] **getBuffer**()

#### setBuffer

public void **setBuffer**(byte[] buffer)

#### getOffset

public int **getOffset**()

---

**setOffset**

```
public void setOffset(int offset)
```

---

---

**getSize**

```
public int getSize()
```

---

---

**setSize**

```
public void setSize(int size)
```

---

---

**getPacketType**

```
public int getPacketType()
```

---

---

**setPacketType**

```
public void setPacketType(int packetType)
```

---

---

**getSample**

```
public long getSample()
```

---

---

**setSample**

```
public void setSample(long sample)
```

---

---

## com.wowza.wms.httpstreamer.model Interface IHTTPSessionFactory

---

public interface **IHTTPSessionFactory**  
extends

---

### Method Summary

<a href="#">IHTTPStreamerSession</a>	<a href="#">createHTTPSessionInstance()</a>
--------------------------------------	---

---

### Methods

#### **createHTTPSessionInstance**

public [IHTTPStreamerSession](#) **createHTTPSessionInstance()**

## com.wowza.wms.httpstreamer.model Interface IHTTPSessionNotify

All Known Implementing Classes:

[HTTPStreamerSessionSmoothStreamer](#), [HTTPStreamerSessionSanJose](#), [HTTPStreamerSessionMPEGDash](#),  
[HTTPStreamerSessionCupertino](#)

public interface **IHTTPSessionNotify**  
extends

### Method Summary

void	<a href="#">notifyHTTPSessionCreate(IApplicationInstance</a> appInstance, <a href="#">IHTTPStreamerSession</a> httpStreamerSession)
void	<a href="#">notifyHTTPSessionDestroy(IApplicationInstance</a> appInstance, <a href="#">IHTTPStreamerSession</a> httpStreamerSession)

### Methods

#### notifyHTTPSessionCreate

public void **notifyHTTPSessionCreate**([IApplicationInstance](#) appInstance,  
[IHTTPStreamerSession](#) httpStreamerSession)

#### notifyHTTPSessionDestroy

public void **notifyHTTPSessionDestroy**([IApplicationInstance](#) appInstance,  
[IHTTPStreamerSession](#) httpStreamerSession)

## com.wowza.wms.httpstreamer.model Interface IHTTPStreamerAdapter

public interface **IHTTPStreamerAdapter**  
extends

IHTTPStreamerAdapter: HTTP streaming adapter interface

### Method Summary

boolean	<a href="#"><u>canHandle</u></a> (String path) Return true if can handle request
String	<a href="#"><u>getAdapterName</u></a> () Get the name of this adapter
HTTPStreamerItem	<a href="#"><u>getHTTPStreamerItem</u></a> () Get the HTTP streamer item associated with this adapter
String	<a href="#"><u>getID</u></a> () Get the id of this adapter
int	<a href="#"><u>getIdleFrequency</u></a> () Get the idle frequency (milliseconds) for HTTP requests.
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties</u></a> () Get properties
int	<a href="#"><u>getSessionProtocol</u></a> () Set the adapter session protocol.
<a href="#"><u>IVHost</u></a>	<a href="#"><u>getVHost</u></a> () Get the vhost associated with this adapter
void	<a href="#"><u>init</u></a> () Initialize the HTTP streaming adapter
void	<a href="#"><u>service</u></a> (org.apache.mina.common.io.Session session, RtmpRequestMessage req, RtmpResponseMessage resp) Called to service each request
void	<a href="#"><u>setHTTPStreamerItem</u></a> (HTTPStreamerItem httpStreamerItem) Set the HTTP streamer item associated with this adapter
void	<a href="#"><u>setID</u></a> (String id) Set the id of this adapter
void	<a href="#"><u>setProperties</u></a> ( <a href="#"><u>WMSProperties</u></a> properties) Set properties
void	<a href="#"><u>setSessionProtocol</u></a> (int sessionProtocol) Get the adapter session protocol.
void	<a href="#"><u>setVHost</u></a> ( <a href="#"><u>IVHost</u></a> vhost) Set the vhost associated with this adapter

void

[shutdownSession](#)([IApplicationInstance](#) appInstance, [IHTTPStreamerSession](#) session)

Called when an HTTP streaming session is shutdown

## Methods

### canHandle

```
public boolean canHandle(String path)
```

Return true if can handle request

**Parameters:**

path - request path

**Returns:**

true if can handle request

### service

```
public void service(org.apache.mina.common.Session session,  
    RtmpRequestMessage req,  
    RtmpResponseMessage resp)
```

Called to service each request

**Parameters:**

session - io session

req - request

resp - response

### getProperties

```
public WMSPProperties getProperties()
```

Get properties

**Returns:**

properties

### setProperties

```
public void setProperties(WMSPProperties properties)
```

Set properties

**Parameters:**

properties - properties

### getHTTPStreamerItem

```
public HTTPStreamerItem getHTTPStreamerItem()
```

Get the HTTP streamer item associated with this adapter

**Returns:**

(continued from last page)

HTTP streamer item

---

## setHTTPStreamerItem

```
public void setHTTPStreamerItem(HTTPStreamerItem httpStreamerItem)
```

Set the HTTP streamer item associated with this adapter

**Parameters:**

httpStreamerItem - HTTP streamer item

---

## getVHost

```
public IVHost getVHost()
```

Get the vhost associated with this adapter

**Returns:**

vhost

---

## setVHost

```
public void setVHost(IVHost vhost)
```

Set the vhost associated with this adapter

**Parameters:**

vhost - vhost

---

## init

```
public void init()
```

Initialize the HTTP streaming adapter

---

## shutdownSession

```
public void shutdownSession(IApplicationInstance appInstance,  
    IHTTPStreamerSession session)
```

Called when an HTTP streaming session is shutdown

**Parameters:**

session - HTTP streaming session

---

## getIdleFrequency

```
public int getIdleFrequency()
```

Get the idle frequency (milliseconds) for HTTP requests. This is how often the session is called back while active.

**Returns:**

idle frequency (milliseconds)

---

## getAdapterName

```
public String getAdapterName()
```

---

(continued from last page)

Get the name of this adapter

**Returns:**

name of this adapter

---

**getID**

```
public String getID()
```

Get the id of this adapter

**Returns:**

id of this adapter

---

**setID**

```
public void setID(String id)
```

Set the id of this adapter

**Parameters:**

id - id of this adapter

---

**getSessionProtocol**

```
public int getSessionProtocol()
```

Set the adapter session protocol. See IHTTPStreamerSession.SESSIONPROTOCOL\_\*

**Returns:**

adapter session protocol

---

**setSessionProtocol**

```
public void setSessionProtocol(int sessionProtocol)
```

Get the adapter session protocol. See IHTTPStreamerSession.SESSIONPROTOCOL\_\*

**Parameters:**

sessionProtocol - adapter session protocol

---

## com.wowza.wms.httpstreamer.model Interface IHTTPStreamerApplicationContext

public interface **IHTTPStreamerApplicationContext**  
extends

IHTTPStreamerApplicationContext: HTTP streamer application context interface. Used by HTTP streaming adapter to store per-application information.

### Field Summary

public static final	<a href="#"><u>HTTPORIGINMODE_AUTO</u></a> Value: <b>1</b>
public static final	<a href="#"><u>HTTPORIGINMODE_OFF</u></a> Value: <b>0</b>
public static final	<a href="#"><u>HTTPORIGINMODE_ON</u></a> Value: <b>2</b>

### Method Summary

void	<a href="#"><u>addQueryStrRemoveList</u></a> (String name) Add a name to the list of query string parameters that will not be copied to the media URLs for HTTP streaming
java.util.Map	<a href="#"><u>filterQueryStr</u></a> (java.util.Map map) Internal
<a href="#"><u>IApplicationInstance</u></a>	<a href="#"><u>getAppInstance</u></a> () Get application instance
String	<a href="#"><u>getCacheControlStatus4xx</u></a> () Get the cache-control header for 4xx HTTP responses
int	<a href="#"><u>getHTTPOriginMode</u></a> () Get current HTTP origin mode.
<a href="#"><u>IHTTPStreamerHTTPOrigInSessionIdProvider</u></a>	<a href="#"><u>getHTTPOriginSessionIdProvider</u></a> () Get HTTP origin sessionId provider used to determine unique HTTP origin sessions.
int	<a href="#"><u>getMaxHTTPSessionsPerTCPSession</u></a> () Get maximum number of HTTP sessions tracked per-TCP session
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties</u></a> () Get properties
<a href="#"><u>MediaCasterItem</u></a>	<a href="#"><u>getRepeaterMediaCasterDef</u></a> () Get the live repeater media caster definition
int	<a href="#"><u>getResponseOnIncompleteChunk</u></a> () Get the response code used when an incomplete chunk (read error) is encountered.

String	<a href="#"><u>getStreamTypeStr()</u></a> Get stream type
java.util.Map	<a href="#"><u>getUserHTTPHeaders()</u></a> Get user HTTP headers.
<a href="#"><u>IVHost</u></a>	<a href="#"><u>getVHost()</u></a> Get vhost
void	<a href="#"><u>init(IApplicationInstance</u> appInstance, HTTPStreamerItem httpStreamerItem)</a> Initialize context
boolean	<a href="#"><u>isHTTPOriginOn()</u></a> Returns true if HTTP origin mode is set to ON.
boolean	<a href="#"><u>isStreamDomainProtectionActive()</u></a> Return true if stream domain protection is on
void	<a href="#"><u>setCacheControlStatus4xx</u></a> (String cacheControlStatus4xx) Set the cache-control header for 4xx HTTP responses
void	<a href="#"><u>setHTTPOriginMode</u></a> (int httpOriginMode) Set current HTTP origin mode.
void	<a href="#"><u>setHTTPOriginSessionIdProvider</u></a> ( <a href="#"><u>IHTTPStreamerHTTPOriginSessionIdProvider</u></a> httpOriginSessionIdProvider) Set HTTP origin sessionId provider used to determine unique HTTP origin sessions.
void	<a href="#"><u>setMaxHTTPSessionsPerTCPSession</u></a> (int maxHTTPSessionsPerTCPSession) Set maximum number of HTTP sessions tracked per-TCP session
void	<a href="#"><u>setRepeaterMediaCasterDef</u></a> ( <a href="#"><u>MediaCasterItem</u></a> repeaterMediaCasterDef) Set the live repeater media caster definition
void	<a href="#"><u>setResponseOnIncompleteChunk</u></a> (int responseOnIncompleteChunk) Set the response code used when an incomplete chunk (read error) is encountered.
void	<a href="#"><u>setStreamDomainProtectionActive</u></a> (boolean streamDomainProtectionActive) Turn on/off stream domain protection
void	<a href="#"><u>setStreamTypeStr</u></a> (String streamTypeStr) Set stream type
void	<a href="#"><u>setUserHTTPHeader</u></a> (String name, String value) Add a user HTTP header to the header map.

## Fields

### HTTPORIGINMODE\_OFF

public static final int **HTTPORIGINMODE\_OFF**

Constant value: **0**

(continued from last page)

## HTTPORIGINMODE\_AUTO

```
public static final int HTTPORIGINMODE_AUTO
```

Constant value: **1**

## HTTPORIGINMODE\_ON

```
public static final int HTTPORIGINMODE_ON
```

Constant value: **2**

## Methods

### init

```
public void init(IApplicationInstance appInstance,  
    HTTPStreamerItem httpStreamerItem)
```

Initialize context

**Parameters:**

`appInstance` - application instance  
`httpStreamerItem` - HTTP streamer

### getProperties

```
public WMSProperties getProperties()
```

Get properties

**Returns:**

properties

### getAppInstance

```
public IApplicationInstance getAppInstance()
```

Get application instance

**Returns:**

application instance

### getVHost

```
public IVHost getVHost()
```

Get vhost

**Returns:**

vhost

### getRepeaterMediaCasterDef

```
public MediaCasterItem getRepeaterMediaCasterDef()
```

Get the live repeater media caster definition

(continued from last page)

**Returns:**

live repeater media caster definition

---

**setRepeaterMediaCasterDef**

```
public void setRepeaterMediaCasterDef(MediaCasterItem repeaterMediaCasterDef)
```

Set the live repeater media caster definition

**Parameters:**

repeaterMediaCasterDef - live repeater media caster definition

---

**getStreamTypeStr**

```
public String getStreamTypeStr()
```

Get stream type

**Returns:**

stream type

---

**setStreamTypeStr**

```
public void setStreamTypeStr(String streamTypeStr)
```

Set stream type

**Parameters:**

streamTypeStr - stream type

---

**isStreamDomainProtectionActive**

```
public boolean isStreamDomainProtectionActive()
```

Return true if stream domain protection is on

**Returns:**

true if stream domain protection is on

---

**setStreamDomainProtectionActive**

```
public void setStreamDomainProtectionActive(boolean streamDomainProtectionActive)
```

Turn on/off stream domain protection

**Parameters:**

streamDomainProtectionActive - true if stream domain protection is on

---

**getHTTPOriginMode**

```
public int getHTTPOriginMode()
```

Get current HTTP origin mode. See HTTPORIGINMODE\_ (auto is currently not supported)

**Returns:**

HTTP origin mode

## setHTTPOriginMode

```
public void setHTTPOriginMode(int httpOriginMode)
```

Set current HTTP origin mode. See HTTPORIGINMODE\_ (auto is currently not supported)

**Parameters:**

httpOriginMode - HTTP origin mode

---

## isHTTPOriginOn

```
public boolean isHTTPOriginOn()
```

Returns true if HTTP origin mode is set to ON.

**Returns:**

true if HTTP origin mode is set to ON.

---

## setUserHTTPHeader

```
public void setUserHTTPHeader(String name,  
                               String value)
```

Add a user HTTP header to the header map. These headers will be added to every HTTP response.

**Parameters:**

name - name

value - value (null if no value)

---

## getUserHTTPHeaders

```
public java.util.Map getUserHTTPHeaders()
```

Get user HTTP headers.

**Returns:**

header map

---

## addQueryStrRemoveList

```
public void addQueryStrRemoveList(String name)
```

Add a name to the list of query string parameters that will not be copied to the media URLs for HTTP streaming

**Parameters:**

name - query name

---

## filterQueryStr

```
public java.util.Map filterQueryStr(java.util.Map map)
```

Internal

**Parameters:**

map - query map

**Returns:**

query map

---

## getCacheControlStatus4xx

```
public String getCacheControlStatus4xx()
```

Get the cache-control header for 4xx HTTP responses

**Returns:**

cache-control header for 4xx HTTP responses

---

## setCacheControlStatus4xx

```
public void setCacheControlStatus4xx(String cacheControlStatus4xx)
```

Set the cache-control header for 4xx HTTP responses

**Parameters:**

cacheControlStatus4xx - cache-control header for 4xx HTTP responses

---

## getResponseOnIncompleteChunk

```
public int getResponseOnIncompleteChunk()
```

Get the response code used when an incomplete chunk (read error) is encountered. If zero, chunk is sent.

**Returns:**

response code

---

## setResponseOnIncompleteChunk

```
public void setResponseOnIncompleteChunk(int responseOnIncompleteChunk)
```

Set the response code used when an incomplete chunk (read error) is encountered. If zero, chunk is sent.

**Parameters:**

responseOnIncompleteChunk - response code

---

## getMaxHTTPSessionsPerTCPSession

```
public int getMaxHTTPSessionsPerTCPSession()
```

Get maximum number of HTTP sessions tracked per-TCP session

**Returns:**

maximum number of HTTP sessions tracked per-TCP session

---

## setMaxHTTPSessionsPerTCPSession

```
public void setMaxHTTPSessionsPerTCPSession(int maxHTTPSessionsPerTCPSession)
```

Set maximum number of HTTP sessions tracked per-TCP session

**Parameters:**

maxHTTPSessionsPerTCPSession - maximum number of HTTP sessions tracked per-TCP session

---

## getHTTPOriginSessionIdProvider

```
public IHTTPStreamerHTTPOriginSessionIdProvider getHTTPOriginSessionIdProvider()
```

---

(continued from last page)

Get HTTP origin sessionId provider used to determine unique HTTP origin sessions.

**Returns:**

sessionId provider

---

## setHTTPOriginSessionIdProvider

```
public void setHTTPOriginSessionIdProvider(IHTTPStreamerHTTPOriginSessionIdProvider  
httpOriginSessionIdProvider)
```

Set HTTP origin sessionId provider used to determine unique HTTP origin sessions.

**Parameters:**

httpOriginSessionIdProvider - sessionId provider

com.wowza.wms.httpstreamer.model

Interface IHTTPStreamerHTTPOriginSessionIdProvider

public interface IHTTPStreamerHTTPOriginSessionIdProvider

extends

Method Summary	
String	<a href="#">getHTTPOriginId</a> (String httpOriginId, <a href="#">IHttpRequest</a> req, <a href="#">IHTTPStreamerApplicationContext</a> appContext, String oldSessionId, String streamDomainStr, boolean isHTTPOrigin, boolean isDvr, long currTime)

Methods

getHTTPOriginId

```
public String getHTTPOriginId(String httpOriginId,
    IHttpRequest req,
    IHTTPStreamerApplicationContext appContext,
    String oldSessionId,
    String streamDomainStr,
    boolean isHTTPOrigin,
    boolean isDvr,
    long currTime)
```

# com.wowza.wms.httpstreamer.model

## Interface IHTTPStreamerRepeater

public interface IHTTPStreamerRepeater  
extends

IHTTPStreamerRepeater: stream switching constants

Field Summary	
public static final	<a href="#">MSG_STARTSTREAM</a> Value: <b>startStream</b>
public static final	<a href="#">MSG_SWITCHSTREAM</a> Value: <b>switchStream</b>

### Fields

#### MSG\_STARTSTREAM

public static final java.lang.String MSG\_STARTSTREAM

Constant value: **startStream**

#### MSG\_SWITCHSTREAM

public static final java.lang.String MSG\_SWITCHSTREAM

Constant value: **switchStream**

## com.wowza.wms.httpstreamer.model Interface IHTTPStreamerRequestContext

public interface IHTTPStreamerRequestContext  
extends

### Field Summary

public static final	<a href="#"><u>CUPERTINO_CHUNKLIST</u></a> Value: <b>2</b>
public static final	<a href="#"><u>CUPERTINO_MANIFEST</u></a> Value: <b>1</b>

int	<a href="#">getRequestType()</a>
void	<a href="#">setRequest</a> ( <a href="#">IHttpRequest</a> request)
void	<a href="#">setRequestType</a> (int requestType)

## Fields

### NONE

public static final int **NONE**

Constant value: **0**

### CUPERTINO\_MANIFEST

public static final int **CUPERTINO\_MANIFEST**

Constant value: **1**

### CUPERTINO\_CHUNKLIST

public static final int **CUPERTINO\_CHUNKLIST**

Constant value: **2**

### CUPERTINO\_MEDIA

public static final int **CUPERTINO\_MEDIA**

Constant value: **3**

---

## CUPERTINO\_SUBTITLE\_LIST

```
public static final int CUPERTINO_SUBTITLE_LIST
```

Constant value: **4**

---

## CUPERTINO\_SUBTITLE\_CHUNK

```
public static final int CUPERTINO_SUBTITLE_CHUNK
```

Constant value: **5**

---

## SANJOSE\_MANIFEST

```
public static final int SANJOSE_MANIFEST
```

Constant value: **10**

---

## SANJOSE\_MEDIA

```
public static final int SANJOSE_MEDIA
```

Constant value: **11**

---

## SMOOTHSTREAMING\_MANIFEST

```
public static final int SMOOTHSTREAMING_MANIFEST
```

Constant value: **20**

---

## SMOOTHSTREAMING\_AUDIO\_FRAGMENT

```
public static final int SMOOTHSTREAMING_AUDIO_FRAGMENT
```

Constant value: **21**

---

## SMOOTHSTREAMING\_VIDEO\_FRAGMENT

```
public static final int SMOOTHSTREAMING_VIDEO_FRAGMENT
```

Constant value: **22**

---

## SMOOTHSTREAMING\_DATA\_FRAGMENT

```
public static final int SMOOTHSTREAMING_DATA_FRAGMENT
```

Constant value: **23**

---

(continued from last page)

---

## MPEGDASH\_MANIFEST

```
public static final int MPEGDASH_MANIFEST
```

Constant value: **30**

---

## MPEGDASH\_MEDIA

```
public static final int MPEGDASH_MEDIA
```

Constant value: **31**

---

## MPEGDASH\_DATA

```
public static final int MPEGDASH_DATA
```

Constant value: **32**

---

## MPEGDASH\_SUBTITLE\_CHUNK

```
public static final int MPEGDASH_SUBTITLE_CHUNK
```

Constant value: **33**

---

## MPEGDASH\_TIME

```
public static final int MPEGDASH_TIME
```

Constant value: **34**

## Methods

### getRequestType

```
public int getRequestType()
```

---

### setRequestType

```
public void setRequestType(int requestType)
```

---

### getRequest

```
public IHttpRequest getRequest()
```

---

### setRequest

```
public void setRequest(IHttpRequest request)
```

---

(continued from last page)

## com.wowza.wms.httpstreamer.model Interface IHTTPStreamerRequestNotify

public interface **IHTTPStreamerRequestNotify**  
extends

IHTTPStreamerRequestNotify: HTTP streamer request interface

### Method Summary

void	<a href="#">onHTTPStreamerRequest</a> ( <a href="#">IHTTPStreamerSession</a> httpStreamerSession, <a href="#">IHTTPStreamerRequestContext</a> requestContext) Called during an HTTP streaming request after the session has been created
------	--

### Methods

#### onHTTPStreamerRequest

public void **onHTTPStreamerRequest**([IHTTPStreamerSession](#) httpStreamerSession,  
[IHTTPStreamerRequestContext](#) requestContext)

Called during an HTTP streaming request after the session has been created

**Parameters:**

httpStreamerSession - HTTP streaming session

## com.wowza.wms.httpstreamer.model Interface IHTTPStreamerSession

public interface **IHTTPStreamerSession**  
extends

IHTTPStreamerSession: HTTP streaming session interface

### Field Summary

public static final	<a href="#"><u>SESSIONPROTOCOL_COUNT</u></a> Value: <b>8</b>

## Method Summary

void	<a href="#">acceptSession()</a> Accept the HTTP session.
void	<a href="#">addHTTPSessionToTCPSession</a> (RtmpSessionInfo wmsSessionInfo, <a href="#">IHTTPStreamerApplicationContext</a> appContext) Add HTTP session to TCP session for tracking
void	<a href="#">addIOPerformance</a> ( <a href="#">IOPerformanceCounter</a> totalIOPerformanceResult) Internal user, keep track of IO performance
void	<a href="#">addIOPerformance2</a> ( <a href="#">IOPerformanceCounter</a> totalIOPerformanceResult) Internal user, keep track of IO performance
void	<a href="#">addStreamDomainStr</a> (String streamDomainStr) Internal user, add stream name
void	<a href="#">addStreamDomainStrs</a> (java.util.List streamNames) Internal user, add stream names
void	<a href="#">addTranscoderVODListener</a> ( <a href="#">IHTTPStreamerTranscoderVODActionNotify</a> listener) Add VOD Transcoder action listener
void	<a href="#">addUserHTTPHeaders</a> ( <a href="#">IHTTPResponse</a> resp) Internal
boolean	<a href="#">checkAndSetPlayLogged()</a> If play has not been logged return false, else returns true, sets play has been logged
void	<a href="#">clearLoggingValues()</a> Internal user, clear logging values
boolean	<a href="#">containsStreamDomainStr</a> (String streamDomainStr) Internal user, test stream name
boolean	<a href="#">containsStreamNameParts</a> (String streamName) Return true if stream name in stream name parts
void	<a href="#">doSessionRedirect</a> ( <a href="#">IHTTPResponse</a> resp) Internal
void	<a href="#">doSessionRedirect</a> ( <a href="#">IHTTPResponse</a> resp, String redirectSessionURL, String redirectSessionContentType, int redirectSessionCode) Internal
void	<a href="#">extractHTTPRequestInfo</a> ( <a href="#">IHTTPRequest</a> req) Extract information from HTTP request
boolean	<a href="#">getAndClearNotifyCreate()</a>

<a href="#"><u>IApplicationInstance</u></a>	<a href="#"><u>getAppInstance</u></a> ( ) Get the application instance associated with this HTTP session
ConnectionHolder	<a href="#"><u>getConnectionHolder</u></a> ( ) Connection holder for this session
String	<a href="#"><u>getCookieStr</u></a> ( ) Get cookie string
HTTPCORSHeaders	<a href="#"><u>getCORSHeaders</u></a> ( )
DvrSessionInfo	<a href="#"><u>getDvrSessionInfo</u></a> ( ) This information is used to manage the connection to the DVR store.
<a href="#"><u>ElapsedTimer</u></a>	<a href="#"><u>getElapsedTime</u></a> ( ) Get the elapsed timer to see how long this session has been running
HTTPStreamerFileInfo	<a href="#"><u>getFileInfo</u></a> (String streamName) Get the file information if video on demand streaming
String	<a href="#"><u>getForwardedIP</u></a> ( ) Get the x-[real forwarded] IP address
String	<a href="#"><u>getHTTPHeader</u></a> (String name) Get a HTTP header value such as 'Content-Length'
java.util.Map	<a href="#"><u>getHTTPHeaderMap</u></a> ( ) Get a copy of the HTTP request header map
java.util.Set	<a href="#"><u>getHTTPHeaderNames</u></a> ( ) Get a Set of the header names
int	<a href="#"><u>getHTTPIntHeader</u></a> (String name) Get a HTTP header value such as 'Content-Length' and return as int
<a href="#"><u>IHTTPStreamerAdapter</u></a>	<a href="#"><u>getHTTPStreamerAdapter</u></a> ( ) Get the HTTP streaming adapter associated with this HTTP session
<a href="#"><u>IOPerformanceCounter</u></a>	<a href="#"><u>getIOPerformanceCounter</u></a> ( ) Get IO performance counter
String	<a href="#"><u>getIpAddress</u></a> ( ) Get the IP address
long	<a href="#"><u>getLastRequest</u></a> ( ) Get the last timestamp of the last Io request
String	<a href="#"><u>getLiveStreamingPacketizer</u></a> ( ) Get the live stream packetizer name
Object	<a href="#"><u>getLock</u></a> ( ) Get the synchronization lock for this HTTP session
long	<a href="#"><u>getPlayDuration</u></a> ( ) Get the play duration (milliseconds) for video on demand playback.
long	<a href="#"><u>getPlaySeek</u></a> ( ) Get the seek location (milliseconds) where playback should start

long	<a href="#"><u>getPlayStart()</u></a> Get the play start time offset (milliseconds) for video on demand playback.
<a href="#"><u>WMSPProperties</u></a>	<a href="#"><u>getProperties()</u></a> Get the properties associated with this session
String	<a href="#"><u>getQueryStr()</u></a> Get query string
byte[]	<a href="#"><u>getRedirectSessionBody()</u></a> Get redirect session body
int	<a href="#"><u>getRedirectSessionCode()</u></a> Get session redirect HTTP response code (default 302)
String	<a href="#"><u>getRedirectSessionContentType()</u></a> Get redirect session HTTP Content-Type
String	<a href="#"><u>getRedirectSessionURL()</u></a> Get redirect session URL
String	<a href="#"><u>getReferrer()</u></a> Get referrer
String	<a href="#"><u>getServerIp()</u></a> Get server IP address
int	<a href="#"><u>getServerPort()</u></a> Get server port
String	<a href="#"><u>getSessionId()</u></a> Get session id
int	<a href="#"><u>getSessionProtocol()</u></a> Get protocol, see SESSIONPROTOCOL_*
int	<a href="#"><u>getSessionTimeout()</u></a> Get the session timeout for this session (milliseconds)
int	<a href="#"><u>getSessionType()</u></a> Get session type: see SESSIONTYPE_*
<a href="#"><u>IMediaStream</u></a>	<a href="#"><u>getStream()</u></a> Get the IMediaStream associated with this HTTP session
String	<a href="#"><u>getStreamExt()</u></a> Get stream extension
String	<a href="#"><u>getStreamName()</u></a> Get stream name
HTTPStreamerStreamNameParts	<a href="#"><u>getStreamNameParts(String streamName)</u></a> Break the stream name into parts
long	<a href="#"><u>getStreamPosition()</u></a> Get stream position
String	<a href="#"><u>getTimeRunning()</u></a> Get the time this session has been running (milliseconds)

double	<a href="#"><u>getTimeRunningSeconds()</u></a> Get the time this session has been running (seconds)
<a href="#"><u>IHTTPStreamerTranscoderVODIndex</u></a>	<a href="#"><u>getTranscoderVODIndex()</u></a> Get the VOD Transcoder index information
<a href="#"><u>IHTTPStreamerTranscoderVODDestinationIndex</u></a>	<a href="#"><u>getTranscoderVODIndex(String bitrateStr)</u></a> Get VOD transcoder index for given bitrate
java.util.Map	<a href="#"><u>getTranscoderVODIndexDestinationsMap()</u></a> Get the VOD Transcoder destination map
java.util.List	<a href="#"><u>getTranscoderVODIndexDestinationsOrder()</u></a> Get the list of VOD Transcoder destinations in playlist order
com.wowza.wms.transcoder.vod.TranscoderVODSession	<a href="#"><u>getTranscoderVODSession()</u></a> Get the vod transcoder session associated with this HTTP session
String	<a href="#"><u>getUri()</u></a> Get the URI associated with initial request
String	<a href="#"><u>getUserAgent()</u></a> Get user agent
java.util.Map	<a href="#"><u>getUserHTTPHeaders()</u></a> Get user HTTP header.
String	<a href="#"><u>getUserQueryStr()</u></a> This query string will be added to URLs used in HTTP streaming
<a href="#"><u>IVHost</u></a>	<a href="#"><u>getVHost()</u></a> Get vhost
String	<a href="#"><u>getVODTranscodeNGRP()</u></a> Get the VOD Transcoder NGRP name
void	<a href="#"><u>indexTranscoderVOD(IHTTPStreamerApplicationContext appContext, String vodTranscodeNGRP)</u></a> Index the HTTP session for VOD transcoder streaming
boolean	<a href="#"><u>isAcceptSession()</u></a> Return true if this session has not been rejected
boolean	<a href="#"><u>isActive()</u></a> Is this session active, false after shutdown
boolean	<a href="#"><u>isDelete()</u></a> Return true if this session is flagged for deletion.
boolean	<a href="#"><u>isDeleteSession()</u></a> Get is session to be deleted.
boolean	<a href="#"><u>isFileInfo(String streamName)</u></a> Return true if the is file information for a given stream name
boolean	<a href="#"><u>isHTTPOrigin()</u></a> Return true if session in an HTTP origin session

boolean	<a href="#"><u>isPlayLogged()</u></a> true, if play has been logged
boolean	<a href="#"><u>isRedirectSession()</u></a> Is session redirect
boolean	<a href="#"><u>isSecure()</u></a> Returns true if the stream is being streamed over an SSL port
boolean	<a href="#"><u>isTimeout(long timecode)</u></a> Return true if this session is timed out.
boolean	<a href="#"><u>isTimeoutSession()</u></a> Get is session timeout.
boolean	<a href="#"><u>isValidated()</u></a> Has this session been validated
boolean	<a href="#"><u>isValidStreamDomainStr(String streamDomainStr)</u></a> Internal user, is stream name valid for HTTP session
void	<a href="#"><u>lockRepeaterStreams(java.util.List streamNames, String liveStreamPacketizer, String liveStreamRepeater, String streamTypeStr)</u></a> Internal user, lock in reapter streams
void	<a href="#"><u>notifyTranscoderVODFillChunkStart(com.wowza.wms.transcoder.vod.TranscoderVODSession transcoderVODSession, com.wowza.wms.transcoder.vod.TranscoderVODDestination transcoderVODDestination, MediaReaderH264Chunk mediaReaderChunk, com.wowza.wms.transcoder.vod.TranscoderVODChunkContext transcoderVODChunkContext)</u></a> Called to notify of VOD Transcoder fill chunk start
void	<a href="#"><u>notifyTranscoderVODFillChunkStop(com.wowza.wms.transcoder.vod.TranscoderVODSession transcoderVODSession, com.wowza.wms.transcoder.vod.TranscoderVODChunkContext transcoderVODChunkContext)</u></a> Called to notify of VOD Transcoder fill stop
void	<a href="#"><u>notifyTranscoderVODFillChunkTranscode(com.wowza.wms.transcoder.vod.TranscoderVODSession transcoderVODSession, com.wowza.wms.transcoder.vod.TranscoderVODChunkContext transcoderVODChunkContext, java.util.List packets)</u></a> Called to notify of VOD Transcoder fill chunk
void	<a href="#"><u>putFileInfo(String streamName, HTTPStreamerFileInfo fileInfo)</u></a> Set the file information
void	<a href="#"><u>putStreamNameParts(String streamName, HTTPStreamerStreamNameParts streamNameParts)</u></a> Add stream name to stream name parts
void	<a href="#"><u>redirectSession(String redirectSessionURL)</u></a> Redirect session
void	<a href="#"><u>redirectSession(String redirectSessionURL, int redirectSessionCode)</u></a> Redirect session
void	<a href="#"><u>rejectSession()</u></a> Reject this HTTP session.
void	<a href="#"><u>removeStreamDomainStr(String streamDomainStr)</u></a> Internal user, remove stream name

boolean	<a href="#"><code>removeTranscoderVODListener</code></a> ( <a href="#"><code>IHTTPStreamerTranscoderVODActionNotifyListener</code></a> ) Remove VOD Transcoder action listener
void	<a href="#"><code>setAcceptSession</code></a> (boolean acceptSession) Set to false to reject session
void	<a href="#"><code>setActive</code></a> (boolean isActive) Set session active
void	<a href="#"><code>setAppInstance</code></a> ( <a href="#"><code>IApplicationInstance</code></a> appInstance) Set the application instance associated with this HTTP session
void	<a href="#"><code>setCookieStr</code></a> (String cookieStr) Set cookie string
void	<a href="#"><code>setDeleteSession</code></a> () Set session to be deleted.
void	<a href="#"><code>setDvrSessionInfo</code></a> (DvrSessionInfo dvr) This information is used to manage the connection to the DVR store.
void	<a href="#"><code>setForwardedIP</code></a> (String ipAddress) Set the x-[real forwarded] IP address
void	<a href="#"><code>setHTTPOrigin</code></a> (boolean isHTTPOrigin) Set to true if HTTP origin session
void	<a href="#"><code>setHTTPStreamerAdapter</code></a> ( <a href="#"><code>IHTTPStreamerAdapter</code></a> httpStreamerAdapter) Set the HTTP streaming adapter associated with this HTTP session
void	<a href="#"><code>setIpAddress</code></a> (String ipAddress) Set the IP address
void	<a href="#"><code>setLiveStreamingPacketizer</code></a> (String liveStreamingPacketizer) Set the live stream packetizer name
void	<a href="#"><code>setPlayDuration</code></a> (long playDuration) Set the play duration (milliseconds) for video on demand playback.
void	<a href="#"><code>setPlayLogged</code></a> (boolean isPlayLogged) true, if play has been logged
void	<a href="#"><code>setPlaySeek</code></a> (long playSeek) Set the seek location (milliseconds) where playback should start
void	<a href="#"><code>setPlayStart</code></a> (long playStart) Set the play start time offset (milliseconds) for video on demand playback.
void	<a href="#"><code>setQueryStr</code></a> (String queryStr) Set query string
void	<a href="#"><code>setRedirectSession</code></a> (boolean redirectSession) Set session redirect
void	<a href="#"><code>setRedirectSessionBody</code></a> (byte[] redirectSessionBody) Set redirect session body
void	<a href="#"><code>setRedirectSessionCode</code></a> (int redirectSessionCode) Set session redirect HTTP response code (default 302)

void	<a href="#"><u>setRedirectSessionContentType</u></a> (String redirectSessionContentType) Set redirect session HTTP Content-Type
void	<a href="#"><u>setRedirectSessionURL</u></a> (String redirectSessionURL) Set redirect session URL
void	<a href="#"><u>setReferrer</u></a> (String referrer) Set referrer
void	<a href="#"><u>setSecure</u></a> (boolean isSecure) Set to true if the stream is being streamed over an SSL port
void	<a href="#"><u>setServerIp</u></a> (String serverIp) Set server IP address
void	<a href="#"><u>setServerPort</u></a> (int serverPort) Set server port
void	<a href="#"><u>setSessionId</u></a> (String sessionId) Set session id
void	<a href="#"><u>setSessionProtocol</u></a> (int sessionProtocol) Set protocol, see SESSIONPROTOCOL_*
void	<a href="#"><u>setSessionTimeout</u></a> (int sessionTimeout) Set the session timeout for this session (milliseconds)
void	<a href="#"><u>setSessionType</u></a> (int sessionType) Set session type: see SESSIONTYPE_*
void	<a href="#"><u>setStream</u></a> (IMediaStream stream) Set the IMediaStream associated with this HTTP session
void	<a href="#"><u>setStreamExt</u></a> (String streamExt) Set stream extension
void	<a href="#"><u>setStreamName</u></a> (String streamName) Set stream name
void	<a href="#"><u>setStreamPosition</u></a> (long streamPosition) Set stream position (will not cause seek)
void	<a href="#"><u>setTimeoutSession</u></a> (boolean timeoutSession) Set is session timeout.
void	<a href="#"><u>setTranscoderVODIndex</u></a> (IHTTPStreamerTranscoderVODIndex transcoderVODIndex) Set the VOD Transcoder index information
void	<a href="#"><u>setTranscoderVODSession</u></a> (com.wowza.wms.transcoder.vod.TranscoderVODSession transcoderVODSession) Set the vod transcoder session associated with this HTTP session
void	<a href="#"><u>setUri</u></a> (String uri) Set the URI associated with initial request
void	<a href="#"><u>setUserAgent</u></a> (String userAgent) Set user agent

void	<a href="#"><code>setUserHTTPHeader</code></a> (String name, String value) Set user HTTP header.
void	<a href="#"><code>setUserQueryStr</code></a> (String userQueryStr) This query string will be added to URLs used in HTTP streaming
void	<a href="#"><code>setVHost</code></a> ( <a href="#"><code>IVHost</code></a> vhost) Set vhost
void	<a href="#"><code>setVODTranscodeNGRP</code></a> (String vodTranscodeNGRP) Set the VOD Transcoder NGRP name
void	<a href="#"><code>shutdown</code></a> () Called then the HTTP session is shutting down
void	<a href="#"><code>touch</code></a> (long timecode) Touch this session to keep it active.
void	<a href="#"><code>updateLoggingValues</code></a> () Internal user, update logging values
String	<a href="#"><code>validStreamDomainToString</code></a> () Return the valid domain strings as a string

## Fields

### SESSIONTYPE\_UNKNOWN

public static final int **SESSIONTYPE\_UNKNOWN**

Constant value: **0**

### SESSIONTYPE\_LIVE

public static final int **SESSIONTYPE\_LIVE**

Constant value: **1**

### SESSIONTYPE\_VOD

public static final int **SESSIONTYPE\_VOD**

Constant value: **2**

### SESSIONTYPE\_LIVEDVR

public static final int **SESSIONTYPE\_LIVEDVR**

Constant value: **3**

### SESSIONPROTOCOL\_UNKNOWN

public static final int **SESSIONPROTOCOL\_UNKNOWN**

(continued from last page)

Constant value: **-1**

---

**SESSIONPROTOCOL\_SMOOTHSTREAMING**

```
public static final int SESSIONPROTOCOL_SMOOTHSTREAMING
```

Constant value: **0**

---

**SESSIONPROTOCOL\_CUPERTINOSTREAMING**

```
public static final int SESSIONPROTOCOL_CUPERTINOSTREAMING
```

Constant value: **1**

---

**SESSIONPROTOCOL\_SANJOSESTREAMING**

```
public static final int SESSIONPROTOCOL_SANJOSESTREAMING
```

Constant value: **2**

---

**SESSIONPROTOCOL\_WEBMSTREAMING**

```
public static final int SESSIONPROTOCOL_WEBMSTREAMING
```

Constant value: **3**

---

**SESSIONPROTOCOL\_MPEGDASHSTREAMING**

```
public static final int SESSIONPROTOCOL_MPEGDASHSTREAMING
```

Constant value: **4**

---

**SESSIONPROTOCOL\_DVRCHUNKSTREAMING**

```
public static final int SESSIONPROTOCOL_DVRCHUNKSTREAMING
```

Constant value: **5**

---

**SESSIONPROTOCOL\_DIRECTSTREAMING**

```
public static final int SESSIONPROTOCOL_DIRECTSTREAMING
```

Constant value: **6**

---

**SESSIONPROTOCOL\_TSSTREAMING**

```
public static final int SESSIONPROTOCOL_TSSTREAMING
```

Constant value: **7**

## SESSIONPROTOCOL\_COUNT

```
public static final int SESSIONPROTOCOL_COUNT
```

Constant value: **8**

## Methods

### getSessionId

```
public String getSessionId()
```

Get session id

**Returns:**

session id

### setSessionId

```
public void setSessionId(String sessionId)
```

Set session id

**Parameters:**

sessionId - session id

### getVHost

```
public IVHost getVHost()
```

Get vhost

**Returns:**

vhost

### setVHost

```
public void setVHost(IVHost vhost)
```

Set vhost

**Parameters:**

vhost - vhost

### touch

```
public void touch(long timecode)
```

Touch this session to keep it active.

**Parameters:**

timecode - timecode of touch - System.currentTimeMillis();

### isTimeout

```
public boolean isTimeout(long timecode)
```

---

(continued from last page)

Return true if this session is timed out.

**Parameters:**

timecode - last touch - System.currentTimeMillis();

**Returns:**

true, if timed out

---

## isDelete

```
public boolean isDelete()
```

Return true if this session is flagged for deletion.

**Returns:**

true, if flagged for deletion

---

## getLock

```
public Object getLock()
```

Get the synchronization lock for this HTTP session

**Returns:**

synchronization lock

---

## shutdown

```
public void shutdown()
```

Called then the HTTP session is shutting down

---

## isActive

```
public boolean isActive()
```

Is this session active, false after shutdown

**Returns:**

true if session is active

---

## setActive

```
public void setActive(boolean isActive)
```

Set session active

**Parameters:**

isActive - session active

---

## getStream

```
public IMediaStream getStream()
```

Get the IMediaStream associated with this HTTP session

**Returns:**

IMediaStream associated with this HTTP session

---

## setStream

```
public void setStream(IMediaStream stream)
```

Set the IMediaStream associated with this HTTP session

**Parameters:**

stream - IMediaStream associated with this HTTP session

---

## isTimeoutSession

```
public boolean isTimeoutSession()
```

Get is session timeout.

**Returns:**

true if this session is timed out

---

## setTimeoutSession

```
public void setTimeoutSession(boolean timeoutSession)
```

Set is session timeout.

**Parameters:**

timeoutSession - true if this session is timed out

---

## isDeleteSession

```
public boolean isDeleteSession()
```

Get is session to be deleted.

**Returns:**

true if this session is flagged for deletion

---

## setDeleteSession

```
public void setDeleteSession()
```

Set session to be deleted.

---

## getSessionTimeout

```
public int getSessionTimeout()
```

Get the session timeout for this session (milliseconds)

**Returns:**

session timeout for this session (milliseconds)

---

## setSessionTimeout

```
public void setSessionTimeout(int sessionTimeout)
```

Set the session timeout for this session (milliseconds)

---

---

(continued from last page)

**Parameters:**

sessionTimeout - session timeout for this session (milliseconds)

---

**isValidated**

```
public boolean isValidated()
```

Has this session been validated

**Returns:**

true, if validated

---

**checkAndSetPlayLogged**

```
public boolean checkAndSetPlayLogged()
```

If play has not been logged return false, else returns true, sets play has been logged

**Returns:**

true, if play has been logged

---

**isPlayLogged**

```
public boolean isPlayLogged()
```

true, if play has been logged

**Returns:**

true, if play has been logged

---

**setPlayLogged**

```
public void setPlayLogged(boolean isPlayLogged)
```

true, if play has been logged

**Parameters:**

isPlayLogged - true, if play has been logged

---

**addIOPerformance**

```
public void addIOPerformance(IOPerformanceCounter totalIOPerformanceResult)
```

Internal user, keep track of IO performance

**Parameters:**

totalIOPerformanceResult - IO performance

---

**addIOPerformance2**

```
public void addIOPerformance2(IOPerformanceCounter totalIOPerformanceResult)
```

Internal user, keep track of IO performance

**Parameters:**

totalIOPerformanceResult - IO performance

---

(continued from last page)

---

## getConnectionHolder

```
public ConnectionHolder getConnectionHolder()
```

Connection holder for this session

**Returns:**

connection holder

---

## getHTTPStreamerAdapter

```
public IHTTPStreamerAdapter getHTTPStreamerAdapter()
```

Get the HTTP streaming adapter associated with this HTTP session

**Returns:**

HTTP streaming adapter

---

## setHTTPStreamerAdapter

```
public void setHTTPStreamerAdapter(IHTTPStreamerAdapter httpStreamerAdapter)
```

Set the HTTP streaming adapter associated with this HTTP session

**Parameters:**

httpStreamerAdapter - HTTP streaming adapter

---

## getAppInstance

```
public IApplicationInstance getAppInstance()
```

Get the application instance associated with this HTTP session

**Returns:**

application instance associated with this HTTP session

---

## setAppInstance

```
public void setAppInstance(IApplicationInstance appInstance)
```

Set the application instance associated with this HTTP session

**Parameters:**

appInstance - application instance associated with this HTTP session

---

## getSessionType

```
public int getSessionType()
```

Get session type: see SESSIONTYPE\_\*

**Returns:**

session type: see SESSIONTYPE\_\*

---

## setSessionType

```
public void setSessionType(int sessionType)
```

---

(continued from last page)

Set session type: see SESSIONTYPE\_\*

**Parameters:**

sessionType - session type: see SESSIONTYPE\_\*

---

## getLiveStreamingPacketizer

```
public String getLiveStreamingPacketizer()
```

Get the live stream packetizer name

**Returns:**

live stream packetizer name

---

## setLiveStreamingPacketizer

```
public void setLiveStreamingPacketizer(String liveStreamingPacketizer)
```

Set the live stream packetizer name

**Parameters:**

liveStreamingPacketizer - live stream packetizer name

---

## getIpAddress

```
public String getIpAddress()
```

Get the IP address

**Returns:**

IP address

---

## setIpAddress

```
public void setIpAddress(String ipAddress)
```

Set the IP address

**Parameters:**

ipAddress - IP address

---

## getForwardedIP

```
public String getForwardedIP()
```

Get the x-[real|forwarded] IP address

**Returns:**

IP address

---

## setForwardedIP

```
public void setForwardedIP(String ipAddress)
```

Set the x-[real|forwarded] IP address

**Parameters:**

ipAddress - IP address

## updateLoggingValues

```
public void updateLoggingValues()
```

Internal user, update logging values

---

## clearLoggingValues

```
public void clearLoggingValues()
```

Internal user, clear logging values

---

## getSessionProtocol

```
public int getSessionProtocol()
```

Get protocol, see SESSIONPROTOCOL\_\*

**Returns:**

protocol, see SESSIONPROTOCOL\_\*

---

## setSessionProtocol

```
public void setSessionProtocol(int sessionProtocol)
```

Set protocol, see SESSIONPROTOCOL\_\*

**Parameters:**

sessionProtocol - protocol, see SESSIONPROTOCOL\_\*

---

## getServerIp

```
public String getServerIp()
```

Get server IP address

**Returns:**

server IP address

---

## setServerIp

```
public void setServerIp(String serverIp)
```

Set server IP address

**Parameters:**

serverIp - server IP address

---

## getServerPort

```
public int getServerPort()
```

Get server port

**Returns:**

server port

---

## setServerPort

```
public void setServerPort(int serverPort)
```

Set server port

**Parameters:**

serverPort - server port

---

## getUserAgent

```
public String getUserAgent()
```

Get user agent

**Returns:**

user agent

---

## setUserAgent

```
public void setUserAgent(String userAgent)
```

Set user agent

**Parameters:**

userAgent - user agent

---

## getUri

```
public String getUri()
```

Get the URI associated with initial request

**Returns:**

URI associated with initial request

---

## setUri

```
public void setUri(String uri)
```

Set the URI associated with initial request

**Parameters:**

uri - URI associated with initial request

---

## getReferrer

```
public String getReferrer()
```

Get referrer

**Returns:**

referrer

---

## setReferrer

```
public void setReferrer(String referrer)
```

---

(continued from last page)

Set referrer

**Parameters:**

referrer - referrer

---

## getQueryStr

```
public String getQueryStr()
```

Get query string

**Returns:**

query string

---

## setQueryStr

```
public void setQueryStr(String queryStr)
```

Set query string

**Parameters:**

queryStr - query string

---

## lockRepeaterStreams

```
public void lockRepeaterStreams(java.util.List streamNames,  
    String liveStreamPacketizer,  
    String liveStreamRepeater,  
    String streamTypeStr)
```

Internal user, lock in reapter streams

**Parameters:**

streamNames - list of stream names

liveStreamPacketizer - live stream packetizer name

liveStreamRepeater - live repeater name

streamTypeStr - stream type

---

## rejectSession

```
public void rejectSession()
```

Reject this HTTP session. No further processing should occur

---

## acceptSession

```
public void acceptSession()
```

Accept the HTTP session.

---

## isAcceptSession

```
public boolean isAcceptSession()
```

Return true if this session has not been rejected

**Returns:**

true if this session has not been rejected

## setAcceptSession

```
public void setAcceptSession(boolean acceptSession)
```

Set to false to reject session

### Parameters:

acceptSession - false to reject session

---

## getCookieStr

```
public String getCookieStr()
```

Get cookie string

### Returns:

cookie string

---

## setCookieStr

```
public void setCookieStr(String cookieStr)
```

Set cookie string

### Parameters:

cookieStr - cookie string

---

## getStreamName

```
public String getStreamName()
```

Get stream name

### Returns:

stream name

---

## setStreamName

```
public void setStreamName(String streamName)
```

Set stream name

### Parameters:

streamName - stream name

---

## getStreamExt

```
public String getStreamExt()
```

Get stream extension

### Returns:

stream extension

---

## setStreamExt

```
public void setStreamExt(String streamExt)
```

---

(continued from last page)

Set stream extension

**Parameters:**

streamExt - stream extension

---

## getStreamNameParts

```
public HTTPStreamerStreamNameParts getStreamNameParts(String streamName)
```

Break the stream name into parts

**Parameters:**

streamName - stream name

**Returns:**

stream name parts

---

## containsStreamNameParts

```
public boolean containsStreamNameParts(String streamName)
```

Return true if stream name in stream name parts

**Parameters:**

streamName - stream name

**Returns:**

true if stream name in stream name parts

---

## putStreamNameParts

```
public void putStreamNameParts(String streamName,  
    HTTPStreamerStreamNameParts streamNameParts)
```

Add stream name to stream name parts

**Parameters:**

streamName - stream name

streamNameParts - stream name parts

---

## getStreamPosition

```
public long getStreamPosition()
```

Get stream position

**Returns:**

stream position

---

## setStreamPosition

```
public void setStreamPosition(long streamPosition)
```

Set stream position (will not cause seek)

**Parameters:**

streamPosition - stream position

## getIOPerformanceCounter

```
public IOPerformanceCounter getIOPerformanceCounter()
```

Get IO performance counter

**Returns:**

IO performance counter

---

## getFileInfo

```
public HTTPStreamerFileInfo getFileInfo(String streamName)
```

Get the file information if video on demand streaming

**Parameters:**

streamName - stream name

**Returns:**

file information

---

## putFileInfo

```
public void putFileInfo(String streamName,  
    HTTPStreamerFileInfo fileInfo)
```

Set the file information

**Parameters:**

streamName - stream name

fileInfo - file information

---

## isFileInfo

```
public boolean isFileInfo(String streamName)
```

Return true if the is file information for a given stream name

**Parameters:**

streamName - stream name

**Returns:**

true if the is file information for a given stream name

---

## isValidStreamDomainStr

```
public boolean isValidStreamDomainStr(String streamDomainStr)
```

Internal user, is stream name valid for HTTP session

**Parameters:**

streamDomainStr - stream name

**Returns:**

true if valid

---

(continued from last page)

## validStreamDomainToString

```
public String validStreamDomainToString()
```

Return the valid domain strings as a string

**Returns:**

valid domain strings as a string

---

## containsStreamDomainStr

```
public boolean containsStreamDomainStr(String streamDomainStr)
```

Internal user, test stream name

**Parameters:**

streamDomainStr - stream name

**Returns:**

true if valid

---

## removeStreamDomainStr

```
public void removeStreamDomainStr(String streamDomainStr)
```

Internal user, remove stream name

**Parameters:**

streamDomainStr - stream name

---

## addStreamDomainStr

```
public void addStreamDomainStr(String streamDomainStr)
```

Internal user, add stream name

**Parameters:**

streamDomainStr - stream name

---

## addStreamDomainStrs

```
public void addStreamDomainStrs(java.util.List streamNames)
```

Internal user, add stream names

**Parameters:**

streamNames - stream names

---

## getElapsedTime

```
public ElapsedTimer getElapsedTime()
```

Get the elapsed timer to see how long this session has been running

**Returns:**

elapsed timer (milliseconds)

---

(continued from last page)

## getTimeRunning

```
public String getTimeRunning()
```

Get the time this session has been running (milliseconds)

**Returns:**

time this session has been running (milliseconds)

---

## getTimeRunningSeconds

```
public double getTimeRunningSeconds()
```

Get the time this session has been running (seconds)

**Returns:**

time this session has been running (seconds)

---

## getProperties

```
public WMSProperties getProperties()
```

Get the properties associated with this session

**Returns:**

properties

---

## getUserQueryStr

```
public String getUserQueryStr()
```

This query string will be added to URLs used in HTTP streaming

**Returns:**

user query string

---

## setUserQueryStr

```
public void setUserQueryStr(String userQueryStr)
```

This query string will be added to URLs used in HTTP streaming

**Parameters:**

userQueryStr - user query string

---

## setDvrSessionInfo

```
public void setDvrSessionInfo(DvrSessionInfo dvr)
```

This information is used to manage the connection to the DVR store.

**Parameters:**

dvr - The DVR session info.

---

## getDvrSessionInfo

```
public DvrSessionInfo getDvrSessionInfo()
```

---

(continued from last page)

This information is used to manage the connection to the DVR store.

**Returns:**

DVR session info.

---

## extractHTTPRequestInfo

```
public void extractHTTPRequestInfo(IHTTPRequest req)
```

Extract information from HTTP request

**Parameters:**

req - HTTP request

---

## getHTTPHeaderMap

```
public java.util.Map getHTTPHeaderMap()
```

Get a copy of the HTTP request header map

**Returns:**

copy of the HTTP request header map

---

## getHTTPHeader

```
public String getHTTPHeader(String name)
```

Get a HTTP header value such as 'Content-Length'

**Parameters:**

name - header name

**Returns:**

header value

---

## getHTTPIntHeader

```
public int getHTTPIntHeader(String name)
```

Get a HTTP header value such as 'Content-Length' and return as int

**Parameters:**

name - header name

**Returns:**

header value

---

## getHTTPHeaderNames

```
public java.util.Set getHTTPHeaderNames()
```

Get a Set of the header names

**Returns:**

Set of header names

---

(continued from last page)

## getPlayStart

```
public long getPlayStart()
```

Get the play start time offset (milliseconds) for video on demand playback.

**Returns:**

play start time offset (milliseconds)

---

## setPlayStart

```
public void setPlayStart(long playStart)
```

Set the play start time offset (milliseconds) for video on demand playback.

**Parameters:**

playStart - play start time offset (milliseconds)

---

## getPlayDuration

```
public long getPlayDuration()
```

Get the play duration (milliseconds) for video on demand playback. A values of -1 means play to end.

**Returns:**

play duration (milliseconds)

---

## setPlayDuration

```
public void setPlayDuration(long playDuration)
```

Set the play duration (milliseconds) for video on demand playback. A values of -1 means play to end.

**Parameters:**

playDuration - play duration (milliseconds)

---

## getPlaySeek

```
public long getPlaySeek()
```

Get the seek location (milliseconds) where playback should start

**Returns:**

seek location (milliseconds)

---

## setPlaySeek

```
public void setPlaySeek(long playSeek)
```

Set the seek location (milliseconds) where playback should start

**Parameters:**

playSeek - seek location (milliseconds)

---

## setUserHTTPHeader

```
public void setUserHTTPHeader(String name,  
                               String value)
```

(continued from last page)

Set user HTTP header. This header value will be added to all HTTP responses

**Parameters:**

name - name  
value - value

---

## getUserHTTPHeaders

```
public java.util.Map getUserHTTPHeaders()
```

Get user HTTP header. This header value will be added to all HTTP responses

**Returns:**

header map

---

## addUserHTTPHeaders

```
public void addUserHTTPHeaders(IHTTPResponse resp)
```

Internal

**Parameters:**

resp - response

---

## getCORSHaders

```
public HTTPCORSHaders getCORSHaders()
```

**Returns:**

HTTPCORSHaders object

---

## doSessionRedirect

```
public void doSessionRedirect(IHTTPResponse resp)
```

Internal

**Parameters:**

resp - response

---

## doSessionRedirect

```
public void doSessionRedirect(IHTTPResponse resp,  
    String redirectSessionURL,  
    String redirectSessionContentType,  
    int redirectSessionCode)
```

Internal

**Parameters:**

resp - response  
redirectSessionURL - redirect session URL  
redirectSessionContentType  
redirectSessionCode - redirect session response code (default 302)

(continued from last page)

## isRedirectSession

```
public boolean isRedirectSession()
```

Is session redirect

**Returns:**

session redirect

---

## setRedirectSession

```
public void setRedirectSession(boolean redirectSession)
```

Set session redirect

**Parameters:**

redirectSession - session redirect

---

## getRedirectSessionCode

```
public int getRedirectSessionCode()
```

Get session redirect HTTP response code (default 302)

**Returns:**

session redirect HTTP response code

---

## setRedirectSessionCode

```
public void setRedirectSessionCode(int redirectSessionCode)
```

Set session redirect HTTP response code (default 302)

**Parameters:**

redirectSessionCode - session redirect HTTP response code

---

## getRedirectSessionURL

```
public String getRedirectSessionURL()
```

Get redirect session URL

**Returns:**

redirect session URL

---

## setRedirectSessionURL

```
public void setRedirectSessionURL(String redirectSessionURL)
```

Set redirect session URL

**Parameters:**

redirectSessionURL - redirect session URL

---

## redirectSession

```
public void redirectSession(String redirectSessionURL)
```

---

(continued from last page)

Redirect session

**Parameters:**

redirectSessionURL - redirect session URL

---

## redirectSession

```
public void redirectSession(String redirectSessionURL,  
    int redirectSessionCode)
```

Redirect session

**Parameters:**

redirectSessionURL - redirect session URL

redirectSessionCode - redirect session response code (default 302)

---

## getRedirectSessionBody

```
public byte[] getRedirectSessionBody()
```

Get redirect session body

**Returns:**

redirect session body

---

## setRedirectSessionBody

```
public void setRedirectSessionBody(byte[] redirectSessionBody)
```

Set redirect session body

**Parameters:**

redirectSessionBody - redirect session body

---

## getRedirectSessionContentType

```
public String getRedirectSessionContentType()
```

Get redirect session HTTP Content-Type

**Returns:**

redirect session HTTP Content-Type

---

## setRedirectSessionContentType

```
public void setRedirectSessionContentType(String redirectSessionContentType)
```

Set redirect session HTTP Content-Type

**Parameters:**

redirectSessionContentType

---

## getLastRequest

```
public long getLastRequest()
```

Get the last timestamp of the last Io request

**Returns:**

(continued from last page)

last timestamp of the last Io request (milliseconds)

---

## isHTTPOrigin

```
public boolean isHTTPOrigin()
```

Return true if session in an HTTP origin session

**Returns:**

true if session in an HTTP origin session

---

## setHTTPOrigin

```
public void setHTTPOrigin(boolean isHTTPOrigin)
```

Set to true if HTTP origin session

**Parameters:**

isHTTPOrigin - true if HTTP origin session

---

## getAndClearNotifyCreate

```
public boolean getAndClearNotifyCreate()
```

---

## getTranscoderVODSession

```
public com.wowza.wms.transcoder.vod.TranscoderVODSession getTranscoderVODSession()
```

Get the vod transcoder session associated with this HTTP session

**Returns:**

vod transcoder session

---

## setTranscoderVODSession

```
public void setTranscoderVODSession(com.wowza.wms.transcoder.vod.TranscoderVODSession transcoderVODSession)
```

Set the vod transcoder session associated with this HTTP session

**Parameters:**

transcoderVODSession - vod transcoder session

---

## getVODTranscodeNGRP

```
public String getVODTranscodeNGRP()
```

Get the VOD Transcoder NGRP name

**Returns:**

VOD Transcoder NGRP name

---

## setVODTranscodeNGRP

```
public void setVODTranscodeNGRP(String vodTranscodeNGRP)
```

(continued from last page)

Set the VOD Transcoder NGRP name

**Parameters:**

vodTranscodeNGRP - VOD Transcoder NGRP name

---

## getTranscoderVODIndex

```
public IHTTPStreamerTranscoderVODIndex getTranscoderVODIndex()
```

Get the VOD Transcoder index information

**Returns:**

VOD Transcoder index

---

## setTranscoderVODIndex

```
public void setTranscoderVODIndex(IHTTPStreamerTranscoderVODIndex transcoderVODIndex)
```

Set the VOD Transcoder index information

**Parameters:**

transcoderVODIndex - VOD Transcoder index

---

## getTranscoderVODIndexDestinationsOrder

```
public java.util.List getTranscoderVODIndexDestinationsOrder()
```

Get the list of VOD Transcoder destinations in playlist order

**Returns:**

list of VOD Transcoder destinations

---

## getTranscoderVODIndexDestinationsMap

```
public java.util.Map getTranscoderVODIndexDestinationsMap()
```

Get the VOD Transcoder destination map

**Returns:**

VOD Transcoder destination map

---

## indexTranscoderVOD

```
public void indexTranscoderVOD(IHTTPStreamerApplicationContext appContext,  
String vodTranscodeNGRP)
```

Index the HTTP session for VOD transcoder streaming

**Parameters:**

appContext - application context

vodTranscodeNGRP - transcoder name group

---

## getTranscoderVODIndex

```
public IHTTPStreamerTranscoderVODDestinationIndex getTranscoderVODIndex(String  
bitrateStr)
```

Get VOD transcoder index for given bitrate

(continued from last page)

**Parameters:**

bitrateStr - bitrate string

**Returns:**

VOD transcoder index

---

## addHTTPSessionToTCPSession

```
public void addHTTPSessionToTCPSession(RtmpSessionInfo wmsSessionInfo,  
    IHTTPStreamerApplicationContext appContext)
```

Add HTTP session to TCP session for tracking

**Parameters:**

wmsSessionInfo - TCP session info

appContext - app context

---

## isSecure

```
public boolean isSecure()
```

Returns true if the stream is being streamed over an SSL port

**Returns:**

true if the stream is being streamed over an SSL port

---

## setSecure

```
public void setSecure(boolean isSecure)
```

Set to true if the stream is being streamed over an SSL port

**Parameters:**

isSecure - true if the stream is being streamed over an SSL port

---

## addTranscoderVODListener

```
public void addTranscoderVODListener(IHTTPStreamerTranscoderVODActionNotify listener)
```

Add VOD Transcoder action listener

**Parameters:**

listener - VOD Transcoder action listener

---

## removeTranscoderVODListener

```
public boolean removeTranscoderVODListener(IHTTPStreamerTranscoderVODActionNotify  
listener)
```

Remove VOD Transcoder action listener

**Parameters:**

listener - VOD Transcoder action listener

**Returns:**

true/false is successful

(continued from last page)

## notifyTranscoderVODFillChunkStart

```
public void
notifyTranscoderVODFillChunkStart(com.wowza.wms.transcoder.vod.TranscoderVODSession
transcoderVODSession,
    com.wowza.wms.transcoder.vod.TranscoderVODDestination
transcoderVODDestination,
    MediaReaderH264Chunk mediaReaderChunk,
    com.wowza.wms.transcoder.vod.TranscoderVODChunkContext
transcoderVODChunkContext)
```

Called to notify of VOD Transcoder fill chunk start

### Parameters:

transcoderVODSession - VOD Transcoder session  
transcoderVODDestination - VOD Transcoder destination  
mediaReaderChunk - media reader for the chunk  
transcoderVODChunkContext - VOD Transcoder context

---

## notifyTranscoderVODFillChunkTranscode

```
public void
notifyTranscoderVODFillChunkTranscode(com.wowza.wms.transcoder.vod.TranscoderVODSession
n transcoderVODSession,
    com.wowza.wms.transcoder.vod.TranscoderVODChunkContext
transcoderVODChunkContext,
    java.util.List packets)
```

Called to notify of VOD Transcoder fill chunk

### Parameters:

transcoderVODSession - VOD Transcoder session  
transcoderVODChunkContext - VOD Transcoder context  
packets

---

## notifyTranscoderVODFillChunkStop

```
public void
notifyTranscoderVODFillChunkStop(com.wowza.wms.transcoder.vod.TranscoderVODSession
transcoderVODSession,
    com.wowza.wms.transcoder.vod.TranscoderVODChunkContext
transcoderVODChunkContext)
```

Called to notify of VOD Transcoder fill stop

### Parameters:

transcoderVODSession - VOD Transcoder session  
transcoderVODChunkContext - VOD Transcoder context

## com.wowza.wms.httpstreamer.model Interface IHTTPStreamerSessionNotify

public interface IHTTPStreamerSessionNotify  
extends

IHTTPStreamerSessionNotify: HTTP session create/destroy interface

### Method Summary

void	<a href="#">onHTTPStreamerSessionCreate</a> ( <a href="#">IHTTPStreamerSession</a> httpStreamerSession) Called when an HTTP streaming session is created
void	<a href="#">onHTTPStreamerSessionDestroy</a> ( <a href="#">IHTTPStreamerSession</a> httpStreamerSession) Called when an HTTP streaming session is destroyed

### Methods

#### onHTTPStreamerSessionCreate

public void **onHTTPStreamerSessionCreate**([IHTTPStreamerSession](#) httpStreamerSession)

Called when an HTTP streaming session is created

**Parameters:**

httpStreamerSession - HTTP streaming session

#### onHTTPStreamerSessionDestroy

public void **onHTTPStreamerSessionDestroy**([IHTTPStreamerSession](#) httpStreamerSession)

Called when an HTTP streaming session is destroyed

**Parameters:**

httpStreamerSession - HTTP streaming session

## com.wowza.wms.httpstreamer.model Interface IHTTPStreamerTranscoderVODActionNotify

public interface **IHTTPStreamerTranscoderVODActionNotify**  
extends

### Method Summary

void	<a href="#"><code>onFillChunkStart</code></a> (com.wowza.wms.transcoder.vod.TranscoderVODSession transcoderVODSession, com.wowza.wms.transcoder.vod.TranscoderVODDestination transcoderVODDestination, <code>MediaReaderH264Chunk</code> mediaReaderChunk, com.wowza.wms.transcoder.vod.TranscoderVODChunkContext transcoderVODChunkContext)
void	<a href="#"><code>onFillChunkStop</code></a> (com.wowza.wms.transcoder.vod.TranscoderVODSession transcoderVODSession, com.wowza.wms.transcoder.vod.TranscoderVODChunkContext transcoderVODChunkContext)
void	<a href="#"><code>onFillChunkTranscode</code></a> (com.wowza.wms.transcoder.vod.TranscoderVODSession transcoderVODSession, com.wowza.wms.transcoder.vod.TranscoderVODChunkContext transcoderVODChunkContext, <code>java.util.List</code> packets)

### Methods

#### **onFillChunkStart**

```
public void onFillChunkStart(com.wowza.wms.transcoder.vod.TranscoderVODSession  
transcoderVODSession,  
    com.wowza.wms.transcoder.vod.TranscoderVODDestination  
transcoderVODDestination,  
    MediaReaderH264Chunk mediaReaderChunk,  
    com.wowza.wms.transcoder.vod.TranscoderVODChunkContext  
transcoderVODChunkContext)
```

#### **onFillChunkTranscode**

```
public void onFillChunkTranscode(com.wowza.wms.transcoder.vod.TranscoderVODSession  
transcoderVODSession,  
    com.wowza.wms.transcoder.vod.TranscoderVODChunkContext  
transcoderVODChunkContext,  
    java.util.List packets)
```

(continued from last page)

**onFillChunkStop**

```
public void onFillChunkStop(com.wowza.wms.transcoder.vod.TranscoderVODSession  
transcoderVODSession,  
    com.wowza.wms.transcoder.vod.TranscoderVODChunkContext  
transcoderVODChunkContext)
```

## com.wowza.wms.httpstreamer.model Interface IHTTPStreamerTranscoderVODDestinationIndex

public interface IHTTPStreamerTranscoderVODDestinationIndex  
extends

### Method Summary

int	<a href="#">getBitrate()</a>
com.wowza.wms.transcoder.vod.TranscoderVODDestination	<a href="#">getTranscoderVODDestination()</a>
void	<a href="#">setBitrate</a> (int bitrate)
void	<a href="#">setTranscoderVODDestination</a> (com.wowza.wms.transcoder.vod.TranscoderVODDestination transcoderVODDestination)

### Methods

#### getTranscoderVODDestination

```
public com.wowza.wms.transcoder.vod.TranscoderVODDestination  
getTranscoderVODDestination()
```

#### setTranscoderVODDestination

```
public void  
setTranscoderVODDestination(com.wowza.wms.transcoder.vod.TranscoderVODDestination  
transcoderVODDestination)
```

#### getBitrate

```
public int getBitrate()
```

#### setBitrate

```
public void setBitrate(int bitrate)
```

## com.wowza.wms.httpstreamer.model Interface IHTTPStreamerTranscoderVODIndex

## com.wowza.wms.httpstreamer.model Interface **ILiveStreamPacketizerChunkWriter**

public interface **ILiveStreamPacketizerChunkWriter**  
extends

### Method Summary

void	<a href="#"><u>addToChunk</u></a> (LiveStreamPacketizerPacketHolder holder)
void	<a href="#"><u>endChunk</u></a> (long timecode, long timecodeAudio)
boolean	<a href="#"><u>isLogAACAudioGaps</u></a> ()
boolean	<a href="#"><u>isM4S</u></a> (int codecAudio, int codecVideo)
boolean	<a href="#"><u>isPacketizeAudio</u></a> ()
boolean	<a href="#"><u>isPacketizeData</u></a> ()
boolean	<a href="#"><u>isPacketizeVideo</u></a> ()
boolean	<a href="#"><u>isValidAudioCodec</u></a> (int codec)
boolean	<a href="#"><u>isValidVideoCodec</u></a> (int codec)
boolean	<a href="#"><u>isWebM</u></a> (int codecAudio, int codecVideo)
void	<a href="#"><u>resetStream</u></a> ()
void	<a href="#"><u>setCodecInfoAudio</u></a> (com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio)
void	<a href="#"><u>setCodecInfoVideo</u></a> (com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo)
void	<a href="#"><u>startChunk</u></a> (long chunkId, long chunkIdUser, int streamMode, int videoCodecId, int audioCodecId, long timecode, long timecodeUser, String originRepeaterContext, <a href="#"><u>CencInfo</u></a> cencInfo)

### Methods

(continued from last page)

## startChunk

```
public void startChunk(long chunkId,  
    long chunkIdUser,  
    int streamMode,  
    int videoCodecId,  
    int audioCodecId,  
    long timecode,  
    long timecodeUser,  
    String originRepeaterContext,  
    CencInfo cencInfo)
```

---

## endChunk

```
public void endChunk(long timecode,  
    long timecodeAudio)
```

---

## addToChunk

```
public void addToChunk(LiveStreamPacketizerPacketHolder holder)
```

---

## setCodecInfoAudio

```
public void setCodecInfoAudio(com.wowza.wms.media.model.MediaCodecInfoAudio  
    codecInfoAudio)
```

---

## setCodecInfoVideo

```
public void setCodecInfoVideo(com.wowza.wms.media.model.MediaCodecInfoVideo  
    codecInfoVideo)
```

---

## resetStream

```
public void resetStream()
```

---

## isPacketizeAudio

```
public boolean isPacketizeAudio()
```

---

## isPacketizeVideo

```
public boolean isPacketizeVideo()
```

---

---

### **isPacketizeData**

```
public boolean isPacketizeData()
```

---

### **isValidAudioCodec**

```
public boolean isValidAudioCodec(int codec)
```

---

### **isValidVideoCodec**

```
public boolean isValidVideoCodec(int codec)
```

---

### **isLogAACAudioGaps**

```
public boolean isLogAACAudioGaps()
```

---

### **isM4S**

```
public boolean isM4S(int codecAudio,  
                    int codecVideo)
```

---

### **isWebM**

```
public boolean isWebM(int codecAudio,  
                    int codecVideo)
```

---

---

Package

**com.wowza.wms.httpstreamer.mpegdashstreaming.file**

## com.wowza.wms.httpstreamer.mpegdashstreaming.file Interface IHTTPStreamerMPEDashIndex

public interface **IHTTPStreamerMPEDashIndex**  
extends

### Method Summary

void	<a href="#"><u>close()</u></a>
<a href="#"><u>IHTTPStreamerApplicationContext</u></a>	<a href="#"><u>getApplicationContext()</u></a>
java.util.List	<a href="#"><u>getBitratesAudio()</u></a>

void	<a href="#">setPlaySeek</a> (long playSeek)
void	<a href="#">setPlayStart</a> (long playStart)
void	<a href="#">setVODTranscodeNGRP</a> (String vodTranscodeNGRP)

## Methods

### init

```
public void init(IHTTPStreamerApplicationContext appContext,
    IHTTPStreamerSession httpStreamerSession,
    String rawStreamName,
    String streamExt,
    String streamName,
    long playStart,
    long playDuration,
    long playSeek,
    TimedTextRequest captionRequest,
    String vodTranscodeNGRP)
```

### indexFile

```
public boolean indexFile(IHTTPStreamerSession httpStreamerSession,
    String rawStreamName)
```

### close

```
public void close()
```

(continued from last page)

## **open**

```
public void open()
```

---

## **getChunk**

```
public MPEGDashDashChunk getChunk(MPEGDashChunkId chunkId)
```

---

## **getApplicationContext**

```
public IHTTPStreamerApplicationContext getApplicationContext()
```

---

## **getHttpStreamerSession**

```
public IHTTPStreamerSession getHttpStreamerSession()
```

---

## **getNumStreams**

```
public int getNumStreams()
```

---

## **getStreamName**

```
public String getStreamName()
```

---

## **getStreamNames**

```
public java.util.List getStreamNames()
```

---

## **getStreamNamesRaw**

```
public java.util.List getStreamNamesRaw()
```

---

## **getBitratesLongs**

```
public java.util.List getBitratesLongs()
```

---

## **getBitratesStrings**

```
public java.util.List getBitratesStrings()
```

---

(continued from last page)

---

## getBitratesAudio

```
public java.util.List getBitratesAudio()
```

---

---

## getBitratesVideo

```
public java.util.List getBitratesVideo()
```

---

---

## getManifest

```
public MPEGDashProfileManifest getManifest(int profile,  
                                             int manifestId,  
                                             java.util.Map queryMap)
```

---

---

## getPlayStart

```
public long getPlayStart()
```

---

---

void	<a href="#">setStartTimecodeVideo</a> (long startTimecode)
void	<a href="#">setStopTimecode</a> (long stopTimecode)
void	<a href="#">setStopTimecodeAudio</a> (long stopTimecode)
void	<a href="#">setStopTimecodeVideo</a> (long stopTimecode)

(continued from last page)

## Methods

### getStartTimecode

```
public long getStartTimecode()
```

### setStartTimecode

```
public void setStartTimecode(long startTimecode)
```

### getStopTimecode

```
public long getStopTimecode()
```

### setStopTimecode

```
public void setStopTimecode(long stopTimecode)
```

### getIndex

```
public int getIndex()
```

### setIndex

```
public void setIndex(int index)
```

### setEncInfo

```
public void setEncInfo(CencInfo encInfo)
```

### getEncInfo

```
public CencInfo getEncInfo()
```

### setCreationDate

```
public void setCreationDate(java.util.Date creationDate)
```

(continued from last page)

---

## getCreationDate

```
public java.util.Date getCreationDate()
```

---

---

## getStartTimecodeVideo

```
public long getStartTimecodeVideo()
```

---

---

## setStartTimecodeVideo

```
public void setStartTimecodeVideo(long startTimecode)
```

---

---

## getStopTimecodeVideo

```
public long getStopTimecodeVideo()
```

---

---

## setStopTimecodeVideo

```
public void setStopTimecodeVideo(long stopTimecode)
```

---

---

## getStartTimecodeAudio

```
public long getStartTimecodeAudio()
```

---

---

## setStartTimecodeAudio

```
public void setStartTimecodeAudio(long startTimecode)
```

---

---

## getStopTimecodeAudio

```
public long getStopTimecodeAudio()
```

---

---

## setStopTimecodeAudio

```
public void setStopTimecodeAudio(long stopTimecode)
```

---

## com.wowza.wms.httpstreamer.mpegdashstreaming.file Interface IMediaReaderMPEGDash

All Superinterfaces:

## getChunkIdHandler

```
public IHTTPStreamerMPEGDashLiveStreamPacketizerChunkIdHandler getChunkIdHandler()
```

---

## setChunkIdHandler

```
public void setChunkIdHandler(IHTTPStreamerMPEGDashLiveStreamPacketizerChunkIdHandler  
chunkIdHandler)
```

## com.wowza.wms.httpstreamer.mpegdashstreaming.livestreampacketizer Class MPEGDashDashChunk

java.lang.Object

com.wowza.wms.httpstreamer.mpegdashstreaming.livestreampacketizer.MPEGDashDashChunk

public class **MPEGDashDashChunk**  
extends Object

### Constructor Summary

public	<a href="#">MPEGDashDashChunk</a> (int chunkType, long chunkIndex)
public	<a href="#">MPEGDashDashChunk</a> ()

### Method Summary

long	<a href="#">getChunkIndex</a> ()
int	<a href="#">getChunkType</a> ()
java.util.Date	<a href="#">getCreationDate</a> ()
long	<a href="#">getDuration</a> ()
<a href="#">PacketFragmentList</a>	<a href="#">getFragments</a> ()
long	<a href="#">getTimecode</a> ()
long	<a href="#">getTimescale</a> ()
int	<a href="#">getVODTranscoderBitrate</a> ()
boolean	<a href="#">isFillSuccessful</a> ()
void	<a href="#">setChunkIndex</a> (long chunkIndex)
void	<a href="#">setChunkType</a> (int chunkType)
void	<a href="#">setDuration</a> (long duration)
void	<a href="#">setFillSuccessful</a> (boolean fillSuccessful)
void	<a href="#">setTimecode</a> (long timecode)

void	<a href="#">setTimescale</a> (long timescale)
void	<a href="#">setVODTranscoderBitrate</a> (int vodTranscoderBitrate)

Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Constructors

### MPEGDashDashChunk

```
public MPEGDashDashChunk(int chunkType,  
                           long chunkIndex)
```

### MPEGDashDashChunk

```
public MPEGDashDashChunk()
```

## Methods

### getFragments

```
public PacketFragmentList getFragments()
```

### getTimecode

```
public long getTimecode()
```

### setTimecode

```
public void setTimecode(long timecode)
```

### getDuration

```
public long getDuration()
```

### setDuration

```
public void setDuration(long duration)
```

---

### getChunkType

```
public int getChunkType()
```

---

### setChunkType

```
public void setChunkType(int chunkType)
```

---

### getTimescale

```
public long getTimescale()
```

---

### setTimescale

```
public void setTimescale(long timescale)
```

---

### getChunkIndex

```
public long getChunkIndex()
```

---

### setChunkIndex

```
public void setChunkIndex(long chunkIndex)
```

---

### getCreationDate

```
public java.util.Date getCreationDate()
```

---

### isFillSuccessful

```
public boolean isFillSuccessful()
```

---

### setFillSuccessful

```
public void setFillSuccessful(boolean fillSuccessful)
```

---

### getVODTranscoderBitrate

```
public int getVODTranscoderBitrate()
```

---

(continued from last page)

---

## **setVODTranscoderBitrate**

```
public void setVODTranscoderBitrate(int vodTranscoderBitrate)
```

## com.wowza.wms.httpstreamer.mpegdashstreaming.livestreampacketizer Class MPEGDashDashChunkDescription

java.lang.Object

com.wowza.wms.httpstreamer.mpegdashstreaming.livestreampacketizer.MPEGDashDashChunkDescription

## Constructor Summary

public	<a href="#">MPEGDashConstants()</a>
--------	-------------------------------------

### Methods inherited from class `java.lang.Object`

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

## Fields

### DEFAULT\_CHUNKDURATIONTARGET

public static final int **DEFAULT\_CHUNKDURATIONTARGET**

Constant value: **10000**

### DEFAULT\_MAXCHUNKCOUNT

public static final int **DEFAULT\_MAXCHUNKCOUNT**

Constant value: **5**

### DEFAULT\_PLAYLISTCHUNKCOUNT

public static final int **DEFAULT\_PLAYLISTCHUNKCOUNT**

Constant value: **5**

### DEFAULT\_REPEATERCHUNKCOUNT

public static final int **DEFAULT\_REPEATERCHUNKCOUNT**

Constant value: **-1**

### LANGUAGEIDKEY

public static final java.lang.String **LANGUAGEIDKEY**

(continued from last page)

Constant value: **1**

---

## PARAMETERDELIMITERKEY

```
public static final java.lang.String PARAMETERDELIMITERKEY
```

Constant value: **\_**

---

## CHUNK\_TYPE\_UNKNOWN

```
public static final int CHUNK_TYPE_UNKNOWN
```

Constant value: **-1**

---

## CHUNK\_TYPE\_MEDIA

```
public static final int CHUNK_TYPE_MEDIA
```

Constant value: **0**

---

## CHUNK\_TYPE\_VIDEO

```
public static final int CHUNK_TYPE_VIDEO
```

Constant value: **1**

---

## CHUNK\_TYPE\_AUDIO

```
public static final int CHUNK_TYPE_AUDIO
```

Constant value: **2**

---

## CHUNK\_TYPE\_DATA

```
public static final int CHUNK_TYPE_DATA
```

Constant value: **3**

---

## CHUNK\_TYPE\_STRINGS

```
public static final java.lang.String CHUNK_TYPE_STRINGS
```

---

## CHUNK\_FORMAT\_UNKNOWN

```
public static final int CHUNK_FORMAT_UNKNOWN
```

Constant value: **-1**

(continued from last page)

---

## CHUNK\_FORMAT\_M4S

```
public static final int CHUNK_FORMAT_M4S
```

Constant value: **0**

---

## CHUNK\_FORMAT\_TS

```
public static final int CHUNK_FORMAT_TS
```

Constant value: **1**

---

## CHUNK\_FORMAT\_WEBM

```
public static final int CHUNK_FORMAT_WEBM
```

Constant value: **2**

---

## CHUNK\_FORMAT\_STRINGS

```
public static final java.lang.String CHUNK_FORMAT_STRINGS
```

---

## CHUNK\_FORMAT\_FILEXT

```
public static final java.lang.String CHUNK_FORMAT_FILEXT
```

---

## INITIALIZATION\_CHUNK\_INDEX

```
public static final int INITIALIZATION_CHUNK_INDEX
```

Constant value: **-1**

---

## CHUNKSET\_UNKNOWN

```
public static final int CHUNKSET_UNKNOWN
```

Constant value: **-1**

---

## CHUNKSET\_M4S\_AV

```
public static final int CHUNKSET_M4S_AV
```

Constant value: **0**

---

## CHUNKSET\_M4S\_MUXED

```
public static final int CHUNKSET_M4S_MUXED
```

(continued from last page)

Constant value: **1**

---

## CHUNKSET\_TS

```
public static final int CHUNKSET_TS
```

Constant value: **2**

---

## CHUNKSET\_WEBM

```
public static final int CHUNKSET_WEBM
```

Constant value: **3**

---

## CHUNKSET\_TOTAL

```
public static final int CHUNKSET_TOTAL
```

Constant value: **4**

---

## MIMETYPE\_MEDIA\_WEBM

```
public static final java.lang.String MIMETYPE_MEDIA_WEBM
```

Constant value: **video/webm**

---

## MIMETYPE\_VIDEO\_WEBM

```
public static final java.lang.String MIMETYPE_VIDEO_WEBM
```

Constant value: **video/webm**

---

## MIMETYPE\_AUDIO\_WEBM

```
public static final java.lang.String MIMETYPE_AUDIO_WEBM
```

Constant value: **audio/webm**

---

## MIMETYPE\_MEDIA\_MP4\_VIDEO

```
public static final java.lang.String MIMETYPE_MEDIA_MP4_VIDEO
```

Constant value: **video/mp4**

---

## MIMETYPE\_MEDIA\_MP4\_AUDIO

```
public static final java.lang.String MIMETYPE_MEDIA_MP4_AUDIO
```

Constant value: **audio/mp4**

---

(continued from last page)

---

## MIMETYPE\_MEDIA\_TS

```
public static final java.lang.String MIMETYPE_MEDIA_TS
```

Constant value: **video/mp2t**

---

## MIMETYPE\_MEDIA\_MPEG\_AUDIO

```
public static final java.lang.String MIMETYPE_MEDIA_MPEG_AUDIO
```

Constant value: **audio/mpeg**

---

## MIMETYPE\_MEDIA\_AAC\_AUDIO

```
public static final java.lang.String MIMETYPE_MEDIA_AAC_AUDIO
```

Constant value: **audio/x-aac**

---

## MIMETYPE\_MEDIA\_VTT\_TEXT

```
public static final java.lang.String MIMETYPE_MEDIA_VTT_TEXT
```

Constant value: **text/vtt**

---

## MANIFESTID\_UNKNOWN

```
public static final int MANIFESTID_UNKNOWN
```

Constant value: **-1**

---

## MANIFESTID\_TIMEBASED

```
public static final int MANIFESTID_TIMEBASED
```

Constant value: **0**

---

## MANIFESTID\_NUMBERBASED

```
public static final int MANIFESTID_NUMBERBASED
```

Constant value: **1**

---

## MANIFESTID\_LISTBASED

```
public static final int MANIFESTID_LISTBASED
```

Constant value: **2**

---

## MANIFESTID\_LISTBASED\_VIDEO

```
public static final int MANIFESTID_LISTBASED_VIDEO
```

(continued from last page)

Constant value: **3**

---

## MANIFESTID\_LISTBASED\_AUDIO

```
public static final int MANIFESTID_LISTBASED_AUDIO
```

Constant value: **4**

---

## MANIFESTID\_DEFAULT

```
public static final int MANIFESTID_DEFAULT
```

Constant value: **0**

---

## MANIFEST\_STRINGS

```
public static final java.lang.String MANIFEST_STRINGS
```

---

## LEVEL1

```
public static final java.lang.String LEVEL1
```

Constant value:

---

## LEVEL2

```
public static final java.lang.String LEVEL2
```

Constant value:

---

## LEVEL3

```
public static final java.lang.String LEVEL3
```

Constant value:

---

## LEVEL4

```
public static final java.lang.String LEVEL4
```

Constant value:

---

## LEVEL5

```
public static final java.lang.String LEVEL5
```

Constant value:

(continued from last page)

## CRLF\_STR

```
public static final java.lang.String CRLF_STR
```

Constant value:

---

## MANIFEST\_PLACEHOLDER\_SECURETOKEN

```
public static final java.lang.String MANIFEST_PLACEHOLDER_SECURETOKEN
```

Constant value: `{secureToken}`

---

## MANIFEST\_PLACEHOLDER\_PLAYSTART

```
public static final java.lang.String MANIFEST_PLACEHOLDER_PLAYSTART
```

Constant value: `{playStart}`

---

## MANIFEST\_PLACEHOLDER\_PLAYDURATION

```
public static final java.lang.String MANIFEST_PLACEHOLDER_PLAYDURATION
```

Constant value: `{playDuration}`

---

## MANIFEST\_PLACEHOLDER\_PLAYSEEK

```
public static final java.lang.String MANIFEST_PLACEHOLDER_PLAYSEEK
```

Constant value: `{playSeek}`

---

## MANIFEST\_PLACEHOLDER\_NGRP

```
public static final java.lang.String MANIFEST_PLACEHOLDER_NGRP
```

Constant value: `{ngrp}`

---

## MANIFEST\_PLACEHOLDER\_MPDLOCATION\_QUERYSTRING

```
public static final java.lang.String MANIFEST_PLACEHOLDER_MPDLOCATION_QUERYSTRING
```

Constant value: `{mpdloc-query-str}`

---

## MANIFEST\_PLACEHOLDER\_CHUNK\_QUERYSTRING

```
public static final java.lang.String MANIFEST_PLACEHOLDER_CHUNK_QUERYSTRING
```

Constant value: `{chunk-query-str}`

---

## MANIFEST\_PLACEHOLDER\_QUERYENCODED

```
public static final java.lang.String MANIFEST_PLACEHOLDER_QUERYENCODED
```

(continued from last page)

---

Constant value: **{query-encoded}**

---

## MANIFEST\_PLACEHOLDER\_SESSIONID

```
public static final java.lang.String MANIFEST_PLACEHOLDER_SESSIONID
```

Constant value: **{sessionId}**

---

## MANIFEST\_PLACEHOLDER\_LANGUAGE

```
public static final java.lang.String MANIFEST_PLACEHOLDER_LANGUAGE
```

Constant value: **{language}**

---

## MANIFEST\_PLACEHOLDER\_DOMAIN

```
public static final java.lang.String MANIFEST_PLACEHOLDER_DOMAIN
```

Constant value: **{domain}**

---

## MANIFEST\_PLACEHOLDER\_BASEURLDOMAIN

```
public static final java.lang.String MANIFEST_PLACEHOLDER_BASEURLDOMAIN
```

Constant value: **{domain-baseurl}**

---

## MANIFEST\_PLACEHOLDER\_APPLICATION

```
public static final java.lang.String MANIFEST_PLACEHOLDER_APPLICATION
```

Constant value: **{application}**

---

## MANIFEST\_PLACEHOLDER\_APPINSTANCE

```
public static final java.lang.String MANIFEST_PLACEHOLDER_APPINSTANCE
```

Constant value: **{appInstance}**

---

## MANIFEST\_PLACEHOLDER\_STREAM

```
public static final java.lang.String MANIFEST_PLACEHOLDER_STREAM
```

Constant value: **{stream}**

---

## MANIFEST\_PLACEHOLDER\_FILENAME

```
public static final java.lang.String MANIFEST_PLACEHOLDER_FILENAME
```

Constant value: **{filename}**

---

---

## MANIFEST\_PLACEHOLDER\_MPDLOCATION

```
public static final java.lang.String MANIFEST_PLACEHOLDER_MPDLOCATION
```

Constant value: **{mpd-location}**

---

## MANIFEST\_PLACEHOLDER\_MPDLOCATIONXML

```
public static final java.lang.String MANIFEST_PLACEHOLDER_MPDLOCATIONXML
```

Constant value:

```
<Location>{domain}/{application}/{appInstance}/{stream}/{filename}{mpdloc-query-str}</Location>
```

---

## MANIFEST\_PLACEHOLDER\_MPDLOCATIONXML\_NOAPPINST

```
public static final java.lang.String MANIFEST_PLACEHOLDER_MPDLOCATIONXML_NOAPPINST
```

Constant value: **<Location>{domain}/{application}/{stream}/{filename}{mpdloc-query-str}</Location>**

---

## MANIFEST\_PLACEHOLDER\_MPDBASEURL

```
public static final java.lang.String MANIFEST_PLACEHOLDER_MPDBASEURL
```

Constant value: **{mpd-baseurl}**

---

## MANIFEST\_PLACEHOLDER\_MPDBASEURLXML

```
public static final java.lang.String MANIFEST_PLACEHOLDER_MPDBASEURLXML
```

Constant value:

```
<BaseURL>{domain-baseurl}/{application}/{appInstance}/{stream}</BaseURL>
```

---

## MANIFEST\_PLACEHOLDER\_REPRESENTATION\_MEDIA

```
public static final java.lang.String MANIFEST_PLACEHOLDER_REPRESENTATION_MEDIA
```

Constant value: **{representation-media}**

---

## MANIFEST\_PLACEHOLDER\_REPRESENTATION\_AUDIO

```
public static final java.lang.String MANIFEST_PLACEHOLDER_REPRESENTATION_AUDIO
```

Constant value: **{representation-audio}**

---

## MANIFEST\_PLACEHOLDER\_REPRESENTATION\_VIDEO

```
public static final java.lang.String MANIFEST_PLACEHOLDER_REPRESENTATION_VIDEO
```

Constant value: **{representation-video}**

---

---

## MANIFEST\_PLACEHOLDER\_BITRATE\_MEDIA

```
public static final java.lang.String MANIFEST_PLACEHOLDER_BITRATE_MEDIA
```

Constant value: **{bitrate-media}**

---

## MANIFEST\_PLACEHOLDER\_BITRATE\_AUDIO

```
public static final java.lang.String MANIFEST_PLACEHOLDER_BITRATE_AUDIO
```

Constant value: **{bitrate-audio}**

---

## MANIFEST\_PLACEHOLDER\_BITRATE\_VIDEO

```
public static final java.lang.String MANIFEST_PLACEHOLDER_BITRATE_VIDEO
```

Constant value: **{bitrate-video}**

---

## CHUNK\_NAME

```
public static final java.lang.String CHUNK_NAME
```

Constant value: **chunk**

---

## MPEGDASH\_DOMAIN\_ENV\_PARAM

```
public static final java.lang.String MPEGDASH_DOMAIN_ENV_PARAM
```

Constant value: **com.wowza.wms.context.ApplicationInstance.MPEGDash.domain**

---

## MPEGDASH\_DOMAIN\_ENV\_VARIABLE

```
public static final java.lang.String MPEGDASH_DOMAIN_ENV_VARIABLE
```

Constant value: **\${com.wowza.wms.context.ApplicationInstance.MPEGDash.domain}**

---

## PROFILE\_STRING\_WEBM\_DISCRETE

```
public static final java.lang.String PROFILE_STRING_WEBM_DISCRETE
```

---

## PROFILE\_STRING\_WEBM\_MUXED

```
public static final java.lang.String PROFILE_STRING_WEBM_MUXED
```

---

## PROFILE\_STRING\_M4S\_DISCRETE

```
public static final java.lang.String PROFILE_STRING_M4S_DISCRETE
```

---

(continued from last page)

---

## PROFILE\_STRING\_M4S\_MUXED

```
public static final java.lang.String PROFILE_STRING_M4S_MUXED
```

---

## PROFILE\_STRING\_TS

```
public static final java.lang.String PROFILE_STRING_TS
```

---

## PROFILE\_UNKNOWN

```
public static final int PROFILE_UNKNOWN
```

Constant value: **-1**

---

## PROFILE\_WEBM\_DISCRETE

```
public static final int PROFILE_WEBM_DISCRETE
```

Constant value: **0**

---

## PROFILE\_WEBM\_MUXED

```
public static final int PROFILE_WEBM_MUXED
```

Constant value: **1**

---

## PROFILE\_M4S\_DISCRETE

```
public static final int PROFILE_M4S_DISCRETE
```

Constant value: **2**

---

## PROFILE\_M4S\_MUXED

```
public static final int PROFILE_M4S_MUXED
```

Constant value: **3**

---

## PROFILE\_TS

```
public static final int PROFILE_TS
```

Constant value: **4**

---

## PROFILE\_TOTAL

```
public static final int PROFILE_TOTAL
```

(continued from last page)

Constant value: **5**

---

## PROFILE\_DEFAULT

```
public static final int PROFILE_DEFAULT
```

Constant value: **2**

---

## PROFILE\_STRINGS

```
public static final java.lang.String PROFILE_STRINGS
```

---

## MPD\_WEBM\_MIMETYPE

```
public static final java.lang.String MPD_WEBM_MIMETYPE
```

Constant value: **video/webm**

---

## MPD\_M4S\_MIMETYPE\_VIDEO

```
public static final java.lang.String MPD_M4S_MIMETYPE_VIDEO
```

Constant value: **video/mp4**

---

## MPD\_M4S\_MIMETYPE\_AUDIO

```
public static final java.lang.String MPD_M4S_MIMETYPE_AUDIO
```

Constant value: **audio/mp4**

---

## MPD\_3GPP\_MIMETYPE

```
public static final java.lang.String MPD_3GPP_MIMETYPE
```

Constant value: **video/3gpp**

---

## XMLHEADER\_10\_UTF8

```
public static final java.lang.String XMLHEADER_10_UTF8
```

Constant value: **<?xml version="1.0" encoding="UTF-8"?>**

---

## MPD\_XMLNS\_XSI

```
public static final java.lang.String MPD_XMLNS_XSI
```

Constant value: **http://www.w3.org/2001/XMLSchema-instance**

(continued from last page)

---

## MPD\_XMLNS\_PLAYREADY

```
public static final java.lang.String MPD_XMLNS_PLAYREADY
```

Constant value: **urn:microsoft:playready**

---

## MPD\_MP4\_PROTECTION\_SCHEME

```
public static final java.lang.String MPD_MP4_PROTECTION_SCHEME
```

Constant value: **urn:mpeg:dash:mp4protection:2011**

---

## MPD\_MPEG2TS\_PROTECTION\_SCHEME

```
public static final java.lang.String MPD_MPEG2TS_PROTECTION_SCHEME
```

Constant value: **urn:mpeg:dash:13818:1:CA\_descriptor:2011**

---

## MPD\_XMLNS\_CENC

```
public static final java.lang.String MPD_XMLNS_CENC
```

Constant value: **urn:mpeg:cenc:2013**

---

## MPD\_XSI\_SCHEMALOCATION

```
public static final java.lang.String MPD_XSI_SCHEMALOCATION
```

Constant value: **urn:mpeg:DASH:schema:MPD:2011**  
**[http://standards.iso.org/ittf/PubliclyAvailableStandards/MPEG-DASH\\_schema\\_files/DASH-MPD.xsd](http://standards.iso.org/ittf/PubliclyAvailableStandards/MPEG-DASH_schema_files/DASH-MPD.xsd)**

---

## MPD\_MPEGB\_SCHEMALOCATION

```
public static final java.lang.String MPD_MPEGB_SCHEMALOCATION
```

Constant value: **urn:mpeg:mpegB:schema:DASH:MPD:DIS2011**

---

## MPD\_XMLNS\_XLINK

```
public static final java.lang.String MPD_XMLNS_XLINK
```

Constant value: **<http://www.w3.org/1999/xlink>**

---

## MPD\_WEBM\_XMLNS

```
public static final java.lang.String MPD_WEBM_XMLNS
```

Constant value: **urn:webm:dash:profile:webm-on-demand:2012**

---

(continued from last page)

---

## MPD\_M4S\_XMLNS

```
public static final java.lang.String MPD_M4S_XMLNS
```

Constant value: **urn:mpeg:dash:schema:mpd:2011**

---

## MPD\_MPEGB\_XMLNS

```
public static final java.lang.String MPD_MPEGB_XMLNS
```

Constant value: **urn:mpeg:mpegB:schema:DASH:MPD:DIS2011**

---

## MPD\_PROFILE\_WEBM\_VOD

```
public static final java.lang.String MPD_PROFILE_WEBM_VOD
```

Constant value: **urn:webm:dash:profile:webm-on-demand:2012**

---

## MPD\_PROFILE\_M4S\_MAIN

```
public static final java.lang.String MPD_PROFILE_M4S_MAIN
```

Constant value: **urn:mpeg:dash:profile:isoff-main:2011**

---

## MPD\_PROFILE\_M4S\_LIVE

```
public static final java.lang.String MPD_PROFILE_M4S_LIVE
```

Constant value: **urn:mpeg:dash:profile:isoff-live:2011**

---

## MPD\_PROFILE\_M4S\_FULL

```
public static final java.lang.String MPD_PROFILE_M4S_FULL
```

Constant value: **urn:mpeg:dash:profile:full:2011**

---

## MPD\_PROFILE\_MPEGB\_FULL

```
public static final java.lang.String MPD_PROFILE_MPEGB_FULL
```

Constant value: **urn:mpeg:mpegB:profile:dash:isoff-basic-on-demand:cm**

---

## MPD\_PROFILE\_DASHIF

```
public static final java.lang.String MPD_PROFILE_DASHIF
```

Constant value: **urn:com:dashif:dash264**

---

## MPD\_PROFILE\_M4S\_LIVE\_HBBTV

```
public static final java.lang.String MPD_PROFILE_M4S_LIVE_HBBTV
```

(continued from last page)

---

Constant value: **urn:hbbtv:dash:profile:isoff-live:2011**

---

**MPD\_AUDIO\_CHAN\_CONFIG\_SCHEME\_URI\_MPEG**

```
public static final java.lang.String MPD_AUDIO_CHAN_CONFIG_SCHEME_URI_MPEG
```

Constant value: **urn:mpeg:dash:23003:3:audio\_channel\_configuration:2011**

---

**MPD\_AUDIO\_CHAN\_CONFIG\_SCHEME\_URI\_DOLBY**

```
public static final java.lang.String MPD_AUDIO_CHAN_CONFIG_SCHEME_URI_DOLBY
```

Constant value: **urn:dolby:dash:audio\_channel\_configuration:2011**

---

**MPD\_AUDIO\_PURPOSE\_CLASSIFICATION\_SCHEME\_URI**

```
public static final java.lang.String MPD_AUDIO_PURPOSE_CLASSIFICATION_SCHEME_URI
```

Constant value: **urn:tva:metadata:cs:AudioPurposeCS:2007**

---

**MPD\_ROLE\_SCHEME\_URI**

```
public static final java.lang.String MPD_ROLE_SCHEME_URI
```

Constant value: **urn:mpeg:dash:role:2011**

---

**DEFAULT\_PROPERTY\_DASH\_HTTP\_REDIRECT\_DEFAULT\_STATUS\_CODE**

```
public static final int DEFAULT_PROPERTY_DASH_HTTP_REDIRECT_DEFAULT_STATUS_CODE
```

Constant value: **307**

---

**DEFAULT\_PROPERTY\_DASH\_AVAILABILITYSTARTTIME\_ADJUSTMENT**

```
public static final int DEFAULT_PROPERTY_DASH_AVAILABILITYSTARTTIME_ADJUSTMENT
```

Constant value: **6000**

---

**MAX\_SUGGESTED\_PRESENTATION\_DELAY**

```
public static final int MAX_SUGGESTED_PRESENTATION_DELAY
```

Constant value: **10000**

---

**DEFAULT\_CORS\_ENABLED**

```
public static final boolean DEFAULT_CORS_ENABLED
```

Constant value: **true**

---

## MPD\_UTCTIMING\_SCHEME\_URI\_DIRECT

```
public static final java.lang.String MPD_UTCTIMING_SCHEME_URI_DIRECT
```

Constant value: **urn:mpeg:dash:utc:direct:2014**

---

## MPD\_UTCTIMING\_SCHEME\_URI\_HTTP\_HEAD

```
public static final java.lang.String MPD_UTCTIMING_SCHEME_URI_HTTP_HEAD
```

Constant value: **urn:mpeg:dash:utc:http-head:2014**

---

## MPD\_UTCTIMING\_SCHEME\_URI\_HTTP\_XSDATE

```
public static final java.lang.String MPD_UTCTIMING_SCHEME_URI_HTTP_XSDATE
```

Constant value: **urn:mpeg:dash:utc:http-xdate:2014**

---

## MPD\_UTCTIMING\_SCHEME\_URI\_HTTP\_ISO

```
public static final java.lang.String MPD_UTCTIMING_SCHEME_URI_HTTP_ISO
```

Constant value: **urn:mpeg:dash:utc:http-iso:2014**

---

## MPD\_UTCTIMING\_SCHEME\_URI\_HTTP\_NTP

```
public static final java.lang.String MPD_UTCTIMING_SCHEME_URI_HTTP_NTP
```

Constant value: **urn:mpeg:dash:utc:http-ntp:2014**

---

## MPD\_UTCTIMING\_SCHEME\_URI\_NTP

```
public static final java.lang.String MPD_UTCTIMING_SCHEME_URI_NTP
```

Constant value: **urn:mpeg:dash:utc:ntp:2014**

---

## MPD\_UTCTIMING\_SCHEME\_URI\_SNTP

```
public static final java.lang.String MPD_UTCTIMING_SCHEME_URI_SNTP
```

Constant value: **urn:mpeg:dash:utc:sntp:2014**

---

## DEFAULT\_UTCTIMING\_SCHEME\_ORDER

```
public static final java.lang.String DEFAULT_UTCTIMING_SCHEME_ORDER
```

Package

**com.wowza.wms.httpstreamer.sanjoestream  
ing.livestreampacketizer**

com.wowza.wms.httpstreamer.sanjosestreaming.livestreampacketizer  
Interface IHTTPStreamerSanJoseLiveStreamPacketizerChunkIdHandler

public interface IHTTPStreamerSanJoseLiveStreamPacketizerChunkIdHandler  
extends

Method Summary	
void	<a href="#">init</a> ( <a href="#">LiveStreamPacketizerSanJose</a> liveStreamPacketizer)
long	<a href="#">onAssignChunkId</a> (HTTPStreamerSanJoseLiveStreamPacketizerChunkIdContext chunkIdContext)

Methods

**init**

public void **init**([LiveStreamPacketizerSanJose](#) liveStreamPacketizer)

**onAssignChunkId**

public long **onAssignChunkId**(HTTPStreamerSanJoseLiveStreamPacketizerChunkIdContext chunkIdContext)

## com.wowza.wms.httpstreamer.sanjosestreaming.livestreampacketizer Interface ISanJoseChunkWriter

All Known Implementing Classes:

[LiveStreamPacketizerSanJose](#)

public interface **ISanJoseChunkWriter**  
extends

### Method Summary

void	<a href="#">addToChunk</a> (SanJosePacketHolder holder)
void	<a href="#">endChunk</a> (long timecode)
boolean	<a href="#">isPacketizeAudio</a> ()
boolean	<a href="#">isPacketizeData</a> ()
boolean	<a href="#">isPacketizeVideo</a> ()
void	<a href="#">resetStream</a> ()
void	<a href="#">setCodecInfoAudio</a> (com.wowza.wms.media.model.MediaCodecInfoAudio codecInfoAudio)
void	<a href="#">setCodecInfoVideo</a> (com.wowza.wms.media.model.MediaCodecInfoVideo codecInfoVideo)
void	<a href="#">setMetaData</a> (SanJosePacketHolder holder)
void	<a href="#">startChunk</a> (int streamMode, int videoCodec, int audioCodec, long timecode)

### Methods

#### startChunk

```
public void startChunk(int streamMode,  
    int videoCodec,  
    int audioCodec,  
    long timecode)
```

#### endChunk

```
public void endChunk(long timecode)
```

(continued from last page)

---

## **addToChunk**

```
public void addToChunk(SanJosePacketHolder holder)
```

---

## **setMetaData**

```
public void setMetaData(SanJosePacketHolder holder)
```

---

## **resetStream**

```
public void resetStream()
```

---

## **setCodecInfoAudio**

```
public void setCodecInfoAudio(com.wowza.wms.media.model.MediaCodecInfoAudio  
codecInfoAudio)
```

---

## **setCodecInfoVideo**

```
public void setCodecInfoVideo(com.wowza.wms.media.model.MediaCodecInfoVideo  
codecInfoVideo)
```

---

## **isPacketizeAudio**

```
public boolean isPacketizeAudio()
```

---

## **isPacketizeVideo**

```
public boolean isPacketizeVideo()
```

---

## **isPacketizeData**

```
public boolean isPacketizeData()
```

---

## com.wowza.wms.httpstreamer.sanjosestreaming.livestreampacketizer Class LiveStreamPacketizerSanJose

java.lang.Object

└─com.wowza.wms.stream.livepacketizer.LiveStreamPacketizerBase

└─

**com.wowza.wms.httpstreamer.sanjosestreaming.livestreampacketizer.LiveStreamPacketizerSanJose**

---

## setSize

```
public void setSize(int size)
```

---

## getStartTimecode

```
public long getStartTimecode()
```

---

## setStartTimecode

```
public void setStartTimecode(long startTimecode)
```

---

## getDuration

```
public long getDuration()
```

---

## setDuration

```
public void setDuration(long duration)
```

---

## getBlockList

```
public java.util.List getBlockList()
```

---

## setBlockList

```
public void setBlockList(java.util.List blocks)
```

---

(continued from last page)

---

## isCacheable

```
public boolean isCacheable()
```

---

---

## setCacheable

```
public void setCacheable(boolean cacheable)
```

---

---

## getBlockCount

```
public int getBlockCount()
```

---

---

## getEncUrl

```
public String getEncUrl()
```

---

---

## setEncUrl

```
public void setEncUrl(String encUrl)
```

---

---

## Fields

### MEDIAREADER\_POSTFIX

```
public static final java.lang.String MEDIAREADER_POSTFIX
```

Constant value: **smooth**

## Methods

### indexEntry

```
public void indexEntry(HTTPStreamerSmoothStreamerIndexEntry entry)
```

### getSmoothStreamingMediaMajorVersion

```
public int getSmoothStreamingMediaMajorVersion()
```

### setSmoothStreamingMediaMajorVersion

```
public void setSmoothStreamingMediaMajorVersion(int smoothStreamingMediaMajorVersion)
```

### getSmoothStreamingMediaMinorVersion

```
public int getSmoothStreamingMediaMinorVersion()
```

### setSmoothStreamingMediaMinorVersion

```
public void setSmoothStreamingMediaMinorVersion(int smoothStreamingMediaMinorVersion)
```

(continued from last page)

## getAudioFragment

```
public SmoothStreamerFileFragmentList  
getAudioFragment(HTTPStreamerSmoothStreamerIndexEntry entry,  
                 long chunkTimecode,  
                 int bitrate)
```

---

## getVideoFragment

```
public SmoothStreamerFileFragmentList  
getVideoFragment(HTTPStreamerSmoothStreamerIndexEntry entry,  
                 long chunkTimecode,  
                 int bitrate)
```

---

## isSmoothVideo

```
public boolean isSmoothVideo()
```

---

## setSmoothVideo

```
public void setSmoothVideo(boolean isSmoothVideo)
```

---

## isSmoothAudio

```
public boolean isSmoothAudio()
```

---

## setSmoothAudio

```
public void setSmoothAudio(boolean isSmoothAudio)
```

---

## getHttpStreamerSession

```
public IHTTPStreamerSession getHttpStreamerSession()
```

---

## setHttpStreamerSession

```
public void setHttpStreamerSession(IHTTPStreamerSession httpStreamerSession)
```

[notifyHTTPSessionCreate](#), [notifyHTTPSessionDestroy](#)

## Constructors

### HTTPStreamerSessionSmoothStreamer

```
public HTTPStreamerSessionSmoothStreamer()
```

## Methods

### shutdown

```
public void shutdown()
```

## containsIndex

```
public boolean containsIndex(String streamName)
```

---

## getIndex

```
public IHTTPStreamerSmoothStreamerIndex getIndex(IHTTPStreamerSession  
httpStreamerSession,  
    IHTTPStreamerApplicationContext appContext,  
    String streamExt,  
    String streamName,  
    long playStart,  
    long playDuration,  
    long playSeek,  
    String vodTranscodeNGRP)
```

---

## updateLoggingValues

```
public void updateLoggingValues()
```

---

## clearLoggingValues

```
public void clearLoggingValues()
```

---

## getLivePlaylist

```
public SmoothStreamingLivePlaylist getLivePlaylist()
```

---

## setLivePlaylist

```
public void setLivePlaylist(SmoothStreamingLivePlaylist livePlaylist)
```

---

## logLiveFragment

```
public void logLiveFragment(SmoothStreamerFragmentId fragmentId,  
    PacketFragmentList fragmentData)
```

---

## logVODFragment

```
public void logVODFragment(SmoothStreamerFragmentId fragmentId,  
    PacketFragmentList fragmentData)
```

---

(continued from last page)

## **notifyHTTPSessionCreate**

```
public void notifyHTTPSessionCreate(IApplicationInstance appInstance,  
    IHTTPStreamerSession httpStreamerSession)
```

---

## **notifyHTTPSessionDestroy**

```
public void notifyHTTPSessionDestroy(IApplicationInstance appInstance,  
    IHTTPStreamerSession httpStreamerSession)
```

---

## **indexTranscoderVOD**

```
public void indexTranscoderVOD(IHTTPStreamerApplicationContext appContext,  
    String vodTranscodeNGRP)
```

---

## **getPublishData**

```
public Object getPublishData()
```

---

## **setPublishData**

```
public void setPublishData(Object publishData)
```

---

---

---

public interface **IHTTPStreamerSmoothLivePacketizerDataHandler**  
extends

Method Summary	
void	<a href="#">onFillChunkDataPacket</a> ( <a href="#">AMFPacket</a> packet)

Methods
---------

**onFillChunkDataPacket**  
public void **onFillChunkDataPacket**([AMFPacket](#) packet)

# com.wowza.wms.httpstreamer.smoothstreaming.livestreampacketizer Interface IHTTPStreamerSmoothLivePacketizerDataTrackHandler

public interface IHTTPStreamerSmoothLivePacketizerDataTrackHandler  
extends

Interface for defining the

Method Summary	
String	<a href="#">getTrackData</a> (long timeCode) Called to return track data for the given timecode.
SmoothStreamingDataTrack	<a href="#">getTrackInfo</a> () Get the track info for this data track.

## Methods

### getTrackData

public String **getTrackData**(long timeCode)

Called to return track data for the given timecode.

**Parameters:**

timeCode - ms

**Returns:**

track data

### getTrackInfo

public SmoothStreamingDataTrack **getTrackInfo**()

Get the track info for this data track.

**Returns:**

track data

## com.wowza.wms.httpstreamer.smoothstreaming.livestreampacketizer Class LiveStreamPacketizerSmoothStreaming

java.lang.Object

└--com.wowza.wms.stream.livepacketizer.LiveStreamPacketizerBase

└--

com.wowza.wms.httpstreamer.smoothstreaming.livestreampacketizer.LiveStreamPacketizerSmoothStreaming

All Implemented Interfaces:

Runnable, IdleNotify, [ILiveStreamPacketizer](#)

```
public class LiveStreamPacketizerSmoothStreaming
extends LiveStreamPacketizerBase
```

Package

**com.wowza.wms.livestreamrecord.manager**

## com.wowza.wms.livestreamrecord.manager

### Interface **ILiveStreamRecordManager**

public interface **ILiveStreamRecordManager**  
extends

This interface provides access to the functionality of the LiveStreamRecordManager. The LiveStreamRecordManger is responsible for maintaining the list of IStreamRecorders as well as managing the IStreamRecorder life cycle.

#### Method Summary

<a href="#">ILiveStreamRecordManagerActionNotify</a>	<a href="#">addListener(<a href="#">ILiveStreamRecordManagerActionNotify</a> listener)</a> Used to add a listener to receive ILiveStreamRecordManagerActionNotify events from the LiveStreamRecordManager.
<a href="#">IStreamRecorder</a>	<a href="#">getRecorder(<a href="#">IApplicationInstance</a> appInstance, String streamName)</a> Used to get a specific IStreamRecorder from the LiveStreamRecordManager. Modifying the returned IStreamRecorder while a recording is active may result in undefined behavior.
java.util.List	<a href="#">getRecordersList(<a href="#">IApplicationInstance</a> appInstance)</a> Used to get the list of IStreamRecorders for a specific application instance.
java.util.Map	<a href="#">getRecordersMap(<a href="#">IApplicationInstance</a> appInstance)</a> Used to get the Map of stream Name to IStreamRecorder for a specific application instance.
void	<a href="#">init(<a href="#">IVHost</a> vhost)</a> Called by vhost init to initialize the LiveStreamRecordManager
boolean	<a href="#">removeListener(<a href="#">ILiveStreamRecordManagerActionNotify</a> listener)</a> Used to remove an ILiveStreamRecordManagerActionNotify listener from the LiveStreamRecordManager.
void	<a href="#">splitRecording(<a href="#">IApplicationInstance</a> appInstance, String streamName)</a> Used to tell the LiveStreamRecordManager to split (a.k.a segment) a recording immediately for a specific stream in a specific application instance.
void	<a href="#">startRecording(<a href="#">IApplicationInstance</a> appInstance, <a href="#">StreamRecorderParameters</a> params)</a> Used to tell the LiveStreamRecordManager to create StreamRecorders for all streams which are published to the specified application instance.
void	<a href="#">startRecording(<a href="#">IApplicationInstance</a> appInstance, String streamName, <a href="#">StreamRecorderParameters</a> params)</a> Used to tell the LiveStreamRecordManager to create a StreamRecorder for a specific stream in a specific application instance.
void	<a href="#">stopRecording(<a href="#">IApplicationInstance</a> appInstance)</a> Used to tell the LiveStreamRecordManager to stop all StreamRecorders on a specific application instance.
void	<a href="#">stopRecording(<a href="#">IApplicationInstance</a> appInstance, String streamName)</a> Used to tell the LiveStreamRecordManager to stop a StreamRecorder for a specific stream in a specific application instance.

#### Methods

(continued from last page)

## init

```
public void init(IVHost vhost)
```

Called by vhost init to initialize the LiveStreamRecordManager

### Parameters:

vhost - The vhost to associated with the instance of LiveStreamRecordManager

---

## getRecorder

```
public IStreamRecorder getRecorder(IApplicationInstance appInstance,  
    String streamName)
```

Used to get a specific IStreamRecorder from the LiveStreamRecordManager. Modifying the returned IStreamRecorder while a recording is active may result in undefined behavior.

### Parameters:

appInstance - The application instance associated with the desired IStreamRecorder  
streamName - The stream name associated with the desired IStreamRecorder

### Returns:

The requested IStreamRecorder or null if it does not exist

---

## getRecordersList

```
public java.util.List getRecordersList(IApplicationInstance appInstance)
```

Used to get the list of IStreamRecorders for a specific application instance. Making changes to the returned list (e.g. removing an IStreamRecorder from the list) does not affect the LiveStreamRecordManager's list, however, changes made to the IStreamRecorders themselves will be reflected in the LiveStreamRecordManager's IStreamRecorder. Therefore, changing IStreamRecorders while a recording is active may result in undefined behavior.

### Parameters:

appInstance - The application instance associated with the desired IStreamRecorder List

### Returns:

The requested IStreamRecorder List. The list can be empty if no IStreamRecorders are set.

---

## getRecordersMap

```
public java.util.Map getRecordersMap(IApplicationInstance appInstance)
```

Used to get the Map of stream Name to IStreamRecorder for a specific application instance. Making changes to the returned map (e.g. removing a mapping entry from the map) does not affect the LiveStreamRecordManager's map, however, changes made to the IStreamRecorders themselves will be reflected in the LiveStreamRecordManager's IStreamRecorder. Therefore, changing IStreamRecorders while a recording is active may result in undefined behavior.

### Parameters:

appInstance - The application instance associated with the desired IStreamRecorder List

### Returns:

The requested stream name to IStreamRecorder mappings. The map can be empty if no IStreamRecorders are set.

---

## startRecording

```
public void startRecording(IApplicationInstance appInstance,  
    StreamRecorderParameters params)
```

(continued from last page)

Used to tell the LiveStreamRecordManager to create StreamRecorders for all streams which are published to the specified application instance. The StreamRecorderParameters specified will be used for each StreamRecorder created. If the StreamRecordParameters are null the default StreamRecordParameters will be used.

**Parameters:**

appInstance - The application instance on which to record all incoming streams  
params - The StreamRecorderParameters to use for all recorders

**See Also:**

[StreamRecorderParameters](#)  
[IStreamRecorderConstants](#)

---

## startRecording

```
public void startRecording(IApplicationInstance appInstance,  
    String streamName,  
    StreamRecorderParameters params)
```

Used to tell the LiveStreamRecordManager to create a StreamRecorder for a specific stream in a specific application instance. The StreamRecorderParameters specified will be used for the StreamRecorder. If the StreamRecordParameters are null the default StreamRecordParameters will be used.

**Parameters:**

appInstance - The application instance on which to record the requested stream  
streamName - The stream name associated with the incoming stream to record  
params - The StreamRecorderParameters to use for the StreamRecorder

**See Also:**

[StreamRecorderParameters](#)  
[IStreamRecorderConstants](#)

---

## stopRecording

```
public void stopRecording(IApplicationInstance appInstance,  
    String streamName)
```

Used to tell the LiveStreamRecordManager to stop a StreamRecorder for a specific stream in a specific application instance. If a StreamRecorder already exists for the specified application instance and stream name, nothing is done.

**Parameters:**

appInstance - The application instance of the StreamRecorder to stop  
streamName - The stream name associated with the StreamRecorder to stop

---

## stopRecording

```
public void stopRecording(IApplicationInstance appInstance)
```

Used to tell the LiveStreamRecordManager to stop all StreamRecorders on a specific application instance. If no StreamRecorders exist for the specified application instance, nothing is done.

**Parameters:**

appInstance - The application instance on which to stop all StreamRecorders

---

## splitRecording

```
public void splitRecording(IApplicationInstance appInstance,  
    String streamName)
```

Used to tell the LiveStreamRecordManager to split (a.k.a segment) a recording immediately for a specific stream in a specific application instance. If no StreamRecorder exists for the specified application instance and stream name, nothing is done.

(continued from last page)

**Parameters:**

appInstance - The application instance of the StreamRecorder to split  
streamName - The stream name associated with the StreamRecorder to split

---

## addListener

```
public ILiveStreamRecordManagerActionNotify  
addListener(ILiveStreamRecordManagerActionNotify listener)
```

Used to add a listener to receive [ILiveStreamRecordManagerActionNotify](#) events from the [LiveStreamRecordManager](#). Listeners are notified in the order in which they are added.

**Parameters:**

listener - An instance of a class which implements the [ILiveStreamRecordManagerActionNotify](#) interface

**Returns:**

The listener instance passed in

**See Also:**

[ILiveStreamRecordManagerActionNotify](#)

---

## removeListener

```
public boolean removeListener(ILiveStreamRecordManagerActionNotify listener)
```

Used to remove an [ILiveStreamRecordManagerActionNotify](#) listener from the [LiveStreamRecordManager](#).

**Parameters:**

listener - The listener passed into the [addListener](#) method.

**Returns:**

true if the listener was found in the list otherwise false.

## com.wowza.wms.livestreamrecord.manager Interface **ILiveStreamRecordManagerActionNotify**

public interface **ILiveStreamRecordManagerActionNotify**  
extends

This interface provides notifications to registered listeners for LiveStreamRecordManager events as it operates on IStreamRecorders. These notification are sent prior to invoking the associated method for a recorder.

Multiple Listener's can be registered for the LiveStreamRecordManager. The listeners are notified in the order in which they were added.

See Also:  
[for API's to add and remove listeners](#)

### Method Summary

void	<a href="#">onCreateRecord</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs when a new recorder is created due to a call to one of the ILiveStreamRecordManager startRecording API's.
void	<a href="#">onSplitRecord</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs due to a call to the ILiveStreamRecordManager splitRecording API.
void	<a href="#">onStartRecord</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs due to a call to one of the ILiveStreamRecordManager startRecording API's.
void	<a href="#">onStopRecord</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs due to a call to the ILiveStreamRecordManager stopRecording API.
void	<a href="#">onSwitchRecord</a> ( <a href="#">IStreamRecorder</a> recorder, <a href="#">IMediaStream</a> newStream) This notification occurs when an existing stream is replaced with a stream of the same name.
<a href="#">IStreamRecorder</a>	<a href="#">recordFactory</a> (String streamName, <a href="#">StreamRecorderParameters</a> recordParams) This notification is the first one to occur when the ILiveStreamRecordManager is requested to start a recording via any of the ILiveStreamRecordManager startRecording API's It gives the listener the opportunity to return a custom class which implements the IStreamRecorder interface to handle the recording. If the listener returns null, the LiveStreamRecordManager will internally create a new StreamRecorder to handle the recording.

### Methods

#### **recordFactory**

```
public IStreamRecorder recordFactory(String streamName,  
    StreamRecorderParameters recordParams)
```

(continued from last page)

This notification is the first one to occur when the `ILiveStreamRecordManager` is requested to start a recording via any of the `ILiveStreamRecordManager` `startRecording` API's

It gives the listener the opportunity to return a custom class which implements the `IStreamRecorder` interface to handle the recording.

If the listener returns null, the `LiveStreamRecordManager` will internally create a new `StreamRecorder` to handle the recording. Since multiple listeners can be registered, `LiveStreamRecordManager` notifies listeners in the order in which they were added, and will use the first `IStreamRecorder` returned which is not null, however, remaining listeners will receive the notification.

Called before `LiveStreamRecordManager` internal action is taken

**Parameters:**

`recordParams` - the parameters passed into `IStreamRecordManager` `startRecording` API  
`streamName` - the stream name passed into `IStreamRecordManager` `startRecording` API

**Returns:**

the `IStreamRecorder` which will handled recording or null

---

## onCreateRecord

```
public void onCreateRecord(IStreamRecorder recorder)
```

This notification occurs when a new recorder is created due to a call to one of the `ILiveStreamRecordManager` `startRecording` API's.

Called after the `recordFactory` notification is called, but before `LiveStreamRecordManager` calls the recorders own `createRecorder` method.

**Parameters:**

`recorder` - The new recorder

---

## onStartRecord

```
public void onStartRecord(IStreamRecorder recorder)
```

This notification occurs due to a call to one of the `ILiveStreamRecordManager` `startRecording` API's.

Called after the `onCreateRecord` notification is called, but before `LiveStreamRecordManager` calls the recorders own `startRecorder` method.

**Parameters:**

`recorder` - The recorder which is starting

---

## onSplitRecord

```
public void onSplitRecord(IStreamRecorder recorder)
```

This notification occurs due to a call to the `ILiveStreamRecordManager` `splitRecording` API.

Called before `LiveStreamRecordManager` calls the recorders own `splitRecorder` method.

**Parameters:**

`recorder` - The recorder for which the split has been requested.

---

## onStopRecord

```
public void onStopRecord(IStreamRecorder recorder)
```

This notification occurs due to a call to the `ILiveStreamRecordManager` `stopRecording` API.

Called before `LiveStreamRecordManager` calls the recorders own `stopRecorder` method.

### Parameters:

`recorder` - The recorder for which a stop has been requested.

---

## onSwitchRecord

```
public void onSwitchRecord(IStreamRecorder recorder,  
    IMediaStream newStream)
```

This notification occurs when an existing stream is replaced with a stream of the same name. This can occur when a stream is published from an encoder, and then a different encoder publishes a stream using the same stream name.

Called before `LiveStreamRecordManager` calls the recorders own `switchRecorder` method.

### Parameters:

`recorder` - The recorder for the existing stream

`newStream` - The new `IMediaStream` associated with the existing stream name

## com.wowza.wms.livestreamrecord.manager

### Interface IStreamRecorder

public interface **IStreamRecorder**  
extends

This interface provides access to into a StreamRecorder.

The StreamRecorder is responsible for performing the actual recording functionality of a live stream, as directed by the LiveStreamRecordManager.

#### Method Summary

<a href="#">IStreamRecorderActionNotify</a>	<a href="#">addListener(IStreamRecorderActionNotify listener)</a> Called to add a listener for IStreamRecorderActionNotify events generated by the recorder. Multiple listeners can be added.
void	<a href="#">createRecorder()</a> Called to tell the recorder to initialize itself after it has been created.
<a href="#">IApplicationInstance</a>	<a href="#">getAppInstance()</a> Called to get the application Instance the recorder is associated with
String	<a href="#">getBaseFilePath()</a> Called to get the full path and filename used by the recorder as the PRIOR to any changes made due to the selected segmentationType and versioningOption.
long	<a href="#">getCurrentDuration()</a> Called to get the current segment duration regardless of segmentationType. This value is updated continuously while the recorder state is RECORDER_STATE_RECORDING.
String	<a href="#">getCurrentFile()</a> Called to get the current segments fully qualified file name regardless of segmentationType. This value is updated continuously while the recorder state is RECORDER_STATE_RECORDING.
long	<a href="#">getCurrentSize()</a> Called to get the current segment size regardless of segmentationType This value is updated continuously while the recorder state is RECORDER_STATE_RECORDING.
org.joda.time.DateTime	<a href="#">getEndTime()</a> Called to get the end time of the recording regardless of segmentationType. When the recording is still active, the returned value is null. When the recording has been stopped, the returned value is for the time when the recording stopped.
String	<a href="#">getErrorString()</a> Called to get an error string describing the error, when the recorder state is RECORDER_STATE_ERROR.
String	<a href="#">getFileFormat()</a> Called to get output file format being used by the recorder.
String	<a href="#">getFilePath()</a> Called to get the full path and filename used by the recorder AFTER changes made due to the selected segmentationType and versioningOption. NOTE: When the recorder is not in RECORDER_STATE_RECORDING state, the returned value will be the basefilePath value.

<a href="#">IStreamRecorderFileVersionDelegate</a>	<a href="#">getFileVersionDelegate()</a> Called to get the IStreamRecorderFileVersionDelegate being used by the recorder.
<a href="#">StreamRecorderParameters</a>	<a href="#">getRecorderParams()</a> Called to get the StreamRecorderParameters for the recorder This is typically used to check or set the StreamRecorderParameters used to configure a recorder.
int	<a href="#">getRecorderState()</a> Called to get the current state of the recorder
String	<a href="#">getRecorderStateString()</a> Called to get the current state of the recorder as a text string.
String	<a href="#">getSegmentationType()</a> Called to get the SegmentationType being used by the recorder.
long	<a href="#">getSegmentDuration()</a> Called to get the segment duration used by the recorder when segmentationType is set to SEGMENT_BY_DURATION.
int	<a href="#">getSegmentNumber()</a> Called to get the current segment number regardless of segmentationType. This value is updated continuously while the recorder state is RECORDER_STATE_RECORDING.
<a href="#">CrontabEvent</a>	<a href="#">getSegmentSchedule()</a> Called to get the CrontabEvent object associated with the recorder when the segmentationType is set to SEGMENT_BY_SCHEDULE When the recorder state is RECORDER_STATE_ERROR, RECORDER_STATE_PENDING or RECORDER_STATE_WAITING, the return value is null, otherwise the CrontabEvent use by the recorder is returned.
String	<a href="#">getSegmentScheduleString()</a> Called to get the segment schedule crontab string used by the recorder when segmentationType is set to SEGMENT_BY_SCHEDULE.
long	<a href="#">getSegmentSize()</a> Called to get the segment size used by the recorder when segmentationType is set to SEGMENT_BY_SIZE.
org.joda.time.DateTime	<a href="#">getStartTime()</a> Called to get the start time of the current recording regardless of segmentationType.
<a href="#">IMediaStream</a>	<a href="#">getStream()</a> Called to get the IMediaStream object being used by the recorder
String	<a href="#">getStreamName()</a> Called to get the stream name being used by the recorder
String	<a href="#">getVersioningOption()</a> Called to get the method used by the recorder to version a file when a file exists of the same name.
boolean	<a href="#">isAppendFile()</a> Called to check the versioningOption used by the recorder. Users should use getVersioningOption instead.
boolean	<a href="#">isMoveFirstVideoFrameToZero()</a> Called to check the value of MoveFirstVideoFrameToZero being used by the recorder.
boolean	<a href="#">isRecordData()</a> Called to check the value of RecordData being used by the recorder.

boolean	<a href="#"><code>isSplitOnTcDiscontinuity()</code></a> Called to check the value of splitOnTcDiscontinuity being used by the recorder.
boolean	<a href="#"><code>isStartOnKeyFrame()</code></a> Called to check the value of StartOnKeyFrame being used by the recorder.
boolean	<a href="#"><code>isVersionFile()</code></a> Called to check the versioningOption used by the recorder. Users should use getVersioningOption instead.
boolean	<a href="#"><code>removeListener(IStreamRecorderActionNotify listener)</code></a> Called to remove a listener from the the recorder.
void	<a href="#"><code>setInternalRecorder(ILiveStreamRecord internalRecorder)</code></a> Called to set the internal recorder used by the StreamRecorder This method should only be used if existing recorder workflows cannot be implemented using the IStreamRecorderActionNotify API's.
void	<a href="#"><code>setStream(IMediaStream stream)</code></a> Called to set the IMediaStream object the recorder will use NOTE: This method is used by LiveStreamRecordManager to manage recorders and associated IMediaStream objects and should NOT be used directly when a StreamRecorder is under the control of LiveStreamRecordManager
void	<a href="#"><code>splitRecorder()</code></a> Called to tell the recorder to stop writing to the current file, create a new file and write begin writing data to the new file. The recorder should start writing data to the new file beginning with a video key frame.
void	<a href="#"><code>startRecorder()</code></a> Called to tell the recorder to start recording.
void	<a href="#"><code>stopRecorder()</code></a> Called to tell the recorder to stop recording.
void	<a href="#"><code>switchRecorder(IMediaStream newStream)</code></a> Called to tell the recorder to switch over to the data from a new IMediaStream. This occurs when an existing stream is replaced with a stream of the same name.

## Methods

### createRecorder

```
public void createRecorder()
```

Called to tell the recorder to initialize itself after it has been created. This API should be called prior to calling the startRecorder() method.

### startRecorder

```
public void startRecorder()
```

Called to tell the recorder to start recording. This API should be called after createRecorder() method has been called to ensure the recorder has been properly initialized

### switchRecorder

```
public void switchRecorder(IMediaStream newStream)
```

(continued from last page)

Called to tell the recorder to switch over to the data from a new IMediaStream.  
This occurs when an existing stream is replaced with a stream of the same name.

For example: When a stream is published from an encoder, and then a different encoder publishes a stream using the same stream name. Called before LiveStreamRecordManager calls the recorders own switchRecorder method.

**Parameters:**

newStream - The new IMediaStream the recorder should switch to.

---

## stopRecorder

```
public void stopRecorder()
```

Called to tell the recorder to stop recording.

---

## splitRecorder

```
public void splitRecorder()
```

Called to tell the recorder to stop writing to the current file, create a new file and write begin writing data to the new file.  
The recorder should start writing data to the new file beginning with a video key frame.

---

## getRecorderParams

```
public StreamRecorderParameters getRecorderParams()
```

Called to get the StreamRecorderParameters for the recorder  
This is typically used to check or set the StreamRecorderParameters used to configure a recorder. To get the actual value used by the recorder, use the appropriate get method found below.

---

**See Also:**

[StreamRecorderParameters](#)

---

## getAppInstance

```
public IApplicationInstance getAppInstance()
```

Called to get the application Instance the recorder is associated with

**Returns:**

IApplicationInstance

---

## getStreamName

```
public String getStreamName()
```

Called to get the stream name being used by the recorder

**Returns:**

String Stream name

---

## getStream

```
public IMediaStream getStream( )
```

Called to get the IMediaStream object being used by the recorder

### Returns:

IMediaStream Stream object

---

## setStream

```
public void setStream(IMediaStream stream)
```

Called to set the IMediaStream object the recorder will use

NOTE: This method is used by LiveStreamRecordManager to manage recorders and associated IMediaStream objects and should NOT be used directly when a StreamRecorder is under the control of LiveStreamRecordManager

### Parameters:

stream - IMediaStream The new Stream object

---

## getRecorderState

```
public int getRecorderState( )
```

Called to get the current state of the recorder

### Returns:

int Current state

### See Also:

[IStreamRecorderConstants.RECORDER\\_STATE\\_ERROR](#)  
[IStreamRecorderConstants.RECORDER\\_STATE\\_PENDING](#)  
[IStreamRecorderConstants.RECORDER\\_STATE\\_WAITING](#)  
[IStreamRecorderConstants.RECORDER\\_STATE\\_RECORDING](#)

---

## getRecorderStateString

```
public String getRecorderStateString( )
```

Called to get the current state of the recorder as a text string.

### Returns:

String Current state as a string

---

(continued from last page)

**See Also:**

[IStreamRecorderConstants.RECORDER\\_STATE\\_ERROR\\_STRING](#)  
[IStreamRecorderConstants.RECORDER\\_STATE\\_PENDING\\_STRING](#)  
[IStreamRecorderConstants.RECORDER\\_STATE\\_WAITING\\_STRING](#)  
[IStreamRecorderConstants.RECORDER\\_STATE\\_RECORDING\\_STRING](#)

---

## getFileFormat

```
public String getFileFormat()
```

Called to get output file format being used by the recorder.

**Returns:**

String Output file format

**See Also:**

[IStreamRecorderConstants.FORMAT\\_MP4](#)  
[IStreamRecorderConstants.FORMAT\\_FLV](#)

---

## isStartOnKeyFrame

```
public boolean isStartOnKeyFrame()
```

Called to check the value of StartOnKeyFrame being used by the recorder.

**Returns:**

boolean true, false

**See Also:**

[StreamRecorderParameters.startOnKeyFrame](#)

---

## isRecordData

```
public boolean isRecordData()
```

Called to check the value of RecordData being used by the recorder.

**Returns:**

boolean true, false

**See Also:**

[StreamRecorderParameters.recordData](#)

---

(continued from last page)

## isSplitOnTcDiscontinuity

```
public boolean isSplitOnTcDiscontinuity()
```

Called to check the value of splitOnTcDiscontinuity being used by the recorder.

### Returns:

boolean true, false

### See Also:

[StreamRecorderParameters.splitOnTcDiscontinuity](#)

---

## isMoveFirstVideoFrameToZero

```
public boolean isMoveFirstVideoFrameToZero()
```

Called to check the value of MoveFirstVideoFrameToZero being used by the recorder.

### Returns:

boolean true, false

### See Also:

[StreamRecorderParameters.moveFirstVideoFrameToZero](#)

---

## getSegmentationType

```
public String getSegmentationType()
```

Called to get the SegmentationType being used by the recorder.

### Returns:

String Segmentation type

### See Also:

[StreamRecorderParameters.segmentationType](#)  
[IStreamRecorderConstants.SEGMENT\\_NONE](#)  
[IStreamRecorderConstants.SEGMENT\\_BY\\_DURATION](#)  
[IStreamRecorderConstants.SEGMENT\\_BY\\_SIZE](#)  
[IStreamRecorderConstants.SEGMENT\\_BY\\_SCHEDULE](#)

---

## getVersioningOption

```
public String getVersioningOption()
```

(continued from last page)

Called to get the method used by the recorder to version a file when a file exists of the same name.

**Returns:**

String Versioning option

**See Also:**

[StreamRecorderParameters.versioningOption](#)  
[IStreamRecorderConstants.APPEND\\_FILE](#)  
[IStreamRecorderConstants.OVERWRITE\\_FILE](#)  
[IStreamRecorderConstants.VERSION\\_FILE](#)

---

## getSegmentSize

```
public long getSegmentSize()
```

Called to get the segment size used by the recorder when segmentationType is set to SEGMENT\_BY\_SIZE.

**Returns:**

long Segment size in bytes

**See Also:**

[StreamRecorderParameters.segmentSize](#)

---

## getSegmentDuration

```
public long getSegmentDuration()
```

Called to get the segment duration used by the recorder when segmentationType is set to SEGMENT\_BY\_DURATION.

**Returns:**

long Segment duration in milliseconds

**See Also:**

[StreamRecorderParameters.segmentDuration](#)

---

## getSegmentScheduleString

```
public String getSegmentScheduleString()
```

Called to get the segment schedule crontab string used by the recorder when segmentationType is set to SEGMENT\_BY\_SCHEDULE.

**Returns:**

(continued from last page)

String Segment schedule

**See Also:**

[StreamRecorderParameters.segmentSchedule](#)

---

## getFilePath

```
public String getFilePath()
```

Called to get the full path and filename used by the recorder AFTER changes made due to the selected segmentationType and versioningOption.

NOTE: When the recorder is not in RECORDER\_STATE\_RECORDING state, the returned value will be the basefilePath value.

**Returns:**

String Full path and filename

**See Also:**

[getBaseFilePath\(\)](#)

---

## getBaseFilePath

```
public String getBaseFilePath()
```

Called to get the full path and filename used by the recorder as the PRIOR to any changes made due to the selected segmentationType and versioningOption.

**Returns:**

String Full path and filename

**See Also:**

[getFilePath\(\)](#)

---

## getCurrentSize

```
public long getCurrentSize()
```

Called to get the current segment size regardless of segmentationType

This value is updated continuously while the recorder state is RECORDER\_STATE\_RECORDING.

**Returns:**

long Segment size in bytes

---

## getCurrentDuration

```
public long getCurrentDuration()
```

(continued from last page)

Called to get the current segment duration regardless of segmentationType.  
This value is updated continuously while the recorder state is RECORDER\_STATE\_RECORDING.

**Returns:**

long Segment duration in milliseconds

---

## getCurrentFile

```
public String getCurrentFile()
```

Called to get the current segments fully qualified file name regardless of segmentationType.  
This value is updated continuously while the recorder state is RECORDER\_STATE\_RECORDING.

**Returns:**

String The current fully qualified file name, packets are being written to.

---

## getSegmentNumber

```
public int getSegmentNumber()
```

Called to get the current segment number regardless of segmentationType.  
This value is updated continuously while the recorder state is RECORDER\_STATE\_RECORDING.

**Returns:**

int Current segment number.

---

## getStartTime

```
public org.joda.time.DateTime getStartTime()
```

Called to get the start time of the current recording regardless of segmentationType.

**Returns:**

DateTime Current segment's start time.

---

## getEndTime

```
public org.joda.time.DateTime getEndTime()
```

Called to get the end time of the recording regardless of segmentationType.  
When the recording is still active, the returned value is null.  
When the recording has been stopped, the returned value is for the time when the recording stopped.

**Returns:**

DateTime Segment end time.

---

## getErrorString

```
public String getErrorString()
```

---

(continued from last page)

Called to get an error string describing the error, when the recorder state is is RECORDER\_STATE\_ERROR.

**Returns:**

String Error description string

---

## getFileVersionDelegate

```
public IStreamRecorderFileVersionDelegate getFileVersionDelegate()
```

Called to get the IStreamRecorderFileVersionDelegate being used by the recorder.

**Returns:**

IStreamRecorderFileVersionDelegate

**See Also:**

[IStreamRecorderFileVersionDelegate](#)

[StreamRecorderFileVersionDelegate](#)

[StreamRecorderSimpleFileVersionDelegate](#)

---

## addListener

```
public IStreamRecorderActionNotify addListener(IStreamRecorderActionNotify listener)
```

Called to add a listener for IStreamRecorderActionNotify events generated by the recorder.  
Multiple listeners can be added. All listeners will be called for each event, in the order in which they were added.

**Parameters:**

listener - An object which implements the IStreamRecorderActionNotify interface

**Returns:**

IStreamRecorderActionNotify The listener object passed in.

**See Also:**

[IStreamRecorderActionNotify](#)

---

## removeListener

```
public boolean removeListener(IStreamRecorderActionNotify listener)
```

Called to remove a listener from the the recorder.

**Parameters:**

listener - The listener which is to be removed

**Returns:**

(continued from last page)

boolean true, if listener was found in list, else false

---

## isVersionFile

```
public boolean isVersionFile()
```

Called to check the versioningOption used by the recorder.  
Users should use getVersioningOption instead.

### Returns:

boolean true when versioningOption is set to VERISON\_FILE, otherwise false

---

## isAppendFile

```
public boolean isAppendFile()
```

Called to check the versioningOption used by the recorder.  
Users should use getVersioningOption instead.

### Returns:

boolean true when versioningOption is set to APPEND\_FILE, otherwise false

---

## getSegmentSchedule

```
public CrontabEvent getSegmentSchedule()
```

Called to get the CrontabEvent object associated with the recorder when the segmentationType is set to SEGMENT\_BY\_SCHEDULE  
When the recorder state is RECORDER\_STATE\_ERROR, RECORDER\_STATE\_PENDING or RECORDER\_STATE\_WAITING, the return value is null,  
otherwise the CrontabEvent use by the recorder is returned.

### Returns:

CrontabEvent

---

## setInternalRecorder

```
public void setInternalRecorder(ILiveStreamRecord internalRecorder)
```

Called to set the internal recorder used by the StreamRecorder  
This method should only be used if existing recorder workflows cannot be implemented using the IStreamRecorderActionNotify API's.

### Parameters:

internalRecorder

## com.wowza.wms.livestreamrecord.manager Interface IStreamRecorderActionNotify

public interface **IStreamRecorderActionNotify**  
extends

This interface provides notifications to registered listeners throughout the life cycle of a StreamRecorder. These events are similar to the ILiveStreamRecordManageActionNotify events, however, they are called by the StreamRecorder deeper in the action processing.

Multiple Listener's can be registered for each StreamRecorder. The listeners are notified in the order in which they were added.

See Also:  
[for API's to add and remove listeners](#)

### Method Summary

void	<a href="#">onCreateRecorder</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs when a new recorder has been created, but before recording has started.
void	<a href="#">onSegmentEnd</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs when a recorder stops writing to the current file
void	<a href="#">onSegmentStart</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs when a recorder starts writing to the current file
void	<a href="#">onSplitRecorder</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs when a recorder is directed to split the active recording.
void	<a href="#">onStartRecorder</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs when a recorder starts recording.
void	<a href="#">onStopRecorder</a> ( <a href="#">IStreamRecorder</a> recorder) This notification occurs when a recorder stops recording.
void	<a href="#">onSwitchRecorder</a> ( <a href="#">IStreamRecorder</a> recorder, <a href="#">IMediaStream</a> newStream) This notification occurs when an existing stream has been replaced by a new stream of the same name.

### Methods

#### onCreateRecorder

public void **onCreateRecorder**([IStreamRecorder](#) recorder)

This notification occurs when a new recorder has been created, but before recording has started. Within this method, changes can be made to the StreamRecorder's StreamRecorderParameters, which will then take affect when the recorder is started.

Called before action is taken

#### Parameters:

recorder - the new recorder

(continued from last page)

---

## onStartRecorder

```
public void onStartRecorder(IStreamRecorder recorder)
```

This notification occurs when a recorder starts recording.

Called after all configuration of the recorder is complete, but before the recording actually starts.

**Parameters:**

recorder - the recorder which is starting

---

## onSplitRecorder

```
public void onSplitRecorder(IStreamRecorder recorder)
```

This notification occurs when a recorder is directed to split the active recording.

Called after all configuration of the recorder is complete, but before the recording actually starts.

**Parameters:**

recorder - the recorder which is starting

---

## onStopRecorder

```
public void onStopRecorder(IStreamRecorder recorder)
```

This notification occurs when a recorder stops recording.

NOTE: Recorders are stopped whenever a stream is unpublished, or when a stream is "reset".

Within this method, calling; `getCurrentFile()`, `getCurrentDuration()`, `getCurrentSize()`, `segmentNumber()`, `getStartTime()`, `getEndTime()` will return the values accumulated from the time the `onStartRecorder` notification was called, to the time this notification was called.

Called after the recorder is stopped.

**Parameters:**

recorder - the recorder which is starting

---

## onSwitchRecorder

```
public void onSwitchRecorder(IStreamRecorder recorder,  
                             IMediaStream newStream)
```

This notification occurs when an existing stream has been replaced by a new stream of the same name. The `StreamRecorder` will stop the recording associated with the existing stream and start a new recording for the new stream, using the same parameters as those used to originally start the recording.

Called before any action is taken

**Parameters:**

recorder - the current recorder for existing stream

newStream - the new stream which will be recorded

---

## onSegmentStart

```
public void onSegmentStart(IStreamRecorder recorder)
```

This notification occurs when a recorder starts writing to the current file

Called after a the file has been opened for writing, but before any data is written to the file.

**Parameters:**

(continued from last page)

recorder - the recorder which is writing the segment

---

## onSegmentEnd

```
public void onSegmentEnd(IStreamRecorder recorder)
```

This notification occurs when a recorder stops writing to the current file

Called after all packets have been written tot he file and the file has been closed.

### Parameters:

recorder - the recorder which is wrote the segment

## com.wowza.wms.livestreamrecord.manager Interface IStreamRecorderConstants

public interface **IStreamRecorderConstants**  
extends

Defines the static constants used by the StreamRecorder system

The Properties for StreamRecorders should be placed in application.xml within the StreamRecorder properties container

for example:

```
</StreamRecorder>
  </Properties>
    </Property>
      </Name>streamRecorderDebugEnabled</Name>
      </Value>true</Value>
      </Type>Boolean</Type>
    </Property>
  </Properties>
</StreamRecorder>
```

### Field Summary

public static final	<a href="#"><u>APPEND_FILE</u></a> Appends new stream data to the existing file. Value: <b>append</b>
public static final	<a href="#"><u>FORMAT_FLV</u></a> Value: <b>flv</b>
public static final	<a href="#"><u>FORMAT_MP4</u></a> Value: <b>mp4</b>
public static final	<a href="#"><u>OVERWRITE_FILE</u></a> Overwrites the existing file with the new file Value: <b>overwrite</b>
public static final	<a href="#"><u>PROPERTY_BACK_BUFFER_TIME</u></a> Application Property "streamRecorderBackBufferTime": for specifying the number of milliseconds of packets to pull from the incoming stream buffer and write to file, before beginning the recording. Value: <b>streamRecorderBackBufferTime</b>
public static final	<a href="#"><u>PROPERTY_DEBUG_ENABLE</u></a> Application Property "streamRecorderDebugEnabled": for enabling additional log statements throughout StreamRecorder Value: <b>streamRecorderDebugEnabled</b>
public static final	<a href="#"><u>PROPERTY_DEFAULT_AUDIO_SEARCH_POSITION</u></a> Application Property "streamRecorderDefaultAudioSearchPosition": for specifying how audio is found when it may not be in sync with the video Value: <b>streamRecorderDefaultAudioSearchPosition</b>

public static final	<a href="#"><u>PROPERTY_FILE_FORMAT</u></a> Application Property "streamRecorderFileFormat": for specifying the default file format used by StreamRecorder. Value: <b>streamRecorderFileFormat</b>
public static final	<a href="#"><u>PROPERTY_FILE_VERSION_DELEGATE</u></a> Application Property "streamRecorderFileVersionDelegate": for specifying a default custom file version delegate. Value: <b>streamRecorderFileVersionDelegate</b>
public static final	<a href="#"><u>PROPERTY_FILE_VERSION_TEMPLATE</u></a> Application Property "streamRecorderFileVersionTemplate": for specifying a default file version template string. Value: <b>streamRecorderFileVersionTemplate</b>
public static final	<a href="#"><u>PROPERTY_MOVE_FIRST_VIDEO_FRAME_TO_ZERO</u></a> Application Property "streamRecorderMoveFirstVideoFrameToZero": for specifying the default moveFirstVideoFrameToZero value used by StreamRecorder. Value: <b>streamRecorderMoveFirstVideoFrameToZero</b>
public static final	<a href="#"><u>PROPERTY_NOTIFY_LISTENER</u></a> Application Property "streamRecorderNotifyListener": for specifying the default listener which will receive StreamRecorder notifications. Value: <b>streamRecorderNotifyListener</b>
public static final	<a href="#"><u>PROPERTY_OUTPUT_FILE</u></a> Application Property "streamRecorderOutputFile": for specifying the default filename used by StreamRecorder for recordings. Value: <b>streamRecorderOutputFile</b>
public static final	<a href="#"><u>PROPERTY_OUTPUT_PATH</u></a> Application Property "streamRecorderOutputPath": for specifying the default path used by StreamRecorder to write recordings. Value: <b>streamRecorderOutputPath</b>
public static final	<a href="#"><u>PROPERTY_RECORD_DATA</u></a> Application Property "streamRecorderRecordData": for specifying the default recordData value used by StreamRecorders. Value: <b>streamRecorderRecordData</b>
public static final	<a href="#"><u>PROPERTY_SEGMENT_DURATION</u></a> Application Property "streamRecorderSegmentDuration": for specifying the default SegmentDuration used by StreamRecorder when the segmentationType is set to SEGMENT_BY_DURATION. Value: <b>streamRecorderSegmentDuration</b>
public static final	<a href="#"><u>PROPERTY_SEGMENT_SCHEDULE</u></a> Application Property "streamRecorderSegmentSchedule": for specifying the default SegmentSchedule string used by StreamRecorder when the segmentationType is set to SEGMENT_BY_SCHEDULE. Value: <b>streamRecorderSegmentSchedule</b>
public static final	<a href="#"><u>PROPERTY_SEGMENT_SIZE</u></a> Application Property "streamRecorderSegmentSize": for specifying the default SegmentSize used by StreamRecorder when the segmentationType is set to SEGMENT_BY_SIZE. Value: <b>streamRecorderSegmentSize</b>

public static final	<a href="#"><u>PROPERTY_SEGMENTATION_TYPE</u></a> Application Property "streamRecorderSegmentationType": for specifying the default segmentation type used by StreamRecorder. Value: <b>streamRecorderSegmentationType</b>
public static final	<a href="#"><u>PROPERTY_SKIP_KEYFRAME_AUDIO_TIMEOUT</u></a> Application Property "streamRecorderSkipKeyFrameUntilAudioTimeout": for specifying how long audio is waited for. Value: <b>streamRecorderSkipKeyFrameUntilAudioTimeout</b>
public static final	<a href="#"><u>PROPERTY_SPLIT_ON_TC_DISCONTINUITY</u></a> Application Property "streamRecorderSplitOnTcDiscontinuity": for specifying the default splitOnTcDiscontinuity value used by StreamRecorder. Value: <b>streamRecorderSplitOnTcDiscontinuity</b>
public static final	<a href="#"><u>PROPERTY_START_ON_KEYFRAME</u></a> Application Property "streamRecorderStartOnKeyFrame": for specifying the default startOnKeyFrame value used by StreamRecorder. Value: <b>streamRecorderStartOnKeyFrame</b>
public static final	<a href="#"><u>PROPERTY_TIMESCALE</u></a> Application Property "streamRecorderTimescale": for specifying the timescale used when writing packets to a file. Value: <b>streamRecorderTimeScale</b>
public static final	<a href="#"><u>PROPERTY_USE_SIMPLE_FILE_VERSION_NAMING</u></a> Application Property "streamRecorderUseSimpleFileVersionNaming": for using StreamRecorderSimpleFileVersionDelegate instead of StreamRecorderFileVersionDelegate as the default file version naming delegate Value: <b>streamRecorderUseSimpleFileVersionNaming</b>
public static final	<a href="#"><u>PROPERTY_VERSIONING_OPTION</u></a> Application Property "streamRecorderVersioningOption": for specifying the default file versioning method used by StreamRecorders Value: <b>streamRecorderVersioningOption</b>
public static final	<a href="#"><u>RECORDER_STATE_ERROR</u></a> Value returned by IStreamRecorder getRecorderState() to indicate an error has occurred in the recorder. Value: <b>-1</b>
public static final	<a href="#"><u>RECORDER_STATE_ERROR_STRING</u></a> String value returned by IStreamRecorder getRecorderStateString() when the recorder state is RECORDER_STATE_ERROR. Value: <b>Recorder Error</b>
public static final	<a href="#"><u>RECORDER_STATE_PENDING</u></a> Value returned by IStreamRecorder getRecorderState() to indicate the recorder has been created but it's IStreamRecorder startRecording() method has not yet been called. Value: <b>0</b>
public static final	<a href="#"><u>RECORDER_STATE_PENDING_STRING</u></a> String value returned by IStreamRecorder getRecorderStateString() when the recorder state is RECORDER_STATE_PENDING. Value: <b>Pending</b>

public static final	<a href="#"><u>RECORDER_STATE_RECORDING</u></a> Value returned by IStreamRecorder getRecorderState() to indicate the recorder is actively recording data to file. Value: <b>2</b>
public static final	<a href="#"><u>RECORDER_STATE_RECORDING_STRING</u></a> String value returned by IStreamRecorder getRecorderStateString() when the recorder state is RECORDER_STATE_RECORDING. Value: <b>Recording</b>
public static final	<a href="#"><u>RECORDER_STATE_WAITING</u></a> Value returned by IStreamRecorder getRecorderState() to indicate the recorder has been started but the associated stream is not currently being received by the server (for example the stream is not being published from the encoder) Value: <b>1</b>
public static final	<a href="#"><u>RECORDER_STATE_WAITING_STRING</u></a> String value returned by IStreamRecorder getRecorderStateString() when the recorder state is RECORDER_STATE_WAITING. Value: <b>Waiting for Stream</b>
public static final	<a href="#"><u>SEGMENT_BY_DURATION</u></a> Value: <b>duration</b>
public static final	<a href="#"><u>SEGMENT_BY_SCHEDULE</u></a> Value: <b>schedule</b>
public static final	<a href="#"><u>SEGMENT_BY_SIZE</u></a> Value: <b>size</b>
public static final	<a href="#"><u>SEGMENT_NONE</u></a> Value: <b>none</b>
public static final	<a href="#"><u>VERSION_FILE</u></a> Uses the file name returned by the configured fileVersionDelegate to version the new file Value: <b>version</b>

## Fields

### PROPERTY\_DEBUG\_ENABLE

```
public static final java.lang.String PROPERTY_DEBUG_ENABLE
```

Application Property "streamRecorderDebugEnabled": for enabling additional log statements throughout StreamRecorder

Add the property to the StreamRecorder Properties section of Application.xml.

Default value is false

Valid values are true or false

Constant value: **streamRecorderDebugEnabled**

### PROPERTY\_USE\_SIMPLE\_FILE\_VERSION\_NAMING

```
public static final java.lang.String PROPERTY_USE_SIMPLE_FILE_VERSION_NAMING
```

(continued from last page)

Application Property "streamRecorderUseSimpleFileVersionNaming": for using StreamRecorderSimpleFileVersionDelegate instead of StreamRecorderFileVersionDelegate as the default file version naming delegate

Add the property to the StreamRecorder Properties section of Application.xml.

Default value is false

Valid values are true, false

Constant value: **streamRecorderUseSimpleFileVersionNaming**

See Also:

[StreamRecorderSimpleFileVersionDelegate](#)

---

## PROPERTY\_SEGMENTATION\_TYPE

```
public static final java.lang.String PROPERTY_SEGMENTATION_TYPE
```

Application Property "streamRecorderSegmentationType": for specifying the default segmentation type used by StreamRecorder.

Add the property to the StreamRecorder Properties section of Application.xml.

Valid values are: none, schedule, size, duration

Constant value: **streamRecorderSegmentationType**

See Also:

[StreamRecorderParameters.segmentationType](#)

---

## SEGMENT\_NONE

```
public static final java.lang.String SEGMENT_NONE
```

Constant value: **none**

---

## SEGMENT\_BY\_SCHEDULE

```
public static final java.lang.String SEGMENT_BY_SCHEDULE
```

Constant value: **schedule**

---

## SEGMENT\_BY\_SIZE

```
public static final java.lang.String SEGMENT_BY_SIZE
```

Constant value: **size**

---

## SEGMENT\_BY\_DURATION

```
public static final java.lang.String SEGMENT_BY_DURATION
```

Constant value: **duration**

---

(continued from last page)

---

## PROPERTY\_FILE\_FORMAT

```
public static final java.lang.String PROPERTY_FILE_FORMAT
```

Application Property "streamRecorderFileFormat": for specifying the default file format used by StreamRecorder.

Add the property to the StreamRecorder Properties section of Application.xml.

Valid values are: flv, mp4

Constant value: **streamRecorderFileFormat**

See Also:

[StreamRecorderParameters.fileFormat](#)

---

## FORMAT\_FLV

```
public static final java.lang.String FORMAT_FLV
```

Constant value: **flv**

---

## FORMAT\_MP4

```
public static final java.lang.String FORMAT_MP4
```

Constant value: **mp4**

---

## PROPERTY\_VERSIONING\_OPTION

```
public static final java.lang.String PROPERTY_VERSIONING_OPTION
```

Application Property "streamRecorderVersioningOption": for specifying the default file versioning method used by StreamRecorders

Add the property to the StreamRecorder Properties section of Application.xml.

Valid values are: version, append, overwrite

Constant value: **streamRecorderVersioningOption**

See Also:

[StreamRecorderParameters.versioningOption](#)

---

## VERSION\_FILE

```
public static final java.lang.String VERSION_FILE
```

Uses the file name returned by the configured fileVersionDelegate to version the new file

Constant value: **version**

See Also:

[IStreamRecorderFileVersionDelegate](#)

[StreamRecorderFileVersionDelegate](#)

[StreamRecorderSimpleFileVersionDelegate](#)

---

(continued from last page)

---

## APPEND\_FILE

```
public static final java.lang.String APPEND_FILE
```

Appends new stream data to the existing file. NOTE: To ensure playback compatibility, it is highly recommended that this option only be used if all streams recorded to the file will be using identical video and audio codecs and configurations.  
Constant value: **append**

---

## OVERWRITE\_FILE

```
public static final java.lang.String OVERWRITE_FILE
```

Overwrites the existing file with the new file  
Constant value: **overwrite**

---

## PROPERTY\_START\_ON\_KEYFRAME

```
public static final java.lang.String PROPERTY_START_ON_KEYFRAME
```

Application Property "streamRecorderStartOnKeyFrame": for specifying the default startOnKeyFrame value used by StreamRecorder.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderStartOnKeyFrame**

See Also:

[StreamRecorderParameters.startOnKeyFrame](#)

---

## PROPERTY\_RECORD\_DATA

```
public static final java.lang.String PROPERTY_RECORD_DATA
```

Application Property "streamRecorderRecordData": for specifying the default recordData value used by StreamRecorders.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderRecordData**

See Also:

[StreamRecorderParameters.recordData](#)

---

## PROPERTY\_MOVE\_FIRST\_VIDEO\_FRAME\_TO\_ZERO

```
public static final java.lang.String PROPERTY_MOVE_FIRST_VIDEO_FRAME_TO_ZERO
```

Application Property "streamRecorderMoveFirstVideoFrameToZero": for specifying the default moveFirstVideoFrameToZero value used by StreamRecorder.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderMoveFirstVideoFrameToZero**

See Also:

[StreamRecorderParameters.moveFirstVideoFrameToZero](#)

---

(continued from last page)

---

## PROPERTY\_SPLIT\_ON\_TC\_DISCONTINUITY

```
public static final java.lang.String PROPERTY_SPLIT_ON_TC_DISCONTINUITY
```

Application Property "streamRecorderSplitOnTcDiscontinuity": for specifying the default splitOnTcDiscontinuity value used by StreamRecorder.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderSplitOnTcDiscontinuity**

See Also:

[StreamRecorderParameters.splitOnTcDiscontinuity](#)

---

## PROPERTY\_SEGMENT\_SIZE

```
public static final java.lang.String PROPERTY_SEGMENT_SIZE
```

Application Property "streamRecorderSegmentSize": for specifying the default SegmentSize used by StreamRecorder when the segmentationType is set to SEGMENT\_BY\_SIZE.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderSegmentSize**

See Also:

[StreamRecorderParameters.segmentSize](#)

---

## PROPERTY\_SEGMENT\_DURATION

```
public static final java.lang.String PROPERTY_SEGMENT_DURATION
```

Application Property "streamRecorderSegmentDuration": for specifying the default SegmentDuration used by StreamRecorder when the segmentationType is set to SEGMENT\_BY\_DURATION.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderSegmentDuration**

See Also:

[StreamRecorderParameters.segmentDuration](#)

---

## PROPERTY\_SEGMENT\_SCHEDULE

```
public static final java.lang.String PROPERTY_SEGMENT_SCHEDULE
```

Application Property "streamRecorderSegmentSchedule": for specifying the default SegmentSchedule string used by StreamRecorder when the segmentationType is set to SEGMENT\_BY\_SCHEDULE.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderSegmentSchedule**

See Also:

[StreamRecorderParameters.segmentSchedule](#)

---

(continued from last page)

---

## PROPERTY\_OUTPUT\_PATH

```
public static final java.lang.String PROPERTY_OUTPUT_PATH
```

Application Property "streamRecorderOutputPath": for specifying the default path used by StreamRecorder to write recordings.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderOutputPath**

See Also:

[StreamRecorderParameters.outputPath](#)

---

## PROPERTY\_OUTPUT\_FILE

```
public static final java.lang.String PROPERTY_OUTPUT_FILE
```

Application Property "streamRecorderOutputFile": for specifying the default filename used by StreamRecorder for recordings.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderOutputFile**

See Also:

[StreamRecorderParameters.outputFile](#)

---

## PROPERTY\_BACK\_BUFFER\_TIME

```
public static final java.lang.String PROPERTY_BACK_BUFFER_TIME
```

Application Property "streamRecorderBackBufferTime": for specifying the number of milliseconds of packets to pull from the incoming stream buffer and write to file, before beginning the recording.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderBackBufferTime**

See Also:

[StreamRecorderParameters.backBufferTime](#)

---

## PROPERTY\_NOTIFY\_LISTENER

```
public static final java.lang.String PROPERTY_NOTIFY_LISTENER
```

Application Property "streamRecorderNotifyListener": for specifying the default listener which will receive StreamRecorder notifications.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderNotifyListener**

See Also:

[StreamRecorderParameters.notifyListener](#)

---

(continued from last page)

## PROPERTY\_FILE\_VERSION\_DELEGATE

```
public static final java.lang.String PROPERTY_FILE_VERSION_DELEGATE
```

Application Property "streamRecorderFileVersionDelegate": for specifying a default custom file version delegate.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderFileVersionDelegate**

See Also:

[StreamRecorderParameters.fileVersionDelegate](#)

---

## PROPERTY\_FILE\_VERSION\_TEMPLATE

```
public static final java.lang.String PROPERTY_FILE_VERSION_TEMPLATE
```

Application Property "streamRecorderFileVersionTemplate": for specifying a default file version template string.

NOTE: only applicable when using the default fileVersionDelegate

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderFileVersionTemplate**

See Also:

[StreamRecorderParameters.fileTemplate](#)

[StreamRecorderParameters.fileVersionDelegate](#)

---

## PROPERTY\_TIMESCALE

```
public static final java.lang.String PROPERTY_TIMESCALE
```

Application Property "streamRecorderTimescale": for specifying the timescale used when writing packets to a file. It ONLY applies to MP4 file outputs. The only VALID values are 90000 or 100000

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderTimeScale**

See Also:

streamRecorderTimescale

---

## PROPERTY\_DEFAULT\_AUDIO\_SEARCH\_POSITION

```
public static final java.lang.String PROPERTY_DEFAULT_AUDIO_SEARCH_POSITION
```

Application Property "streamRecorderDefaultAudioSearchPosition": for specifying how audio is found when it may not be in sync with the video

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderDefaultAudioSearchPosition**

See Also:

streamRecorderDefaultAudioSearchPosition

(continued from last page)

---

## PROPERTY\_SKIP\_KEYFRAME\_AUDIO\_TIMEOUT

```
public static final java.lang.String PROPERTY_SKIP_KEYFRAME_AUDIO_TIMEOUT
```

Application Property "streamRecorderSkipKeyFrameUntilAudioTimeout": for specifying how long audio is waited for.

Add the property to the StreamRecorder Properties section of Application.xml.

Constant value: **streamRecorderSkipKeyFrameUntilAudioTimeout**

**See Also:**

`streamRecorderSkipKeyFrameUntilAudioTimeout`

---

## RECORDER\_STATE\_ERROR

```
public static final int RECORDER_STATE_ERROR
```

Value returned by `IStreamRecorder getRecorderState()` to indicate an error has occurred in the recorder.

Constant value: **-1**

**See Also:**

[RECORDER\\_STATE\\_ERROR\\_STRING](#)

---

## RECORDER\_STATE\_PENDING

```
public static final int RECORDER_STATE_PENDING
```

Value returned by `IStreamRecorder getRecorderState()` to indicate the recorder has been created but it's `IStreamRecorder startRecording()` method has not yet been called.

Constant value: **0**

**See Also:**

[RECORDER\\_STATE\\_PENDING\\_STRING](#)

---

## RECORDER\_STATE\_WAITING

```
public static final int RECORDER_STATE_WAITING
```

Value returned by `IStreamRecorder getRecorderState()` to indicate the recorder has been started but the associated stream is not currently being received by the server (for example the stream is not being published from the encoder)

Constant value: **1**

**See Also:**

[RECORDER\\_STATE\\_WAITING\\_STRING](#)

---

## RECORDER\_STATE\_RECORDING

```
public static final int RECORDER_STATE_RECORDING
```

Value returned by `IStreamRecorder getRecorderState()` to indicate the recorder is actively recording data to file.

Constant value: **2**

---

(continued from last page)

**See Also:**[RECORDER\\_STATE\\_RECORDING\\_STRING](#)

---

## RECORDER\_STATE\_ERROR\_STRING

```
public static final java.lang.String RECORDER_STATE_ERROR_STRING
```

String value returned by IStreamRecorder getRecorderStateString() when the recorder state is RECORDER\_STATE\_ERROR.

Constant value: **Recorder Error**

**See Also:**[RECORDER\\_STATE\\_ERROR](#)

---

## RECORDER\_STATE\_PENDING\_STRING

```
public static final java.lang.String RECORDER_STATE_PENDING_STRING
```

String value returned by IStreamRecorder getRecorderStateString() when the recorder state is RECORDER\_STATE\_PENDING.

Constant value: **Pending**

**See Also:**[RECORDER\\_STATE\\_PENDING](#)

---

## RECORDER\_STATE\_WAITING\_STRING

```
public static final java.lang.String RECORDER_STATE_WAITING_STRING
```

String value returned by IStreamRecorder getRecorderStateString() when the recorder state is RECORDER\_STATE\_WAITING.

Constant value: **Waiting for Stream**

**See Also:**[RECORDER\\_STATE\\_PENDING](#)

---

## RECORDER\_STATE\_RECORDING\_STRING

```
public static final java.lang.String RECORDER_STATE_RECORDING_STRING
```

String value returned by IStreamRecorder getRecorderStateString() when the recorder state is RECORDER\_STATE\_RECORDING.

Constant value: **Recording**

**See Also:**[RECORDER\\_STATE\\_RECORDING](#)

## com.wowza.wms.livestreamrecord.manager Interface IStreamRecorderFileVersionDelegate

All Known Implementing Classes:

[StreamRecorderSimpleFileVersionDelegate](#), [StreamRecorderFileVersionDelegate](#)

public interface **IStreamRecorderFileVersionDelegate**  
extends

This interface is used to implement a custom file versioning scheme during live stream recording.

The `getFilename` method is called under 2 conditions

- 1 - when a recorder needs to create a new output file, and an file already exists by the same name.
- 2 - when a recorder creates a new file and has been configured to use any `segmentationType` other than none

The string returned must be a valid and fully qualified filename, including the full path.

For example:

`c:\test\myFile.flv`

`usr/home/content/myFile.mp4`

See Also:

[StreamRecorderParameters.segmentationType](#)

### Method Summary

String	<a href="#">getFilename</a> ( <a href="#">IStreamRecorder</a> recContext)
--------	---

### Methods

#### **getFilename**

public String **getFilename**([IStreamRecorder](#) recContext)

##### Parameters:

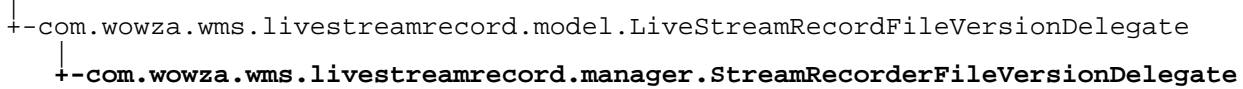

recContext - The IStreamRecorder requesting the file name

##### Returns:

String The versioned file name

## com.wowza.wms.livestreamrecord.manager Class StreamRecorderFileVersionDelegate

java.lang.Object

All Implemented Interfaces:

[IStreamRecorderFileVersionDelegate](#), [ILiveStreamRecordFileVersionDelegate](#)

public class **StreamRecorderFileVersionDelegate**

extends [LiveStreamRecordFileVersionDelegate](#)

implements [ILiveStreamRecordFileVersionDelegate](#), [IStreamRecorderFileVersionDelegate](#)

Default FileVersionDelegate class

This delegate allows the configuration of a custom FileName using a template string. The tags in the template string are replaced with their associated values, to generate a filename.

Valid template tags are;

`${SourceStreamName}` - The name of the stream

`${BaseFileName}` - The basefile name, which is the filename prior to any versioning changes

`${SegmentNumber}` - An incrementing value representing the current number of segments which have been created for this recording, starting at 0

`${RecordingStartTime}` - The time at which the recording was started formatted as yyyy-MM-dd-HH.mm.ss.SSS-zzz

`${SegmentTime}` - Time time at which the segment was created

The default template string is

`${BaseFileName}_${RecordingStartTime}_${SegmentNumber}`

### Fields inherited from class

com.wowza.wms.livestreamrecord.model.LiveStreamRecordFileVersionDelegate

BASE\_NAME\_TAG, DATETIME\_LAYOUT\_NORMAL, DATETIME\_LAYOUT\_NORMAL\_ALT, SEGMENT\_NUMBER\_TAG, SEGMENT\_TIME\_TAG, START\_TIME\_TAG, STREAM\_NAME\_TAG

## Constructor Summary

public [StreamRecorderFileVersionDelegate](#)()

## Method Summary

String [getFilename](#)([IStreamRecorder](#) recContext)  
Creates a new filename using the default template string,

### Methods inherited from class

## Constructors

### StreamRecorderFileVersionDelegate

```
public StreamRecorderFileVersionDelegate()
```

## Methods

### getFilename

```
public String getFilename(IStreamRecorder recContext)
```

Creates a new filename using the default template string,

**Parameters:**

recContext - The IStreamRecorder requesting the file name

**Returns:**

String The versioned file name

## com.wowza.wms.livestreamrecord.manager Class StreamRecorderParameters

java.lang.Object

└─com.wowza.wms.livestreamrecord.manager.StreamRecorderParameters

public class **StreamRecorderParameters**  
extends Object

This class is used to configure the recording parameters for the StreamRecorder class.  
All members of this class are public and therefore can be accessed and modified directly.

### Field Summary

public	<a href="#"><u>backBufferTime</u></a> Configures the number of milliseconds of packets to pull from the incoming stream buffer and write to file, before beginning the recording.
public	<a href="#"><u>defaultAudioSearchPosition</u></a> Configures the default search position for audio before starting to record.
public	<a href="#"><u>fileFormat</u></a> Configures the output file format
public	<a href="#"><u>fileTemplate</u></a> Configures the file version template string used by the default fileVersionDelegate, to generate a versioned file name for the recorder NOTE: if set to null then a default file template string, as defined by StreamRecorderFileVersionDelegate, will be used
public	<a href="#"><u>fileVersionDelegate</u></a> Configures the fileVersionDelegate for the recorder Valid values are the fully qualified class path to the class which implements the IStreamRecorderFileVersionDelegate interface. Default value is com.wowza.wms.livestreamrecord.manager.StreamRecorderFileVersionDelegate
public	<a href="#"><u>moveFirstVideoFrameToZero</u></a> Configures whether or not the recorder will set the first packet's timecode to 0, when recording fileFormat is FORMAT_MP4
public	<a href="#"><u>notifyListener</u></a> Configures the StreamRecorder listener for the recorder Valid values are the fully qualified class path to the class which implements the IStreamRecorderActionNotify interface.
public	<a href="#"><u>outputFile</u></a> Configures the output file name used for the recording If segmentationType is not SEGMENT_NONE, then this value is used as the base file name for the file segments when using either of the fileVersionDelegates NOTE 1: When set to null or "", the recorder will create the filename based upon the stream name and the value of fileFormat.
public	<a href="#"><u>outputPath</u></a> Configures the output directory where recorded file will be written NOTE: When set to null or "", the recorder will write files to the default content directory for the application.
public	<a href="#"><u>recordData</u></a> Configures whether or not the recorder will write data packets to the output file.

public	<a href="#">segmentationType</a> Configures the type of recording segmentation the recorder will use Segmentation provides a means by which the recording of an incoming live stream can be split into a series of files in order to manage them more easily.
public	<a href="#">segmentDuration</a> Configures the output file size in milliseconds for each recording segment, when segmentationType is SEGMENT_BY_DURATION. This value is specified in milliseconds
public	<a href="#">segmentSchedule</a> Configures the crontab schedule used to segment a recording, when segmentationType is SEGMENT_BY_SCHEDULE.
public	<a href="#">segmentSize</a> Configures the output file size in bytes for each recording segment, when segmentationType is SEGMENT_BY_SIZE. This value is specified in bytes
public	<a href="#">skipKeyFrameUntilAudioTimeout</a> Configures the audio timeout when waiting for audio sync.
public	<a href="#">splitOnTcDiscontinuity</a> Configures whether or not the recorder will create a new segment for a recording when packet timecode discontinuities are detected A discontinuity is said to occur when 10 consecutive packets have timecodes which jump backward in time.
public	<a href="#">startOnKeyFrame</a> Configures whether or not the recorder will wait until a video key frame is received to start writing packets to the output file, thus ensuring the first packet in the file contains a video key frame.
public	<a href="#">timeScale</a> Configures the timescale in milliseconds for the recording
public	<a href="#">versioningOption</a> Configures the behavior when a new recording file is created with a name that already exists

## Constructor Summary

public	<a href="#">StreamRecorderParameters</a> ( <a href="#">IApplicationInstance</a> appInstance) The constructor will read any defaults set via properties in application.xml and will use those values as the default values for this class.
public	<a href="#">StreamRecorderParameters</a> ( <a href="#">IApplicationInstance</a> appInstance, <a href="#">StreamRecorderParameters</a> params) The constructor will copy another StreamRecorderParameters object.

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### segmentationType

public java.lang.String **segmentationType**

(continued from last page)

Configures the type of recording segmentation the recorder will use

Segmentation provides a means by which the recording of an incoming live stream can be split into a series of files in order to manage them more easily. The files can be limited by; size, duration, or split at a specific time (e.g. at the top of every hour). If SEGMENT\_NONE is used, then the recording is written to a single file.

Valid values are defined in IStreamRecorderConstants

**See Also:**[IStreamRecorderConstants.SEGMENT\\_NONE](#)[IStreamRecorderConstants.SEGMENT\\_BY\\_DURATION](#)[IStreamRecorderConstants.SEGMENT\\_BY\\_SIZE](#)[IStreamRecorderConstants.SEGMENT\\_BY\\_SCHEDULE](#)

---

## versioningOption

```
public java.lang.String versioningOption
```

Configures the behavior when a new recording file is created with a name that already exists

NOTE: APPEND\_FILE and OVERWRITE\_FILE are only applicable when the segmentationType is SEGMENT\_NONE

Valid values are defined in IStreamRecorderConstants

**See Also:**[IStreamRecorderConstants.VERSION\\_FILE](#)[IStreamRecorderConstants.APPEND\\_FILE](#)[IStreamRecorderConstants.OVERWRITE\\_FILE](#)[segmentSize](#)[segmentDuration](#)[segmentSchedule](#)

---

## fileFormat

```
public java.lang.String fileFormat
```

Configures the output file format

Valid values are defined in IStreamRecorderConstants

**See Also:**[IStreamRecorderConstants.FORMAT\\_FLV](#)[IStreamRecorderConstants.FORMAT\\_MP4](#)

---

## startOnKeyFrame

```
public boolean startOnKeyFrame
```

Configures whether or not the recorder will wait until a video key frame is received to start writing packets to the output file, thus ensuring the first packet in the file contains a video key frame.

Valid values are true, false  
default value is true

---

## recordData

```
public boolean recordData
```

Configures whether or not the recorder will write data packets to the output file.

Valid values are true, false  
default value is false

## moveFirstVideoFrameToZero

```
public boolean moveFirstVideoFrameToZero
```

Configures whether or not the recorder will set the first packet's timecode to 0, when recording fileFormat is FORMAT\_MP4

Valid values are true, false  
default value is true

---

## splitOnTcDiscontinuity

```
public boolean splitOnTcDiscontinuity
```

Configures whether or not the recorder will create a new segment for a recording when packet timecode discontinuities are detected

A discontinuity is said to occur when 10 consecutive packets have timecodes which jump backward in time. i.e. the current packet's timecode is less than the previous packet's timecode.

Valid values are true, false  
default value is false

---

## backBufferTime

```
public long backBufferTime
```

Configures the number of milliseconds of packets to pull from the incoming stream buffer and write to file, before beginning the recording. This parameter is typically used with manual recordings to mitigate the delay between a start recording request and when data is actually written to file, thus ensuring that the beginning of an event is recorded to file.

This value is in milliseconds.  
default value is 0  
NOTE: The incoming stream buffer contains approximately 8 seconds of packets

---

## segmentSize

```
public long segmentSize
```

Configures the output file size in bytes for each recording segment, when segmentationType is SEGMENT\_BY\_SIZE. This value is specified in bytes

Valid values are any positive long value greater than 0, however a minimum size of 1048576 bytes (1 MB) is highly recommended to ensure the recorded file segments can start on a video key frame if configured to do so.  
default value is 10485760 bytes (10 MB)

---

## segmentDuration

```
public long segmentDuration
```

Configures the output file size in milliseconds for each recording segment, when segmentationType is SEGMENT\_BY\_DURATION. This value is specified in milliseconds

Valid values are any positive long value greater than 0, however a minimum size of 60000 ms (1 minute) is highly recommended to ensure the recorded file segments can start on a video key frame if configured to do so.  
default value is 900000 ms (15 minutes)

---

## segmentSchedule

```
public java.lang.String segmentSchedule
```

---

(continued from last page)

Configures the crontab schedule used to segment a recording, when segmentationType is SEGMENT\_BY\_SCHEDULE.

#### Crontab expressions

A crontab expression specifies the segmentation interval in minutes, hours, months, years, days of the month, or days of the week. The available crontab fields are (in order):

[Minute] [Hour] [Day\_of\_the\_Month] [Month\_of\_the\_Year] [Day\_of\_the\_Week] [Year]  
where:

Minute - Specifies the minute value (between 0 and 59) at which the segmentation occurs.

Hour - Specifies the hour (between 0 and 23 based on a 24-hour clock) at which the segmentation occurs.

Day\_of\_the\_Month - Specifies the day (between 0 and 31) at which the split occurs. To specify that live recordings always be segmentation on the last day of the month, specify 31.

Month\_of\_the\_Year - Specifies the month at which the segmentation occurs. You can specify the month by using the abbreviated name of the month (for example, Jan) or a numerical equivalent (for example, 1).

Day\_of\_the\_Week - Specifies the day in a week at which the segmentation occurs. You can specify the day by using the abbreviated name of the day (for example, Mon) or a numerical equivalent (for example, 1).

Year - Specifies the year at which the segmentation occurs (for example, 2013).

#### Example

To segmentation a live recording every 30 minutes (at the top of each hour and every half-hour):

0,30 \* \* \* \* \*

0,30 (simplified version)

for more details see (<http://www.nncron.ru/help/EN/working/cron-format.htm>).

Note: The nnCron nonstandard question mark character (?), which specifies that the server startup time is substituted into the cron expression, is NOT currently supported.

Valid values are any valid crontab expression exception for '?'

default value is "0 \* \* \* \* \*" (segment every hour at the top of the hour)

---

## outputFile

```
public java.lang.String outputFile
```

Configures the output file name used for the recording

If segmentationType is not SEGMENT\_NONE, then this value is used as the base file name for the file segments when using either of the fileVersionDelegates

NOTE 1: When set to null or "", the recorder will create the filename based upon the stream name and the value of fileFormat.

NOTE 2: The fileFormat will be appended to the file name to ensure the file extension matches the actual file format written.

Example mytestRecording, with no fileFormat specified will result in the default fileFormat being used and a recorded file name of mytestRecording.mp4 myOtherTest.mp4, with the the fileFormat specified as 1 (FLV), will result in the recorded file name of myOtherTest.mp4.flv

Valid values are any valid filename

default value is null

---

## outputPath

```
public java.lang.String outputPath
```

Configures the output directory where recorded file will be written

NOTE: When set to null or "", the recorder will write files to the default content directory for the application.

Examples c:\myfiles\recordings /home/user/myfiles/recordings

Valid values are any valid path.

default value is null

---

## notifyListener

```
public com.wowza.wms.livestreamrecord.manager.IStreamRecorderActionNotify  
notifyListener
```

(continued from last page)

Configures the StreamRecorder listener for the recorder

Valid values are the fully qualified class path to the class which implements the IStreamRecorderActionNotify interface. default value is null

See Also:

[IStreamRecorderActionNotify](#)

---

## fileVersionDelegate

```
public com.wowza.wms.livestreamrecord.manager.IStreamRecorderFileVersionDelegate  
fileVersionDelegate
```

Configures the fileVersionDelegate for the recorder

Valid values are the fully qualified class path to the class which implements the IStreamRecorderFileVersionDelegate interface.

Default value is com.wowza.wms.livestreamrecord.manager.StreamRecorderFileVersionDelegate

See Also:

[IStreamRecorderFileVersionDelegate](#)

[StreamRecorderFileVersionDelegate](#)

[StreamRecorderSimpleFileVersionDelegate](#)

---

## fileTemplate

```
public java.lang.String fileTemplate
```

Configures the file version template string used by the default fileVersionDelegate, to generate a versioned file name for the recorder

NOTE: if set to null then a default file template string, as defined by StreamRecorderFileVersionDelegate, will be used

Valid values are null or a valid file version template string

Default value is null

See Also:

[StreamRecorderFileVersionDelegate](#)

---

## timeScale

```
public long timeScale
```

Configures the timescale in milliseconds for the recording

This value is in milliseconds.

default value is 90000

NOTE: There are only two valid values 90000 and 100000

---

## defaultAudioSearchPosition

```
public boolean defaultAudioSearchPosition
```

Configures the default search position for audio before starting to record.

Default value is LiveStreamRecorderBase.DEFAULT\_FORCE\_AUDIO\_SEARCH

---

## skipKeyFrameUntilAudioTimeout

```
public int skipKeyFrameUntilAudioTimeout
```

Configures the audio timeout when waiting for audio sync. This value is in milliseconds.  
default balue is LiveStreamRecorderBase.DEFAULT\_SKIPKEYFRAMESUNTILAUDIOTIMEOUT

## Constructors

### StreamRecorderParameters

```
public StreamRecorderParameters(IApplicationInstance appInstance)
```

The constructor will read any defaults set via properties in application.xml and will use those values as the default values for this class.

**Parameters:**

appInstance

---

### StreamRecorderParameters

```
public StreamRecorderParameters(IApplicationInstance appInstance,  
                                StreamRecorderParameters params)
```

The constructor will copy another StreamRecorderParameters object.

**Parameters:**

appInstance

params

## com.wowza.wms.livestreamrecord.manager Class StreamRecorderSimpleFileVersionDelegate

java.lang.Object

```

    |
    +--com.wowza.wms.livestreamrecord.model.LiveStreamRecordSimpleFileVersionDelegate
        |
        +--com.wowza.wms.livestreamrecord.manager.StreamRecorderSimpleFileVersionDelegate
  
```

All Implemented Interfaces:

[IStreamRecorderFileVersionDelegate](#), [ILiveStreamRecordFileVersionDelegate](#)

public class **StreamRecorderSimpleFileVersionDelegate**  
 extends [LiveStreamRecordSimpleFileVersionDelegate](#)  
 implements [ILiveStreamRecordFileVersionDelegate](#), [IStreamRecorderFileVersionDelegate](#)

StreamRecorderSimpleFileVersionDelegate class

This delegate uses the simple file versioning method to generate a file version name. The simple method is to version the existing file and always use the "basename" for the current file

Simple File Versioning:

The simple file versioning scheme attempts to resolve file name conflicts by appending "\_1" to the end of the existing file, so that the current recording can use the requested file name. If a file by that name already exists the appended number will be incremented and renaming will be tried again. This will continue until a non-conflicting file name is found.

For example: if the file name is "myStream.flv", and that file already exists, "myStream\_1.flv" will be tried. If that still conflicts with an existing file, "myStream\_2.flv" will be tried. This process continues until a non conflicting name is found. The recorder will then record to "mystream.flv"

### Constructor Summary

public static final	<a href="#"><u>TIMESTAMP_RULE_FORMAT</u></a> time stamp pattern string literal. Value: <b>yyyy/MM/dd HH:mm:ss</b>

## Fields

### LOG4J\_PACKAGE\_NAME

public static final java.lang.String **LOG4J\_PACKAGE\_NAME**

log4j package name string literal.  
Constant value: **org.apache.log4j**

### DEFAULT\_REPOSITORY\_NAME

public static final java.lang.String **DEFAULT\_REPOSITORY\_NAME**

The name of the default repository is "default" (without the quotes).  
Constant value: **default**

## APPLICATION\_KEY

```
public static final java.lang.String APPLICATION_KEY
```

application string literal.

Constant value: **application**

---

## HOSTNAME\_KEY

```
public static final java.lang.String HOSTNAME_KEY
```

hostname string literal.

Constant value: **hostname**

---

## RECEIVER\_NAME\_KEY

```
public static final java.lang.String RECEIVER_NAME_KEY
```

receiver string literal.

Constant value: **receiver**

---

## LOG4J\_ID\_KEY

```
public static final java.lang.String LOG4J_ID_KEY
```

log4jid string literal.

Constant value: **log4jid**

---

## TIMESTAMP\_RULE\_FORMAT

```
public static final java.lang.String TIMESTAMP_RULE_FORMAT
```

time stamp pattern string literal.

Constant value: **yyyy/MM/dd HH:mm:ss**

---

## DEFAULT\_CONFIGURATION\_FILE

```
public static final java.lang.String DEFAULT_CONFIGURATION_FILE
```

The default property file name for automatic configuration.

Constant value: **log4j.properties**

---

## DEFAULT\_XML\_CONFIGURATION\_FILE

```
public static final java.lang.String DEFAULT_XML_CONFIGURATION_FILE
```

The default XML configuration file name for automatic configuration.

Constant value: **log4j.xml**

---

## DEFAULT\_CONFIGURATION\_KEY

```
public static final java.lang.String DEFAULT_CONFIGURATION_KEY
```

log4j.configuration string literal.

Constant value: **log4j.configuration**

---

(continued from last page)

---

## CONFIGURATOR\_CLASS\_KEY

```
public static final java.lang.String CONFIGURATOR_CLASS_KEY
```

log4j.configuratorClass string literal.

Constant value: **log4j.configuratorClass**

---

## JNDI\_CONTEXT\_NAME

```
public static final java.lang.String JNDI_CONTEXT_NAME
```

JNDI context name string literal.

Constant value: **java:comp/env/log4j/context-name**

---

## TEMP\_LIST\_APPENDER\_NAME

```
public static final java.lang.String TEMP_LIST_APPENDER_NAME
```

TEMP\_LIST\_APPENDER string literal.

Constant value: **TEMP\_LIST\_APPENDER**

---

## TEMP\_CONSOLE\_APPENDER\_NAME

```
public static final java.lang.String TEMP_CONSOLE_APPENDER_NAME
```

TEMP\_CONSOLE\_APPENDER string literal.

Constant value: **TEMP\_CONSOLE\_APPENDER**

---

## CODES\_HREF

```
public static final java.lang.String CODES_HREF
```

Codes URL string literal.

Constant value: **http://logging.apache.org/log4j/docs/codes.html**

---

## ABSOLUTE\_FORMAT

```
public static final java.lang.String ABSOLUTE_FORMAT
```

ABSOLUTE string literal.

Constant value: **ABSOLUTE**

---

## ABSOLUTE\_TIME\_PATTERN

```
public static final java.lang.String ABSOLUTE_TIME_PATTERN
```

SimpleTimePattern for ABSOLUTE.

Constant value: **HH:mm:ss,SSS**

---

## DATE\_AND\_TIME\_FORMAT

```
public static final java.lang.String DATE_AND_TIME_FORMAT
```

DATE string literal.

Constant value: **DATE**

---

## DATE\_AND\_TIME\_PATTERN

```
public static final java.lang.String DATE_AND_TIME_PATTERN
```

---

(continued from last page)

SimpleTimePattern for DATE.

Constant value: **dd MMM yyyy HH:mm:ss,SSS**

---

## ISO8601\_FORMAT

```
public static final java.lang.String ISO8601_FORMAT
```

ISO8601 string literal.

Constant value: **ISO8601**

---

## ISO8601\_PATTERN

```
public static final java.lang.String ISO8601_PATTERN
```

SimpleTimePattern for ISO8601.

Constant value: **yyyy-MM-dd HH:mm:ss,SSS**

## com.wowza.wms.logging Interface ILogNotify

All Known Implementing Classes:

[LogNotifyCalculateIncremental](#)

---

public interface **ILogNotify**  
extends

ILogNotify: Interface to add custom fields to the Wowza Pro log files. To add your own custom log fields, define a class that implements this interface. The onLog method will be called each time the Wowza Pro server logs a message. Here is an example of a simple ILogNotify class that logs the current system time in milliseconds as a Long (systime-long) and as a String (systime-string).

```
package com.wowza.wms.plugin.newlogfields;

import org.apache.log4j.*;

import com.wowza.wms.logging.*;
import com.wowza.wms.stream.*;

public class LogNotifyDocs implements ILogNotify
{
    public void onLog(Level level, String comment, IMediaStream stream, String category,
String event, int status, String context)
    {
        long systime = System.currentTimeMillis();
        WMSLoggerFactory.putGlobalLogValue("systime-long", new Long(systime));
        WMSLoggerFactory.putGlobalLogValue("systime-string", systime+"");
    }
}
```

*Note: To get any of the values currently being logged use the logging API  
WMSLoggerFactory.getGlobalLogValue(WMSLoggerIDs.FD\_\*)*

To add your class to Wowza Pro, compile your class into a .class file, bind the class into a .jar file and copy the .jar file into the Wowza Pro server /lib folder. Next, edit:

- [install-dir]/bin/setenv.bat (Windows)
- [install-dir]/bin/setenv.sh (Linux, OSX, Solaris)

Add **-Dcom.wowza.wms.logging.LogNotify=[full-path-to-your-ILogNotify-class]** to the **JAVA\_OPTS**. For example for the class above the JAVA\_OPTS would look like:

Linux/OSX

JAVA\_OPTS="-Xmx768M -

Dcom.wowza.wms.logging.LogNotify=com.wowza.wms.plugin.newlogfields.NewLogFields"

Windows

JAVA\_OPTS=-Xmx768M -

Dcom.wowza.wms.logging.LogNotify=com.wowza.wms.plugin.newlogfields.NewLogFields

Next, edit `[install-dir]/conf/log4j.properties` and add the new field names to any `log4j.appender.[appender-name].layout.Fields` fields lists to which you want to log these values. For example:

```
log4j.appender.stdout.layout.Fields=x-severity,x-category,x-event,x-ctx,x-comment,systemtime-long,systemtime-string
```

## Method Summary

void

[onLog](#)(org.apache.log4j.Level level, String comment, [IMediaStream](#) stream, String category, String event, int status, String context)

Called each time the server logs a message.

## Methods

### onLog

```
public void onLog(org.apache.log4j.Level level,
    String comment,
    IMediaStream stream,
    String category,
    String event,
    int status,
    String context)
```

Called each time the server logs a message.

#### Parameters:

level - log level as defined by (org.apache.log4j.Level)  
comment - comment part of the log statement  
stream - if stream category log message it's the source stream  
category - log category as defined by WMSLoggerIDs.CAT\_\*  
event - log event as defined by WMSLoggerIDs.EVT\_\*  
status - log status (same as HTTP status field) as defined by WMSLoggerIDs.STAT\_\*  
context - log context value like stream name, vhost name, application name

## com.wowza.wms.logging Class LogNotifyCalculateIncremental

java.lang.Object

└─com.wowza.wms.logging.LogNotifyCalculateIncremental

All Implemented Interfaces:

[ILogNotify](#)

public class **LogNotifyCalculateIncremental**  
extends Object  
implements [ILogNotify](#)

LogNotifyCalculateIncremental: pre-built implementation of ILogNotify that adds 5 new log fields:

- cs-bytes-inc (client to server bytes streamed since last log entry)
- sc-bytes-inc (server to client bytesstreamed since last log entry)
- cs-stream-bytes-inc (client to server stream bytesstreamed since last log entry)
- sc-stream-bytes-inc (server to client stream bytesstreamed since last log entry)
- x-duration-inc (time in seconds that have passed since the last log event)

These are incremental versions of the regular log values. To add this to Wowza Pro edit:

- [install-dir]/bin/setenv.bat (Windows)
- [install-dir]/bin/setenv.sh (Linux, OSX)

Add `-Dcom.wowza.wms.logging.LogNotify=com.wowza.wms.logging.LogNotifyCalculateIncremental` to the `JAVA_OPTS`. Also, edit `[install-dir]/conf/log4j.properties` and add these field names to any `log4j.appender.[appender-name].layout.Fields` fields lists to which you want to log these values.

*NOTE: These new log values are only accurate if all the events are included for the **session** and **stream** log categories.*

### Field Summary

public static final	<a href="#">FD_cs_bytes_inc</a> Value: <b>cs-bytes-inc</b>
public static final	<a href="#">FD_cs_stream_bytes_inc</a> Value: <b>cs-stream-bytes-inc</b>
public static final	<a href="#">FD_sc_bytes_inc</a> Value: <b>sc-bytes-inc</b>
public static final	<a href="#">FD_sc_stream_bytes_inc</a> Value: <b>sc-stream-bytes-inc</b>
public static final	<a href="#">FD_x_duration_inc</a> Value: <b>x-duration-inc</b>

Constant value: **sc-stream-bytes-inc**

### FD\_x\_duration\_inc

public static final java.lang.String **FD\_x\_duration\_inc**

Constant value: **x-duration-inc**

## Constructors

(continued from last page)

## LogNotifyCalculateIncremental

```
public LogNotifyCalculateIncremental()
```

## Methods

### onLog

```
public void onLog(org.apache.log4j.Level level,  
    String comment,  
    IMediaStream stream,  
    String category,  
    String event,  
    int status,  
    String context)
```

## com.wowza.wms.logging Class UDPAppender

```
java.lang.Object
|
|--org.apache.log4j.AppenderSkeleton
|   |
|   |--com.wowza.wms.logging.UDPAppender
```

### All Implemented Interfaces:

PortBased, org.apache.log4j.spi.OptionHandler, org.apache.log4j.Appender

```
public class UDPAppender
extends org.apache.log4j.AppenderSkeleton
implements org.apache.log4j.Appender, org.apache.log4j.spi.OptionHandler, PortBased
```

Sends log information as a UDP datagrams.

The UDPAppender is meant to be used as a diagnostic logging tool so that logging can be monitored by a simple UDP client.

Messages are not sent as LoggingEvent objects but as text after applying the designated Layout.

The port and remoteHost properties can be set in configuration properties. By setting the remoteHost to a broadcast address any number of clients can listen for log messages.

This was inspired and really extended/copied from SocketAppender. Please see the docs for the proper credit to the authors of that class.

## Field Summary

public static final	<a href="#">DEFAULT_PORT</a> The default port number for the UDP packets, 9991. Value: <b>9991</b>
---------------------	--

## Fields inherited from class org.apache.log4j.AppenderSkeleton

closed, errorHandler, headFilter, layout, name, tailFilter, threshold

## Constructor Summary

public	<a href="#">UDPAppender</a> ()
public	<a href="#">UDPAppender</a> (java.net.InetAddress address, int port) Sends UDP packets to the address and port.
public	<a href="#">UDPAppender</a> (String host, int port) Sends UDP packets to the address and port.

## Method Summary

void	<a href="#">activateOptions</a> () Open the UDP sender for the <b>RemoteHost</b> and <b>Port</b> .
void	<a href="#">append</a> (org.apache.log4j.spi.LoggingEvent event)

void	<a href="#"><code>cleanup()</code></a> Close the UDP Socket and release the underlying connector thread if it has been created
void	<a href="#"><code>close()</code></a> Close this appender.
String	<a href="#"><code>getApplication()</code></a> Returns value of the <b>App</b> option.
String	<a href="#"><code>getEncoding()</code></a> Returns value of the <b>Encoding</b> option.
int	<a href="#"><code>getPort()</code></a> Returns value of the <b>Port</b> option.
String	<a href="#"><code>getRemoteHost()</code></a> Returns value of the <b>RemoteHost</b> option.
boolean	<a href="#"><code>isActive()</code></a>
boolean	<a href="#"><code>requiresLayout()</code></a> The UDPAppender uses layouts.
void	<a href="#"><code>setApplication(String app)</code></a> The <b>App</b> option takes a string value which should be the name of the application getting logged.
void	<a href="#"><code>setEncoding(String encoding)</code></a> The <b>Encoding</b> option specifies how the bytes are encoded.
void	<a href="#"><code>setPort(int port)</code></a> The <b>Port</b> option takes a positive integer representing the port where UDP packets will be sent.
void	<a href="#"><code>setRemoteHost(String host)</code></a> The <b>RemoteHost</b> option takes a string value which should be the host name or ipaddress to send the UDP packets.

**Methods inherited from class org.apache.log4j.AppenderSkeleton**

activateOptions, addFilter, append, clearFilters, doAppend, finalize, getErrorHandler, getFilter, getFirstFilter, getLayout, getName, getThreshold, isAsSevereAsThreshold, setErrorHandler, setLayout, setName, setThreshold

**Methods inherited from class java.lang.Object**

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

**Methods inherited from interface org.apache.log4j.Appender**

addFilter, clearFilters, close, doAppend, getErrorHandler, getFilter, getLayout, getName, requiresLayout, setErrorHandler, setLayout, setName

**Methods inherited from interface org.apache.log4j.spi.OptionHandler**

activateOptions

**Methods inherited from interface com.wowza.wms.logging.PortBased**

```
getPort
```

Methods inherited from interface `com.wowza.wms.logging.NetworkBased`

```
getName, isActive
```

## Fields

### DEFAULT\_PORT

```
public static final int DEFAULT_PORT
```

The default port number for the UDP packets, 9991.  
Constant value: **9991**

## Constructors

### UDPAppender

```
public UDPAppender()
```

### UDPAppender

```
public UDPAppender(java.net.InetAddress address,  
                    int port)
```

Sends UDP packets to the address and port.

### UDPAppender

```
public UDPAppender(String host,  
                    int port)
```

Sends UDP packets to the address and port.

## Methods

### activateOptions

```
public void activateOptions()
```

Open the UDP sender for the **RemoteHost** and **Port**.

### close

```
public void close()
```

Close this appender.

This will mark the appender as closed and call then [cleanup\(\)](#) method.

(continued from last page)

## cleanUp

```
public void cleanUp()
```

Close the UDP Socket and release the underlying connector thread if it has been created

---

## append

```
public void append(org.apache.log4j.spi.LoggingEvent event)
```

---

## isActive

```
public boolean isActive()
```

---

## requiresLayout

```
public boolean requiresLayout()
```

The **UDPAppender** uses layouts. Hence, this method returns true.

---

## setRemoteHost

```
public void setRemoteHost(String host)
```

The **RemoteHost** option takes a string value which should be the host name or ipaddress to send the UDP packets.

---

## getRemoteHost

```
public String getRemoteHost()
```

Returns value of the **RemoteHost** option.

---

## setApplication

```
public void setApplication(String app)
```

The **App** option takes a string value which should be the name of the application getting logged. If property was already set (via system property), don't set here.

---

## getApplication

```
public String getApplication()
```

Returns value of the **App** option.

---

## setEncoding

```
public void setEncoding(String encoding)
```

The **Encoding** option specifies how the bytes are encoded. If this option is not specified, the System encoding is used.

---

## getEncoding

```
public String getEncoding()
```

---

(continued from last page)

Returns value of the **Encoding** option.

---

## setPort

```
public void setPort(int port)
```

The **Port** option takes a positive integer representing the port where UDP packets will be sent.

---

## getPort

```
public int getPort()
```

Returns value of the **Port** option.

## Constructors

### WMSLoggerFactory

```
public WMSLoggerFactory()
```

## Methods

### getLoggerObj

```
public WMSLogger getLoggerObj(String name)
```

(continued from last page)

## forceNewLoggerInstance

```
public WMSLogger forceNewLoggerInstance(String name,  
    org.apache.log4j.Logger tmpLogger)
```

---

## getInstance

```
public static WMSLoggerFactory getInstance()
```

---

## initContextLogging

```
public static void initContextLogging(IVHost vhost)
```

---

## initContextLogging

```
public static void initContextLogging(IApplication application)
```

---

## initContextLogging

```
public static void initContextLogging(IApplicationInstance appInstance)
```

---

## initializeLogging

```
public static WMSLogger initializeLogging(String loggingConfigURL)
```

---

## initializeLogging

```
public static WMSLogger initializeLogging(String loggingConfigURL,  
    IVHost vhost)
```

---

## makeNewLoggerInstance

```
public org.apache.log4j.Logger makeNewLoggerInstance(String name)
```

---

## resetMDC

```
public static void resetMDC()
```

---

(continued from last page)

---

## removeGlobalLogValues

```
public static void removeGlobalLogValues()
```

---

## removeGlobalLogValue

```
public static void removeGlobalLogValue(String key)
```

---

## isGlobalLogValueSet

```
public static boolean isGlobalLogValueSet(String key)
```

---

## putGlobalLogValue

```
public static void putGlobalLogValue(String key,  
                                     Object obj)
```

---

## getGlobalLogValue

```
public static Object getGlobalLogValue(String key)
```

---

## getLoggerObj

```
public static WMSLogger getLoggerObj(IVHost vhost)
```

---

## getLoggerObj

```
public static WMSLogger getLoggerObj(IApplication application)
```

---

## getLoggerObj

```
public static WMSLogger getLoggerObj(IApplicationInstance appInstance)
```

---

## getLogger

```
public static WMSLogger getLogger(Class classObj)
```

---

## com.wowza.wms.logging Class WMSLoggerIDs

java.lang.Object

└-com.wowza.wms.logging.WMSLoggerIDs

public class **WMSLoggerIDs**  
extends Object

### Field Summary

public static final	<a href="#">CAT_ALL</a>
public static final	<a href="#">CAT_application</a> Value: <b>application</b>
public static final	<a href="#">CAT_cupertino</a> Value: <b>cupertino</b>
public static final	<a href="#">CAT_dvrchunk</a> Value: <b>dvrchunk</b>
public static final	<a href="#">CAT_mpegdash</a> Value: <b>mpegdash</b>
public static final	<a href="#">CAT_rtsp</a> Value: <b>rtsp</b>
public static final	<a href="#">CAT_sanjose</a> Value: <b>sanjose</b>
public static final	<a href="#">CAT_server</a> Value: <b>server</b>
public static final	<a href="#">CAT_session</a> Value: <b>session</b>
public static final	<a href="#">CAT_smoothstreaming</a> Value: <b>smoothstreaming</b>
public static final	<a href="#">CAT_stream</a> Value: <b>stream</b>
public static final	<a href="#">CAT_transcoder</a> Value: <b>transcoder</b>

public static final	<a href="#">CAT_ts</a> Value: <b>ts</b>
public static final	<a href="#">CAT_vhost</a> Value: <b>vhost</b>
public static final	<a href="#">CAT_webm</a> Value: <b>webm</b>
public static final	<a href="#">CAT_webrtc</a> Value: <b>webrtc</b>
public static final	<a href="#">CTRL_playlist_node</a> Value: <b>CTRL-playlist-node</b>
public static final	<a href="#">EVT_ALL</a>
public static final	<a href="#">EVT_announce</a> Value: <b>announce</b>
public static final	<a href="#">EVT_app_start</a> Value: <b>app-start</b>
public static final	<a href="#">EVT_app_stop</a> Value: <b>app-stop</b>
public static final	<a href="#">EVT_comment</a> Value: <b>comment</b>
public static final	<a href="#">EVT_connect</a> Value: <b>connect</b>
public static final	<a href="#">EVT_connect_burst</a> Value: <b>connect-burst</b>
public static final	<a href="#">EVT_connect_pending</a> Value: <b>connect-pending</b>
public static final	<a href="#">EVT_create</a> Value: <b>create</b>
public static final	<a href="#">EVT_decoderaudiostart</a> Value: <b>decoder-audio-start</b>
public static final	<a href="#">EVT_decoderaudiostop</a> Value: <b>decoder-audio-stop</b>

public static final	<a href="#">EVT_decodervideostart</a> Value: <b>decoder-video-start</b>
public static final	<a href="#">EVT_decodervideostop</a> Value: <b>decoder-video-stop</b>
public static final	<a href="#">EVT_describe</a> Value: <b>describe</b>
public static final	<a href="#">EVT_destroy</a> Value: <b>destroy</b>
public static final	<a href="#">EVT_disconnect</a> Value: <b>disconnect</b>
public static final	<a href="#">EVT_encoderaudiostart</a> Value: <b>encoder-audio-start</b>
public static final	<a href="#">EVT_encoderaudiostop</a> Value: <b>encoder-audio-stop</b>
public static final	<a href="#">EVT_encodervideostart</a> Value: <b>encoder-video-start</b>
public static final	<a href="#">EVT_encodervideostop</a> Value: <b>encoder-video-stop</b>
public static final	<a href="#">EVT_pause</a> Value: <b>pause</b>
public static final	<a href="#">EVT_play</a> Value: <b>play</b>
public static final	<a href="#">EVT_publish</a> Value: <b>publish</b>
public static final	<a href="#">EVT_push</a> Value: <b>push</b>
public static final	<a href="#">EVT_record</a> Value: <b>record</b>
public static final	<a href="#">EVT_recordstop</a> Value: <b>recordstop</b>
public static final	<a href="#">EVT_seek</a> Value: <b>seek</b>

public static final	<a href="#">EVT_server_start</a> Value: <b>server-start</b>
public static final	<a href="#">EVT_server_stop</a> Value: <b>server-stop</b>
public static final	<a href="#">EVT_setbuffertime</a> Value: <b>setbuffertime</b>
public static final	<a href="#">EVT_setstreamtype</a> Value: <b>setstreamtype</b>
public static final	<a href="#">EVT_stop</a> Value: <b>stop</b>
public static final	<a href="#">EVT_transcoderstart</a> Value: <b>transcoder-start</b>
public static final	<a href="#">EVT_transcoderstop</a> Value: <b>transcoder-stop</b>
public static final	<a href="#">EVT_unpause</a> Value: <b>unpause</b>
public static final	<a href="#">EVT_unpublish</a> Value: <b>unpublish</b>
public static final	<a href="#">EVT_unpush</a> Value: <b>unpush</b>
public static final	<a href="#">EVT_vhost_start</a> Value: <b>vhost-start</b>
public static final	<a href="#">EVT_vhost_stop</a> Value: <b>vhost-stop</b>
public static final	<a href="#">FD_ALL</a>
public static final	<a href="#">FD_c_client_id</a> Value: <b>c-client-id</b>
public static final	<a href="#">FD_c_ip</a> Value: <b>c-ip</b>
public static final	<a href="#">FD_c_proto</a> Value: <b>c-proto</b>

public static final	<a href="#">FD_c_referrer</a> Value: <b>c-referrer</b>
public static final	<a href="#">FD_c_user_agent</a> Value: <b>c-user-agent</b>
public static final	<a href="#">FD_cs_bytes</a> Value: <b>cs-bytes</b>
public static final	<a href="#">FD_cs_stream_bytes</a> Value: <b>cs-stream-bytes</b>
public static final	<a href="#">FD_cs_uri_query</a> Value: <b>cs-uri-query</b>
public static final	<a href="#">FD_cs_uri_stem</a> Value: <b>cs-uri-stem</b>
public static final	<a href="#">FD_date</a> Value: <b>date</b>
public static final	<a href="#">FD_s_ip</a> Value: <b>s-ip</b>
public static final	<a href="#">FD_s_port</a> Value: <b>s-port</b>
public static final	<a href="#">FD_s_uri</a> Value: <b>s-uri</b>
public static final	<a href="#">FD_sc_bytes</a> Value: <b>sc-bytes</b>
public static final	<a href="#">FD_sc_stream_bytes</a> Value: <b>sc-stream-bytes</b>
public static final	<a href="#">FD_time</a> Value: <b>time</b>
public static final	<a href="#">FD_tz</a> Value: <b>tz</b>
public static final	<a href="#">FD_x_app</a> Value: <b>x-app</b>
public static final	<a href="#">FD_x_appinst</a> Value: <b>x-appinst</b>

public static final	<a href="#">FD_x_category</a> Value: <b>x-category</b>
public static final	<a href="#">FD_x_comment</a> Value: <b>x-comment</b>
public static final	<a href="#">FD_x_ctx</a> Value: <b>x-ctx</b>
public static final	<a href="#">FD_x_ctx_override</a> Value: <b>x-ctx-override</b>
public static final	<a href="#">FD_x_duration</a> Value: <b>x-duration</b>
public static final	<a href="#">FD_x_event</a> Value: <b>x-event</b>
public static final	<a href="#">FD_x_file_ext</a> Value: <b>x-file-ext</b>
public static final	<a href="#">FD_x_file_length</a> Value: <b>x-file-length</b>
public static final	<a href="#">FD_x_file_name</a> Value: <b>x-file-name</b>
public static final	<a href="#">FD_x_file_size</a> Value: <b>x-file-size</b>
public static final	<a href="#">FD_x_forward_ip</a> Value: <b>x-forwarded-ip</b>
public static final	<a href="#">FD_x_severity</a> Value: <b>x-severity</b>
public static final	<a href="#">FD_x_sname</a> Value: <b>x-sname</b>
public static final	<a href="#">FD_x_sname_query</a> Value: <b>x-sname-query</b>
public static final	<a href="#">FD_x_spos</a> Value: <b>x-spos</b>
public static final	<a href="#">FD_x_status</a> Value: <b>x-status</b>

public static final	<a href="#">FD_x_stream_id</a> Value: <b>x-stream-id</b>
public static final	<a href="#">FD_x_suri</a> Value: <b>x-suri</b>
public static final	<a href="#">FD_x_suri_query</a> Value: <b>x-suri-query</b>
public static final	<a href="#">FD_x_suri_stem</a> Value: <b>x-suri-stem</b>
public static final	<a href="#">FD_x_vhost</a> Value: <b>x-vhost</b>
public static final	<a href="#">PROTO_HTTP</a> Value: <b>http</b>
public static final	<a href="#">PROTO_HTTPCUPERTINO</a> Value: <b>http (cupertino)</b>
public static final	<a href="#">PROTO_HTTPDVRCHUNK</a> Value: <b>http (dvr)</b>
public static final	<a href="#">PROTO_HTTPMPEGDASH</a> Value: <b>http (mpegdash)</b>
public static final	<a href="#">PROTO_HTTPS</a> Value: <b>https</b>
public static final	<a href="#">PROTO_HTTPSANJOSE</a> Value: <b>http (sanjose)</b>
public static final	<a href="#">PROTO_HTTPSCUPERTINO</a> Value: <b>https (cupertino)</b>

## Constructor Summary

public	<a href="#">WMSLoggerIDs()</a>
--------	--------------------------------

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

(continued from last page)

## FD\_x\_event

```
public static final java.lang.String FD_x_event
```

Constant value: **x-event**

---

## FD\_x\_category

```
public static final java.lang.String FD_x_category
```

Constant value: **x-category**

---

## FD\_date

```
public static final java.lang.String FD_date
```

Constant value: **date**

---

## FD\_time

```
public static final java.lang.String FD_time
```

Constant value: **time**

---

## FD\_tz

```
public static final java.lang.String FD_tz
```

Constant value: **tz**

---

## FD\_x\_ctx

```
public static final java.lang.String FD_x_ctx
```

Constant value: **x-ctx**

---

## FD\_x\_ctx\_override

```
public static final java.lang.String FD_x_ctx_override
```

Constant value: **x-ctx-override**

---

## FD\_x\_vhost

```
public static final java.lang.String FD_x_vhost
```

Constant value: **x-vhost**

---

(continued from last page)

---

## FD\_x\_app

```
public static final java.lang.String FD_x_app
```

Constant value: **x-app**

---

## FD\_x\_appinst

```
public static final java.lang.String FD_x_appinst
```

Constant value: **x-appinst**

---

## FD\_c\_ip

```
public static final java.lang.String FD_c_ip
```

Constant value: **c-ip**

---

## FD\_c\_proto

```
public static final java.lang.String FD_c_proto
```

Constant value: **c-proto**

---

## FD\_s\_uri

```
public static final java.lang.String FD_s_uri
```

Constant value: **s-uri**

---

## FD\_c\_referrer

```
public static final java.lang.String FD_c_referrer
```

Constant value: **c-referrer**

---

## FD\_c\_user\_agent

```
public static final java.lang.String FD_c_user_agent
```

Constant value: **c-user-agent**

---

## FD\_c\_client\_id

```
public static final java.lang.String FD_c_client_id
```

Constant value: **c-client-id**

---

## FD\_cs\_bytes

```
public static final java.lang.String FD_cs_bytes
```

---

(continued from last page)

Constant value: **cs-bytes**

---

## FD\_sc\_bytes

```
public static final java.lang.String FD_sc_bytes
```

Constant value: **sc-bytes**

---

## FD\_x\_sname

```
public static final java.lang.String FD_x_sname
```

Constant value: **x-sname**

---

## FD\_x\_file\_size

```
public static final java.lang.String FD_x_file_size
```

Constant value: **x-file-size**

---

## FD\_x\_file\_length

```
public static final java.lang.String FD_x_file_length
```

Constant value: **x-file-length**

---

## FD\_x\_spos

```
public static final java.lang.String FD_x_spos
```

Constant value: **x-spos**

---

## FD\_cs\_stream\_bytes

```
public static final java.lang.String FD_cs_stream_bytes
```

Constant value: **cs-stream-bytes**

---

## FD\_sc\_stream\_bytes

```
public static final java.lang.String FD_sc_stream_bytes
```

Constant value: **sc-stream-bytes**

---

## FD\_s\_ip

```
public static final java.lang.String FD_s_ip
```

Constant value: **s-ip**

---

## FD\_x\_duration

```
public static final java.lang.String FD_x_duration
```

Constant value: **x-duration**

---

## FD\_x\_status

```
public static final java.lang.String FD_x_status
```

Constant value: **x-status**

---

## FD\_cs\_uri\_stem

```
public static final java.lang.String FD_cs_uri_stem
```

Constant value: **cs-uri-stem**

---

## FD\_cs\_uri\_query

```
public static final java.lang.String FD_cs_uri_query
```

Constant value: **cs-uri-query**

---

## FD\_x\_sname\_query

```
public static final java.lang.String FD_x_sname_query
```

Constant value: **x-sname-query**

---

## FD\_x\_file\_name

```
public static final java.lang.String FD_x_file_name
```

Constant value: **x-file-name**

---

## FD\_x\_file\_ext

```
public static final java.lang.String FD_x_file_ext
```

Constant value: **x-file-ext**

---

## FD\_x\_suri\_query

```
public static final java.lang.String FD_x_suri_query
```

Constant value: **x-suri-query**

---

(continued from last page)

---

## FD\_x\_suri\_stem

```
public static final java.lang.String FD_x_suri_stem
```

Constant value: **x-suri-stem**

---

## FD\_x\_suri

```
public static final java.lang.String FD_x_suri
```

Constant value: **x-suri**

---

## FD\_x\_severity

```
public static final java.lang.String FD_x_severity
```

Constant value: **x-severity**

---

## FD\_x\_comment

```
public static final java.lang.String FD_x_comment
```

Constant value: **x-comment**

---

## FD\_s\_port

```
public static final java.lang.String FD_s_port
```

Constant value: **s-port**

---

## FD\_x\_stream\_id

```
public static final java.lang.String FD_x_stream_id
```

Constant value: **x-stream-id**

---

## FD\_x\_forward\_ip

```
public static final java.lang.String FD_x_forward_ip
```

Constant value: **x-forwarded-ip**

---

## CAT\_server

```
public static final java.lang.String CAT_server
```

Constant value: **server**

---

## CAT\_vhost

```
public static final java.lang.String CAT_vhost
```

---

(continued from last page)

Constant value: **vhost**

---

## CAT\_application

```
public static final java.lang.String CAT_application
```

Constant value: **application**

---

## CAT\_session

```
public static final java.lang.String CAT_session
```

Constant value: **session**

---

## CAT\_stream

```
public static final java.lang.String CAT_stream
```

Constant value: **stream**

---

## CAT\_rtsp

```
public static final java.lang.String CAT_rtsp
```

Constant value: **rtsp**

---

## CAT\_cupertino

```
public static final java.lang.String CAT_cupertino
```

Constant value: **cupertino**

---

## CAT\_sanjose

```
public static final java.lang.String CAT_sanjose
```

Constant value: **sanjose**

---

## CAT\_smoothstreaming

```
public static final java.lang.String CAT_smoothstreaming
```

Constant value: **smoothstreaming**

---

## CAT\_dvrchunk

```
public static final java.lang.String CAT_dvrchunk
```

Constant value: **dvrchunk**

---

## CAT\_webm

```
public static final java.lang.String CAT_webm
```

Constant value: **webm**

---

## CAT\_transcoder

```
public static final java.lang.String CAT_transcoder
```

Constant value: **transcoder**

---

## CAT\_mpegdash

```
public static final java.lang.String CAT_mpegdash
```

Constant value: **mpegdash**

---

## CAT\_ts

```
public static final java.lang.String CAT_ts
```

Constant value: **ts**

---

## CAT\_webrtc

```
public static final java.lang.String CAT_webrtc
```

Constant value: **webrtc**

---

## EVT\_connect\_pending

```
public static final java.lang.String EVT_connect_pending
```

Constant value: **connect-pending**

---

## EVT\_connect

```
public static final java.lang.String EVT_connect
```

Constant value: **connect**

---

## EVT\_connect\_burst

```
public static final java.lang.String EVT_connect_burst
```

Constant value: **connect-burst**

---

(continued from last page)

---

## EVT\_disconnect

```
public static final java.lang.String EVT_disconnect
```

Constant value: **disconnect**

---

## EVT\_publish

```
public static final java.lang.String EVT_publish
```

Constant value: **publish**

---

## EVT\_unpublish

```
public static final java.lang.String EVT_unpublish
```

Constant value: **unpublish**

---

## EVT\_play

```
public static final java.lang.String EVT_play
```

Constant value: **play**

---

## EVT\_pause

```
public static final java.lang.String EVT_pause
```

Constant value: **pause**

---

## EVT\_setbuffertime

```
public static final java.lang.String EVT_setbuffertime
```

Constant value: **setbuffertime**

---

## EVT\_create

```
public static final java.lang.String EVT_create
```

Constant value: **create**

---

## EVT\_destroy

```
public static final java.lang.String EVT_destroy
```

Constant value: **destroy**

---

## EVT\_setstreamtype

```
public static final java.lang.String EVT_setstreamtype
```

(continued from last page)

---

Constant value: **setstreamtype**

---

## EVT\_unpause

```
public static final java.lang.String EVT_unpause
```

Constant value: **unpause**

---

## EVT\_seek

```
public static final java.lang.String EVT_seek
```

Constant value: **seek**

---

## EVT\_stop

```
public static final java.lang.String EVT_stop
```

Constant value: **stop**

---

## EVT\_record

```
public static final java.lang.String EVT_record
```

Constant value: **record**

---

## EVT\_recordstop

```
public static final java.lang.String EVT_recordstop
```

Constant value: **recordstop**

---

## EVT\_server\_start

```
public static final java.lang.String EVT_server_start
```

Constant value: **server-start**

---

## EVT\_server\_stop

```
public static final java.lang.String EVT_server_stop
```

Constant value: **server-stop**

---

## EVT\_vhost\_start

```
public static final java.lang.String EVT_vhost_start
```

Constant value: **vhost-start**

---

## EVT\_vhost\_stop

```
public static final java.lang.String EVT_vhost_stop
```

Constant value: **vhost-stop**

---

## EVT\_app\_start

```
public static final java.lang.String EVT_app_start
```

Constant value: **app-start**

---

## Constructors

### WMSLoggerIDs

```
public WMSLoggerIDs()
```

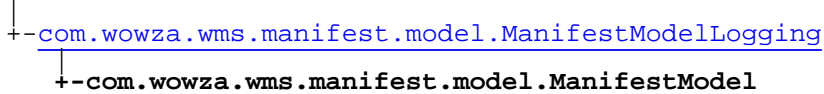

---

Package

**com.wowza.wms.manifest.model**

## com.wowza.wms.manifest.model Class ManifestModel

java.lang.Object

### All Implemented Interfaces:

Cloneable

### Direct Known Subclasses:

[PlaylistModel](#), [MediaSegmentModel](#), [SanJoseManifestModel](#), [MPEGDashManifestModel](#)

public abstract class **ManifestModel**

extends [ManifestModelLogging](#)

implements Cloneable

Abstract Manifest Model base class Provides implementations that are common to all Manifest / Playlist models

## Constructor Summary

public	<a href="#">ManifestModel()</a>
--------	---------------------------------

## Method Summary

Object	<a href="#">clone()</a>
boolean	<a href="#">equals</a> (Object obj)
String	<a href="#">getManifest()</a>
int	<a href="#">hashCode()</a>
void	<a href="#">setManifest</a> (String manifest)
String	<a href="#">toString()</a>

### Methods inherited from class [com.wowza.wms.manifest.model.ManifestModelLogging](#)

[clone](#), [getContextStr](#), [getDebugLog](#), [logDebug](#), [logError](#), [logError](#), [logError](#), [logInfo](#), [logWarn](#), [setDebugLog](#), [setUseSystemOut](#), [usingSystemOut](#)

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

(continued from last page)

## Constructors

### ManifestModel

```
public ManifestModel()
```

## Methods

### getManifest

```
public String getManifest()
```

**Returns:**

the manifest

### setManifest

```
public void setManifest(String manifest)
```

**Parameters:**

manifest - the manifest to set

### equals

```
public boolean equals(Object obj)
```

### hashCode

```
public int hashCode()
```

### clone

```
public Object clone()  
    throws CloneNotSupportedException
```

### toString

```
public String toString()
```

## com.wowza.wms.manifest.model Class ManifestModelLogging

java.lang.Object

└--com.wowza.wms.manifest.model.ManifestModelLogging

Direct Known Subclasses:

[ManifestWriter](#), [ManifestValidator](#), [TagModel](#), [ManifestModel](#)

public abstract class **ManifestModelLogging**  
extends Object

This class is the base of all the manifest models providing a standardized mechanism of logging

### Constructor Summary

public	<a href="#">ManifestModelLogging()</a> Constructs an empty Manifest Model
--------	--

### Method Summary

Object	<a href="#">clone()</a>
abstract String	<a href="#">getContextStr()</a> Get the context string associated with the Model to include with the log statements
boolean	<a href="#">getDebugLog()</a> Get the current debug log setting
void	<a href="#">logDebug</a> (String methodName, String log) log information conditionally based on debug setting using the info level of the logger
void	<a href="#">logError</a> (String methodName, String log) log a string at the error setting
void	<a href="#">logError</a> (String methodName, String log, Throwable e) log a string and a throwable information at the error setting
void	<a href="#">logError</a> (String methodName, Throwable e) log a throwables information at the error setting
void	<a href="#">logInfo</a> (String methodName, String log) Log a string at the info setting
void	<a href="#">logWarn</a> (String methodName, String log) log a string at the warn setting
boolean	<a href="#">setDebugLog</a> (boolean debugLog) Enable/disable debug logging.
void	<a href="#">setUseSystemOut</a> (boolean useSystemOut) specify whether to log using System.out rather than the default (log4j)

boolean

[usingSystemOut\(\)](#)

Get the current setting of using the system out for debug (vs log4j)

Methods inherited from class `java.lang.Object`

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### ManifestModelLogging

```
public ManifestModelLogging()
```

Constructs an empty Manifest Model

## Methods

### setDebugLog

```
public boolean setDebugLog(boolean debugLog)
```

Enable/disable debug logging.

**Parameters:**

debugLog

**Returns:**

boolean value of the debug log setting before applying the new setting

### getDebugLog

```
public boolean getDebugLog()
```

Get the current debug log setting

**Returns:**

true if debug logging is enabled

### setUseSystemOut

```
public void setUseSystemOut(boolean useSystemOut)
```

specify whether to log using System.out rather than the default (log4j)

**Parameters:**

useSystemOut

### usingSystemOut

```
public boolean usingSystemOut()
```

Get the current setting of using the system out for debug (vs log4j)

**Returns:**

(continued from last page)

true if logging is using System.out

---

## logDebug

```
public void logDebug(String methodName,  
                    String log)
```

log information conditionally based on debug setting using the info level of the logger

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log

---

## logInfo

```
public void logInfo(String methodName,  
                   String log)
```

Log a string at the info setting

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log

---

## logWarn

```
public void logWarn(String methodName,  
                   String log)
```

log a string at the warn setting

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log

---

## logError

```
public void logError(String methodName,  
                   String log)
```

log a string at the error setting

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log

---

## logError

```
public void logError(String methodName,  
                   String log,  
                   Throwable e)
```

log a string and a throwable information at the error setting

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log  
e -- the throwable exception to log the information about

## logError

```
public void logError(String methodName,  
                    Throwable e)
```

log a throwables information at the error setting

### Parameters:

methodName -- method name to include in the log statement  
e -- the throwable exception to log the information about

---

## getContextStr

```
protected abstract String getContextStr()
```

Get the context string associated with the Model to include with the log statements

### Returns:

String

---

## clone

```
public Object clone()  
    throws CloneNotSupportedException
```

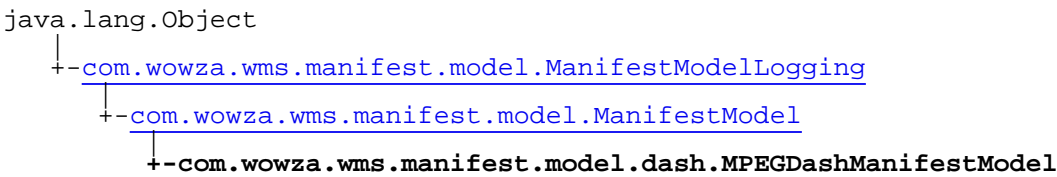

---

Package

**com.wowza.wms.manifest.model.dash**

com.wowza.wms.manifest.model.dash

# Class MPEGDashManifestModel

All Implemented Interfaces:  
Cloneable

```
public class MPEGDashManifestModel
extends ManifestModel
```

## Constructor Summary

public	<a href="#">MPEGDashManifestModel()</a>
--------	---

## Method Summary

Object	<a href="#">clone()</a>
String	<a href="#">getContextStr()</a>

Methods inherited from class [com.wowza.wms.manifest.model.ManifestModel](#)

[clone](#), [equals](#), [getManifest](#), [hashCode](#), [setManifest](#), [toString](#)

Methods inherited from class [com.wowza.wms.manifest.model.ManifestModelLogging](#)

[clone](#), [getContextStr](#), [getDebugLog](#), [logDebug](#), [logError](#), [logError](#), [logError](#), [logInfo](#), [logWarn](#), [setDebugLog](#), [setUseSystemOut](#), [usingSystemOut](#)

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

MPEGDashManifestModel

```
public MPEGDashManifestModel()
```

## Methods

(continued from last page)

## getContextStr

protected String **getContextStr()**

Get the context string associated with the Model to include with the log statements

---

## clone

public Object **clone()**  
throws CloneNotSupportedException

---

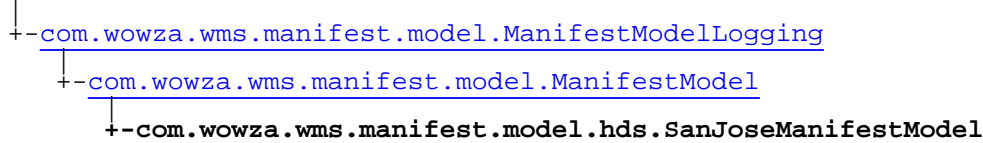

Package

## Constructor Summary

public	<a href="#">Constants()</a>
--------	-----------------------------

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Fields

### MIME\_TYPE

public static final java.lang.String **MIME\_TYPE**

Constant value: **application/vnd.apple.mpegurl**

### MIME\_TYPE\_COMPATIBILITY

public static final java.lang.String **MIME\_TYPE\_COMPATIBILITY**

Constant value: **audio/mpegurl**

### ATTRIBUTE\_SEPARATOR

public static final java.lang.String **ATTRIBUTE\_SEPARATOR**

Constant value: **=**

### COMMA\_CHAR

public static final char **COMMA\_CHAR**

Constant value: **44**

(continued from last page)

---

## AT\_CHAR

```
public static final char AT_CHAR
```

Constant value: **64**

---

## COMMA

```
public static final java.lang.String COMMA
```

---

## ATTRIBUTE\_LIST\_SEPARATOR

```
public static final java.lang.String ATTRIBUTE_LIST_SEPARATOR
```

---

## LIST\_SEPARATOR

```
public static final java.lang.String LIST_SEPARATOR
```

Constant value: **/**

---

## COMMENT\_PREFIX

```
public static final java.lang.String COMMENT_PREFIX
```

Constant value: **#**

---

## EXT\_TAG\_PREFIX

```
public static final java.lang.String EXT_TAG_PREFIX
```

Constant value: **#EXT**

---

## EXT\_TAG\_END

```
public static final java.lang.String EXT_TAG_END
```

Constant value: **:**

---

## WRITE\_NEW\_LINE

```
public static final java.lang.String WRITE_NEW_LINE
```

Constant value:

---

## PARSE\_NEW\_LINE

```
public static final java.lang.String PARSE_NEW_LINE
```

(continued from last page)

Constant value: `\r?\n`

---

## NULL\_TAG\_NAME

```
public static final java.lang.String NULL_TAG_NAME
```

Constant value: `NULL-TAG-NAME`

---

## NULL\_VALUE

```
public static final java.lang.String NULL_VALUE
```

Constant value: `NULL-VALUE`

---

## NULL\_ATTRIBUTE\_NAME

```
public static final java.lang.String NULL_ATTRIBUTE_NAME
```

Constant value: `NULL-ATTRIBUTE-NAME`

---

## EXTM3U\_TAG

```
public static final java.lang.String EXTM3U_TAG
```

Constant value: `EXTM3U`

---

## EXT\_X\_VERSION\_TAG

```
public static final java.lang.String EXT_X_VERSION_TAG
```

Constant value: `EXT-X-VERSION`

---

## URI

```
public static final java.lang.String URI
```

Constant value: `URI`

---

## EXT\_X\_MEDIA\_TAG

```
public static final java.lang.String EXT_X_MEDIA_TAG
```

Constant value: `EXT-X-MEDIA`

---

## TYPE

```
public static final java.lang.String TYPE
```

Constant value: `TYPE`

(continued from last page)

---

## GROUP\_ID

```
public static final java.lang.String GROUP_ID
```

Constant value: **GROUP-ID**

---

## LANGUAGE

```
public static final java.lang.String LANGUAGE
```

Constant value: **LANGUAGE**

---

## ASSOCIATED\_LANGUAGE

```
public static final java.lang.String ASSOCIATED_LANGUAGE
```

Constant value: **ASSOC-LANGUAGE**

---

## NAME

```
public static final java.lang.String NAME
```

Constant value: **NAME**

---

## DEFAULT

```
public static final java.lang.String DEFAULT
```

Constant value: **DEFAULT**

---

## AUTO\_SELECT

```
public static final java.lang.String AUTO_SELECT
```

Constant value: **AUTOSELECT**

---

## FORCED

```
public static final java.lang.String FORCED
```

Constant value: **FORCED**

---

## IN\_STREAM\_ID

```
public static final java.lang.String IN_STREAM_ID
```

Constant value: **INSTREAM-ID**

---

## CHARACTERISTICS

```
public static final java.lang.String CHARACTERISTICS
```

---

(continued from last page)

Constant value: **CHARACTERISTICS**

---

## EXT\_X\_I\_FRAME\_STREAM\_INF\_TAG

```
public static final java.lang.String EXT_X_I_FRAME_STREAM_INF_TAG
```

Constant value: **EXT-X-I-FRAME-STREAM-INF**

---

## EXT\_X\_STREAM\_INF\_TAG

```
public static final java.lang.String EXT_X_STREAM_INF_TAG
```

Constant value: **EXT-X-STREAM-INF**

---

## BANDWIDTH

```
public static final java.lang.String BANDWIDTH
```

Constant value: **BANDWIDTH**

---

## AVERAGE\_BANDWIDTH

```
public static final java.lang.String AVERAGE_BANDWIDTH
```

Constant value: **AVERAGE-BANDWIDTH**

---

## CODECS

```
public static final java.lang.String CODECS
```

Constant value: **CODECS**

---

## RESOLUTION

```
public static final java.lang.String RESOLUTION
```

Constant value: **RESOLUTION**

---

## FRAME\_RATE

```
public static final java.lang.String FRAME_RATE
```

Constant value: **FRAME-RATE**

---

## VIDEO

```
public static final java.lang.String VIDEO
```

Constant value: **VIDEO**

---

## PROGRAM\_ID

```
public static final java.lang.String PROGRAM_ID
```

Constant value: **PROGRAM-ID**

---

## AUDIO

```
public static final java.lang.String AUDIO
```

Constant value: **AUDIO**

---

## SUBTITLES

```
public static final java.lang.String SUBTITLES
```

Constant value: **SUBTITLES**

---

## CLOSED\_CAPTIONS

```
public static final java.lang.String CLOSED_CAPTIONS
```

Constant value: **CLOSED-CAPTIONS**

---

## EXT\_X\_SESSION\_DATA\_TAG

```
public static final java.lang.String EXT_X_SESSION_DATA_TAG
```

Constant value: **EXT-X-SESSION-DATA**

---

## DATA\_ID

```
public static final java.lang.String DATA_ID
```

Constant value: **DATA-ID**

---

## VALUE

```
public static final java.lang.String VALUE
```

Constant value: **VALUE**

---

## EXT\_X\_SESSION\_KEY\_TAG

```
public static final java.lang.String EXT_X_SESSION_KEY_TAG
```

Constant value: **EXT-X-SESSION-KEY**

---

(continued from last page)

---

## EXT\_X\_TARGETDURATION\_TAG

```
public static final java.lang.String EXT_X_TARGETDURATION_TAG
```

Constant value: **EXT-X-TARGETDURATION**

---

## EXT\_X\_MEDIA\_SEQUENCE\_TAG

```
public static final java.lang.String EXT_X_MEDIA_SEQUENCE_TAG
```

Constant value: **EXT-X-MEDIA-SEQUENCE**

---

## EXT\_X\_DISCONTINUITY\_SEQUENCE\_TAG

```
public static final java.lang.String EXT_X_DISCONTINUITY_SEQUENCE_TAG
```

Constant value: **EXT-X-DISCONTINUITY-SEQUENCE**

---

## EXT\_X\_ENDLIST\_TAG

```
public static final java.lang.String EXT_X_ENDLIST_TAG
```

Constant value: **EXT-X-ENDLIST**

---

## EXT\_X\_PLAYLIST\_TYPE\_TAG

```
public static final java.lang.String EXT_X_PLAYLIST_TYPE_TAG
```

Constant value: **EXT-X-PLAYLIST-TYPE**

---

## EXT\_X\_I\_FRAMES\_ONLY\_TAG

```
public static final java.lang.String EXT_X_I_FRAMES_ONLY_TAG
```

Constant value: **EXT-X-I-FRAMES-ONLY**

---

## EXT\_X\_ALLOW\_CACHE\_TAG

```
public static final java.lang.String EXT_X_ALLOW_CACHE_TAG
```

Constant value: **EXT-X-ALLOW-CACHE**

---

## EXT\_X\_START\_TAG

```
public static final java.lang.String EXT_X_START_TAG
```

Constant value: **EXT-X-START**

---

## TIME\_OFFSET

```
public static final java.lang.String TIME_OFFSET
```

(continued from last page)

Constant value: **TIME-OFFSET**

---

## PRECISE

```
public static final java.lang.String PRECISE
```

Constant value: **PRECISE**

---

## EXT\_X\_INDEPENDENT\_SEGMENTS\_TAG

```
public static final java.lang.String EXT_X_INDEPENDENT_SEGMENTS_TAG
```

Constant value: **EXT-X-INDEPENDENT-SEGMENTS**

---

## EXTINF\_TAG

```
public static final java.lang.String EXTINF_TAG
```

Constant value: **EXTINF**

---

## EXT\_X\_BYTERANGE\_TAG

```
public static final java.lang.String EXT_X_BYTERANGE_TAG
```

Constant value: **EXT-X-BYTERANGE**

---

## EXT\_X\_DISCONTINUITY\_TAG

```
public static final java.lang.String EXT_X_DISCONTINUITY_TAG
```

Constant value: **EXT-X-DISCONTINUITY**

---

## EXT\_X\_KEY\_TAG

```
public static final java.lang.String EXT_X_KEY_TAG
```

Constant value: **EXT-X-KEY**

---

## METHOD

```
public static final java.lang.String METHOD
```

Constant value: **METHOD**

---

## IV

```
public static final java.lang.String IV
```

Constant value: **IV**

## KEY\_FORMAT

```
public static final java.lang.String KEY_FORMAT
```

Constant value: **KEYFORMAT**

---

## KEY\_FORMAT\_VERSIONS

```
public static final java.lang.String KEY_FORMAT_VERSIONS
```

Constant value: **KEYFORMATVERSIONS**

---

## EXT\_X\_MAP\_TAG

```
public static final java.lang.String EXT_X_MAP_TAG
```

Constant value: **EXT-X-MAP**

---

## MAP\_BYTERANGE

```
public static final java.lang.String MAP_BYTERANGE
```

Constant value: **BYTERANGE**

---

## EXT\_X\_PROGRAM\_DATE\_TIME\_TAG

```
public static final java.lang.String EXT_X_PROGRAM_DATE_TIME_TAG
```

Constant value: **EXT-X-PROGRAM-DATE-TIME**

---

## YES

```
public static final java.lang.String YES
```

Constant value: **YES**

---

## NO

```
public static final java.lang.String NO
```

Constant value: **NO**

---

## HEXADECIMAL\_PATTERN

```
public static final java.util.regex.Pattern HEXADECIMAL_PATTERN
```

## RESOLUTION\_PATTERN

```
public static final java.util.regex.Pattern RESOLUTION_PATTERN
```

(continued from last page)

---

## EXT\_X\_VERSION\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_VERSION_PATTERN
```

---

## EXT\_X\_TARGETDURATION\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_TARGETDURATION_PATTERN
```

---

## EXT\_X\_MEDIA\_SEQUENCE\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_MEDIA_SEQUENCE_PATTERN
```

---

## EXT\_X\_PLAYLIST\_TYPE\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_PLAYLIST_TYPE_PATTERN
```

---

## EXT\_X\_MEDIA\_IN\_STREAM\_ID\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_MEDIA_IN_STREAM_ID_PATTERN
```

---

## EXTINF\_PATTERN

```
public static final java.util.regex.Pattern EXTINF_PATTERN
```

---

## EXT\_X\_ENDLIST\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_ENDLIST_PATTERN
```

---

## EXT\_X\_I\_FRAMES\_ONLY\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_I_FRAMES_ONLY_PATTERN
```

---

## EXT\_X\_DISCONTINUITY\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_DISCONTINUITY_PATTERN
```

---

(continued from last page)

---

## EXT\_X\_BYTERANGE\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_BYTERANGE_PATTERN
```

---

## EXT\_X\_DISCONTINUITY\_SEQUENCE\_PATTERN

```
public static final java.util.regex.Pattern EXT_X_DISCONTINUITY_SEQUENCE_PATTERN
```

---

## MAP\_BYTERANGE\_PATTERN

```
public static final java.util.regex.Pattern MAP_BYTERANGE_PATTERN
```

---

## UTF\_8\_BOM\_BYTES

```
public static final int UTF_8_BOM_BYTES
```

---

## UNICODE\_BOM

```
public static final char UNICODE_BOM
```

Constant value: **65279**

---

## VERSION\_1

```
public static final int VERSION_1
```

Constant value: **1**

---

## VERSION\_2

```
public static final int VERSION_2
```

Constant value: **2**

---

## VERSION\_3

```
public static final int VERSION_3
```

Constant value: **3**

---

## VERSION\_4

```
public static final int VERSION_4
```

Constant value: **4**

---

---

## VERSION\_5

```
public static final int VERSION_5
```

Constant value: **5**

---

## VERSION\_6

```
public static final int VERSION_6
```

Constant value: **6**

---

## VERSION\_7

```
public static final int VERSION_7
```

Constant value: **7**

---

## MIN\_COMPATIBILITY\_VERSION

```
public static final int MIN_COMPATIBILITY_VERSION
```

Constant value: **1**

---

## MAX\_COMPATIBILITY\_VERSION

```
public static final int MAX_COMPATIBILITY_VERSION
```

Constant value: **7**

---

## DEFAULT\_COMPATIBILITY\_VERSION

```
public static final int DEFAULT_COMPATIBILITY_VERSION
```

Constant value: **1**

---

## IV\_SIZE

```
public static final int IV_SIZE
```

Constant value: **16**

---

## IV\_SIZE\_ALTERNATIVE

```
public static final int IV_SIZE_ALTERNATIVE
```

Constant value: **32**

---

(continued from last page)

---

## DEFAULT\_KEY\_FORMAT

```
public static final java.lang.String DEFAULT_KEY_FORMAT
```

Constant value: **identity**

---

## NO\_CLOSED\_CAPTIONS

```
public static final java.lang.String NO_CLOSED_CAPTIONS
```

Constant value: **NONE**

---

## DEFAULT\_KEY\_FORMAT\_VERSIONS

```
public static final java.util.List DEFAULT_KEY_FORMAT_VERSIONS
```

---

## INSTREAM\_ID\_SERVICE\_PREFIX

```
public static final java.lang.String INSTREAM_ID_SERVICE_PREFIX
```

Constant value: **Service**

[clone](#), [equals](#), [finalize](#), [getClass](#), [hashCode](#), [notify](#), [notifyAll](#), [toString](#), [wait](#), [wait](#), [wait](#)

## Fields

### properties

```
public com.wowza.wms.application.WMSProperties properties
```

### chunkInfoCupertino

```
public java.lang.Object chunkInfoCupertino
```

## Constructors

### MediaSegmentModel

```
public MediaSegmentModel()
```

## Methods

### getContextStr

```
protected String getContextStr()
```

Get the context string associated with the Model to include with the log statements

### getUri

```
public java.net.URI getUri()
```

(continued from last page)

**Returns:**

the uri

---

**setUri**

```
public void setUri(java.net.URI uri)
```

**Parameters:**

uri - the uri to set

---

**getFragmentList**

```
public PacketFragmentList getFragmentList()
```

Get the fragment list that represents the byte data that makes up the fragment

**Returns:**

fragment list

---

**setFragmentList**

```
public void setFragmentList(PacketFragmentList fragmentList)
```

Set the fragment list that represents the byte data that makes up the fragment

**Parameters:**

fragmentList - fragment list

---

**toString**

```
public String toString()
```

---

**hashCode**

```
public int hashCode()
```

---

**equals**

```
public boolean equals(Object obj)
```

---

**clone**

```
public Object clone()  
    throws CloneNotSupportedException
```

(continued from last page)

## getChunkInfoCupertino

```
public Object getChunkInfoCupertino()
```

Get generic reference to LiveStreamPacketizerCupertinoChunk with chunk details

**Returns:**

generic reference to LiveStreamPacketizerCupertinoChunk with chunk details

---

## setChunkInfoCupertino

```
public void setChunkInfoCupertino(Object chunkInfoCupertino)
```

Set generic reference to LiveStreamPacketizerCupertinoChunk with chunk details

**Parameters:**

chunkInfoCupertino - generic reference to LiveStreamPacketizerCupertinoChunk with chunk details

---

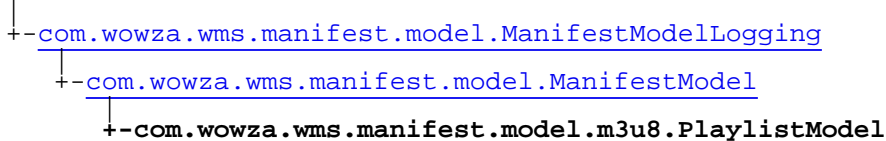

## getProperties

```
public WMSProperties getProperties()
```

## com.wowza.wms.manifest.model.m3u8

### Class PlaylistModel

java.lang.Object

All Implemented Interfaces:

Cloneable

public class **PlaylistModel**

extends [ManifestModel](#)

Provides implementations that are common to all Playlist models

#### Field Summary

public	<a href="#">mediaSegments</a>
public	<a href="#">playlists</a>
public	<a href="#">properties</a>
public	<a href="#">tags</a>

#### Constructor Summary

public	<a href="#">PlaylistModel()</a>
--------	---------------------------------

#### Method Summary

boolean	<a href="#">addAllTags</a> (java.util.Collection tags) Add a list of tags to the playlistmodel and propagate context and debug settings
boolean	<a href="#">addTag</a> ( <a href="#">TagModel</a> tag) Add a tag to the playlist model and propagate context and debug settings
Object	<a href="#">clone</a> ()
boolean	<a href="#">equals</a> (Object obj)
String	<a href="#">getContextStr</a> ()
<a href="#">WMSProperties</a>	<a href="#">getProperties</a> ()
java.net.URI	<a href="#">getUri</a> () Get the uri of the playlist

int	<a href="#"><code>getVersion()</code></a> Get the playlist version
int	<a href="#"><code>hashCode()</code></a>
boolean	<a href="#"><code>isExtended()</code></a> Is this an extended M3U8 playlist
boolean	<a href="#"><code>isMasterPlaylist()</code></a> Is the playlist represented by this class a Master playlist?
boolean	<a href="#"><code>isMediaPlaylist()</code></a> Is the playlist represent by this class a Media Playlist
void	<a href="#"><code>setContextStr(String context)</code></a> Specific to Playlist reader to set the context in which the playlist is reading.
void	<a href="#"><code>setMasterPlaylist()</code></a> Mark the playlist this instance represents as a master playlist.
void	<a href="#"><code>setMediaPlaylist()</code></a> Mark the playlist this instance represents as a media playlist.
void	<a href="#"><code>setUri(java.net.URI uri)</code></a> Set the uri of the playlist
String	<a href="#"><code>toString()</code></a>

#### Methods inherited from class [com.wowza.wms.manifest.model.ManifestModel](#)

[clone](#), [equals](#), [getManifest](#), [hashCode](#), [setManifest](#), [toString](#)

#### Methods inherited from class [com.wowza.wms.manifest.model.ManifestModelLogging](#)

## Fields

### tags

```
public java.util.List tags
```

### playlists

```
public java.util.List playlists
```

## mediaSegments

```
public java.util.List mediaSegments
```

---

## properties

```
public com.wowza.wms.application.WMSProperties properties
```

---

## Constructors

### PlaylistModel

```
public PlaylistModel()
```

## Methods

### setMasterPlaylist

```
public void setMasterPlaylist()
```

Mark the playlist this instance represents as a master playlist.

---

### setMediaPlaylist

```
public void setMediaPlaylist()
```

Mark the playlist this instance represents as a media playlist.

---

### isMasterPlaylist

```
public boolean isMasterPlaylist()
```

Is the playlist represented by this class a Master playlist?

**Returns:**

true if the playlist represented by this model is a master playlist

---

### isMediaPlaylist

```
public boolean isMediaPlaylist()
```

Is the playlist represent by this class a Media Playlist

**Returns:**

true if the playlist is a media playlist

---

### getUri

```
public java.net.URI getUri()
```

Get the uri of the playlist

---

(continued from last page)

**Returns:**

URI the playlist uri

---

**setUri**

```
public void setUri(java.net.URI uri)
```

Set the uri of the playlist

**Parameters:**

uri - of the playlist

---

**getVersion**

```
public int getVersion()
```

Get the playlist version

**Returns:**

integer version number

---

**isExtended**

```
public boolean isExtended()
```

Is this an extended M3U8 playlist

**Returns:**

true if the playlist represented by this model is extended

---

**getContextStr**

```
public String getContextStr()
```

Get the context string associated with the Model to include with the log statements

---

**setContextStr**

```
public void setContextStr(String context)
```

Specific to Playlist reader to set the context in which the playlist is reading. Intent would be this would be the Source stream name to associate the log entries with

**Parameters:**

context - context of the reader

---

**addTag**

```
public boolean addTag(TagModel tag)
```

Add a tag to the playlist model and propagate context and debug settings

**Parameters:**

tag - to be added to the playlist model

**Returns:**

true if the tag was added

---

## addAllTags

```
public boolean addAllTags(java.util.Collection tags)
```

Add a list of tags to the playlistmodel and propagate context and debug settings

### Parameters:

tags - - list of tags to be added to the playlist model

### Returns:

true if all the tags were added to the playlist model

---

## equals

```
public boolean equals(Object obj)
```

---

## hashCode

```
public int hashCode()
```

---

## toString

```
public String toString()
```

---

## clone

```
public Object clone()  
    throws CloneNotSupportedException
```

---

## getProperties

```
public WMSProperties getProperties()
```

---

---

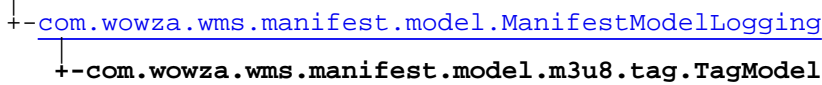

Package

**com.wowza.wms.manifest.model.m3u8.tag**

## com.wowza.wms.manifest.model.m3u8.tag

### Class TagModel

java.lang.Object

#### All Implemented Interfaces:

Cloneable

#### Direct Known Subclasses:

[TagModelVersion](#), [TagModelUnknown](#), [TagModelURI](#), [TagModelTargetDuration](#), [TagModelStreamInfCommon](#), [TagModelStart](#), [TagModelSessionKey](#), [TagModelSessionData](#), [TagModelProgramDateTime](#), [TagModelPlaylistType](#), [TagModelMediaSequence](#), [TagModelMedia](#), [TagModelMap](#), [TagModelM3U](#), [TagModelKey](#), [TagModelIndependentSegments](#), [TagModelINF](#), [TagModelIFramesOnly](#), [TagModelEndlist](#), [TagModelDiscontinuitySequence](#), [TagModelDiscontinuity](#), [TagModelByteRange](#), [TagModelAllowCache](#)

public abstract class **TagModel**  
 extends [ManifestModelLogging](#)  
 implements Cloneable

### Field Summary

protected	<a href="#">attributes</a>
protected	<a href="#">tagName</a>

### Constructor Summary

protected	<a href="#">TagModel</a> (String tagName)
-----------	---

### Method Summary

---

## Fields

### **attributes**

```
protected java.util.List attributes
```

---

### **tagName**

```
protected java.lang.String tagName
```

---

## Constructors

### **TagModel**

```
protected TagModel(String tagName)
```

---

## Methods

### **getTag**

```
public String getTag()
```

---

### **validForMasterPlaylist**

```
public abstract boolean validForMasterPlaylist()
```

---

### **validForMediaPlaylist**

```
public abstract boolean validForMediaPlaylist()
```

---

### **toString**

```
public abstract String toString()
```

---

(continued from last page)

---

## write

```
public abstract void write(TagWriter writer)
    throws java.io.IOException
```

### Parameters:

writer

### Throws:

IOException

---

## isMediaSegmentTag

```
public abstract boolean isMediaSegmentTag()
```

---

## isValid

```
public abstract boolean isValid(Integer version)
```

---

## addAttribute

```
public boolean addAttribute(Attribute attribute)
```

---

## addAllAttributes

```
public boolean addAllAttributes(java.util.Collection c)
```

---

## getUnknownAttributes

```
public java.util.List getUnknownAttributes()
```

---

## formatUnquotedStringAttribute

```
public String formatUnquotedStringAttribute(String name,
    String value)
```

Format an unquoted-string tag attribute. Bad values and bad attribute names are reported in the output string.

### Parameters:

name - is the attribute name

value - is the String attribute's value

### Returns:

the formatted attribute as '='

---

(continued from last page)

---

## formatQuotedStringAttribute

```
public String formatQuotedStringAttribute(String name,  
                                           String value)
```

Format a quoted-string tag attribute. Bad values and bad attribute names are reported in the output string.

**Parameters:**

name - is the attribute name  
value - is the String attribute's value

**Returns:**

the formatted attribute as '='

---

## formatBooleanAttribute

```
public String formatBooleanAttribute(String name,  
                                       Boolean value)
```

Format a Boolean tag attribute. Bad values and bad attribute names are reported in the output string.

**Parameters:**

name - is the attribute name  
value - is the Boolean attribute's value

**Returns:**

the formatted Boolean attribute

---

## formatIntegerAttribute

```
public String formatIntegerAttribute(String name,  
                                       Integer value)
```

Format an Integer tag attribute. Bad values and bad attribute names are reported in the output string.

**Parameters:**

name - is the attribute name  
value - is the Integer attribute's value

**Returns:**

the formatted Integer attribute

---

## formatFloatAttribute

```
public String formatFloatAttribute(String name,  
                                     Float value)
```

Format an Float tag attribute. Bad values and bad attribute names are reported in the output string.

**Parameters:**

name - is the attribute name  
value - is the Float attribute's value

**Returns:**

the formatted Float attribute

---

(continued from last page)

## formatEnumAttribute

```
public String formatEnumAttribute(String name,  
    Enum value)
```

Format an Enumerated tag attribute. Bad values and bad attribute names are reported in the output string.

**Parameters:**

name - is the attribute name

value - is the Enumerated attribute's value

**Returns:**

the formatted Enumerated attribute

---

## formatBoolean

```
public String formatBoolean(Boolean value)
```

Format a Boolean tag value. Bad values are reported in the output string.

**Parameters:**

value - is the Boolean value

**Returns:**

the formatted Boolean

---

## formatInteger

```
public String formatInteger(Integer value)
```

Format a Integer tag value. Bad values are reported in the output string.

**Parameters:**

value - is the Integer value

**Returns:**

the formatted Integer

---

## formatFloat

```
public String formatFloat(Float value)
```

Format a Float tag value. Bad values are reported in the output string.

**Parameters:**

value - is the Float value

**Returns:**

the formatted Float

---

## formatString

```
public String formatString(String value)
```

Format a String tag value. Bad values are reported in the output string.

**Parameters:**

value - is the String value

---

---

(continued from last page)

**Returns:**

the formatted String

---

**formatValue**

```
public String formatValue(Object value)
```

Format a Float, Integer, or String tag value. Bad values are reported in the output string.

**Parameters:**

value - is the Float, Integer, or String value

**Returns:**

the formatted value

---

**getContextStr**

```
public String getContextStr()
```

Get the context string associated with the Model to include with the log statements

---

**setContextStr**

```
public void setContextStr(String contextStr)
```

**Parameters:**

contextStr - the contextStr to set

---

**hashCode**

```
public int hashCode()
```

---

**equals**

```
public boolean equals(Object obj)
```

---

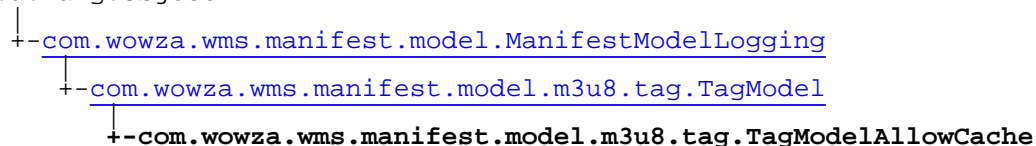

**clone**

```
public Object clone()  
    throws CloneNotSupportedException
```

---

## com.wowza.wms.manifest.model.m3u8.tag Class TagModelAllowCache

## Constructors

### TagModelINF

```
public TagModelINF()
```

## Methods

### getDuration

```
public Object getDuration()
```

#### Returns:

the duration

### setDuration

```
public void setDuration(Object duration)
```

#### Parameters:

duration - the duration to set as either a Float or Integer object

### getTitle

```
public String getTitle()
```

(continued from last page)

**Returns:**

the title

---

**setTitle**

```
public void setTitle(String title)
```

**Parameters:**

title - the title to set

---

**validForMasterPlaylist**

```
public boolean validForMasterPlaylist()
```

---

**validForMediaPlaylist**

```
public boolean validForMediaPlaylist()
```

---

**toString**

```
public String toString()
```

---

**write**

```
public void write(TagWriter writer)  
    throws java.io.IOException
```

---

**isMediaSegmentTag**

```
public boolean isMediaSegmentTag()
```

---

**isValid**

```
public boolean isValid(Integer version)
```

---

**hashCode**

```
public int hashCode()
```

---

(continued from last page)

**equals**

```
public boolean equals(Object obj)
```

---

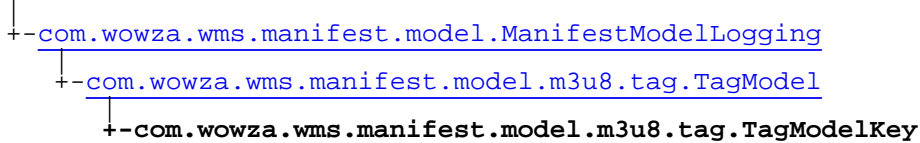

**clone**

```
public Object clone()  
    throws CloneNotSupportedException
```

## Methods

(continued from last page)

## getMethod

```
public TagModelKey.Method getMethod()
```

**Returns:**

the method

---

## setMethod

```
public void setMethod(TagModelKey.Method method)
```

**Parameters:**

method - the method to set

---

## getUri

```
public String getUri()
```

**Returns:**

the uri

---

## setUri

```
public void setUri(String uri)
```

**Parameters:**

uri - the uri to set

---

## getIv

```
public String getIv()
```

**Returns:**

the iv

---

## setIv

```
public void setIv(String iv)
```

**Parameters:**

iv - the iv to set

---

## getKeyFormat

```
public String getKeyFormat()
```

(continued from last page)

**Returns:**the keyFormat

---

**setKeyFormat**

```
public void setKeyFormat(String keyFormat)
```

**Parameters:**keyFormat - the keyFormat to set

---

**getKeyFormatVersions**

```
public String getKeyFormatVersions()
```

**Returns:**the keyFormatVersions

---

**setKeyFormatVersions**

```
public void setKeyFormatVersions(String keyFormatVersions)
```

**Parameters:**keyFormatVersions - the keyFormatVersions to set

---

**validForMasterPlaylist**

```
public boolean validForMasterPlaylist()
```

**validForMediaPlaylist**

```
public boolean validForMediaPlaylist()
```

## Constructors

### TagModelMedia

```
public TagModelMedia()
```

## Methods

### getType

```
public TagModelMedia.Type getType()
```

**Returns:**

the type

### setType

```
public void setType(TagModelMedia.Type type)
```

**Parameters:**

type - the type to set

### getGroupId

```
public String getGroupId()
```

**Returns:**

the groupId

(continued from last page)

## setGroupId

```
public void setGroupId(String groupId)
```

### Parameters:

groupId - the groupId to set

---

## getName

```
public String getName()
```

### Returns:

the name

---

## setName

```
public void setName(String name)
```

### Parameters:

name - the name to set

---

## getInstreamId

```
public String getInstreamId()
```

### Returns:

the instreamId

---

## setInstreamId

```
public void setInstreamId(String instreamId)
```

### Parameters:

instreamId - the instreamId to set

---

## getUri

```
public java.net.URI getUri()
```

### Returns:

the uri

---

## setUri

```
public void setUri(java.net.URI uri)
```

(continued from last page)

**Parameters:**uri - the uri to set

---

**getLanguage**

```
public String getLanguage()
```

**Returns:**the language

---

**setLanguage**

```
public void setLanguage(String language)
```

**Parameters:**language - the language to set

---

**getAssociatedLanguage**

```
public String getAssociatedLanguage()
```

**Returns:**the associatedLanguage

---

**setAssociatedLanguage**

```
public void setAssociatedLanguage(String associatedLanguage)
```

**Parameters:**associatedLanguage - the associatedLanguage to set

---

**getDefaultRendition**

```
public Boolean getDefaultRendition()
```

**Returns:**the defaultRendition

---

**setDefaultRendition**

```
public void setDefaultRendition(Boolean defaultRendition)
```

**Parameters:**defaultRendition - the defaultRendition to set

---

---

## getAutoselect

```
public Boolean getAutoselect()
```

### Returns:

the autoselect

---

## setAutoselect

```
public void setAutoselect(Boolean autoselect)
```

### Parameters:

autoselect - the autoselect to set

---

## getForced

```
public Boolean getForced()
```

### Returns:

the forced

---

## setForced

```
public void setForced(Boolean forced)
```

### Parameters:

forced - the forced to set

---

## getCharacteristics

```
public String getCharacteristics()
```

### Returns:

the characteristics

---

## setCharacteristics

```
public void setCharacteristics(String characteristics)
```

### Parameters:

characteristics - the characteristics to set

---

## validForMasterPlaylist

```
public boolean validForMasterPlaylist()
```

(continued from last page)

---

## validForMediaPlaylist

```
public boolean validForMediaPlaylist()
```

---

---

## toString

```
public String toString()
```

---

---

## write

```
public void write(TagWriter writer)  
    throws java.io.IOException
```

---

---

## isMediaSegmentTag

```
public boolean isMediaSegmentTag()
```

---

---

## isValid

```
public boolean isValid(Integer version)
```

---

---

## hashCode

```
public int hashCode()
```

---

---

## equals

```
public boolean equals(Object obj)
```

---

## Constructors

### TagModelStreamInf

```
public TagModelStreamInf()
```

## Methods

### getAudio

```
public String getAudio()
```

#### Returns:

the audio

### setAudio

```
public void setAudio(String audio)
```

(continued from last page)

**Parameters:**

audio - the audio to set

---

**getSubtitles**

```
public String getSubtitles()
```

**Returns:**

the subtitles

---

**setSubtitles**

```
public void setSubtitles(String subtitles)
```

**Parameters:**

subtitles - the subtitles to set

---

**getClosedCaptions**

```
public String getClosedCaptions()
```

**Returns:**

the closedCaptions

---

**setClosedCaptions**

```
public void setClosedCaptions(String closedCaptions)
```

**Parameters:**

closedCaptions - the closedCaptions to set

---

**toString**

```
public String toString()
```

---

**write**

```
public void write(TagWriter writer)  
    throws java.io.IOException
```

---

**isMediaSegmentTag**

```
public boolean isMediaSegmentTag()
```

---

## isValid

```
public boolean isValid(Integer version)
```

---

## hashCode

```
public int hashCode()
```

---

## equals

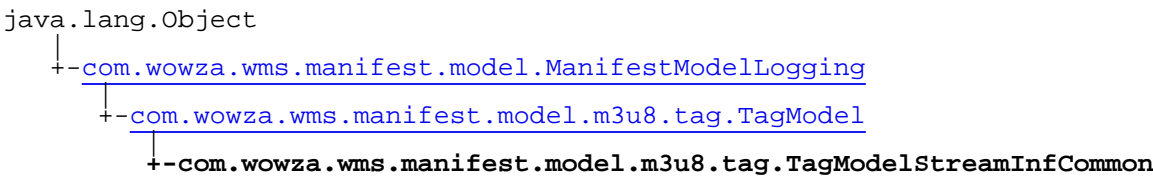

```
public boolean equals(Object obj)
```

---

## clone

```
public Object clone()  
    throws CloneNotSupportedException
```

## Constructors

### TagModelStreamInfCommon

```
protected TagModelStreamInfCommon(String tagName)
```

## Methods

### validForMasterPlaylist

```
public boolean validForMasterPlaylist()
```

### validForMediaPlaylist

```
public boolean validForMediaPlaylist()
```

### getBandwidth

```
public Integer getBandwidth()
```

**Returns:**

the bandwidth

### setBandwidth

```
public void setBandwidth(Integer bandwidth)
```

**Parameters:**

bandwidth - the bandwidth to set

### getAvgBandwidth

```
public Integer getAvgBandwidth()
```

**Returns:**

the avgBandwidth

### setAvgBandwidth

```
public void setAvgBandwidth(Integer avgBandwidth)
```

**Parameters:**

avgBandwidth - the avgBandwidth to set

---

## getCodecs

```
public String getCodecs()
```

### Returns:

the codecs

---

## setCodecs

```
public void setCodecs(String codecs)
```

### Parameters:

codecs - the codecs to set

---

## getResolution

```
public String getResolution()
```

### Returns:

the resolution

---

## setResolution

```
public void setResolution(String resolution)
```

### Parameters:

resolution - the resolution to set

---

## getFrameRate

```
public Float getFrameRate()
```

### Returns:

the frameRate

---

## setFrameRate

```
public void setFrameRate(Float frameRate)
```

### Parameters:

frameRate - the frameRate to set

---

## getVideo

```
public String getVideo()
```

---

(continued from last page)

**Returns:**the video

---

**setVideo**

```
public void setVideo(String video)
```

**Parameters:**video - the video to set

---

**getProgramId**

```
public Integer getProgramId()
```

**Returns:**the programId

---

**setProgramId**

```
public void setProgramId(Integer programId)
```

**Parameters:**programId - the programId to set

---

**getUri**

```
public java.net.URI getUri()
```

**Returns:**the uri

---

**setUri**

```
public void setUri(java.net.URI uri)
```

**Parameters:**uri - the uri to set

---

**toString**

```
protected void toString(StringBuilder sb)
```

---

(continued from last page)

**write**

```
public void write(TagWriter writer,  
                 StringBuffer buf)  
    throws java.io.IOException
```

---

**isMediaSegmentTag**

```
public boolean isMediaSegmentTag()
```

---

**isValid**

```
public boolean isValid(Integer version)
```

---

**hashCode**

```
public int hashCode()
```

Package

**com.wowza.wms.manifest.reader**

## com.wowza.wms.manifest.reader Class ManifestReader

java.lang.Object

Direct Known Subclasses:

[PlaylistReader](#)

public abstract class **ManifestReader**  
extends [ManifestReaderLogging](#)

Abstract Manifest Reader base class Provides implementations that are common to all Manifest readers

### Constructor Summary

public	<a href="#">ManifestReader()</a>
--------	----------------------------------

Methods inherited from class [com.wowza.wms.manifest.reader.ManifestReaderLogging](#)

[getContextStr](#), [getDebugLog](#), [logDebug](#), [logError](#), [logError](#), [logError](#), [logInfo](#), [logWarn](#),  
[setDebugLog](#), [setUseSystemOut](#), [usingSystemOut](#)

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait,  
wait

### Constructors

#### ManifestReader

public **ManifestReader**()

## com.wowza.wms.manifest.reader Class ManifestReaderLogging

java.lang.Object

└─com.wowza.wms.manifest.reader.ManifestReaderLogging

Direct Known Subclasses:

[ManifestReader](#)

public abstract class **ManifestReaderLogging**  
extends Object

This class is the base of all the manifest readers providing a standardized mechanism of logging

### Constructor Summary

public	<a href="#">ManifestReaderLogging()</a> Constructs an empty Manifest Reader
--------	--

### Method Summary

abstract String	<a href="#">getContextStr()</a> Get the context string associated with the Model to include with the log statements
boolean	<a href="#">getDebugLog()</a> Get the current setting for debug logging
void	<a href="#">logDebug</a> (String methodName, String log) log information conditionally based on debug setting using the info level of the logger
void	<a href="#">logError</a> (String methodName, String log) log a string at the error setting
void	<a href="#">logError</a> (String methodName, String log, Throwable e) log a string and a throwable information at the error setting
void	<a href="#">logError</a> (String methodName, Throwable e) log a throwables information at the error setting
void	<a href="#">logInfo</a> (String methodName, String log) Log a string at the info setting
void	<a href="#">logWarn</a> (String methodName, String log) log a string at the warn setting
boolean	<a href="#">setDebugLog</a> (boolean debugLog) Enable/disable debug logging.
void	<a href="#">setUseSystemOut</a> (boolean useSystemOut) specify whether to log using System.out rather than the default (log4j)
boolean	<a href="#">usingSystemOut()</a> Get the setting controlling the debug output to System.out (vs log4j)

Methods inherited from class java.lang.Object

```
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait
```

## Constructors

### ManifestReaderLogging

```
public ManifestReaderLogging()
```

Constructs an empty Manifest Reader

## Methods

### setDebugLog

```
public boolean setDebugLog(boolean debugLog)
```

Enable/disable debug logging.

**Parameters:**

debugLog

**Returns:**

boolean value of the debug log setting before applying the new setting

### getDebugLog

```
public boolean getDebugLog()
```

Get the current setting for debug logging

**Returns:**

true debug logging is enabled

### setUseSystemOut

```
public void setUseSystemOut(boolean useSystemOut)
```

specify whether to log using System.out rather than the default (log4j)

**Parameters:**

useSystemOut

### usingSystemOut

```
public boolean usingSystemOut()
```

Get the setting controlling the debug output to System.out (vs log4j)

**Returns:**

true if using System.out for logging

(continued from last page)

---

## logDebug

```
public void logDebug(String methodName,  
    String log)
```

log information conditionally based on debug setting using the info level of the logger

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log

---

## logInfo

```
public void logInfo(String methodName,  
    String log)
```

Log a string at the info setting

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log

---

## logWarn

```
public void logWarn(String methodName,  
    String log)
```

log a string at the warn setting

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log

---

## logError

```
public void logError(String methodName,  
    String log)
```

log a string at the error setting

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log

---

## logError

```
public void logError(String methodName,  
    String log,  
    Throwable e)
```

log a string and a throwable information at the error setting

### Parameters:

methodName -- method name to include in the log statement  
log -- the string to log  
e -- the throwable exception to log the information about

---

(continued from last page)

## logError

```
public void logError(String methodName,  
                    Throwable e)
```

log a throwables information at the error setting

### Parameters:

methodName -- method name to include in the log statement

e -- the throwable exception to log the information about

---

## getContextStr

```
protected abstract String getContextStr()
```

Get the context string associated with the Model to include with the log statements

### Returns:

String

---

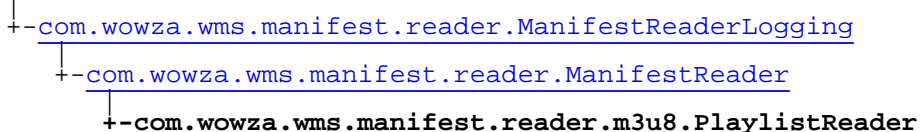

Package

**com.wowza.wms.manifest.reader.m3u8**

## com.wowza.wms.manifest.reader.m3u8

### Class PlaylistReader

java.lang.Object

public class **PlaylistReader**  
 extends [ManifestReader](#)

Provides implementations that are common to all Playlist readers

### Constructor Summary

public	<a href="#">PlaylistReader()</a>
--------	----------------------------------

### Method Summary

void	<a href="#">addTagReader</a> ( <a href="#">ITagReader</a> reader)
String	<a href="#">getContextStr</a> ()
boolean	<a href="#">getDebugTagReaders</a> ()
void	<a href="#">init</a> () Initialize any internals before use
<a href="#">PlaylistModel</a>	<a href="#">parsePlaylist</a> (java.io.BufferedReader reader)
<a href="#">PlaylistModel</a>	<a href="#">parsePlaylist</a> (java.io.InputStream in)
void	<a href="#">setContextStr</a> (String context) Specific to Playlist reader to set the context in which the playlist is reading.
boolean	<a href="#">setDebugTagReaders</a> (boolean enabled)

#### Methods inherited from class [com.wowza.wms.manifest.reader.ManifestReaderLogging](#)

[getContextStr](#), [getDebugLog](#), [logDebug](#), [logError](#), [logError](#), [logError](#), [logInfo](#), [logWarn](#),  
[setDebugLog](#), [setUseSystemOut](#), [usingSystemOut](#)

#### Methods inherited from class java.lang.Object

[clone](#), [equals](#), [finalize](#), [getClass](#), [hashCode](#), [notify](#), [notifyAll](#), [toString](#), [wait](#), [wait](#),  
[wait](#)

(continued from last page)

## Constructors

### PlaylistReader

```
public PlaylistReader()
```

## Methods

### init

```
public void init()
```

Initialize any internals before use

### getContextStr

```
public String getContextStr()
```

Get the context string associated with the Model to include with the log statements

### setContextStr

```
public void setContextStr(String context)
```

Specific to Playlist reader to set the context in which the playlist is reading. Intent would be this would be the Source stream name to associate the log entries with

#### Parameters:

context - of the reader

### parsePlaylist

```
public PlaylistModel parsePlaylist(java.io.InputStream in)
```

### parsePlaylist

```
public PlaylistModel parsePlaylist(java.io.BufferedReader reader)  
    throws java.io.IOException
```

### addTagReader

```
public void addTagReader(ITagReader reader)
```

### setDebugTagReaders

```
public boolean setDebugTagReaders(boolean enabled)
```

(continued from last page)

## **getDebugTagReaders**

```
public boolean getDebugTagReaders()
```

---

Package

**com.wowza.wms.manifest.reader.m3u8.tag**

## com.wowza.wms.manifest.reader.m3u8.tag Class Attribute

java.lang.Object

└─com.wowza.wms.manifest.reader.m3u8.tag.Attribute

All Implemented Interfaces:

Cloneable

public class **Attribute**  
extends Object  
implements Cloneable

### Field Summary

public final	<a href="#">name</a>
public final	<a href="#">value</a>

### Constructor Summary

public	<a href="#">Attribute</a> (String name, String value)
--------	---

### Method Summary

Object	<a href="#">clone</a> ()
String	<a href="#">toString</a> ()

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Fields

#### **name**

public final java.lang.String **name**

#### **value**

public final java.lang.String **value**

## Constructors

### Attribute

```
public Attribute(String name,  
                String value)
```

## Methods

### toString

```
public String toString()
```

---

### clone

```
public Object clone()  
    throws CloneNotSupportedException
```

## com.wowza.wms.manifest.reader.m3u8.tag Interface ITagReader

All Known Implementing Classes:

[TagReaderVersion](#), [TagReaderUnknown](#), [TagReaderTargetDuration](#), [TagReaderStreamInf](#), [TagReaderStart](#), [TagReaderSessionKey](#), [TagReaderSessionData](#), [TagReaderProgramDateTime](#), [TagReaderPlaylistType](#), [TagReaderMediaSequence](#), [TagReaderMedia](#), [TagReaderMap](#), [TagReaderM3U](#), [TagReaderKey](#), [TagReaderIndependentSegments](#), [TagReaderINF](#), [TagReaderIFramesOnly](#), [TagReaderIFrameStreamInf](#), [TagReaderEndList](#), [TagReaderDiscontinuitySequence](#), [TagReaderDiscontinuity](#), [TagReaderByteRange](#), [TagReaderAllowCache](#)

public interface **ITagReader**  
extends

### Method Summary

String	<a href="#"><code>getContextStr()</code></a>
boolean	<a href="#"><code>getDebugLogEnabled()</code></a>
String	<a href="#"><code>getTag()</code></a>
boolean	<a href="#"><code>getUseSystemOut()</code></a>
boolean	<a href="#"><code>parseTag</code></a> (String line, java.io.BufferedReader reader, <a href="#">PlaylistModel</a> playlist)
void	<a href="#"><code>setContextStr</code></a> (String contextStr)
boolean	<a href="#"><code>setDebugLogEnabled</code></a> (boolean enabled)
void	<a href="#"><code>setUseSystemOut</code></a> (boolean useSystemOut)

### Methods

#### **getTag**

public String **getTag**()

#### **parseTag**

public boolean **parseTag**(String line,  
java.io.BufferedReader reader,  
[PlaylistModel](#) playlist)

---

**setDebugLogEnabled**

```
public boolean setDebugLogEnabled(boolean enabled)
```

---

**getDebugLogEnabled**

```
public boolean getDebugLogEnabled()
```

---

**setUseSystemOut**

```
public void setUseSystemOut(boolean useSystemOut)
```

---

**getUseSystemOut**

```
public boolean getUseSystemOut()
```

---

**setContextStr**

```
public void setContextStr(String contextStr)
```

---

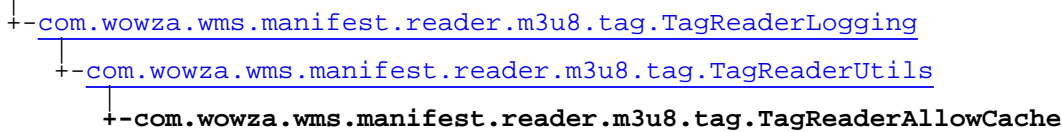

**getContextStr**

```
public String getContextStr()
```

---

## com.wowza.wms.manifest.reader.m3u8.tag Class TagReaderAllowCache

java.lang.Object

All Implemented Interfaces:

[ITagReader](#)

public class **TagReaderAllowCache**

extends [TagReaderUtils](#)

implements [ITagReader](#)

### Constructor Summary

public	<a href="#">TagReaderAllowCache()</a>
--------	---------------------------------------

### Method Summary

String	<a href="#">getTag()</a>
boolean	<a href="#">parseTag</a> (String line, java.io.BufferedReader reader, <a href="#">PlaylistModel</a> playlist)

Methods inherited from class [com.wowza.wms.manifest.reader.m3u8.tag.TagReaderUtils](#)

## com.wowza.wms.manifest.reader.m3u8.tag Class TagReaderLogging

java.lang.Object

└─com.wowza.wms.manifest.reader.m3u8.tag.TagReaderLogging

Direct Known Subclasses:

[TagReaderUtils](#)

public abstract class **TagReaderLogging**  
extends Object

### Constructor Summary

public	<a href="#">TagReaderLogging()</a> Constructs an empty tag parsing logger
--------	--

### Method Summary

boolean	<a href="#">getDebugLogEnabled()</a>
boolean	<a href="#">getUseSystemOut()</a> Get the setting controlling the debug output to System.out (vs log4j)
void	<a href="#">logDebug</a> (String context, String tag, String log) log information conditionally based on debug setting using the info level of the logger
void	<a href="#">logError</a> (String context, String tag, String log) log a string at the error setting
void	<a href="#">logError</a> (String context, String tag, String log, Throwable e) log a string and a throwable information at the error setting
void	<a href="#">logError</a> (String context, String tag, Throwable e) log a throwables information at the error setting
void	<a href="#">logInfo</a> (String context, String tag, String log) Log a string at the info setting
void	<a href="#">logWarn</a> (String context, String tag, String log) log a string at the warn setting
boolean	<a href="#">setDebugLogEnabled</a> (boolean debugLog) Enable/disable debug logging.
void	<a href="#">setUseSystemOut</a> (boolean useSystemOut) specify whether to log using System.out rather than the default (log4j)

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### TagReaderLogging

```
public TagReaderLogging()
```

Constructs an empty tag parsing logger

## Methods

### setDebugLogEnabled

```
public boolean setDebugLogEnabled(boolean debugLog)
```

Enable/disable debug logging.

**Parameters:**

debugLog

**Returns:**

boolean value of the debug log setting before applying the new setting

### getDebugLogEnabled

```
public boolean getDebugLogEnabled()
```

### setUseSystemOut

```
public void setUseSystemOut(boolean useSystemOut)
```

specify whether to log using System.out rather than the default (log4j)

**Parameters:**

useSystemOut

### getUseSystemOut

```
public boolean getUseSystemOut()
```

Get the setting controlling the debug output to System.out (vs log4j)

**Returns:**

true if using System.out for logging

### logDebug

```
public void logDebug(String context,  
                    String tag,  
                    String log)
```

log information conditionally based on debug setting using the info level of the logger

**Parameters:**

log - - the string to log

## logInfo

```
public void logInfo(String context,  
                    String tag,  
                    String log)
```

Log a string at the info setting

**Parameters:**

log - - the string to log

---

## logWarn

```
public void logWarn(String context,  
                    String tag,  
                    String log)
```

log a string at the warn setting

**Parameters:**

log - - the string to log

---

## logError

```
public void logError(String context,  
                     String tag,  
                     String log)
```

log a string at the error setting

**Parameters:**

log - - the string to log

---

## logError

```
public void logError(String context,  
                     String tag,  
                     String log,  
                     Throwable e)
```

log a string and a throwable information at the error setting

**Parameters:**

log - - the string to log

e - - the throwable exception to log the information about

---

## logError

```
public void logError(String context,  
                     String tag,  
                     Throwable e)
```

log a throwables information at the error setting

**Parameters:**

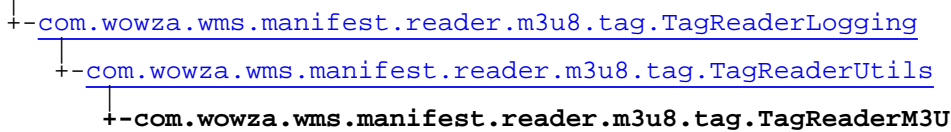

e - - the throwable exception to log the information about

---

## com.wowza.wms.manifest.reader.m3u8.tag

### Class TagReaderM3U

java.lang.Object

All Implemented Interfaces:

[ITagReader](#)

public class **TagReaderM3U**

extends [TagReaderUtils](#)

implements [ITagReader](#)

### Constructor Summary

public	<a href="#">TagReaderM3U()</a>

## Fields

### HEADERSIZE

```
public static final int HEADERSIZE
```

Constant value: **10**

### TEXTENCODING\_ISO\_8859\_1

```
public static final int TEXTENCODING_ISO_8859_1
```

Constant value: **0**

### TEXTENCODING\_UTF16

```
public static final int TEXTENCODING_UTF16
```

Constant value: **1**

### TEXTENCODING\_UTF16BE

```
public static final int TEXTENCODING_UTF16BE
```

Constant value: **2**

### TEXTENCODING\_UTF8

```
public static final int TEXTENCODING_UTF8
```

Constant value: **3**

### TEXTENCODING\_URL

```
public static final java.lang.String TEXTENCODING_URL
```

Constant value: **ISO-8859-1**

(continued from last page)

---

## TEXTENCODING\_DEFAULT

```
public static final java.lang.String TEXTENCODING_DEFAULT
```

Constant value: **UTF-8**

---

## DEFAULT\_LANGUAGE

```
public static final java.lang.String DEFAULT_LANGUAGE
```

Constant value: **eng**

---

## TAG\_UNKN

```
public static final java.lang.String TAG_UNKN
```

Constant value: **UNKN**

---

## TAG\_PRIV

```
public static final java.lang.String TAG_PRIV
```

Constant value: **PRIV**

---

## TAG\_APIC

```
public static final java.lang.String TAG_APIC
```

Constant value: **APIC**

---

## TAG\_LINK

```
public static final java.lang.String TAG_LINK
```

Constant value: **LINK**

---

## TAG\_SYLT

```
public static final java.lang.String TAG_SYLT
```

Constant value: **SYLT**

---

## TAG\_RBUF

```
public static final java.lang.String TAG_RBUF
```

Constant value: **RBUF**

---

## TAG\_TALB

```
public static final java.lang.String TAG_TALB
```

---

(continued from last page)

Constant value: **TALB**

---

## TAG\_TBPM

```
public static final java.lang.String TAG_TBPM
```

Constant value: **TBPM**

---

## TAG\_TCOM

```
public static final java.lang.String TAG_TCOM
```

Constant value: **TCOM**

---

## TAG\_TCON

```
public static final java.lang.String TAG_TCON
```

Constant value: **TCON**

---

## TAG\_TCOP

```
public static final java.lang.String TAG_TCOP
```

Constant value: **TCOP**

---

## TAG\_TDEN

```
public static final java.lang.String TAG_TDEN
```

Constant value: **TDEN**

---

## TAG\_TDLY

```
public static final java.lang.String TAG_TDLY
```

Constant value: **TDLY**

---

## TAG\_TDOR

```
public static final java.lang.String TAG_TDOR
```

Constant value: **TDOR**

---

## TAG\_TDRC

```
public static final java.lang.String TAG_TDRC
```

Constant value: **TDRC**

---

## TAG\_TDRL

```
public static final java.lang.String TAG_TDRL
```

Constant value: **TDRL**

---

## TAG\_TDTG

```
public static final java.lang.String TAG_TDTG
```

Constant value: **TDTG**

---

## TAG\_TENC

```
public static final java.lang.String TAG_TENC
```

Constant value: **TENC**

---

## TAG\_TEXT

```
public static final java.lang.String TAG_TEXT
```

Constant value: **TEXT**

---

## TAG\_TFLT

```
public static final java.lang.String TAG_TFLT
```

Constant value: **TFLT**

---

## TAG\_TIPL

```
public static final java.lang.String TAG_TIPL
```

Constant value: **TIPL**

---

## TAG\_TIT1

```
public static final java.lang.String TAG_TIT1
```

Constant value: **TIT1**

---

## TAG\_TIT2

```
public static final java.lang.String TAG_TIT2
```

Constant value: **TIT2**

---

(continued from last page)

---

## TAG\_TIT3

```
public static final java.lang.String TAG_TIT3
```

Constant value: **TIT3**

---

## TAG\_TKEY

```
public static final java.lang.String TAG_TKEY
```

Constant value: **TKEY**

---

## TAG\_TLAN

```
public static final java.lang.String TAG_TLAN
```

Constant value: **TLAN**

---

## TAG\_TLEN

```
public static final java.lang.String TAG_TLEN
```

Constant value: **TLEN**

---

## TAG\_TMCL

```
public static final java.lang.String TAG_TMCL
```

Constant value: **TMCL**

---

## TAG\_TMED

```
public static final java.lang.String TAG_TMED
```

Constant value: **TMED**

---

## TAG\_TMOO

```
public static final java.lang.String TAG_TMOO
```

Constant value: **TMOO**

---

## TAG\_TOAL

```
public static final java.lang.String TAG_TOAL
```

Constant value: **TOAL**

---

## TAG\_TOFN

```
public static final java.lang.String TAG_TOFN
```

---

(continued from last page)

Constant value: **TOFN**

---

## TAG\_TOLY

```
public static final java.lang.String TAG_TOLY
```

Constant value: **TOLY**

---

## TAG\_TOPE

```
public static final java.lang.String TAG_TOPE
```

Constant value: **TOPE**

---

## TAG\_TOWN

```
public static final java.lang.String TAG_TOWN
```

Constant value: **TOWN**

---

## TAG\_TPE1

```
public static final java.lang.String TAG_TPE1
```

Constant value: **TPE1**

---

## TAG\_TPE2

```
public static final java.lang.String TAG_TPE2
```

Constant value: **TPE2**

---

## TAG\_TPE3

```
public static final java.lang.String TAG_TPE3
```

Constant value: **TPE3**

---

## TAG\_TPE4

```
public static final java.lang.String TAG_TPE4
```

Constant value: **TPE4**

---

## TAG\_TPOS

```
public static final java.lang.String TAG_TPOS
```

Constant value: **TPOS**

---

## TAG\_TPRO

```
public static final java.lang.String TAG_TPRO
```

Constant value: **TPRO**

---

## TAG\_TPUB

```
public static final java.lang.String TAG_TPUB
```

Constant value: **TPUB**

---

## TAG\_TRCK

```
public static final java.lang.String TAG_TRCK
```

Constant value: **TRCK**

---

## TAG\_TRSN

```
public static final java.lang.String TAG_TRSN
```

Constant value: **TRSN**

---

## TAG\_TRSO

```
public static final java.lang.String TAG_TRSO
```

Constant value: **TRSO**

---

## TAG\_TSOA

```
public static final java.lang.String TAG_TSOA
```

Constant value: **TSOA**

---

## TAG\_TSOP

```
public static final java.lang.String TAG_TSOP
```

Constant value: **TSOP**

---

## TAG\_TSOT

```
public static final java.lang.String TAG_TSOT
```

Constant value: **TSOT**

---

(continued from last page)

---

## TAG\_TSRC

```
public static final java.lang.String TAG_TSRC
```

Constant value: **TSRC**

---

## TAG\_TSSE

```
public static final java.lang.String TAG_TSSE
```

Constant value: **TSSE**

---

## TAG\_TSST

```
public static final java.lang.String TAG_TSST
```

Constant value: **TSST**

---

## TAGS\_TEXTINFORMATION

```
public static final java.lang.String TAGS_TEXTINFORMATION
```

---

## TAG\_WCOM

```
public static final java.lang.String TAG_WCOM
```

Constant value: **WCOM**

---

## TAG\_WCOP

```
public static final java.lang.String TAG_WCOP
```

Constant value: **WCOP**

---

## TAG\_WOAF

```
public static final java.lang.String TAG_WOAF
```

Constant value: **WOAF**

---

## TAG\_WOAR

```
public static final java.lang.String TAG_WOAR
```

Constant value: **WOAR**

---

## TAG\_WOAS

```
public static final java.lang.String TAG_WOAS
```

(continued from last page)

Constant value: **WOAS**

---

## TAG\_WORS

```
public static final java.lang.String TAG_WORS
```

Constant value: **WORS**

---

## TAG\_WPAY

```
public static final java.lang.String TAG_WPAY
```

Constant value: **WPAY**

---

## TAG\_WPUB

```
public static final java.lang.String TAG_WPUB
```

Constant value: **WPUB**

---

## TAG\_TXXX

```
public static final java.lang.String TAG_TXXX
```

Constant value: **TXXX**

---

## TAG\_COMM

```
public static final java.lang.String TAG_COMM
```

Constant value: **COMM**

---

## TAG\_WXXX

```
public static final java.lang.String TAG_WXXX
```

Constant value: **WXXX**

---

## FLAGS\_DEFAULT

```
public static final int FLAGS_DEFAULT
```

Constant value: **0**

---

## Constructors

### ID3V2FrameBase

```
public ID3V2FrameBase(String idStr,  
                       int flags)
```

## Methods

### textEncodingToCharsetName

```
public static String textEncodingToCharsetName(int textEncoding)
```

### byteStringLen

```
public static int byteStringLen(String value,  
    int textEncoding)
```

### byteStringLen

```
public static int byteStringLen(String value,  
    String encodingStr)
```

### serializeStringLen

```
public static int serializeStringLen(String value,  
    int textEncoding,  
    boolean addZero)
```

### serializeStringLen

```
public static int serializeStringLen(String value,  
    String encodingStr,  
    boolean addZero)
```

### trimTrailingZero

```
public static String trimTrailingZero(String value)
```

### serializeString

```
public static int serializeString(String value,  
    byte[] buffer,  
    int offset,  
    int textEncoding,  
    boolean addZero)
```

(continued from last page)

---

## serializeString

```
public static int serializeString(String value,  
    byte[] buffer,  
    int offset,  
    String charsetName,  
    boolean addZero)
```

---

## deserializeString

```
public static ID3V2FrameBase.DeserializeResult deserializeString(byte[] buffer,  
    int offset,  
    int len,  
    int textEncoding)
```

---

## deserializeString

```
public static ID3V2FrameBase.DeserializeResult deserializeString(byte[] buffer,  
    int offset,  
    int len,  
    String charsetName)
```

---

## serialize

```
public int serialize(byte[] buffer,  
    int offset)
```

---

## getIdStr

```
public String getIdStr()
```

---

## setIdStr

```
public void setIdStr(String idStr)
```

---

## getFlags

```
public int getFlags()
```

---

## setFlags

```
public void setFlags(int flags)
```

---

(continued from last page)

## getSize

```
public int getSize()
```

---

## getMapIdStr

```
public String getMapIdStr()
```

---

## deserializeFrame

```
public static ID3DeserializeFrameResult deserializeFrame(byte[] buffer,  
    int offset,  
    int len)
```

public int getBodySize()
```

---

## deserializeBody

```
public void deserializeBody(byte[] buffer,  
                             int offset,  
                             int len)
```

---

## serializeBody

```
public int serializeBody(byte[] buffer,  
                           int offset)
```

---

## serialize

```
public int serialize(byte[] buffer,  
                     int offset)
```

---

---

Package

**com.wowza.wms.mediacache.impl**

## com.wowza.wms.mediacache.impl Interface IMediaCacheHTTPByteReader

public interface **IMediaCacheHTTPByteReader**  
extends

Interface for HTTP byte reader implementations

This should be used in conjunction with IMediaCacheItemHTTPReaderFactory and any implementation has to return head and read results.

### Method Summary

void	<a href="#"><u>close()</u></a> Close any open connection.
MediaCacheHTTPByteReaderResult	<a href="#"><u>head</u></a> (String path)
void	<a href="#"><u>init</u></a> () Initialize the byte reader.
MediaCacheHTTPByteReaderResult	<a href="#"><u>read</u></a> (String path, long pos, int flen)
void	<a href="#"><u>setConnectionTimeout</u></a> (int connectionTimeout) Set the connection timeout, milliseconds.
void	<a href="#"><u>setDestinationAddress</u></a> (String host, int port) Set the destination host and port where to retrieve data.
void	<a href="#"><u>setMaxRetries</u></a> (int maxRetries) Set the maximum number retries.
void	<a href="#"><u>setProxyAddress</u></a> (String host, int port) Set the proxy host and port.
void	<a href="#"><u>setReadTimeout</u></a> (int readTimeout) Set the read timeout for data, milliseconds.
void	<a href="#"><u>setReceiveBufferSize</u></a> (int receiveBufferSize) Set the receive buffer size, byte size.
void	<a href="#"><u>setRequestFullURL</u></a> (boolean requestFullURL) Flag to set if a full URL is required as part of the head/read request.
void	<a href="#"><u>setSendBufferSize</u></a> (int sendBufferSize) Set the send buffer size, byte size.

---

## Methods

### **init**

```
public void init()
```

Initialize the byte reader.

---

### **head**

```
public MediaCacheHTTPByteReaderResult head(String path)
```

Retrieve asset information via a HEAD request. Parameters are the path of the object.

This of course does not need to be an actual head command to the remote side, but something that returns the asset length and preferably last modified time.

Assume `contentLength` and `lastModified` were populated from any code implemented you can then create a return object with.

```
long startTime = System.nanoTime();  
ret = new MediaCacheHTTPByteReaderResult();  
ret.status = 200;  
ret.contentLength = contentLength;  
ret.lastModified = lastModified;  
ret.elapsedTime = (System.nanoTime()-startTime)/1000000L;
```

A return status other than 200 may cause failure within MediaCache and consequently cause any client requests to be rejected.

#### **Parameters:**

path

#### **Returns:**

MediaCacheHTTPByteReaderResult

---

### **read**

```
public MediaCacheHTTPByteReaderResult read(String path,  
      long pos,  
      int flen)
```

(continued from last page)

Retrieve data from the remote service/server. Parameters are the path of the object, the current position into the object and the amount of data to get (flen).

The remote source should support HTTP/1.1 so partial requests can be made.

The data size returned in the MediaCacheHTTPByteReadResult must match the flen requested otherwise the data will be considered invalid.

Consider you have an input and out byteStream object

```
long startTime = System.nanoTime();
InputStream input = myConnectionToSomeWhere.getInputStream();
ByteArrayOutputStream byteStream = new ByteArrayOutputStream();
byte[] buffer = new byte[this.receiveBufferSize];
int n = - 1;
while ( (n = input.read(buffer)) != -1)
{
    byteStream.write(buffer, 0, n);
}

ret = new MediaCacheHTTPByteReaderResult();
ret.buffer = byteStream.toByteArray();
ret.status = 206;
ret.headerLength = 0;
ret.contentLength = byteStream.size();
ret.roffset = requestStart;
ret.rlen = requestLength;
ret.lastModified = this.mediaCacheConnection.getLastModified();
ret.elapsedTime = (System.nanoTime()-startTime)/1000000L;
```

A return status other than  $\geq 200$  or  $\leq 300$  may cause failure within MediaCache and consequently cause any client requests to be rejected.

**Parameters:**

path  
pos  
flen

**Returns:**

MediaCacheHTTPByteReaderResult

---

**close**

```
public void close()
```

---

(continued from last page)

Close any open connection.

---

## setDestinationAddress

```
public void setDestinationAddress(String host,  
    int port)
```

Set the destination host and port where to retrieve data.

**Parameters:**

host  
port

---

## setProxyAddress

```
public void setProxyAddress(String host,  
    int port)
```

Set the proxy host and port. It is up to the specific byte reader implementation to implement support for proxy connections.

**Parameters:**

host  
port

---

## setRequestFullURL

```
public void setRequestFullURL(boolean requestFullURL)
```

Flag to set if a full URL is required as part of the head/read request. It is up to the specific byte reader implementation to use this flag.

**Parameters:**

requestFullURL

---

## setReadTimeout

```
public void setReadTimeout(int readTimeout)
```

Set the read timeout for data, milliseconds. It is up to the specific byte reader implementation to use this setting.

**Parameters:**

readTimeout

---

## setMaxRetries

```
public void setMaxRetries(int maxRetries)
```

Set the maximum number retries. It is up to the specific byte reader implementation to use this setting.

**Parameters:**

maxRetries

---

## setConnectionTimeout

```
public void setConnectionTimeout(int connectionTimeout)
```

Set the connection timeout, milliseconds. It is up to the specific byte reader implementation to use this setting.

---

(continued from last page)

**Parameters:**`connectionTimeout`

---

**setSendBufferSize**

```
public void setSendBufferSize(int sendBufferSize)
```

Set the send buffer size, byte size. It is up to the specific byte reader implementation to use this setting.

**Parameters:**`sendBufferSize`

---

**setReceiveBufferSize**

```
public void setReceiveBufferSize(int receiveBufferSize)
```

Set the receive buffer size, byte size. It is up to the specific byte reader implementation to use this setting.

**Parameters:**`receiveBufferSize`

---

## com.wowza.wms.mediache.impl Interface IMediaCacheItemHTTPReaderFactory

public interface **IMediaCacheItemHTTPReaderFactory**  
extends **IGenericPoolFactory**

Interface for HTTP byte reader factory implementations

You need to have a **IMediaCacheItemHTTPByteReader** implementation available to use with your factory implementation.

In order to make implementation simpler and safer you should extend the factory base with

**MediaCacheItemHTTPCustomFactory** extends **MediaCacheItemHTTPReaderFactoryBase**

To use your own implementation you should add the following property to the HTTP media cache source entry

```
<Property>
<Name>httpReaderFactoryClass</Name>
<Value>com.wowza.streamschool.mediache.ExampleHTTPReaderFactory</Value>
<Type>String</Type>
</Property>
```

The value points to the class name of your implementation.

### Method Summary

void	<a href="#"><b>addProperties</b></a> ( <a href="#">WMSProperties</a> properties) Add properties to this specific factory, these could be passed from
<a href="#">IMediaCacheHTTPByteReader</a>	<a href="#"><b>createInstance</b></a> () Create a HTTP byte reader suited to this factory.
void	<a href="#"><b>destroyInstance</b></a> ( <a href="#">IMediaCacheHTTPByteReader</a> instance) Destroy the HTTP Byte reader associated with this factory implementation
int	<a href="#"><b>getConnectionTimeout</b></a> () Get the current connection timeout set.
<a href="#">IMediaCacheItem</a>	<a href="#"><b>getMediaCacheItem</b></a> () Get the Media Cache item associated with this instance.
int	<a href="#"><b>getPort</b></a> () Get the port to be used for connecting to the remote source.

int	<a href="#"><u>getReadRetries()</u></a> Get the retries set for this instance
int	<a href="#"><u>getReadTimeout()</u></a> Get the current read time out set.
int	<a href="#"><u>getReceiveBufferSize()</u></a> Get the receive buffer size set.
int	<a href="#"><u>getSendBufferSize()</u></a> Get the send buffer size set.
void	<a href="#"><u>init()</u></a> Initialize the HTTP Reader Factory.
boolean	<a href="#"><u>isRequestFullURL()</u></a> Set if the request should contain the full URL.
void	<a href="#"><u>setConnectionTimeout(int connectionTimeout)</u></a> Set the connection timeout, milliseconds.
void	<a href="#"><u>setDestinationAddress(String host, int port)</u></a> Set the destination host and port where to retrieve data.
void	<a href="#"><u>setMediaCacheItem(IMediaCacheItem mediaCacheItem)</u></a> Set the Media Cache item associated to this instance.
void	<a href="#"><u>setPort(int port)</u></a> Set the port to be used for connecting to the remote source.
void	<a href="#"><u>setProxyAddress(String host, int port)</u></a> Set the proxy host and port.
void	<a href="#"><u>setReadRetries(int readRetries)</u></a> Set the maximum number retries.
void	<a href="#"><u>setReadTimeout(int readTimeout)</u></a> Set the read timeout for data, milliseconds.
void	<a href="#"><u>setReceiveBufferSize(int receiveBufferSize)</u></a> Set the receive buffer size, byte size.
void	<a href="#"><u>setRequestFullURL(boolean requestFullURL)</u></a> Flag to set if a full URL is required as part of the head/read request.
void	<a href="#"><u>setSendBufferSize(int sendBufferSize)</u></a> Set the send buffer size, byte size.

#### Methods inherited from interface com.wowza.util.IGenericPoolFactory

createInstance, destroyInstance

## Methods

### init

```
public void init()
```

(continued from last page)

Initialize the HTTP Reader Factory.

---

## addProperties

```
public void addProperties(WMSProperties properties)
```

Add properties to this specific factory, these could be passed from

### Parameters:

[WMSProperties](#) - properties

---

## createInstance

```
public IMediaCacheHTTPByteReader createInstance( )
```

Create a HTTP byte reader suited to this factory.

### Returns:

[IMediaCacheHTTPByteReader](#)

---

## destroyInstance

```
public void destroyInstance(IMediaCacheHTTPByteReader instance)
```

Destroy the HTTP Byte reader associated with this factory implementation

### Parameters:

[IMediaCacheHTTPByteReader](#) - instance

---

## setMediaCacheItem

```
public void setMediaCacheItem(IMediaCacheItem mediaCacheItem)
```

Set the Media Cache item associated to this instance.

### Parameters:

[IMediaCacheItem](#) - mediaCacheItem

---

## getMediaCacheItem

```
public IMediaCacheItem getMediaCacheItem( )
```

Get the Media Cache item associated with this instance.

### Returns:

[IMediaCacheItem](#)

---

## setDestinationAddress

```
public void setDestinationAddress(String host,  
int port)
```

Set the destination host and port where to retrieve data. It is up to the specific implementation to use these or not.

### Parameters:

String - host

int - port

---

## setProxyAddress

```
public void setProxyAddress(String host,  
                             int port)
```

Set the proxy host and port. It is up to the specific byte reader implementation to implement support for proxy connections.

**Parameters:**

String - host  
int - port

---

## isRequestFullURL

```
public boolean isRequestFullURL()
```

Set if the request should contain the full URL. It is up to the specific implementation to use this.

**Returns:**

boolean

---

## setRequestFullURL

```
public void setRequestFullURL(boolean requestFullURL)
```

Flag to set if a full URL is required as part of the head/read request.

**Parameters:**

boolean - requestFullURL

---

## getReadTimeout

```
public int getReadTimeout()
```

Get the current read time out set.

**Returns:**

int

---

## setReadTimeout

```
public void setReadTimeout(int readTimeout)
```

Set the read timeout for data, milliseconds. It is up to the specific byte reader implementation to use this setting.

**Parameters:**

int - readTimeout

---

## getConnectionTimeout

```
public int getConnectionTimeout()
```

Get the current connection timeout set.

**Returns:**

int

---

(continued from last page)

## setConnectionTimeout

```
public void setConnectionTimeout(int connectionTimeout)
```

Set the connection timeout, milliseconds. It is up to the specific byte reader implementation to use this setting.

**Parameters:**

int - connectionTimeout

---

## getPort

```
public int getPort()
```

Get the port to be used for connecting to the remote source.

**Returns:**

int

---

## setPort

```
public void setPort(int port)
```

Set the port to be used for connecting to the remote source. It is up to the specific byte reader implementation to use this setting.

**Parameters:**

int - port

---

## getReadRetries

```
public int getReadRetries()
```

Get the retries set for this instance

**Returns:**

int

---

## setReadRetries

```
public void setReadRetries(int readRetries)
```

Set the maximum number retries. It is up to the specific byte reader implementation to use this setting.

**Parameters:**

int - maxRetries

---

## getSendBufferSize

```
public int getSendBufferSize()
```

Get the send buffer size set.

**Returns:**

int

---

## setSendBufferSize

```
public void setSendBufferSize(int sendBufferSize)
```

(continued from last page)

Set the send buffer size, byte size. It is up to the specific byte reader implementation to use this setting.

**Parameters:**

sendBufferSize

---

## getReceiveBufferSize

```
public int getReceiveBufferSize()
```

Get the receive buffer size set.

**Returns:**

int

---

## setReceiveBufferSize

```
public void setReceiveBufferSize(int receiveBufferSize)
```

Set the receive buffer size, byte size. It is up to the specific byte reader implementation to use this setting.

**Parameters:**

receiveBufferSize

## **com.wowza.wms.mediacache.impl**

Package

**com.wowza.wms.mediacache.model**

# com.wowza.wms.mediacache.model

## Interface IMediaCacheContextMapper

public interface **IMediaCacheContextMapper**  
extends

Interface for ContextMapper implementations

This interface is invoked via the ContextMapperClass configuration item in the main MediaCache configuration section.

When the context mapper class implementation is in use the configuration parameters

URLEscapeStreamNameSpaces  
URLEscapeStreamNameAll

are no longer implemented and it is up to the context mapper to implement these if needed.

Method Summary	
String	<a href="#">getMediaNameFromContext</a> ( <a href="#">IApplicationInstance</a> appInstance, <a href="#">IMediaStream</a> stream, String basePath, String mediaName, String mediaExtension)
void	<a href="#">init</a> (MediaCache mediaCache) Initialize the context mapper.

## Methods

### init

public void **init**(MediaCache mediaCache)

Initialize the context mapper. This provides the context for the instance of media cache being used.

**Parameters:**  
MediaCache - mediaCache

### getMediaNameFromContext

public String **getMediaNameFromContext**([IApplicationInstance](#) appInstance, [IMediaStream](#) stream, String basePath, String mediaName, String mediaExtension)

(continued from last page)

This is called each time a request is made into the MediaCache system for retrieval.

The input parameters provide a context of the request

appInstance - Application instance related to the client making the request

stream - IMediaStream object directly attached to the client

basePath - The current source base path the request will be services by. If this is empty then

no source was found for the request

mediaName - The asset name with the source prefixed, such as http/mp4:sample.mp4. This would indicate

the source with a prefix of http/ was being used.

mediaExtension - This is the extension of the asset, so commonly mp4.

The return parameter should be the mediaName needed to satisfy the Media Cache request.

At this stage you can change/manipulate the mediaName to point to a different source, or even serve completely different content if required.

If you do not want to do anything you can pass the mediaName directly to the output parameter.

**Parameters:**

appInstance  
stream  
basePath  
mediaName  
mediaExtension

**Returns:**

String

## com.wowza.wms.mediacache.model Interface IMediaCacheItem

public interface **IMediaCacheItem**  
extends

IMediaCacheItem

### Field Summary

public static final	<a href="#">PROPS_ITEM_LASTMODIFIED</a> Value: <b>mediaCacheItem.lastModified</b>
public static final	<a href="#">PROPS_ITEM_LENGTH</a> Value: <b>mediaCacheItem.length</b>
public static final	<a href="#">PROPS_ITEM_MEDIANAME</a> Value: <b>mediaCacheItem.mediaName</b>
public static final	<a href="#">PROPS_SOURCE_BLOCKSIZE</a> Value: <b>mediaCacheSource.blockSize</b>
public static final	<a href="#">PROPS_SOURCE_NAME</a> Value: <b>mediaCacheSource.name</b>

### Method Summary

void	<a href="#">addPendingWrites</a> (MediaCacheBlockPtr blockPtr) Add the block to the list of pending writes
long	<a href="#">blockSize</a> () Get the block size configured for this item
void	<a href="#">close</a> () Close the item
void	<a href="#">decPendingWriteCount</a> () Decrement the pending write count
boolean	<a href="#">exists</a> () Return if the item exists
long	<a href="#">getBlockCount</a> () Get the block count
MediaCacheBlockPtr	<a href="#">getBlockPtr</a> (long offset, long length) Get a block pointer for the offset and length given
long	<a href="#">getBlockSize</a> () Get the block size for the item

MediaCacheItemInfo	<a href="#">getInfo()</a> Get the MediaCacheItemInfo object for this item
String	<a href="#">getLocalPath()</a> Get the local path for the item
int	<a href="#">getLockCount()</a> Get the current lock count
long	<a href="#">getMaxTimeToLive()</a> Get the maximum time to live for the item
<a href="#">IMediaCacheSource</a>	<a href="#">getMediaCacheSource()</a> Gets the MediaCache source for the item
java.io.File	<a href="#">getMediaFile()</a> Get the file pointed to for this CacheItem
String	<a href="#">getMediaName()</a> Get the MediaName for this item
long	<a href="#">getMinTimeToLive()</a> Get the minimum time to live for the item
long	<a href="#">getPendingWriteCount()</a> Get the pending write count
MediaCacheBlockPtr	<a href="#">getPendingWrites(long blockId)</a> Get the block from the list of pending writes
<a href="#">IMediaCacheStoreItem</a>	<a href="#">getStoreItem()</a> Get the store item object for this item
<a href="#">IMediaCacheStoreItem</a>	<a href="#">getStoreItem(boolean doLoad)</a> Get the item from the store.
edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock	<a href="#">getSyncLock()</a> Get the WMSReadWriteLock object
void	<a href="#">incPendingWriteCount()</a> Increment the pending write count
boolean	<a href="#">init(String mediaName, <a href="#">IMediaCacheStoreItem</a> storeItem)</a> Initialize the item
boolean	<a href="#">isBlockInCache(long block)</a> Check if the block needed is already cached
boolean	<a href="#">isLocal()</a> Return if the item is local
boolean	<a href="#">isReadAheadTrigger(long pos, int threshold)</a> Determine if the read ahead should occur
long	<a href="#">lastModified()</a> Get the last modified time of the item

long	<a href="#"><u>length()</u></a> Get the length of the item
int	<a href="#"><u>lock()</u></a> Add to lock count for item
long	<a href="#"><u>posToBlock(long pos)</u></a> Convert the position given into a block number
void	<a href="#"><u>preload()</u></a> Start the readahead system
long	<a href="#"><u>read(MediaCacheReadContext readContext, long foffset, byte[] buffer, long boffset, long length)</u></a> Reads data using the read context and returns the byte count read
MediaCacheReadResult	<a href="#"><u>read(MediaCacheReadContext readContext, long foffset, long length)</u></a> Reads data using the read context and returns a MediaCacheReadResult object
void	<a href="#"><u>readAhead()</u></a> Read ahead for all pending read ahead objects
MediaCacheBlockPtr	<a href="#"><u>removePendingWrites(long blockId)</u></a> Remove the block from list of pending writes
void	<a href="#"><u>saveBlock(MediaCacheBlockPtr blockPtr)</u></a> Save the block provided by the block pointer object
void	<a href="#"><u>setLastModified(long lastModified)</u></a> Set the last modified time of the item
void	<a href="#"><u>setLastRelease(long lastRelease)</u></a> Set the last release time of the item
void	<a href="#"><u>setLength(long length)</u></a> Set the length of the item
void	<a href="#"><u>setLocal(boolean isLocal)</u></a> Set if the item is local
void	<a href="#"><u>setLocalPath(String localPath)</u></a> Set the local path for the item
void	<a href="#"><u>setMaxTimeToLive(long maxTimeToLive)</u></a> Set the maximum time to live for the item
void	<a href="#"><u>setMediaCacheSource(IMediaCacheSource mediaCacheSource)</u></a> Sets the MediaCache source for the item
void	<a href="#"><u>setMediaName(String name)</u></a> Set the MediaName for this item
void	<a href="#"><u>setMinTimeToLive(long minTimeToLive)</u></a> Set the minimum time to live for the item
void	<a href="#"><u>tiggerReadAhead(long pos)</u></a> Cause a read ahead
int	<a href="#"><u>unlock()</u></a> Remove from lock count from item

boolean	<a href="#">validate()</a> Validate this item
boolean	<a href="#">validate()</a> ( java.util.Properties props) Validate this item with your own properties

## Fields

### PROPS\_ITEM\_LENGTH

```
public static final java.lang.String PROPS_ITEM_LENGTH
```

Constant value: **mediaCacheItem.length**

### PROPS\_ITEM\_LASTMODIFIED

```
public static final java.lang.String PROPS_ITEM_LASTMODIFIED
```

Constant value: **mediaCacheItem.lastModified**

### PROPS\_ITEM\_MEDIANAME

```
public static final java.lang.String PROPS_ITEM_MEDIANAME
```

Constant value: **mediaCacheItem.mediaName**

### PROPS\_SOURCE\_NAME

```
public static final java.lang.String PROPS_SOURCE_NAME
```

Constant value: **mediaCacheSource.name**

### PROPS\_SOURCE\_BLOCKSIZE

```
public static final java.lang.String PROPS_SOURCE_BLOCKSIZE
```

Constant value: **mediaCacheSource.blockSize**

## Methods

### getMediaCacheSource

```
public IMediaCacheSource getMediaCacheSource()
```

Gets the MediaCache source for the item

**Returns:**

IMediaCacheSource

(continued from last page)

---

## setMediaCacheSource

```
public void setMediaCacheSource(IMediaCacheSource mediaCacheSource)
```

Sets the MediaCache source for the item

**Parameters:**

mediaCacheSource

---

## lock

```
public int lock()
```

Add to lock count for item

**Returns:**

int

---

## unlock

```
public int unlock()
```

Remove from lock count from item

**Returns:**

int

---

## getLockCount

```
public int getLockCount()
```

Get the current lock count

**Returns:**

int

---

## getSyncLock

```
public edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock  
getSyncLock()
```

Get the WMSReadWriteLock object

**Returns:**

WMSReadWriteLock

---

## init

```
public boolean init(String mediaName,  
    IMediaCacheStoreItem storeItem)
```

Initialize the item

**Parameters:**

mediaName

storeItem

**Returns:**

boolean - false failed to init, true success

---

## close

```
public void close()
```

Close the item

---

## getBlockPtr

```
public MediaCacheBlockPtr getBlockPtr(long offset,  
                                         long length)
```

Get a block pointer for the offset and length given

**Parameters:**

offset  
length

**Returns:**

MediaCacheBlockPtr

---

## saveBlock

```
public void saveBlock(MediaCacheBlockPtr blockPtr)
```

Save the block provided by the block pointer object

**Parameters:**

blockPtr

---

## readAhead

```
public void readAhead()
```

Read ahead for all pending read ahead objects

---

## getMediaFile

```
public java.io.File getMediaFile()
```

Get the file pointed to for this CacheItem

**Returns:**

File

---

## isBlockInCache

```
public boolean isBlockInCache(long block)
```

Check if the block needed is already cached

**Parameters:**

block

**Returns:**

boolean - cached is true, not cached false

---

(continued from last page)

## blockSize

```
public long blockSize()
```

Get the block size configured for this item

**Returns:**

long

---

## validate

```
public boolean validate()
```

Validate this item

**Returns:**

boolean - valid is true, not valid is false

---

## validate

```
public boolean validate(java.util.Properties props)
```

Validate this item with your own properties

**Parameters:**

props

**Returns:**

boolean - valid is true, not valid is false

---

## getInfo

```
public MediaCacheItemInfo getInfo()
```

Get the MediaCacheItemInfo object for this item

**Returns:**

MediaCacheItemInfo

---

## getMediaName

```
public String getMediaName()
```

Get the MediaName for this item

**Returns:**

String

---

## setMediaName

```
public void setMediaName(String name)
```

Set the MediaName for this item

**Parameters:**

name

(continued from last page)

## getStoreItem

```
public IMediaCacheStoreItem getStoreItem( )
```

Get the store item object for this item

**Returns:**

[IMediaCacheStoreItem](#)

---

## getStoreItem

```
public IMediaCacheStoreItem getStoreItem(boolean doLoad)
```

Get the item from the store. If doLoad is set to true or the item is already loaded then the item is returned, otherwise a new store item is returned

**Parameters:**

doLoad

**Returns:**

[IMediaCacheStoreItem](#)

---

## addPendingWrites

```
public void addPendingWrites(MediaCacheBlockPtr blockPtr)
```

Add the block to the list of pending writes

**Parameters:**

blockPtr

---

## removePendingWrites

```
public MediaCacheBlockPtr removePendingWrites(long blockId)
```

Remove the block from list of pending writes

**Parameters:**

blockId

**Returns:**

[MediaCacheBlockPtr](#)

---

## getPendingWrites

```
public MediaCacheBlockPtr getPendingWrites(long blockId)
```

Get the block from the list of pending writes

**Parameters:**

blockId

**Returns:**

[MediaCacheBlockPtr](#)

---

## incPendingWriteCount

```
public void incPendingWriteCount( )
```

(continued from last page)

Increment the pending write count

---

## decPendingWriteCount

```
public void decPendingWriteCount()
```

Decrement the pending write count

---

## getPendingWriteCount

```
public long getPendingWriteCount()
```

Get the pending write count

**Returns:**

long

---

## getMinTimeToLive

```
public long getMinTimeToLive()
```

Get the minimum time to live for the item

**Returns:**

long

---

## setMinTimeToLive

```
public void setMinTimeToLive(long minTimeToLive)
```

Set the minimum time to live for the item

**Parameters:**

minTimeToLive

---

## getMaxTimeToLive

```
public long getMaxTimeToLive()
```

Get the maximum time to live for the item

**Returns:**

long

---

## setMaxTimeToLive

```
public void setMaxTimeToLive(long maxTimeToLive)
```

Set the maximum time to live for the item

**Parameters:**

maxTimeToLive

---

## getBlockSize

```
public long getBlockSize()
```

Get the block size for the item

(continued from last page)

**Returns:**

long

---

**getBlockCount**

```
public long getBlockCount()
```

Get the block count

**Returns:**

long

---

**isReadAheadTrigger**

```
public boolean isReadAheadTrigger(long pos,  
    int threshold)
```

Determine if the read ahead should occur

**Parameters:**

pos

threshold

**Returns:**

boolean - readahead true, no readahead false

---

**tiggerReadAhead**

```
public void tiggerReadAhead(long pos)
```

Cause a read ahead

**Parameters:**

pos

---

**posToBlock**

```
public long posToBlock(long pos)
```

Convert the position given into a block number

**Parameters:**

pos

**Returns:**

long

---

**preload**

```
public void preload()
```

Start the readahead system

---

**getLocalPath**

```
public String getLocalPath()
```

Get the local path for the item

(continued from last page)

**Returns:**String

---

**setLocalPath**

```
public void setLocalPath(String localPath)
```

Set the local path for the item

**Parameters:**localPath

---

**isLocal**

```
public boolean isLocal()
```

Return if the item is local

**Returns:**boolean - local is true, not local is false

---

**setLocal**

```
public void setLocal(boolean isLocal)
```

Set if the item is local

**Parameters:**isLocal

---

**exists**

```
public boolean exists()
```

Return if the item exists

**Returns:**boolean - exists is true, does not exist is false

---

**length**

```
public long length()
```

Get the length of the item

**Returns:**long

---

**setLength**

```
public void setLength(long length)
```

Set the length of the item

**Parameters:**length

---

## lastModified

```
public long lastModified()
```

Get the last modified time of the item

**Returns:**

long

---

## setLastModified

```
public void setLastModified(long lastModified)
```

Set the last modified time of the item

**Parameters:**

lastModified

---

## setLastRelease

```
public void setLastRelease(long lastRelease)
```

Set the last release time of the item

**Parameters:**

lastRelease

---

## read

```
public long read(MediaCacheReadContext readContext,  
                long foffset,  
                byte[] buffer,  
                long boffset,  
                long length)
```

Reads data using the read context and returns the byte count read

**Parameters:**

readContext  
foffset  
buffer  
boffset  
length

**Returns:**

long

---

## read

```
public MediaCacheReadResult read(MediaCacheReadContext readContext,  
                                  long foffset,  
                                  long length)
```

Reads data using the read context and returns a MediaCacheReadResult object

**Parameters:**

readContext  
foffset

---

(continued from last page)

length

**Returns:**  
MediaCacheReadResult

## com.wowza.wms.mediacache.model Interface IMediaCacheReader

public interface **IMediaCacheReader**  
extends

IMediaCacheReader

### Method Summary

void	<a href="#"><code>close()</code></a> Close the reader
long	<a href="#"><code>getFilePointer()</code></a> Get the file pointer for this reader
<a href="#"><code>IMediaCacheItem</code></a>	<a href="#"><code>getMediaCacheItem()</code></a> Get the MediaCache item associated with this reader
Object	<a href="#"><code>getOpaqueObject()</code></a> Get the opaque object
long	<a href="#"><code>lastModified()</code></a> Get the last modified time
long	<a href="#"><code>length()</code></a> Get the length
void	<a href="#"><code>open()</code></a> Open the reader
int	<a href="#"><code>read(byte[] buffer, int offset, int len)</code></a> Read bytes for this reader
void	<a href="#"><code>seek(long pos)</code></a> Seek to the position provided
void	<a href="#"><code>setMediaCacheItem(IMediaCacheItem mediaCacheItem)</code></a> Set the MediaCache item associated with this reader
void	<a href="#"><code>setOpaqueObject(Object object)</code></a> Set the opaque object

### Methods

#### **seek**

public void **seek**(long pos)

Seek to the position provided

**Parameters:**

pos

## getFilePointer

```
public long getFilePointer()
```

Get the file pointer for this reader

**Returns:**

long

---

## read

```
public int read(byte[] buffer,  
                int offset,  
                int len)
```

Read bytes for this reader

**Parameters:**

buffer  
offset  
len

**Returns:**

int - number of bytes read

---

## setMediaCacheItem

```
public void setMediaCacheItem(IMediaCacheItem mediaCacheItem)
```

Set the MediaCache item associated with this reader

**Parameters:**

mediaCacheItem

---

## getMediaCacheItem

```
public IMediaCacheItem getMediaCacheItem()
```

Get the MediaCache item associated with this reader

**Returns:**

IMediaCacheItem

---

## open

```
public void open()
```

Open the reader

---

## close

```
public void close()
```

Close the reader

---

(continued from last page)

## length

```
public long length()
```

Get the length

**Returns:**

long

---

## lastModified

```
public long lastModified()
```

Get the last modified time

**Returns:**

long

---

## getOpaqueObject

```
public Object getOpaqueObject()
```

Get the opaque object

**Returns:**

Object

---

## setOpaqueObject

```
public void setOpaqueObject(Object object)
```

Set the opaque object

**Parameters:**

object

---

## com.wowza.wms.mediache.model

### Interface IMediaCacheSource

public interface **IMediaCacheSource**  
 extends

Internal use do not use. Please see descriptions in IMediaCacheItemHTTPReaderFactory and IMediaCacheHTTPByteReader

#### Method Summary

boolean	<a href="#"><u>canHandle</u></a> (String mediaName)
String	<a href="#"><u>getBaseClass</u></a> ()
int	<a href="#"><u>getDefaultBlockSize</u></a> ()
String	<a href="#"><u>getDescription</u></a> ()
long	<a href="#"><u>getMaxTimeToLive</u></a> ()
MediaCache	<a href="#"><u>getMediaCache</u></a> ()
long	<a href="#"><u>getMinTimeToLive</u></a> ()
String	<a href="#"><u>getName</u></a> ()
MediaCachePerformance Counter	<a href="#"><u>getPerformanceCount</u></a> ()
String	<a href="#"><u>getPrefix</u></a> ()
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties</u></a> ()
int	<a href="#"><u>getReadAheadThreshold</u></a> ()
String	<a href="#"><u>getReaderClass</u></a> ()
String	<a href="#"><u>getSourcePath</u></a> ()
boolean	<a href="#"><u>isPassThru</u></a> ()
boolean	<a href="#"><u>isReadAhead</u></a> ()
<a href="#"><u>IMediaCacheItem</u></a>	<a href="#"><u>loadCacheItem</u></a> (String mediaName, <a href="#"><u>IMediaCacheStoreItem</u></a> storeItem)
<a href="#"><u>IMediaCacheItem</u></a>	<a href="#"><u>loadCacheItem</u></a> (String mediaName, <a href="#"><u>IMediaCacheStoreItem</u></a> storeItem, long length, long lastModified)

<a href="#"><u>IMediaCacheItem</u></a>	<a href="#"><u>newCacheItem</u></a> (String mediaName)
void	<a href="#"><u>setBaseClass</u></a> (String baseClass)
void	<a href="#"><u>setDefaultBlockSize</u></a> (int defaultBlockSize)
void	<a href="#"><u>setDescription</u></a> (String description)
void	<a href="#"><u>setMaxTimeToLive</u></a> (long maxTimeToLive)
void	<a href="#"><u>setMediaCache</u></a> (MediaCache mediaCache)
void	<a href="#"><u>setMinTimeToLive</u></a> (long minTimeToLive)
void	<a href="#"><u>setName</u></a> (String name)
void	<a href="#"><u>setPassThru</u></a> (boolean isPassThru)
void	<a href="#"><u>setPrefix</u></a> (String prefix)
void	<a href="#"><u>setProperties</u></a> ( <a href="#"><u>WMSProperties</u></a> properties)
void	<a href="#"><u>setReadAhead</u></a> (boolean readAhead)
void	<a href="#"><u>setReadAheadThreshold</u></a> (int readAheadThreshold)
void	<a href="#"><u>setReaderClass</u></a> (String readerClass)
void	<a href="#"><u>setSourcePath</u></a> (String sourcePath)

## Methods

### canHandle

```
public boolean canHandle(String mediaName)
```

### newCacheItem

```
public IMediaCacheItem newCacheItem(String mediaName)
```

### loadCacheItem

```
public IMediaCacheItem loadCacheItem(String mediaName,  
    IMediaCacheStoreItem storeItem)
```

---

## loadCacheItem

```
public IMediaCacheItem loadCacheItem(String mediaName,  
    IMediaCacheStoreItem storeItem,  
    long length,  
    long lastModified)
```

---

## getName

```
public String getName()
```

---

## setName

```
public void setName(String name)
```

---

## setPrefix

```
public void setPrefix(String prefix)
```

---

## getPrefix

```
public String getPrefix()
```

---

## getDescription

```
public String getDescription()
```

---

## setDescription

```
public void setDescription(String description)
```

---

## getBaseClass

```
public String getBaseClass()
```

---

## setBaseClass

```
public void setBaseClass(String baseClass)
```

---

### getSourcePath

```
public String getSourcePath()
```

---

### setSourcePath

```
public void setSourcePath(String sourcePath)
```

---

### getDefaultBlockSize

```
public int getDefaultBlockSize()
```

---

### setDefaultBlockSize

```
public void setDefaultBlockSize(int defaultBlockSize)
```

---

### getProperties

```
public WMSProperties getProperties()
```

---

### setProperties

```
public void setProperties(WMSProperties properties)
```

---

### getReaderClass

```
public String getReaderClass()
```

---

### setReaderClass

```
public void setReaderClass(String readerClass)
```

---

### getMediaCache

```
public MediaCache getMediaCache()
```

---

### setMediaCache

```
public void setMediaCache(MediaCache mediaCache)
```

---

(continued from last page)

---

## getPerformanceCount

```
public MediaCachePerformanceCounter getPerformanceCount()
```

---

## getMinTimeToLive

```
public long getMinTimeToLive()
```

---

## setMinTimeToLive

```
public void setMinTimeToLive(long minTimeToLive)
```

---

## getMaxTimeToLive

```
public long getMaxTimeToLive()
```

---

## setMaxTimeToLive

```
public void setMaxTimeToLive(long maxTimeToLive)
```

---

## isReadAhead

```
public boolean isReadAhead()
```

---

## setReadAhead

```
public void setReadAhead(boolean readAhead)
```

---

## getReadAheadThreshold

```
public int getReadAheadThreshold()
```

---

## setReadAheadThreshold

```
public void setReadAheadThreshold(int readAheadThreshold)
```

---

(continued from last page)

## **isPassThru**

```
public boolean isPassThru()
```

---

## **setPassThru**

```
public void setPassThru(boolean isPassThru)
```

## com.wowza.wms.mediacache.model Interface IMediaCacheSourceNotify

public interface **IMediaCacheSourceNotify**  
extends

MediaCache Interface for source creation and destroy notifications

This interface can be configured via the CacheSourceListenerClassList configuration item in the main MediaCache configuration section.

```
<CacheSourceListenerClassList>com.wowza.mediacache.example.sourcelistener</CacheSourceListene  
rClassList>
```

It is triggered when a source is added/removed from the running MediaCache configuration. This is done either as MediaCache starts up or dynamically via the API.

### Method Summary

void	<a href="#">onMediaCacheSourceCreate</a> ( <a href="#">IMediaCacheSource</a> mediaCacheSource) When a source is added this is called with the current source as a parameter.
void	<a href="#">onMediaCacheSourceDestroy</a> ( <a href="#">IMediaCacheSource</a> mediaCacheSource) When a source is removed successfully this is called with the source that has been removed as a parameter.

### Methods

#### onMediaCacheSourceCreate

public void **onMediaCacheSourceCreate**([IMediaCacheSource](#) mediaCacheSource)

When a source is added this is called with the current source as a parameter.

**Parameters:**

mediaCacheSource

#### onMediaCacheSourceDestroy

public void **onMediaCacheSourceDestroy**([IMediaCacheSource](#) mediaCacheSource)

When a source is removed successfully this is called with the source that has been removed as a parameter.

**Parameters:**

mediaCacheSource

## com.wowza.wms.mediacache.model Interface IMediaCacheStoreItem

public interface **IMediaCacheStoreItem**  
extends

Interface that describes items within a Media Cache store.

### Method Summary

byte[]	<a href="#">getBlockMask()</a> Internal
String	<a href="#">getBlockPath()</a> Get the path of the block associated with this item.
String	<a href="#">getMediaPath()</a> Get the path of the media associated with this item.
java.util.Properties	<a href="#">getProperties()</a> Get the properties for this item
String	<a href="#">getPropertiesPath()</a> Get the full path of the properties
MediaCacheStore	<a href="#">getStore()</a> Get the store associated to this item.
void	<a href="#">initMedia(long length)</a> Initialise the media entry with the length of the asset.
long	<a href="#">length()</a> Get the length of the asset.
void	<a href="#">setBlockMask(byte[] blockMask)</a> Internal
void	<a href="#">setLength(long length)</a> Set the length of the asset.
void	<a href="#">setProperties(java.util.Properties props)</a> Set the properties for this item.
String	<a href="#">toString()</a>
void	<a href="#">updateBlockMask(byte[] blockMask, long offset, long len)</a> Internal

### Methods

#### getStore

public MediaCacheStore **getStore()**

---

(continued from last page)

Get the store associated to this item.

**Returns:**

MediaCacheStore

---

## setProperty

```
public void setProperty(java.util.Properties props)
```

Set the properties for this item.

**Parameters:**

Properties - props

---

## getProperty

```
public java.util.Properties getProperty()
```

Get the properties for this item

**Returns:**

Properties

---

## getPropertyPath

```
public String getPropertyPath()
```

Get the full path of the properties

**Returns:**

---

## initMedia

```
public void initMedia(long length)
```

Initialise the media entry with the length of the asset.

**Parameters:**

length

---

## getMediaPath

```
public String getMediaPath()
```

Get the path of the media associated with this item.

**Returns:**

String

---

## getBlockPath

```
public String getBlockPath()
```

Get the path of the block associated with this item.

**Returns:**

String

---

---

## setBlockMask

```
public void setBlockMask(byte[] blockMask)
```

Internal

### Parameters:

blockMask

---

## getBlockMask

```
public byte[] getBlockMask()
```

Internal

### Returns:

byte[]

---

## updateBlockMask

```
public void updateBlockMask(byte[] blockMask,  
                             long offset,  
                             long len)
```

Internal

### Parameters:

blockMask

offset

len

---

## toString

```
public String toString()
```

---

## length

```
public long length()
```

Get the length of the asset.

### Returns:

long

---

## setLength

```
public void setLength(long length)
```

Set the length of the asset. Should be identical size when initMedia is called.

### Parameters:

length

---

## com.wowza.wms.mediacache.model Interface IMediaCacheStoreItemEvent

public interface **IMediaCacheStoreItemEvent**  
extends

Interface for Store Item GC events

When an item within a store is about to be processed for removal this provides the detailed information of the item.

It gives the opportunity to alter the timing parameters of the item so to delay when it is next processed or allow it to be removed.

The default is for the item to be removed unless this is changed with

```
item.setItemRemove(false);
```

### Method Summary

boolean	<a href="#"><u>getBadItemTime()</u></a> Gets the current bad item state
long	<a href="#"><u>getFreedSpaceTotal()</u></a> Get the total space to be made available
String	<a href="#"><u>getItemName()</u></a> Get the item name
int	<a href="#"><u>getItemNumber()</u></a> Get this item number
boolean	<a href="#"><u>getItemRemove()</u></a> Get the item remove flag
long	<a href="#"><u>getItemSize()</u></a> Gets the item size in bytes
String	<a href="#"><u>getItemStorePath()</u></a> Get the item store path
int	<a href="#"><u>getItemTotalCount()</u></a> Get the total number of items to be processed
boolean	<a href="#"><u>getMaxTTLReached()</u></a> Gets the MaxTTL reached state
boolean	<a href="#"><u>getMinTTLReached()</u></a> Gets the MinTTL reached state

long	<a href="#"><u>getReleaseItemTime</u></a> ( ) Gets release time in milliseconds
void	<a href="#"><u>setBadItemTime</u></a> (boolean state) Sets the state for bad item time
void	<a href="#"><u>setFreedSpaceTotal</u></a> (long size) Set the total space to be made available
void	<a href="#"><u>setItemName</u></a> (String name) Set the item name
void	<a href="#"><u>setItemNumber</u></a> (int number) Set this item number
void	<a href="#"><u>setItemReleaseTime</u></a> (long releaseTime) Sets the item current release time
void	<a href="#"><u>setItemRemove</u></a> (boolean state) Set the item remove flag
void	<a href="#"><u>setItemSize</u></a> (long size) Sets the item size in bytes
void	<a href="#"><u>setItemStorePath</u></a> (String path) Set the item store path
void	<a href="#"><u>setItemTotalCount</u></a> (int count) Set the total number of items to be processed
void	<a href="#"><u>setMaxTTLReached</u></a> (boolean state) Sets the MaxTTL reached state
void	<a href="#"><u>setMinTTLReached</u></a> (boolean state) Sets the MinTTL reached state

## Methods

### setItemName

public void **setItemName**(String name)

Set the item name

**Parameters:**  
name

### getItemName

public String **getItemName**( )

Get the item name

**Returns:**  
item name

(continued from last page)

---

## setItemStorePath

```
public void setItemStorePath(String path)
```

Set the item store path

**Parameters:**  
path

---

## getItemStorePath

```
public String getItemStorePath()
```

Get the item store path

**Returns:**  
storage path

---

## setItemReleaseTime

```
public void setItemReleaseTime(long releaseTime)
```

Sets the item current release time

**Parameters:**  
releaseTime - time in milliseconds

---

## getReleaseItemTime

```
public long getReleaseItemTime()
```

Gets release time in milliseconds

**Returns:**  
time in milliseconds

---

## setBadItemTime

```
public void setBadItemTime(boolean state)
```

Sets the state for bad item time

**Parameters:**  
state

---

## getBadItemTime

```
public boolean getBadItemTime()
```

Gets the current bad item state

**Returns:**  
state

---

## setMaxTTLReached

```
public void setMaxTTLReached(boolean state)
```

---

(continued from last page)

Sets the MaxTTL reached state

**Parameters:**  
state

---

## getMaxTTLReached

```
public boolean getMaxTTLReached()
```

Gets the MaxTTL reached state

**Returns:**  
maxTTL reached state

---

## setMinTTLReached

```
public void setMinTTLReached(boolean state)
```

Sets the MinTTL reached state

**Parameters:**  
state

---

## getMinTTLReached

```
public boolean getMinTTLReached()
```

Gets the MinTTL reached state

**Returns:**  
MinTTL reached state

---

## setItemSize

```
public void setItemSize(long size)
```

Sets the item size in bytes

**Parameters:**  
size

---

## getItemSize

```
public long getItemSize()
```

Gets the item size in bytes

**Returns:**  
item size in bytes

---

## setFreedSpaceTotal

```
public void setFreedSpaceTotal(long size)
```

Set the total space to be made available

**Parameters:**  
size

---

## getFreedSpaceTotal

```
public long getFreedSpaceTotal()
```

Get the total space to be made available

**Returns:**

total space to be made available

---

## setItemTotalCount

```
public void setItemTotalCount(int count)
```

Set the total number of items to be processed

**Parameters:**

count

---

## getItemTotalCount

```
public int getItemTotalCount()
```

Get the total number of items to be processed

**Returns:**

total number of items to be processed

---

## setItemNumber

```
public void setItemNumber(int number)
```

Set this item number

**Parameters:**

number

---

## getItemNumber

```
public int getItemNumber()
```

Get this item number

**Returns:**

item number

---

## setItemRemove

```
public void setItemRemove(boolean state)
```

Set the item remove flag

**Parameters:**

state

---

## getItemRemove

```
public boolean getItemRemove()
```

---

(continued from last page)

Get the item remove flag

**Returns:**

item remove flag

## com.wowza.wms.mediacache.model Interface IMediaCacheStoreItemListener

public interface **IMediaCacheStoreItemListener**  
extends

Interface for Store Item GC events

When an item within a store is about to be processed for removal this interface can be called and provide information on the item and the ability to change/update the decision being made.

The interface `IMediaCacheStoreItemEvent` provides the context of the item being removed.

### Method Summary

void	<a href="#"><code>init()</code></a> Initialise the CacheStoreItemListener
void	<a href="#"><code>processMediaCacheItemEvent(IMediaCacheStoreItemEvent itemEvent)</code></a> Process the itemEvent presented at GC time

### Methods

#### **init**

public void **init**()

Initialise the CacheStoreItemListener

#### **processMediaCacheItemEvent**

public void **processMediaCacheItemEvent**([`IMediaCacheStoreItemEvent`](#) itemEvent)

Process the itemEvent presented at GC time

##### **Parameters:**

itemEvent

# com.wowza.wms.mediacache.model Interface IMediaCacheStoreNotify

public interface **IMediaCacheStoreNotify**  
extends

MediaCache Interface for store creation and destroy notifications

This interface can be configured via the CacheStoreListenerClassList configuration item in the main MediaCache configuration section.

```
<CacheStoreListenerClassList>com.wowza.mediacache.example.storelistener</CacheStoreListenerClassList>
```

It is triggered when a store is added/removed from the running MediaCache configuration. This is done either as MediaCache starts up or dynamically via the API.

Method Summary		
	void	<a href="#">onMediaCacheStoreCreate</a> (MediaCacheStore mediaCacheStore) When a store is added this is called with the current store as a parameter.
	void	<a href="#">onMediaCacheStoreDestroy</a> (MediaCacheStore mediaCacheStore) When a store is removed successfully this is called with the store removed as a parameter.

## Methods

### onMediaCacheStoreCreate

public void **onMediaCacheStoreCreate**(MediaCacheStore mediaCacheStore)

When a store is added this is called with the current store as a parameter. You can not at this point alter a store configuration, any changes made are ignored.

**Parameters:**  
mediaCacheStore

### onMediaCacheStoreDestroy

public void **onMediaCacheStoreDestroy**(MediaCacheStore mediaCacheStore)

When a store is removed successfully this is called with the store removed as a parameter.

**Parameters:**  
mediaCacheStore

## com.wowza.wms.mediacache.model Interface IMediaCacheStoreTraverseFile

public interface **IMediaCacheStoreTraverseFile**  
extends

Interface to provide per file access when traversing a file tree

This interface is used as part of the cache reload functionality and can not be changed out from the internal implementation.

### Method Summary

void	<a href="#">onFile</a> (java.io.File item) Called when an item is selected.
------	--

### Methods

#### onFile

public void **onFile**(java.io.File item)

Called when an item is selected.

#### Parameters:

item

## com.wowza.wms.mediacache.model Interface IMediaCacheStoreTraverseItem

public interface **IMediaCacheStoreTraverseItem**  
extends

Interface to provide per MediaCache store item access when traversing the item tree

This interface is used as part of the cache reload functionality and can not be changed out from the internal implementation.

### Method Summary

void	<a href="#">onItem(IMediaCacheStoreItem item)</a> Called when an item is selected.
------	---

### Methods

#### onItem

public void **onItem**([IMediaCacheStoreItem](#) item)

Called when an item is selected.

**Parameters:**

item

---

Package

**com.wowza.wms.mediacaster**

## com.wowza.wms.mediacaster Interface IMediaCaster

public interface **IMediaCaster**  
extends

public static final	<a href="#">STREAMTIMEOUTREASON_NOURL</a> Value: <b>3</b>
public static final	<a href="#">STREAMTIMEOUTREASON_RECONNECTRUNNING</a> Value: <b>5</b>
public static final	<a href="#">STREAMTIMEOUTREASON_UNKNOWN</a> Value: <b>0</b>

## Method Summary

boolean	<a href="#">doWatchdog()</a> Idle processor
void	<a href="#">forceReset()</a> Force a reset/reconnect of this media caster
<a href="#">IApplicationInstance</a>	<a href="#">getAppInstance()</a> Get the application instance this media caster is associated with
long	<a href="#">getConnectLastAttempt()</a> Get system time in milliseconds of last connection attempt
long	<a href="#">getConnectLastForceReset()</a> Get system time in milliseconds of last time forceReset was called
long	<a href="#">getConnectLastSuccess()</a> Get system time in milliseconds of last connection success
int	<a href="#">getIdleTimeout()</a> Get the idle timeout for this media caster (milliseconds)
Object	<a href="#">getLock()</a> Get the MediaCaster lock for an individual MediaCaster item.
<a href="#">MediaCasterItem</a>	<a href="#">getMediaCasterDef()</a> Get the media caster definition
String	<a href="#">getMediaCasterId()</a> Get the media caster id
<a href="#">MediaCasterStreamItem</a>	<a href="#">getMediaCasterStreamItem()</a> Get the media caster item associated with this media caster
int	<a href="#">getMediaCasterType()</a> Get the media caster type.
int	<a href="#">getReconnectWaitTime()</a> Get the minimum time between reconnect attempts (milliseconds)
<a href="#">IMediaStream</a>	<a href="#">getStream()</a> Get the underlying stream being used by this media caster
long	<a href="#">getStreamLastSeq()</a> Get the AMFPacket sequence number of last watchdog processed packet

long	<a href="#"><u>getStreamMissingTime()</u></a> Get the time in milliseconds the stream has been missing
long	<a href="#"><u>getStreamRunningIndex()</u></a> Each time a MediaCaster stream switches from not running to running this value is incremented
int	<a href="#"><u>getStreamTimeout()</u></a> Get the watchdog stream timeout (milliseconds)
long	<a href="#"><u>getStreamTimeoutLastReset()</u></a> Get system time in milliseconds of last time stream was reset due to stream timeout (debug)
long	<a href="#"><u>getStreamTimeoutLastTime()</u></a> Get system time in milliseconds of last time stream was considered in missing state (debug)
int	<a href="#"><u>getStreamTimeoutReason()</u></a> Get the reason the stream is in timeout condition (debug)
<a href="#"><u>IVHost</u></a>	<a href="#"><u>getVHost()</u></a> Get the virtual host associated with this media caster
void	<a href="#"><u>init(MediaCasterStreamItem mediaCasterStreamItem, MediaCasterItem mediaCasterDef, IApplicationInstance appInstance, String mediaCasterId, String streamExt)</u></a> Initialize the media caster
boolean	<a href="#"><u>isSession()</u></a> Is there current a session attached to this MediaCaster
boolean	<a href="#"><u>isStream()</u></a> Is there a stream associated with this MediaCaster
boolean	<a href="#"><u>isStreamIsRunning()</u></a> Return true if stream is currently running
void	<a href="#"><u>registerPlayer(IMediaStreamPlay player)</u></a> Register a player with this media caster
void	<a href="#"><u>sessionClosed(org.apache.mina.common.io.Session session)</u></a> sessionClosed callback
void	<a href="#"><u>sessionOpened(org.apache.mina.common.io.Session session)</u></a> sessionOpened callback
void	<a href="#"><u>setAppInstance(IApplicationInstance appInstance)</u></a> Set the application instance this media caster is associated with
void	<a href="#"><u>setMediaCasterDef(MediaCasterItem mediaCasterDef)</u></a> Set the media caster definition
void	<a href="#"><u>setMediaCasterId(String mediaCasterId)</u></a> Get the media caster id
void	<a href="#"><u>setMediaCasterType(int mediaCasterType)</u></a> Set the media caster type.
void	<a href="#"><u>setReconnectWaitTime(int reconnectWaitTime)</u></a> Set the minimum time between reconnect attempts (milliseconds)

void	<a href="#"><code>setStream(IMediaStream stream)</code></a> Set the underlying stream being used by this media caster
void	<a href="#"><code>setStreamRunning(boolean streamRunning)</code></a> Called internally to track when streams are running or are stopped.
void	<a href="#"><code>setStreamTimeout(int streamTimeout)</code></a> Set the watchdog stream timeout (milliseconds)
void	<a href="#"><code>shutdown(boolean isAppInstanceShutdown)</code></a> Shutdown media caster
void	<a href="#"><code>unregisterPlayer(IMediaStreamPlay player)</code></a> Unregister a player with this media caster

## Fields

### STREAMTIMEOUTREASON\_UNKNOWN

```
public static final int STREAMTIMEOUTREASON_UNKNOWN
```

Constant value: **0**

### STREAMTIMEOUTREASON\_NOTIMEOUT

```
public static final int STREAMTIMEOUTREASON_NOTIMEOUT
```

Constant value: **1**

### STREAMTIMEOUTREASON\_NOSESSION

```
public static final int STREAMTIMEOUTREASON_NOSESSION
```

Constant value: **2**

### STREAMTIMEOUTREASON\_NOURL

```
public static final int STREAMTIMEOUTREASON_NOURL
```

Constant value: **3**

### STREAMTIMEOUTREASON\_NOSTREAM

```
public static final int STREAMTIMEOUTREASON_NOSTREAM
```

Constant value: **4**

### STREAMTIMEOUTREASON\_RECONNECTRUNNING

```
public static final int STREAMTIMEOUTREASON_RECONNECTRUNNING
```

(continued from last page)

Constant value: **5**

---

**STREAMTIMEOUTREASON\_NORTSPSESSION**

```
public static final int STREAMTIMEOUTREASON_NORTSPSESSION
```

Constant value: **6**

---

**STREAMTIMEOUTREASON\_GOOD**

```
public static final int STREAMTIMEOUTREASON_GOOD
```

Constant value: **100**

---

**STREAMTIMEOUTREASON\_MISSING**

```
public static final int STREAMTIMEOUTREASON_MISSING
```

Constant value: **101**

---

**MEDIACASTERTYPE\_UNKNOWN**

```
public static final int MEDIACASTERTYPE_UNKNOWN
```

Constant value: **0**

---

**MEDIACASTERTYPE\_LIVEREPEATER**

```
public static final int MEDIACASTERTYPE_LIVEREPEATER
```

Constant value: **1**

---

**MEDIACASTERTYPE\_SHOUTCAST**

```
public static final int MEDIACASTERTYPE_SHOUTCAST
```

Constant value: **2**

---

**MEDIACASTERTYPE\_RTPLIVE**

```
public static final int MEDIACASTERTYPE_RTPLIVE
```

Constant value: **3**

---

**MEDIACASTERTYPE\_CUPERTINO**

```
public static final int MEDIACASTERTYPE_CUPERTINO
```

Constant value: **4**

(continued from last page)

## MEDIACASTERTYPE\_MPEGTSTCP

```
public static final int MEDIACASTERTYPE_MPEGTSTCP
```

Constant value: **5**

## MEDIACASTERTYPE\_SRTRECEIVER

```
public static final int MEDIACASTERTYPE_SRTRECEIVER
```

Constant value: **6**

## Methods

### init

```
public void init(MediaCasterStreamItem mediaCasterStreamItem,  
                 MediaCasterItem mediaCasterDef,  
                 IApplicationInstance appInstance,  
                 String mediaCasterId,  
                 String streamExt)
```

Initialize the media caster

#### Parameters:

mediaCasterStreamItem - media caster item  
mediaCasterDef - media caster definition  
appInstance - application instance  
mediaCasterId - media caster id  
streamExt - stream ext or prefix

### getVHost

```
public IVHost getVHost()
```

Get the virtual host associated with this media caster

#### Returns:

virtual host associated with this media caster

### getMediaCasterId

```
public String getMediaCasterId()
```

Get the media caster id

#### Returns:

media caster id

### setMediaCasterId

```
public void setMediaCasterId(String mediaCasterId)
```

Get the media caster id

#### Parameters:

mediaCasterId - media caster id

## getStream

```
public IMediaStream getStream( )
```

Get the underlying stream being used by this media caster

**Returns:**

underlying stream being used by this media caster

---

## setStream

```
public void setStream(IMediaStream stream)
```

Set the underlying stream being used by this media caster

**Parameters:**

stream - underlying stream being used by this media caster

---

## getAppInstance

```
public IApplicationInstance getAppInstance( )
```

Get the application instance this media caster is associated with

**Returns:**

application instance this media caster is associated with

---

## setAppInstance

```
public void setAppInstance(IApplicationInstance appInstance)
```

Set the application instance this media caster is associated with

**Parameters:**

appInstance - application instance this media caster is associated with

---

## getMediaCasterDef

```
public MediaCasterItem getMediaCasterDef( )
```

Get the media caster definition

**Returns:**

media caster definition

---

## setMediaCasterDef

```
public void setMediaCasterDef(MediaCasterItem mediaCasterDef)
```

Set the media caster definition

**Parameters:**

mediaCasterDef - media caster definition

---

## shutdown

```
public void shutdown(boolean isAppInstanceShutdown)
```

---

(continued from last page)

Shutdown media caster

**Parameters:**

isAppInstanceShutdown - is server shutdown

---

## registerPlayer

```
public void registerPlayer(IMediaStreamPlay player)
```

Register a player with this media caster

**Parameters:**

player - player to register

---

## unregisterPlayer

```
public void unregisterPlayer(IMediaStreamPlay player)
```

Unregister a player with this media caster

**Parameters:**

player - player to unregister

---

## getIdleTimeout

```
public int getIdleTimeout()
```

Get the idle timeout for this media caster (milliseconds)

**Returns:**

idle timeout for this media caster (milliseconds)

---

## sessionOpened

```
public void sessionOpened(org.apache.mina.common.Session session)
```

sessionOpened callback

**Parameters:**

session - IO Session

---

## sessionClosed

```
public void sessionClosed(org.apache.mina.common.Session session)
```

sessionClosed callback

**Parameters:**

session - IO Session

---

## getMediaCasterStreamItem

```
public MediaCasterStreamItem getMediaCasterStreamItem()
```

Get the media caster item associated with this media caster

**Returns:**

media caster item associated with this media caster

## forceReset

```
public void forceReset()
```

Force a reset/reconnect of this media caster

---

## doWatchdog

```
public boolean doWatchdog()
```

Idle processor

**Returns:**

return true if media caster unloaded due to idle event

---

## getStreamTimeout

```
public int getStreamTimeout()
```

Get the watchdog stream timeout (milliseconds)

**Returns:**

stream timeout

---

## setStreamTimeout

```
public void setStreamTimeout(int streamTimeout)
```

Set the watchdog stream timeout (milliseconds)

**Parameters:**

streamTimeout - stream timeout

---

## getStreamMissingTime

```
public long getStreamMissingTime()
```

Get the time in milliseconds the stream has been missing

**Returns:**

time in milliseconds the stream has been missing

---

## getStreamLastSeq

```
public long getStreamLastSeq()
```

Get the AMFPacket sequence number of last watchdog processed packet

**Returns:**

AMFPacket sequence number

---

## getStreamTimeoutReason

```
public int getStreamTimeoutReason()
```

Get the reason the stream is in timeout condition (debug)

---

---

(continued from last page)

**Returns:**

reason the stream is in timeout condition (debug)

---

**getStreamTimeoutLastTime**

```
public long getStreamTimeoutLastTime( )
```

Get system time in milliseconds of last time stream was considered in missing state (debug)

**Returns:**

time in milliseconds of last time stream was considered in missing

---

**getStreamTimeoutLastReset**

```
public long getStreamTimeoutLastReset( )
```

Get system time in milliseconds of last time stream was reset due to stream timeout (debug)

**Returns:**

time in milliseconds of last time stream was reset

---

**isSession**

```
public boolean isSession( )
```

Is there current a session attached to this MediaCaster

**Returns:**

true is MediaCaster has session

---

**isStream**

```
public boolean isStream( )
```

Is there a stream associated with this MediaCaster

**Returns:**

true if stream associated with this MediaCaster

---

**getConnectLastAttempt**

```
public long getConnectLastAttempt( )
```

Get system time in milliseconds of last connection attempt

**Returns:**

system time in milliseconds of last connection attempt

---

**getConnectLastSuccess**

```
public long getConnectLastSuccess( )
```

Get system time in milliseconds of last connection success

**Returns:**

system time in milliseconds of last connection success

---

(continued from last page)

## getConnectLastForceReset

```
public long getConnectLastForceReset()
```

Get system time in milliseconds of last time forceReset was called

**Returns:**

system time in milliseconds of last time forceReset was called

---

## isStreamIsRunning

```
public boolean isStreamIsRunning()
```

Return true if stream is currently running

**Returns:**

true if stream is currently running

---

## getReconnectWaitTime

```
public int getReconnectWaitTime()
```

Get the minimum time between reconnect attempts (milliseconds)

**Returns:**

minimum time between reconnect attempts (milliseconds)

---

## setReconnectWaitTime

```
public void setReconnectWaitTime(int reconnectWaitTime)
```

Set the minimum time between reconnect attempts (milliseconds)

**Parameters:**

reconnectWaitTime - minimum time between reconnect attempts (milliseconds)

---

## getMediaCasterType

```
public int getMediaCasterType()
```

Get the media caster type. See IMediaCaster.MEDIACASTERTYPE\_\*

**Returns:**

media caster type

---

## setMediaCasterType

```
public void setMediaCasterType(int mediaCasterType)
```

Set the media caster type. See IMediaCaster.MEDIACASTERTYPE\_\*

**Parameters:**

mediaCasterType - media caster type

---

## getLock

```
public Object getLock()
```

(continued from last page)

Get the MediaCaster lock for an individual MediaCaster item.

---

## **setStreamRunning**

```
public void setStreamRunning(boolean streamRunning)
```

Called internally to track when streams are running or are stopped.

### **Parameters:**

streamRunning - set to true if stream is running

---

## **getStreamRunningIndex**

```
public long getStreamRunningIndex()
```

Each time a MediaCaster stream switches from not running to running this value is incremented

### **Returns:**

stream running index

---

## com.wowza.wms.mediacaster Interface IMediaCasterDataReceiver

---

public interface **IMediaCasterDataReceiver**  
extends

IMediaCasterDataReceiver: For internal use only.

---

### Method Summary

void	<a href="#">onData</a> (org.apache.mina.common.ByteBuffer data) Data callback
------	--

---

### Methods

#### onData

public void **onData**(org.apache.mina.common.ByteBuffer data)

Data callback

**Parameters:**

data - data

---

## com.wowza.wms.mediacaster Interface IMediaCasterNetConnection

---

public interface **IMediaCasterNetConnection**  
extends

IMediaCasterNetConnection: Internal use only

---

### Method Summary

NetConnection	
	<a href="#">getNetConnection()</a> Receives the INetConnection interface for a live repeater connection

---

### Methods

#### getNetConnection

public NetConnection **getNetConnection()**

Receives the INetConnection interface for a live repeater connection

**Returns:**

INetConnection interface

## com.wowza.wms.mediacaster Interface IMediaCasterNotify

All Subinterfaces:

[IMediaCasterNotify2](#)

public interface **IMediaCasterNotify**  
extends

IMediaCasterNotify: listener interface to MediaCaster system. See IApplicationInstance.addMediaCasterListener().

### Method Summary

void	<a href="#">onMediaCasterCreate</a> ( <a href="#">IMediaCaster</a> mediaCaster) Invoked when mediaCaster created
void	<a href="#">onMediaCasterDestroy</a> ( <a href="#">IMediaCaster</a> mediaCaster) Invoked when MediaCaster destroyed
void	<a href="#">onRegisterPlayer</a> ( <a href="#">IMediaCaster</a> mediaCaster, <a href="#">IMediaStreamPlay</a> player) Invoked when a player is added to this mediaCaster
void	<a href="#">onSetSourceStream</a> ( <a href="#">IMediaCaster</a> mediaCaster, <a href="#">IMediaStream</a> stream) Invoked when soure stream is set (can be called with stream of null)
void	<a href="#">onUnRegisterPlayer</a> ( <a href="#">IMediaCaster</a> mediaCaster, <a href="#">IMediaStreamPlay</a> player) Invoked when a player is removed from this mediaCaster

### Methods

#### onMediaCasterCreate

public void **onMediaCasterCreate**([IMediaCaster](#) mediaCaster)

Invoked when mediaCaster created

**Parameters:**

mediaCaster

#### onMediaCasterDestroy

public void **onMediaCasterDestroy**([IMediaCaster](#) mediaCaster)

Invoked when MediaCaster destroyed

**Parameters:**

mediaCaster

#### onRegisterPlayer

public void **onRegisterPlayer**([IMediaCaster](#) mediaCaster,  
[IMediaStreamPlay](#) player)

(continued from last page)

Invoked when a player is added to this mediaCaster

**Parameters:**

mediaCaster  
player

---

## onUnRegisterPlayer

```
public void onUnRegisterPlayer(IMediaCaster mediaCaster,  
    IMediaStreamPlay player)
```

Invoked when a player is removed from this mediaCaster

**Parameters:**

mediaCaster  
player

---

## onSetSourceStream

```
public void onSetSourceStream(IMediaCaster mediaCaster,  
    IMediaStream stream)
```

Invoked when source stream is set (can be called with stream of null)

**Parameters:**

mediaCaster  
stream

## com.wowza.wms.mediacaster Interface IMediaCasterNotify2

All Superinterfaces:

[IMediaCasterNotify](#)

public interface **IMediaCasterNotify2**

extends [IMediaCasterNotify](#)

### Method Summary

void	<a href="#">onConnectFailure</a> ( <a href="#">IMediaCaster</a> mediaCaster) Invoked when a connection or reconnection attempt fails
void	<a href="#">onConnectStart</a> ( <a href="#">IMediaCaster</a> mediaCaster) Invoked when a connection or reconnection attempt is invoked
void	<a href="#">onConnectSuccess</a> ( <a href="#">IMediaCaster</a> mediaCaster) Invoked when a connection or reconnection attempt is successful
void	<a href="#">onStreamStart</a> ( <a href="#">IMediaCaster</a> mediaCaster) Invoked when the stream starts receiving media data from the media source.
void	<a href="#">onStreamStop</a> ( <a href="#">IMediaCaster</a> mediaCaster) Invoked when the stream stops receiving media data from the media source after the streamTimeout value has passed.

Methods inherited from interface [com.wowza.wms.mediacaster.IMediaCasterNotify](#)

[onMediaCasterCreate](#), [onMediaCasterDestroy](#), [onRegisterPlayer](#), [onSetSourceStream](#), [onUnRegisterPlayer](#)

### Methods

#### onConnectStart

public void **onConnectStart**([IMediaCaster](#) mediaCaster)

Invoked when a connection or reconnection attempt is invoked

**Parameters:**

mediaCaster

#### onConnectSuccess

public void **onConnectSuccess**([IMediaCaster](#) mediaCaster)

Invoked when a connection or reconnection attempt is successful

**Parameters:**

mediaCaster

## onConnectFailure

```
public void onConnectFailure(IMediaCaster mediaCaster)
```

Invoked when a connection or reconnection attempt fails

**Parameters:**

mediaCaster

---

## onStreamStart

```
public void onStreamStart(IMediaCaster mediaCaster)
```

Invoked when the stream starts receiving media data from the media source. This event will only be thrown if the MediaCaster property streamTimeout is set to a non-zero value.

**Parameters:**

mediaCaster

---

## onStreamStop

```
public void onStreamStop(IMediaCaster mediaCaster)
```

Invoked when the stream stops receiving media data from the media source after the streamTimeout value has passed. This event will only be thrown if the MediaCaster property streamTimeout is set to a non-zero value.

**Parameters:**

mediaCaster

---

## com.wowza.wms.mediacaster

# Interface IMediaCasterValidateMediaCaster

public interface **IMediaCasterValidateMediaCaster**  
extends

IMediaCasterValidateMediaCaster: interface for implementing stream validators. See  
IApplicationInstance.setMediaCasterValidator(IMediaCasterValidateMediaCaster mediaCasterValidator)

## Method Summary

boolean	<a href="#">onResetMediaCaster</a> ( <a href="#">IApplicationInstance</a> appInstance, <a href="#">IMediaCaster</a> mediaCaster) Called when media caster is reset
boolean	<a href="#">onValidateMediaCaster</a> ( <a href="#">IApplicationInstance</a> appInstance, <a href="#">IMediaCaster</a> mediaCaster) Called for each media caster to validate the media caster.
void	<a href="#">onValidateMediaCastersStart</a> ( <a href="#">IApplicationInstance</a> appInstance) Called when validation for all streams of an application instance is starting
void	<a href="#">onValidateMediaCastersStop</a> ( <a href="#">IApplicationInstance</a> appInstance) Called when validation for all streams of an application instance is done

## Methods

### onValidateMediaCastersStart

public void **onValidateMediaCastersStart**([IApplicationInstance](#) appInstance)

Called when validation for all streams of an application instance is starting

**Parameters:**

appInstance - application instance

### onValidateMediaCastersStop

public void **onValidateMediaCastersStop**([IApplicationInstance](#) appInstance)

Called when validation for all streams of an application instance is done

**Parameters:**

appInstance

### onValidateMediaCaster

public boolean **onValidateMediaCaster**([IApplicationInstance](#) appInstance, [IMediaCaster](#) mediaCaster)

Called for each media caster to validate the media caster. Return true if valid.

**Parameters:**

(continued from last page)

appInstance - application instance  
mediaCaster - media caster

**Returns:**

true, if valid

---

## onResetMediaCaster

```
public boolean onResetMediaCaster(IApplicationInstance appInstance,  
    IMediaCaster mediaCaster)
```

Called when media caster is reset

**Parameters:**

appInstance - application instance  
mediaCaster - media caster

**Returns:**

return true

## com.wowza.wms.mediacaster

### Class MediaCasterItem

java.lang.Object

└─com.wowza.wms.mediacaster.MediaCasterItem

public class **MediaCasterItem**  
extends Object

#### Constructor Summary

public	<a href="#"><u>MediaCasterItem</u></a> (String name, String streamType, String baseClass) Media caster item constructor
--------	--

#### Method Summary

void	<a href="#"><u>clearProperty</u></a> (String name) Clear property
String	<a href="#"><u>getBaseClass</u></a> () Get base class
int	<a href="#"><u>getConnectionTimeout</u></a> () Get connection timeout (milliseconds)
String	<a href="#"><u>getDescription</u></a> () Get description
static String	<a href="#"><u>getIdString</u></a> (String name, String liveStreamPacketizer, String liveStreamRepeater) Get id string for this media caster item (not used - returns name unchanged)
int	<a href="#"><u>getKeepAliveTime</u></a> () Get keep alive time (milliseconds)
String	<a href="#"><u>getName</u></a> () Get name
<a href="#"><u>WMSProperties</u></a>	<a href="#"><u>getProperties</u></a> () Get properties collection
String	<a href="#"><u>getProperty</u></a> (String name) Get property value
String	<a href="#"><u>getStreamType</u></a> () Get the stream type
String	<a href="#"><u>idStringToName</u></a> (String idString) Convert name to id string (not used - returns id string unchanged)
static MediaCasterStreamId	<a href="#"><u>parseIdString</u></a> (String idString)

void	<a href="#"><u>setBaseClass</u></a> (String baseClass) Set base class
void	<a href="#"><u>setConnectionTimeout</u></a> (int connectionTimeout) Set connection timeout (milliseconds)
void	<a href="#"><u>setDescription</u></a> (String description) Set description
void	<a href="#"><u>setKeepAliveTime</u></a> (int keepAliveTime) Set keep alive time (milliseconds)
void	<a href="#"><u>setName</u></a> (String name) Set name
void	<a href="#"><u>setProperty</u></a> (String name, String value) Set a property
void	<a href="#"><u>setStreamType</u></a> (String streamType) Set stream type
String	<a href="#"><u>toString</u></a> () toString

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### MediaCasterItem

```
public MediaCasterItem(String name,
                      String streamType,
                      String baseClass)
```

Media caster item constructor

#### Parameters:

name - media caster name  
streamType - stream type  
baseClass - base class

## Methods

### getStreamType

```
public String getStreamType()
```

Get the stream type

#### Returns:

stream type

(continued from last page)

## setStreamType

```
public void setStreamType(String streamType)
```

Set stream type

**Parameters:**

streamType - stream type

---

## getName

```
public String getName()
```

Get name

**Returns:**

name

---

## setName

```
public void setName(String name)
```

Set name

**Parameters:**

name - name

---

## setProperty

```
public void setProperty(String name,  
                        String value)
```

Set a property

**Parameters:**

name - name

value - value

---

## clearProperty

```
public void clearProperty(String name)
```

Clear property

**Parameters:**

name - name

---

## getProperty

```
public String getProperty(String name)
```

Get property value

**Parameters:**

name - name

**Returns:**

property value

---

## getProperties

```
public WMSProperties getProperties()
```

Get properties collection

**Returns:**  
properties collection

---

## getDescription

```
public String getDescription()
```

Get description

**Returns:**  
description

---

## setDescription

```
public void setDescription(String description)
```

Set description

**Parameters:**  
description - description

---

## getBaseClass

```
public String getBaseClass()
```

Get base class

**Returns:**  
base class

---

## setBaseClass

```
public void setBaseClass(String baseClass)
```

Set base class

**Parameters:**  
baseClass - base class

---

## getConnectionTimeout

```
public int getConnectionTimeout()
```

Get connection timeout (milliseconds)

**Returns:**  
connection timeout (milliseconds)

---

## setConnectionTimeout

```
public void setConnectionTimeout(int connectionTimeout)
```

---

(continued from last page)

Set connection timeout (milliseconds)

**Parameters:**

connectionTimeout - connection timeout (milliseconds)

---

## getKeepAliveTime

```
public int getKeepAliveTime()
```

Get keep alive time (milliseconds)

**Returns:**

keep alive time (milliseconds)

---

## setKeepAliveTime

```
public void setKeepAliveTime(int keepAliveTime)
```

Set keep alive time (milliseconds)

**Parameters:**

keepAliveTime - keep alive time (milliseconds)

---

## getIdString

```
public static String getIdString(String name,  
    String liveStreamPacketizer,  
    String liveStreamRepeater)
```

Get id string for this media caster item (not used - returns name unchanged)

**Parameters:**

name - name

**Returns:**

id string for this media caster item

---

## parseIdString

```
public static MediaCasterStreamId parseIdString(String idString)
```

---

## idStringToName

```
public String idStringToName(String idString)
```

Convert name to id string (not used - returns id string unchanged)

**Parameters:**

idString - id string

**Returns:**

name

---

## toString

```
public String toString()
```

(continued from last page)

toString

## com.wowza.wms.mediacaster Class MediaCasterList

java.lang.Object

└─com.wowza.wms.mediacaster.MediaCasterList

public class **MediaCasterList**  
extends Object

### Constructor Summary

public	<a href="#"><u>MediaCasterList()</u></a> Constructor
--------	---

### Method Summary

<a href="#"><u>MediaCasterItem</u></a>	<a href="#"><u>getMediaCasterDef()</u></a> (String name) Get media caster definition by name
java.util.Map	<a href="#"><u>getMediaCasterDefs()</u></a> Get map of media caster items
java.util.List	<a href="#"><u>getMediaCasterNames()</u></a> Get list of media caster names

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### MediaCasterList

public **MediaCasterList()**

Constructor

### Methods

#### getMediaCasterDefs

public java.util.Map **getMediaCasterDefs()**

Get map of media caster items

##### Returns:

map of media caster items

(continued from last page)

## getMediaCasterNames

```
public java.util.List getMediaCasterNames()
```

Get list of media caster names

**Returns:**

list of media caster names

---

## getMediaCasterDef

```
public MediaCasterItem getMediaCasterDef(String name)
```

Get media caster definition by name

**Parameters:**

name - name

**Returns:**

media caster definition

## com.wowza.wms.mediacaster Class MediaCasterSettings

java.lang.Object

└─com.wowza.wms.mediacaster.MediaCasterSettings

public class **MediaCasterSettings**  
extends Object

### Constructor Summary

public	<a href="#">MediaCasterSettings()</a>
--------	---------------------------------------

### Method Summary

<a href="#">HostPortConfig</a>	<a href="#">getMediaCasterHostPortConfig()</a> Get media caster host port config
int	<a href="#">getMediaCasterProcessorCount()</a> Get the thread count use for this host port
void	<a href="#">setMediaCasterHostPortConfig(<a href="#">HostPortConfig</a> mediaCasterHostPortConfig)</a> Set media caster host port config
void	<a href="#">setMediaCasterProcessorCount(int mediaCasterProcessorCount)</a> Set the thread count for this processor

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### MediaCasterSettings

public **MediaCasterSettings()**

### Methods

#### getMediaCasterHostPortConfig

public [HostPortConfig](#) **getMediaCasterHostPortConfig()**

Get media caster host port config

**Returns:**

host port config

---

## setMediaCasterHostPortConfig

```
public void setMediaCasterHostPortConfig(HostPortConfig mediaCasterHostPortConfig)
```

Set media caster host port config

**Parameters:**

mediaCasterHostPortConfig

---

## getMediaCasterProcessorCount

```
public int getMediaCasterProcessorCount()
```

Get the thread count use for this host port

**Returns:**

thread count use for this host port

---

## setMediaCasterProcessorCount

```
public void setMediaCasterProcessorCount(int mediaCasterProcessorCount)
```

Set the thread count for this processor

**Parameters:**

mediaCasterProcessorCount - thread count use for this host port

---

## com.wowza.wms.mediacaster Class MediaCasterStreamItem

java.lang.Object

└─com.wowza.wms.mediacaster.MediaCasterStreamItem

public class **MediaCasterStreamItem**  
extends Object

### Constructor Summary

public	<a href="#">MediaCasterStreamItem</a> (long uniqueId) Media caster item constructor
--------	--

### Method Summary

void	<a href="#">acquire</a> () Increment acquire lock count for this media caster item
void	<a href="#">acquireAndRelease</a> () Increment then decrement acquire lock count for this media caster item
boolean	<a href="#">doWatchdog</a> () Do idle processing
String	<a href="#">getLiveStreamPacketizer</a> () Get the live stream packetizer for this media caster stream item
String	<a href="#">getLiveStreamRepeater</a> () Get the live stream repeater for this media caster stream item
Object	<a href="#">getLock</a> ()
int	<a href="#">getLockCount</a> () Get the current number of acquire locks on this media caster item
<a href="#">IMediaCaster</a>	<a href="#">getMediaCaster</a> () Get the underlying IMediaCaster interface for this MediaCaster
String	<a href="#">getMediaCasterId</a> () Get this media caster item id
int	<a href="#">getPlayerCount</a> () Get the current number of players associated with this media caster item
String	<a href="#">getStreamExt</a> ()
long	<a href="#">getUniqueId</a> ()

void	<a href="#"><code>init</code></a> (String mediaCasterId, String streamExt, <a href="#"><code>MediaCasterItem</code></a> mediaCasterDef, <a href="#"><code>MediaCasterStreamMap</code></a> parent, String liveStreamPacketizer, String liveStreamRepeater) Initialize the media caster item (internal use)
boolean	<a href="#"><code>isShutdownOnRelease</code></a> ( ) On last release shutdown the stream even if clients are connected
boolean	<a href="#"><code>isValid</code></a> ( )
void	<a href="#"><code>registerPlayer</code></a> ( <a href="#"><code>IMediaStreamPlay</code></a> player) Register a player with a media caster item (internal use)
void	<a href="#"><code>release</code></a> ( ) Decrement acquire lock count for this media caster item
void	<a href="#"><code>reset</code></a> ( ) Force a reconnect or reset for this media caster item
void	<a href="#"><code>setLiveStreamPacketizer</code></a> (String liveStreamPacketizer) Set the live stream packetizer for this media caster stream item
void	<a href="#"><code>setLiveStreamRepeater</code></a> (String liveStreamRepeater) Set the live stream repeater for this media caster stream item
void	<a href="#"><code>setShutdownOnRelease</code></a> (boolean shutdownOnRelease) On last release shutdown the stream even if clients are connected
void	<a href="#"><code>setStreamExt</code></a> (String streamExt)
void	<a href="#"><code>setValid</code></a> (boolean isValid)
void	<a href="#"><code>shutdown</code></a> (boolean isAppInstanceShutdown) Shutdown this media caster item
void	<a href="#"><code>unregisterPlayer</code></a> ( <a href="#"><code>IMediaStreamPlay</code></a> player) Unregister a player with a media caster item (internal use)

#### Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Constructors

### MediaCasterStreamItem

```
public MediaCasterStreamItem(long uniqueId)
```

Media caster item constructor

## Methods

(continued from last page)

---

## getLock

```
public Object getLock()
```

---

## getUniqueId

```
public long getUniqueId()
```

---

## isValid

```
public boolean isValid()
```

---

## setValid

```
public void setValid(boolean isValid)
```

---

## init

```
public void init(String mediaCasterId,  
                String streamExt,  
                MediaCasterItem mediaCasterDef,  
                MediaCasterStreamMap parent,  
                String liveStreamPacketizer,  
                String liveStreamRepeater)
```

Initialize the media caster item (internal use)

### Parameters:

mediaCasterId - media caster id  
streamExt - stream extension or prefix  
mediaCasterDef - media caster definition  
parent - parent map

---

## getMediaCasterId

```
public String getMediaCasterId()
```

Get this media caster item id

### Returns:

media caster item id

---

## getMediaCaster

```
public IMediaCaster getMediaCaster()
```

Get the underlying IMediaCaster interface for this MediaCaster

### Returns:

underlying IMediaCaster interface

## registerPlayer

```
public void registerPlayer(IMediaStreamPlay player)
```

Register a player with a media caster item (internal use)

**Parameters:**

player - player to register

---

## unregisterPlayer

```
public void unregisterPlayer(IMediaStreamPlay player)
```

Unregister a player with a media caster item (internal use)

**Parameters:**

player - player to unregister

---

## doWatchdog

```
public boolean doWatchdog()
```

Do idle processing

**Returns:**

return true if caused shutdown of item

---

## reset

```
public void reset()
```

Force a reconnect or reset for this media caster item

---

## shutdown

```
public void shutdown(boolean isAppInstanceShutdown)
```

Shutdown this media caster item

**Parameters:**

isAppInstanceShutdown - is this due to application shutdown

---

## getPlayerCount

```
public int getPlayerCount()
```

Get the current number of players associated with this media caster item

**Returns:**

current number of players associated with this media caster item

---

## getLockCount

```
public int getLockCount()
```

Get the current number of acquire locks on this media caster item

---

---

(continued from last page)

**Returns:**

current number of acquire locks on this media caster item

---

**acquireAndRelease**

```
public void acquireAndRelease( )
```

Increment then decrement acquire lock count for this media caster item

---

**acquire**

```
public void acquire( )
```

Increment acquire lock count for this media caster item

---

**release**

```
public void release( )
```

Decrement acquire lock count for this media caster item

---

**getStreamExt**

```
public String getStreamExt( )
```

---

**setStreamExt**

```
public void setStreamExt(String streamExt)
```

---

**isShutdownOnRelease**

```
public boolean isShutdownOnRelease( )
```

On last release shutdown the stream even if clients are connected

**Returns:**

true if shutting down on release

---

**setShutdownOnRelease**

```
public void setShutdownOnRelease(boolean shutdownOnRelease)
```

On last release shutdown the stream even if clients are connected

**Parameters:**

shutdownOnRelease - true if shutting down on release

---

**getLiveStreamPacketizer**

```
public String getLiveStreamPacketizer( )
```

Get the live stream packetizer for this media caster stream item

**Returns:**

(continued from last page)

live stream packetizer

---

## setLiveStreamPacketizer

```
public void setLiveStreamPacketizer(String liveStreamPacketizer)
```

Set the live stream packetizer for this media caster stream item

**Parameters:**

liveStreamPacketizer - live stream packetizer

---

## getLiveStreamRepeater

```
public String getLiveStreamRepeater()
```

Get the live stream repeater for this media caster stream item

**Returns:**

live stream repeater

---

## setLiveStreamRepeater

```
public void setLiveStreamRepeater(String liveStreamRepeater)
```

Set the live stream repeater for this media caster stream item

**Parameters:**

liveStreamRepeater - live stream repeater

## com.wowza.wms.mediacaster Class MediaCasterStreamManager

java.lang.Object

└─com.wowza.wms.mediacaster.MediaCasterStreamManager

public class **MediaCasterStreamManager**  
extends Object

### Constructor Summary

public	<a href="#">MediaCasterStreamManager</a> ( <a href="#">MediaCasterStreamMap</a> mediaCasterStreamMap)
--------	---

### Method Summary

String[]	<a href="#">getStreamArray</a> () Get a list of active streams
java.util.List	<a href="#">getStreamList</a> () Get a list of active streams
boolean	<a href="#">startStream</a> (String streamName, String mediaCasterType) Start a stream by name
boolean	<a href="#">stopStream</a> (String streamName) Stop a stream by name
boolean	<a href="#">streamExists</a> (String streamName) Returns true if stream exists

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Constructors

#### MediaCasterStreamManager

public **MediaCasterStreamManager**([MediaCasterStreamMap](#) mediaCasterStreamMap)

### Methods

#### getStreamArray

public String[] **getStreamArray**()

Get a list of active streams

(continued from last page)

**Returns:**

list of active streams

---

**getStreamList**

```
public java.util.List getStreamList()
```

Get a list of active streams

**Returns:**

list of active streams

---

**streamExists**

```
public boolean streamExists(String streamName)
```

Returns true if stream exists

**Parameters:**

streamName - stream name

**Returns:**

true if stream exists

---

**stopStream**

```
public boolean stopStream(String streamName)
```

Stop a stream by name

**Parameters:**

streamName - stream name

**Returns:**

true is successful

---

**startStream**

```
public boolean startStream(String streamName,  
    String mediaCasterType)
```

Start a stream by name

**Parameters:**

streamName - stream name

mediaCasterType - MediaCaster type as defined in the name field of conf/MediaCasters.xml

**Returns:**

true is successful

## com.wowza.wms.mediacaster

### Class MediaCasterStreamMap

java.lang.Object

└─com.wowza.wms.mediacaster.MediaCasterStreamMap

public class **MediaCasterStreamMap**  
extends Object

#### Constructor Summary

public	<a href="#">MediaCasterStreamMap</a> ( <a href="#">IApplicationInstance</a> appInstance) Create a new mediacaster map
--------	--

#### Method Summary

<a href="#">MediaCasterStreamItem</a>	<a href="#">acquire</a> (String streamName) Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away).
<a href="#">MediaCasterStreamItem</a>	<a href="#">acquire</a> (String inStreamName, <a href="#">MediaCasterItem</a> mediaCasterDef) Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away).
<a href="#">MediaCasterStreamItem</a>	<a href="#">acquire</a> (String inStreamName, String streamType) Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away).
<a href="#">MediaCasterStreamItem</a>	<a href="#">acquire</a> (String streamName, String liveStreamPacketizer, String liveStreamRepeater) Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away).
<a href="#">MediaCasterStreamItem</a>	<a href="#">acquire</a> (String inStreamName, String liveStreamPacketizer, String liveStreamRepeater, <a href="#">MediaCasterItem</a> mediaCasterDef) Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away).
<a href="#">MediaCasterStreamItem</a>	<a href="#">acquire</a> (String inStreamName, String liveStreamPacketizer, String liveStreamRepeater, String streamType) Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away).
<a href="#">MediaCasterStreamItem</a>	<a href="#">acquireAndRelease</a> (String inStreamName, String liveStreamPacketizer, String liveStreamRepeater, <a href="#">MediaCasterItem</a> mediaCasterDef) Increment and then decrement the lock count for a media caster item (so that it is loaded and will stay loaded for at least the KeepAliveTime).
void	<a href="#">addStreamSrcToMediaCaster</a> (long streamSrc, String mediaCasterId)
void	<a href="#">clearStreamSrcToMediaCaster</a> (long streamSrc)
void	<a href="#">doWatchdog</a> () Do periodic idle time processing

<a href="#">IApplicationInstance</a>	<a href="#">getApplicationInstance()</a> Get the parent application instance for this map
edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock	<a href="#">getLock()</a> Get the read/write lock for this interface
<a href="#">MediaCasterStreamItem</a>	<a href="#">getMediaCaster(String streamName)</a> Get media caster item based on given stream name
<a href="#">MediaCasterStreamItem</a>	<a href="#">getMediaCaster(String streamName, String liveStreamPacketizer, String liveStreamRepeater)</a> Get media caster item based on given stream name
int	<a href="#">getMediaCasterCount()</a> Get the number of mediacasters current running
java.util.List	<a href="#">getMediaCasterNames()</a> Get a list of all the currently running media caster names
java.util.List	<a href="#">getMediaCasterStreamItems()</a>
<a href="#">MediaCasterStreamManager</a>	<a href="#">getStreamManager()</a> Get the stream manager interface for managing the starting and stopping of streams
void	<a href="#">registerPlayer(IMediaStreamPlay player, MediaCasterItem mediaCasterDef)</a> Register a player to a media caster item (internal use)
void	<a href="#">release(MediaCasterStreamItem mediaCasterStreamItem)</a> Decrement lock count on media caster item
void	<a href="#">release(MediaCasterStreamItem mediaCasterStreamItem, boolean removeIfZero)</a>
void	<a href="#">remove(MediaCasterStreamItem mediaCasterStreamItem)</a>
void	<a href="#">shutdown(boolean isAppInstanceShutdown)</a> Shutdown this media caster and close all running media casters
String	<a href="#">streamSrcToMediaCaster(long streamSrc)</a>
void	<a href="#">unregisterPlayer(IMediaStreamPlay player, MediaCasterItem mediaCasterDef)</a> Unregister a player to a media caster item (internal use)

#### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructors

### MediaCasterStreamMap

```
public MediaCasterStreamMap(IApplicationInstance appInstance)
```

(continued from last page)

Create a new mediacaster map

**Parameters:**

appInstance - application instance

## Methods

### getLock

```
public edu.emory.mathcs.backport.java.util.concurrent.locks.WMSReadWriteLock getLock()
```

Get the read/write lock for this interface

**Returns:**

read/write lock

### getStreamManager

```
public MediaCasterStreamManager getStreamManager()
```

Get the stream manager interface for managing the starting and stopping of streams

**Returns:**

stream manager interface

### getApplicationInstance

```
public IApplicationInstance getApplicationInstance()
```

Get the parent application instance for this map

**Returns:**

parent application instance for this map

### getMediaCasterCount

```
public int getMediaCasterCount()
```

Get the number of mediacasters current running

**Returns:**

number of mediacasters current running

### getMediaCasterStreamItems

```
public java.util.List getMediaCasterStreamItems()
```

### doWatchdog

```
public void doWatchdog()
```

Do periodic idle time processing

(continued from last page)

## shutdown

```
public void shutdown(boolean isAppInstanceShutdown)
```

Shutdown this media caster and close all running media casters

**Parameters:**

isAppInstanceShutdown - is this due to application shutdown

---

## getMediaCasterNames

```
public java.util.List getMediaCasterNames()
```

Get a list of all the currently running media caster names

**Returns:**

list of all the currently running media caster names

---

## getMediaCaster

```
public MediaCasterStreamItem getMediaCaster(String streamName)
```

Get media caster item based on given stream name

**Parameters:**

streamName - stream name

**Returns:**

media caster item

---

## getMediaCaster

```
public MediaCasterStreamItem getMediaCaster(String streamName,  
String liveStreamPacketizer,  
String liveStreamRepeater)
```

Get media caster item based on given stream name

**Parameters:**

streamName - stream name

liveStreamPacketizer - live stream packetizer name

liveStreamRepeater - live stream repeater name

**Returns:**

media caster item

---

## acquire

```
public MediaCasterStreamItem acquire(String streamName,  
String liveStreamPacketizer,  
String liveStreamRepeater)
```

Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away). Will load the media caster if not already loaded. Uses default application instance stream type.

**Parameters:**

streamName - stream name

liveStreamPacketizer - live stream packetizer name

liveStreamRepeater - live stream repeater name

(continued from last page)

**Returns:**

media caster item

---

**acquire**

```
public MediaCasterStreamItem acquire(String streamName)
```

Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away). Will load the media caster if not already loaded. Uses default application instance stream type.

**Parameters:**

streamName - stream name

**Returns:**

media caster item

---

**acquire**

```
public MediaCasterStreamItem acquire(String inStreamName,  
    MediaCasterItem mediaCasterDef)
```

Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away). Will load the media caster if not already loaded. This API allow loading of a MediaCaster into a non-MediaCaster stream type such as the "live" or "liverepeater-origin" stream type.

**Parameters:**

inStreamName - stream name

mediaCasterDef - MediaCaster definition

**Returns:**

media caster item

---

**acquire**

```
public MediaCasterStreamItem acquire(String inStreamName,  
    String liveStreamPacketizer,  
    String liveStreamRepeater,  
    MediaCasterItem mediaCasterDef)
```

Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away). Will load the media caster if not already loaded. This API allow loading of a MediaCaster into a non-MediaCaster stream type such as the "live" or "liverepeater-origin" stream type.

**Parameters:**

inStreamName - stream name

liveStreamPacketizer - live stream packetizer name

liveStreamRepeater - live stream repeater name

mediaCasterDef - MediaCaster definition

**Returns:**

media caster item

---

**acquireAndRelease**

```
public MediaCasterStreamItem acquireAndRelease(String inStreamName,  
    String liveStreamPacketizer,  
    String liveStreamRepeater,  
    MediaCasterItem mediaCasterDef)
```

(continued from last page)

Increment and then decrement the lock count for a media caster item (so that it is loaded and will stay loaded for at least the KeepAliveTime). Will load the media caster if not already loaded. This API allow loading of a MediaCaster into a non-MediaCaster stream type such as the "live" or "liverepeater-origin" stream type.

**Parameters:**

inStreamName - stream name  
 liveStreamPacketizer - live stream packetizer name  
 liveStreamRepeater - live stream repeater name  
 mediaCasterDef - MediaCaster definition

**Returns:**

media caster item

**acquire**

```
public MediaCasterStreamItem acquire(String inStreamName,  
    String streamType)
```

Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away). Will load the media caster if not already loaded.

**Parameters:**

inStreamName - stream name  
 streamType - stream type to use (null will use default application streamType)

**Returns:**

media caster item

**acquire**

```
public MediaCasterStreamItem acquire(String inStreamName,  
    String liveStreamPacketizer,  
    String liveStreamRepeater,  
    String streamType)
```

Increment the lock count for a media caster item (so that it remains loaded even if all listeners go away). Will load the media caster if not already loaded.

**Parameters:**

inStreamName - stream name  
 liveStreamPacketizer - live stream packetizer name  
 liveStreamRepeater - live stream repeater name  
 streamType - stream type to use (null will use default application streamType)

**Returns:**

media caster item

**release**

```
public void release(MediaCasterStreamItem mediaCasterStreamItem)
```

Decrement lock count on media caster item

**Parameters:**

mediaCasterStreamItem - media caster item to decrement

**release**

```
public void release(MediaCasterStreamItem mediaCasterStreamItem,  
    boolean removeIfZero)
```

(continued from last page)

---

## remove

```
public void remove(MediaCasterStreamItem mediaCasterStreamItem)
```

---

## streamSrcToMediaCaster

```
public String streamSrcToMediaCaster(long streamSrc)
```

---

## addStreamSrcToMediaCaster

```
public void addStreamSrcToMediaCaster(long streamSrc,  
    String mediaCasterId)
```

---

## clearStreamSrcToMediaCaster

```
public void clearStreamSrcToMediaCaster(long streamSrc)
```

---

## registerPlayer

```
public void registerPlayer(IMediaStreamPlay player,  
    MediaCasterItem mediaCasterDef)
```

Register a player to a media caster item (internal use)

### Parameters:

player - player to register  
mediaCasterDef - media caster definition

---

## unregisterPlayer

```
public void unregisterPlayer(IMediaStreamPlay player,  
    MediaCasterItem mediaCasterDef)
```

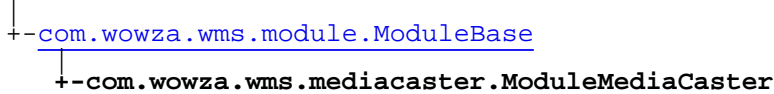

Unregister a player to a media caster item (internal use)

### Parameters:

player - player to unregister  
mediaCasterDef - media caster definition

## com.wowza.wms.mediacaster Class ModuleMediaCaster

java.lang.Object

All Implemented Interfaces:

[IModuleOnApp](#)

public class **ModuleMediaCaster**  
 extends [ModuleBase](#)  
 implements [IModuleOnApp](#)

ModuleMediaCaster: Module for manipulating media casters through a Flash UI.

## Constructors

### ModuleMediaCaster

```
public ModuleMediaCaster()
```

## Methods

### onAppStart

```
public void onAppStart(IApplicationInstance appInstance)
```

onAppStart

### onAppStop

```
public void onAppStop(IApplicationInstance appInstance)
```

onAppStop

## getLockCount

```
public void getLockCount(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Get the current lock count for a stream

**Parameters:**

client - client  
function - function  
params - {streamName}

---

## getPlayerCount

```
public void getPlayerCount(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Get the numbers of players associated with a particular media caster

**Parameters:**

client - client  
function - function  
params - {streamName}

---

## getStreamNames

```
public void getStreamNames(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Get an array of stream names that are media casters associate with this application instance (returned as AMFDataArray)

**Parameters:**

client - client  
function - function  
params - (no params)

---

## resetStream

```
public void resetStream(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Reset a media caster stream

**Parameters:**

client - client  
function - function  
params - {streamName}

---

## shutdownStream

```
public void shutdownStream(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Force shutdown a media caster stream

---

(continued from last page)

**Parameters:**

client - client  
function - function  
params - {streamName}

---

**acquireMediaCaster**

```
public void acquireMediaCaster(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Increment the lock count of a media caster stream. If the media caster does not exist create it and connect.

**Parameters:**

client - client  
function - function  
params - {streamName, streamType [optional]}

---

**releaseMediaCaster**

```
public void releaseMediaCaster(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Decrement the lock count of a media caster stream

**Parameters:**

client - client  
function - function  
params - {streamName}

---

Package

**com.wowza.wms.mediacaster.cupertino**

## com.wowza.wms.mediacaster.cupertino Interface ICupertinoMediaCasterChunkFetch

public interface **ICupertinoMediaCasterChunkFetch**  
extends

Interface to fetch Apple HLS chunks for processing This can be replaced by a custom implementation from the default using the property in MediaCaster -> Properties Name: cupertinoChunkFetchClass Value: Full Class Path Type: String

### Method Summary

CupertinoMediaCasterFetchedResult	<a href="#">fetchBlock</a> (String path, int timeOut, int retries) Called when a manifest is to be fetched
CupertinoMediaCasterFetchedResult	<a href="#">fetchManifest</a> (String path, int timeOut, int retries) Called when a manifest is to be fetched
void	<a href="#">init</a> ( <a href="#">IApplicationInstance</a> appins, CupertinoMediaCasterContext context) Called when the class is initiated.

### Methods

#### init

```
public void init(IApplicationInstance appins,  
CupertinoMediaCasterContext context)
```

Called when the class is initiated.

##### Parameters:

appins - Application instance

context - MediaCaster context object containing configuration settings

#### fetchManifest

```
public CupertinoMediaCasterFetchedResult fetchManifest(String path,  
int timeOut,  
int retries)
```

Called when a manifest is to be fetched

##### Parameters:

path - - The path to the manifest to be fetched. It is up to the class to handle the path

timeOut - - The time in milliseconds to wait for a timeout

retries - - The number of retries to perform when attempt to get the data requested

##### Returns:

CupertinoMediaCasterFetchedResult - The data type should be set to CupertinoMediaCasterFetchedResult.textType

(continued from last page)

## fetchBlock

```
public CupertinoMediaCasterFetchResult fetchBlock(String path,  
    int timeout,  
    int retries)
```

Called when a manifest is to be fetched

### Parameters:

path - - The path to the asset to be fetched. It is up to the class to handle the path

timeout - - The time in milliseconds to wait for a timeout

retries - - The number of retries to perform when attempt to get the data requested

### Returns:

CupertinoMediaCasterFetchResult - The data type should be set to CupertinoMediaCasterFetchResult.dataType

## com.wowza.wms.mediacaster.cupertino Interface ICupertinoMediaCasterHolder

public interface **ICupertinoMediaCasterHolder**  
extends

Interface to define parameters potentially retrievable when a stream is found within a manifest along with maintaining a list of elements that are made available within a chunklist It is up to the ICupertinoMediaCasterPlaylistParser implementation to set these parameters. The ICupertinoMediaCasterHolder object is made available to the ICupertinoMediaCasterManageStreamName implementation so to provide context when determining stream names to use.

### Method Summary

void	<a href="#"><u>addIndexElement</u></a> (String ElementValue, long duration) Add an Index element to the list
boolean	<a href="#"><u>checkIndexAvailable</u></a> (String url) Check if the URL provided is in this holder
String	<a href="#"><u>getAudioCodec</u></a> ( ) Get the audio codec
long	<a href="#"><u>getCurrentDuration</u></a> ( ) Get the current duration
int	<a href="#"><u>getIndexAudioTag</u></a> ( ) Get the audio tag
int	<a href="#"><u>getIndexBitrate</u></a> ( ) Get the bitrate
int	<a href="#"><u>getIndexBitsPerSample</u></a> ( ) Get the bits per sample
int	<a href="#"><u>getIndexChannel</u></a> ( ) Get the channel count
int	<a href="#"><u>getIndexChunkCount</u></a> ( ) Get the chunk count
String	<a href="#"><u>getIndexCodecPrivateData</u></a> ( ) Get the index codec private data
int	<a href="#"><u>getIndexDisplayHeight</u></a> ( ) Get the display height
int	<a href="#"><u>getIndexDisplayWidth</u></a> ( ) Get the index display width
int	<a href="#"><u>getIndexElementCount</u></a> ( ) Get the element count
String	<a href="#"><u>getIndexFourCC</u></a> ( ) Get the FourCC parameter

String	<a href="#"><u>getIndexGroupID()</u></a> Get the group ID
int	<a href="#"><u>getIndexId()</u></a> Get the index ID
String	<a href="#"><u>getIndexLanguage()</u></a> Get the language
int	<a href="#"><u>getIndexMaxHeight()</u></a> Get the max height
int	<a href="#"><u>getIndexMaxWidth()</u></a> Get the max width
String	<a href="#"><u>getIndexMediaLine()</u></a> Get the media line
String	<a href="#"><u>getIndexName()</u></a> Get the index name
int	<a href="#"><u>getIndexPacketSize()</u></a> Get the index packet size
String	<a href="#"><u>getIndexProgramID()</u></a> Get the program ID
String	<a href="#"><u>getIndexResolution()</u></a> Get the resolution
int	<a href="#"><u>getIndexSampleRate()</u></a> Get the sample rate
String	<a href="#"><u>getIndexType()</u></a> Get the index type
String	<a href="#"><u>getIndexURL()</u></a> Get the URL
boolean	<a href="#"><u>getisLive()</u></a> Get this isLive flag
String	<a href="#"><u>getNextIndexElement()</u></a> Get the next index element
String	<a href="#"><u>getVideoCodec()</u></a> Get the video codec
void	<a href="#"><u>setAudioCodec()</u></a> (String audiocodec) Set the audio codec
void	<a href="#"><u>setIndexAudioLocation()</u></a> (String audioLocation) Set the audio location
void	<a href="#"><u>setIndexAudioTag()</u></a> (int audiotag) Set the audio tag
void	<a href="#"><u>setIndexBitrate()</u></a> (String bitrate) Set the bitrate

void	<a href="#"><u>setIndexBitsPerSample</u></a> (int bitspersample) Set the bits per sample
void	<a href="#"><u>setIndexChannel</u></a> (int channel) Set the channel count
void	<a href="#"><u>setIndexChunkCount</u></a> (int index) Set the chunk count
void	<a href="#"><u>setIndexCodecPrivateData</u></a> (String codecprivatedata) Set the index codec private data
void	<a href="#"><u>setIndexCODECS</u></a> (String completeCodecs) Set the codec string
void	<a href="#"><u>setIndexDefault</u></a> (String defaultSetting) Set the default setting
void	<a href="#"><u>setIndexDisplayHeight</u></a> (int displayheight) Set the display height
void	<a href="#"><u>setIndexDisplayWidth</u></a> (int displaywidth) Set the index display width
void	<a href="#"><u>setIndexFourCC</u></a> (String fourcc) Set the FourCC parameter
void	<a href="#"><u>setIndexGroupID</u></a> (String groupid) Set the group ID
void	<a href="#"><u>setIndexId</u></a> (int index) Set the index ID
void	<a href="#"><u>setIndexLanguage</u></a> (String lang) Set the language
void	<a href="#"><u>setIndexMaxHeight</u></a> (int maxheight) Set the max height
void	<a href="#"><u>setIndexMaxWidth</u></a> (int maxwidth) Set the max width
void	<a href="#"><u>setIndexMediaLine</u></a> (String medialine) Set the media line
void	<a href="#"><u>setIndexName</u></a> (String name) Set the index name
void	<a href="#"><u>setIndexPacketSize</u></a> (int packetsize) Set the index packet size
void	<a href="#"><u>setIndexProgramID</u></a> (String id) Set the program ID
void	<a href="#"><u>setIndexResolution</u></a> (String resolution) Set the resolution
void	<a href="#"><u>setIndexSampleRate</u></a> (int samplerate) Set the sample rate

void	<a href="#"><code>setIndexType</code></a> (String type) Set the index type
void	<a href="#"><code>setIndexURL</code></a> (String url) Set the URL
void	<a href="#"><code>setisLive</code></a> (boolean live) Set the isLive flag
void	<a href="#"><code>setVideoCodec</code></a> (String videocodec) Set the video codec

## Methods

### `getisLive`

```
public boolean getisLive()
```

Get this isLive flag

**Returns:**

### `setisLive`

```
public void setisLive(boolean live)
```

Set the isLive flag

**Parameters:**

live

### `getNextIndexElement`

```
public String getNextIndexElement()
```

Get the next index element

**Returns:**

String

### `addIndexElement`

```
public void addIndexElement(String ElementValue,  
    long duration)
```

Add an Index element to the list

**Parameters:**

ElementValue

duration

### `getCurrentDuration`

```
public long getCurrentDuration()
```

(continued from last page)

Get the current duration

**Returns:**

long

---

**setIndexCodecPrivateData**

```
public void setIndexCodecPrivateData(String codecprivatedata)
```

Set the index codec private data

**Parameters:**

codecprivatedata

---

**getIndexCodecPrivateData**

```
public String getIndexCodecPrivateData()
```

Get the index codec private data

**Returns:**

String

---

**setIndexDisplayWidth**

```
public void setIndexDisplayWidth(int displaywidth)
```

Set the index display width

**Parameters:**

displaywidth

---

**getIndexDisplayWidth**

```
public int getIndexDisplayWidth()
```

Get the index display width

**Returns:**

int

---

**setIndexDisplayHeight**

```
public void setIndexDisplayHeight(int displayheight)
```

Set the display height

**Parameters:**

displayheight

---

**getIndexDisplayHeight**

```
public int getIndexDisplayHeight()
```

Get the display height

**Returns:**

int

---

## setIndexMaxHeight

```
public void setIndexMaxHeight(int maxheight)
```

Set the max height

**Parameters:**

maxheight

---

## getIndexMaxHeight

```
public int getIndexMaxHeight()
```

Get the max height

**Returns:**

int

---

## setIndexMaxWidth

```
public void setIndexMaxWidth(int maxwidth)
```

Set the max width

**Parameters:**

maxwidth

---

## getIndexMaxWidth

```
public int getIndexMaxWidth()
```

Get the max width

**Returns:**

int

---

## setIndexAudioTag

```
public void setIndexAudioTag(int audiotag)
```

Set the audio tag

**Parameters:**

audiotag

---

## getIndexAudioTag

```
public int getIndexAudioTag()
```

Get the audio tag

**Returns:**

int

---

## setIndexPacketSize

```
public void setIndexPacketSize(int packetsize)
```

---

(continued from last page)

Set the index packet size

**Parameters:**

packetSize

---

## getIndexPacketSize

```
public int getIndexPacketSize()
```

Get the index packet size

**Returns:**

---

## setIndexBitsPerSample

```
public void setIndexBitsPerSample(int bitspersample)
```

Set the bits per sample

**Parameters:**

bitspersample

---

## getIndexBitsPerSample

```
public int getIndexBitsPerSample()
```

Get the bits per sample

**Returns:**

int

---

## setIndexBitrate

```
public void setIndexBitrate(String bitrate)
```

Set the bitrate

**Parameters:**

bitrate

---

## getIndexBitrate

```
public int getIndexBitrate()
```

Get the bitrate

**Returns:**

int

---

## setIndexChannel

```
public void setIndexChannel(int channel)
```

Set the channel count

**Parameters:**

channel

---

## getIndexChannel

```
public int getIndexChannel()
```

Get the channel count

**Returns:**

int

---

## setIndexSampleRate

```
public void setIndexSampleRate(int samplerate)
```

Set the sample rate

**Parameters:**

samplerate

---

## getIndexSampleRate

```
public int getIndexSampleRate()
```

Get the sample rate

**Returns:**

int

---

## setIndexFourCC

```
public void setIndexFourCC(String fourcc)
```

Set the FourCC parameter

**Parameters:**

fourcc

---

## getIndexFourCC

```
public String getIndexFourCC()
```

Get the FourCC parameter

**Returns:**

---

## setIndexChunkCount

```
public void setIndexChunkCount(int index)
```

Set the chunk count

**Parameters:**

index

---

## getIndexChunkCount

```
public int getIndexChunkCount()
```

---

(continued from last page)

Get the chunk count

**Returns:**

int

---

## setIndexCODECS

```
public void setIndexCODECS(String completeCodecs)
```

Set the codec string

**Parameters:**

completeCodecs

---

## setIndexId

```
public void setIndexId(int index)
```

Set the index ID

**Parameters:**

index

---

## getIndexId

```
public int getIndexId()
```

Get the index ID

**Returns:**

int

---

## setAudioCodec

```
public void setAudioCodec(String audiocodec)
```

Set the audio codec

**Parameters:**

audiocodec

---

## getAudioCodec

```
public String getAudioCodec()
```

Get the audio codec

**Returns:**

String

---

## setVideoCodec

```
public void setVideoCodec(String videocodec)
```

Set the video codec

**Parameters:**

videocodec

## getVideoCodec

```
public String getVideoCodec()
```

Get the video codec

**Returns:**  
String

---

## setIndexMediaLine

```
public void setIndexMediaLine(String medialine)
```

Set the media line

**Parameters:**  
medialine

---

## getIndexMediaLine

```
public String getIndexMediaLine()
```

Get the media line

**Returns:**  
String

---

## setIndexType

```
public void setIndexType(String type)
```

Set the index type

**Parameters:**  
type

---

## getIndexType

```
public String getIndexType()
```

Get the index type

**Returns:**  
String

---

## setIndexGroupID

```
public void setIndexGroupID(String groupid)
```

Set the group ID

**Parameters:**  
groupid

---

## getIndexGroupID

```
public String getIndexGroupID()
```

---

(continued from last page)

Get the group ID

**Returns:**

String

---

## setIndexLanguage

```
public void setIndexLanguage(String lang)
```

Set the language

**Parameters:**

lang

---

## getIndexLanguage

```
public String getIndexLanguage()
```

Get the language

**Returns:**

String

---

## setIndexName

```
public void setIndexName(String name)
```

Set the index name

**Parameters:**

name

---

## getIndexName

```
public String getIndexName()
```

Get the index name

**Returns:**

String

---

## getIndexElementCount

```
public int getIndexElementCount()
```

Get the element count

**Returns:**

int

---

## setIndexURL

```
public void setIndexURL(String url)
```

Set the URL

**Parameters:**

url

---

## getIndexURL

```
public String getIndexURL()
```

Get the URL

**Returns:**  
String

---

## setIndexProgramID

```
public void setIndexProgramID(String id)
```

Set the program ID

**Parameters:**  
id

---

## getIndexProgramID

```
public String getIndexProgramID()
```

Get the program ID

**Returns:**  
String

---

## setIndexResolution

```
public void setIndexResolution(String resolution)
```

Set the resolution

**Parameters:**  
resolution

---

## getIndexResolution

```
public String getIndexResolution()
```

Get the resolution

**Returns:**  
String

---

## checkIndexAvailable

```
public boolean checkIndexAvailable(String url)
```

Check if the URL provided is in this holder

**Parameters:**  
url

**Returns:**  
boolean - available is true, not available false

---

---

## setIndexDefault

```
public void setIndexDefault(String defaultSetting)
```

Set the default setting

### Parameters:

defaultSetting

---

## setIndexAudioLocation

```
public void setIndexAudioLocation(String audioLocation)
```

Set the audio location

### Parameters:

audioLocation

## com.wowza.wms.mediacaster.cupertino Interface ICupertinoMediaCasterHolders

public interface **ICupertinoMediaCasterHolders**  
extends

ICupertinoMediaCasterHolders

### Method Summary

void	<a href="#"><code>addAudioIndex(ICupertinoMediaCasterHolder thisHolder)</code></a> Add a CupertinoCasterHolder to the audio index
void	<a href="#"><code>addVideoIndex(ICupertinoMediaCasterHolder thisHolder)</code></a> Add a CupertinoCasterHolder to the video index
void	<a href="#"><code>clearCupertinoHolder()</code></a> Clear this holder
java.util.ArrayList	<a href="#"><code>getAudioBitrates()</code></a> Get the audio bitrates for the object
int	<a href="#"><code>getAudioCount()</code></a> Get the audio count
int	<a href="#"><code>getAudioSegmentID()</code></a> Get the AudioSegmentID for this object
<a href="#"><code>ICupertinoMediaCasterHolder</code></a>	<a href="#"><code>getCupertinoAudioIndex(int indexposition)</code></a> Get the CupertinoCaster holder from audio index by position
<a href="#"><code>ICupertinoMediaCasterHolder</code></a>	<a href="#"><code>getCupertinoVideoIndex(int indexposition)</code></a> Get the CupertinoCaster holder from video index by position
boolean	<a href="#"><code>getisLive()</code></a> Get this isLive flag
String	<a href="#"><code>getManifestURL()</code></a> Get the manifest URL
String	<a href="#"><code>getSessionID()</code></a> Get the session ID for this object
java.util.ArrayList	<a href="#"><code>getVideoBitrates()</code></a> Get the video bitrates for the object
int	<a href="#"><code>getVideoCount()</code></a> Get the video count
int	<a href="#"><code>getVideoSegmentID()</code></a> Get the VideoSegmentID for this object
void	<a href="#"><code>init(WMSProperties props)</code></a> Initialize this object

void	<a href="#"><code>setAudioSegmentID</code></a> (int segment) Set the AudioSegmentID for this object
void	<a href="#"><code>setExtVersion</code></a> (int extversion) Set the EXT version for this object
void	<a href="#"><code>setisLive</code></a> (boolean live) Set the isLive flag
void	<a href="#"><code>setManifestURL</code></a> (String url) Set the manifest URL
void	<a href="#"><code>setSessionID</code></a> (String session) Set the session ID for this object
void	<a href="#"><code>setVideoSegmentID</code></a> (int segment) Set the VideoSegmentID for this object

## Methods

### **init**

```
public void init(WMSProperties props)
```

Initialize this object

**Parameters:**  
props

### **setSessionID**

```
public void setSessionID(String session)
```

Set the session ID for this object

**Parameters:**  
session

### **getSessionID**

```
public String getSessionID()
```

Get the session ID for this object

**Returns:**  
String

### **getisLive**

```
public boolean getisLive()
```

Get this isLive flag

**Returns:**  
boolean

---

## setisLive

```
public void setisLive(boolean live)
```

Set the isLive flag

**Parameters:**  
live

---

## setExtVersion

```
public void setExtVersion(int extversion)
```

Set the EXT version for this object

**Parameters:**  
extversion

---

## setAudioSegmentID

```
public void setAudioSegmentID(int segment)
```

Set the AudioSegmentID for this object

**Parameters:**  
segment

---

## getAudioSegmentID

```
public int getAudioSegmentID()
```

Get the AudioSegmentID for this object

**Returns:**  
int

---

## setVideoSegmentID

```
public void setVideoSegmentID(int segment)
```

Set the VideoSegmentID for this object

**Parameters:**  
segment

---

## getVideoSegmentID

```
public int getVideoSegmentID()
```

Get the VideoSegmentID for this object

**Returns:**  
int

---

## getManifestURL

```
public String getManifestURL()
```

---

---

(continued from last page)

Get the manifest URL

**Returns:**

String

---

## setManifestURL

```
public void setManifestURL(String url)
```

Set the manifest URL

**Parameters:**

url

---

## clearCupertinoHolder

```
public void clearCupertinoHolder()
```

Clear this holder

---

## addAudioIndex

```
public void addAudioIndex(ICupertinoMediaCasterHolder thisHolder)
```

Add a CupertinoCasterHolder to the audio index

**Parameters:**

thisHolder

---

## addVideoIndex

```
public void addVideoIndex(ICupertinoMediaCasterHolder thisHolder)
```

Add a CupertinoCasterHolder to the video index

**Parameters:**

thisHolder

---

## getVideoCount

```
public int getVideoCount()
```

Get the video count

**Returns:**

int

---

## getAudioCount

```
public int getAudioCount()
```

Get the audio count

**Returns:**

int

---

(continued from last page)

## getCupertinoAudioIndex

```
public ICupertinoMediaCasterHolder getCupertinoAudioIndex(int indexposition)
```

Get the CupertinoCaster holder from audio index by position

**Parameters:**

indexposition

**Returns:**

ICupertinoMediaCasterHolder

---

## getCupertinoVideoIndex

```
public ICupertinoMediaCasterHolder getCupertinoVideoIndex(int indexposition)
```

Get the CupertinoCaster holder from video index by position

**Parameters:**

indexposition

**Returns:**

ICupertinoMediaCasterHolder

---

## getVideoBitrates

```
public java.util.ArrayList getVideoBitrates()
```

Get the video bitrates for the object

**Returns:**

ArrayList

---

## getAudioBitrates

```
public java.util.ArrayList getAudioBitrates()
```

Get the audio bitrates for the object

**Returns:**

ArrayList

---

## com.wowza.wms.mediacaster.cupertino Interface ICupertinoMediaCasterID3Processor

public interface **ICupertinoMediaCasterID3Processor**  
extends

### Method Summary

void	<a href="#"><code>clearID3()</code></a>
boolean	<a href="#"><code>getDebug()</code></a>
java.util.HashMap	<a href="#"><code>getID3()</code></a>
void	<a href="#"><code>init(IApplicationInstance</code> appins, CupertinoMediaCasterContext context)</a>
boolean	<a href="#"><code>isID3Available()</code></a>
int	<a href="#"><code>processBuffer</code></a> (byte[] buffer, int offset, int len)
void	<a href="#"><code>processMetaData()</code></a>
void	<a href="#"><code>setDebug</code></a> (boolean debug)

### Methods

#### **init**

```
public void init(IApplicationInstance appins,  
                 CupertinoMediaCasterContext context)
```

#### **setDebug**

```
public void setDebug(boolean debug)
```

#### **getDebug**

```
public boolean getDebug()
```

#### **clearID3**

```
public void clearID3()
```

(continued from last page)

---

## **processBuffer**

```
public int processBuffer(byte[] buffer,  
    int offset,  
    int len)
```

---

## **processMetaData**

```
public void processMetaData()
```

---

## **isID3Available**

```
public boolean isID3Available()
```

---

## **getID3**

```
public java.util.HashMap getID3()
```

## com.wowza.wms.mediacaster.cupertino Interface ICupertinoMediaCasterManageStreamName

public interface **ICupertinoMediaCasterManageStreamName**  
extends

Interface to control the naming scheme used for Apple HLS ingest This can be replaced by a custom implementation from the default using the property in MediaCaster -> Properties Name: cupertinoManageStreamNameClass Value: Full Class Path Type: String

### Method Summary

String	<a href="#">getStreamName</a> (String inputName, int streamsSize, int count, <a href="#">ICupertinoMediaCasterHolder</a> inboundStreamInformation) Called when a new stream is being created by the Apple HLS ingestion code
void	<a href="#">init</a> ( <a href="#">IApplicationInstance</a> appins, <a href="#">IMediaCaster</a> mediacaster, <a href="#">CupertinoMediaCasterContext</a> context) Called when the called is initiated

### Methods

#### init

```
public void init(IApplicationInstance appins,  
                 IMediaCaster mediacaster,  
                 CupertinoMediaCasterContext context)
```

Called when the called is initiated

##### Parameters:

appins - - Application instance  
mediacaster - - The mediacaster making the call  
context - - MediaCaster context object containing configuration settings

#### getStreamName

```
public String getStreamName(String inputName,  
                             int streamsSize,  
                             int count,  
                             ICupertinoMediaCasterHolder inboundStreamInformation)
```

Called when a new stream is being created by the Apple HLS ingestion code

##### Parameters:

inputName - - The basename of the stream being created. This should be the name of the .stream name  
streamsSize - - The number of streams found when the base manifest was parsed  
count - - The number of this stream in relation to the main count  
inboundStreamInformation - - The context information when the manifest was parsed

##### Returns:

String - The stream name to be used for this stream creation The default for this code is if ( streamsSize == 1 || count == 0) return inputName; else return inputName+"\_"+String.valueOf(count); If the size

## com.wowza.wms.mediacaster.cupertino Interface ICupertinoMediaCasterPlaylistParser

public interface **ICupertinoMediaCasterPlaylistParser**  
extends

Interface to parse manifests for processing This can be replaced by a custom implementation from the default using the property in MediaCaster -> Properties Name: cupertinoPlaylistParserClass Value: Full Class Path Type: String

### Method Summary

int	<a href="#">getCurrentIndex()</a> Returns the current manifest number
void	<a href="#">init(ICupertinoMediaCasterHolders myholders, WMSProperties props)</a> Called when the class is initiated.
int	<a href="#">parseCupertinoChunklist(String baseurl, String chunklist, ICupertinoMediaCasterHolder holder, int indexpos)</a> Parses a specific chunklist found in the main manifest via the chunklist string provided In order to support absolute URIs the baseurl used to retrieve the manifest is also made available.
void	<a href="#">parseCupertinoPlaylist(String baseurl, String mainplaylist)</a> Parses the main manifest string provided in mainplaylist.
void	<a href="#">setContext(CupertinoMediaCasterContext context)</a> Called when the class is initiated.
void	<a href="#">setCurrentIndex(int index)</a> Sets the current manifest number

### Methods

#### init

```
public void init(ICupertinoMediaCasterHolders myholders,  
                 WMSProperties props)
```

Called when the class is initiated.

#### Parameters:

myholders - Management framework object for manifest entries  
props - MediaCaster properties object

#### setContext

```
public void setContext(CupertinoMediaCasterContext context)
```

Called when the class is initiated.

#### Parameters:

context - MediaCaster context object containing configuration settings

## getCurrentIndex

```
public int getCurrentIndex()
```

Returns the current manifest number

**Returns:**

int Current manifest index number

---

## setCurrentIndex

```
public void setCurrentIndex(int index)
```

Sets the current manifest number

**Parameters:**

index

---

## parseCupertinoPlaylist

```
public void parseCupertinoPlaylist(String baseurl,  
    String mainplaylist)
```

Parses the main manifest string provided in mainplaylist. In order to support absolute URIs the baseurl used to retrieve the manifest is also made available.

**Parameters:**

baseurl -- baseurl used to retrieve the chunklist

mainplaylist -- string containing the playlist For each new entry found a new ICupertinoMediaCasterHolder is added to ICupertinoMediaCasterHolders

---

## parseCupertinoChunklist

```
public int parseCupertinoChunklist(String baseurl,  
    String chunklist,  
    ICupertinoMediaCasterHolder holder,  
    int indexpos)
```

Parses a specific chunklist found in the main manifest via the chunklist string provided In order to support absolute URIs the baseurl used to retrieve the manifest is also made available.

**Parameters:**

baseurl -- baseurl used to retrieve the chunklist

chunklist -- string containing the chunklist

holder -- pointer to the holder of this chunklist information to be updated

indexpos -- index of this chunk list against the main playlist

**Returns:**

int - Should contain the index number of the last chunk processed

---

## com.wowza.wms.mediacaster.cupertino Interface ICupertinoMediaCasterSegments

public interface **ICupertinoMediaCasterSegments**  
extends

ICupertinoMediaCasterSegments

### Method Summary

void	<a href="#"><code>addMPEGTSegment</code></a> (CupertinoMediaCasterMPEGTSegment segment) Add a CupertinoMediaCasterMPEGTSegment to the process list
int	<a href="#"><code>getBufferMaxBlockCount</code></a> () Get the buffer max block count
CupertinoMediaCasterContext	<a href="#"><code>getContext</code></a> () Get the CupertinoMediaCasterContext for this object
CupertinoMediaCasterConnection	<a href="#"><code>getMediaCasterConnection</code></a> () Get the CupertinoMediaCasterConnection for this object
CupertinoMediaCaster	<a href="#"><code>getMediaCasterObject</code></a> () Get the CupertinoMediaCaster object
int	<a href="#"><code>getMPEGTSegmentCount</code></a> () Get the number of segments available
CupertinoMediaCasterMPEGTSegment	<a href="#"><code>getNextMPEGTSegment</code></a> () Get the next CupertinoMediaCasterMPEGTSegment to be processed
String	<a href="#"><code>getStreamName</code></a> () Get the stream name
void	<a href="#"><code>init</code></a> (CupertinoMediaCasterConnection connection, <a href="#"><code>IApplicationInstance</code></a> appins, CupertinoMediaCasterContext context) Initialise this segments handler
boolean	<a href="#"><code>isRunning</code></a> () Get the running state of the segments handler
void	<a href="#"><code>quit</code></a> () Quit the segments handler
void	<a href="#"><code>setBufferBlockCount</code></a> (int blockcount) Set the buffer block count
void	<a href="#"><code>setBufferMaxBlockCount</code></a> (int maxblockcount) Set the buffer max block count
void	<a href="#"><code>setMediaCasterObject</code></a> (CupertinoMediaCaster caster) Set the CupertinoMediaCaster object
void	<a href="#"><code>setRunning</code></a> (boolean state) Set the running state of the segments handler

void	<a href="#">setStreamName</a> (String name) Set the stream name
------	--

## Methods

### init

```
public void init(CupertinoMediaCasterConnection connection,  
    IApplicationInstance appins,  
    CupertinoMediaCasterContext context)
```

Initialise this segments handler

**Parameters:**

connection  
appins  
context

### getContext

```
public CupertinoMediaCasterContext getContext()
```

Get the CupertinoMediaCasterContext for this object

**Returns:**

CupertinoMediaCasterContext

### getMediaCasterConnection

```
public CupertinoMediaCasterConnection getMediaCasterConnection()
```

Get the CupertinoMediaCasterConnection for this object

**Returns:**

CupertinoMediaCasterConnection

### setBufferBlockCount

```
public void setBufferBlockCount(int blockcount)
```

Set the buffer block count

**Parameters:**

blockcount

### setBufferMaxBlockCount

```
public void setBufferMaxBlockCount(int maxblockcount)
```

Set the buffer max block count

**Parameters:**

maxblockcount

(continued from last page)

## getBufferMaxBlockCount

```
public int getBufferMaxBlockCount()
```

Get the buffer max block count

**Returns:**  
int

---

## setStreamName

```
public void setStreamName(String name)
```

Set the stream name

**Parameters:**  
name

---

## getStreamName

```
public String getStreamName()
```

Get the stream name

**Returns:**

---

## setMediaCasterObject

```
public void setMediaCasterObject(CupertinoMediaCaster caster)
```

Set the CupertinoMediaCaster object

**Parameters:**  
caster

---

## getMediaCasterObject

```
public CupertinoMediaCaster getMediaCasterObject()
```

Get the CupertinoMediaCaster object

**Returns:**  
CupertinoMediaCaster

---

## addMPEGTSegment

```
public void addMPEGTSegment(CupertinoMediaCasterMPEGTSegment segment)
```

Add a CupertinoMediaCasterMPEGTSegment to the process list

**Parameters:**  
segment

---

## getNextMPEGTSegment

```
public CupertinoMediaCasterMPEGTSegment getNextMPEGTSegment()
```

---

(continued from last page)

Get the next CupertinoMediaCasterMPEGTSSegment to be processed

**Returns:**

CupertinoMediaCasterMPEGTSSegment

---

## getMPEGTSSegmentCount

```
public int getMPEGTSSegmentCount()
```

Get the number of segments available

**Returns:**

int

---

## isRunning

```
public boolean isRunning()
```

Get the running state of the segments handler

**Returns:**

---

## setRunning

```
public void setRunning(boolean state)
```

Set the running state of the segments handler

**Parameters:**

state

---

## quit

```
public void quit()
```

Quit the segments handler

---

Package

**com.wowza.wms.mediacaster.rtp**

## com.wowza.wms.mediacaster.rtp Interface IRTPSessionDescriptionDataProvider

public interface **IRTPSessionDescriptionDataProvider**  
extends

IRTPSessionDescriptionDataProvider: Internal use.

### Method Summary

boolean	<a href="#">doIdle</a> (MediaCaster mediaCaster)
RTPSessionDescription Data	<a href="#">getSessionDescriptionData</a> ( <a href="#">IApplicationInstance</a> appInstance, String streamName, int retryCount, <a href="#">IRTPSessionDescriptionSessionHandler</a> handler, <a href="#">IMediaCaster</a> mediaCaster)
void	<a href="#">init</a> (MediaCaster mediaCaster)
void	<a href="#">sessionStart</a> ( <a href="#">RTPSession</a> rtpSession)
void	<a href="#">sessionStop</a> ( <a href="#">RTPSession</a> rtpSession)

### Methods

#### **init**

```
public void init(MediaCaster mediaCaster)
```

#### **getSessionDescriptionData**

```
public RTPSessionDescriptionData getSessionDescriptionData(IApplicationInstance appInstance,  
    String streamName,  
    int retryCount,  
    IRTPSessionDescriptionSessionHandler handler,  
    IMediaCaster mediaCaster)
```

#### **sessionStart**

```
public void sessionStart(RTPSession rtpSession)
```

#### **sessionStop**

```
public void sessionStop(RTPSession rtpSession)
```

(continued from last page)

---

## doIdle

```
public boolean doIdle(MediaCaster mediaCaster)
```

---

## com.wowza.wms.mediacaster.rtp Interface IRTPSessionDescriptionSessionHandler

---

public interface **IRTPSessionDescriptionSessionHandler**  
extends

IRTPSessionDescriptionSessionHandler: Internal use.

---

### Method Summary

void	<a href="#">onDisconnect()</a>
------	--------------------------------

---

### Methods

#### **onDisconnect**

public void **onDisconnect()**

---

Package

**com.wowza.wms.mediacaster.shoutcast**

## com.wowza.wms.mediacaster.shoutcast Interface IShoutCastFrameReceiver

public interface **IShoutCastFrameReceiver**  
extends

IShoutCastFrameReceiver: Internal use.

### Method Summary

void	<a href="#">onCodecConfigAAC</a> (com.wowza.wms.media.aac.AACFrame frame, byte[] buffer, long offset)
void	<a href="#">onCodecConfigOpus</a> (byte[] codecinfo, byte[] commentData, long timecode)
void	<a href="#">onCodecConfigVorbis</a> (byte[] codecinfo, byte[] commentData, byte[] firstAudioInfo, long timecode)
void	<a href="#">onFrameAAC</a> (com.wowza.wms.media.aac.AACFrame frame, byte[] buffer, long offset)
void	<a href="#">onFrameMP3</a> (int frequency, int samplesPerFrame, int channels, byte[] syncHeader, byte[] packetHeader, byte[] frameData)
void	<a href="#">onFrameOgg</a> (com.wowza.wms.media.ogg.OggHeader oggData)
void	<a href="#">onHeaderData</a> (java.util.Map headerMap)
void	<a href="#">onMetaData</a> (java.util.Map metaMap)
void	<a href="#">onTrim</a> ()

### Methods

#### onFrameMP3

```
public void onFrameMP3(int frequency,  
    int samplesPerFrame,  
    int channels,  
    byte[] syncHeader,  
    byte[] packetHeader,  
    byte[] frameData)
```

(continued from last page)

## onCodecConfigAAC

```
public void onCodecConfigAAC(com.wowza.wms.media.aac.AACFrame frame,
    byte[] buffer,
    long offset)
```

---

## onFrameAAC

```
public void onFrameAAC(com.wowza.wms.media.aac.AACFrame frame,
    byte[] buffer,
    long offset)
```

---

## onFrameOgg

```
public void onFrameOgg(com.wowza.wms.media.ogg.OggHeader oggData)
```

---

## onCodecConfigVorbis

```
public void onCodecConfigVorbis(byte[] codecinfo,
    byte[] commentData,
    byte[] firstAudioInfo,
    long timecode)
```

---

## onCodecConfigOpus

```
public void onCodecConfigOpus(byte[] codecinfo,
    byte[] commentData,
    long timecode)
```

---

## onTrim

```
public void onTrim()
```

---

## onHeaderData

```
public void onHeaderData(java.util.Map headerMap)
```

---

## onMetaData

```
public void onMetaData(java.util.Map metaMap)
```

---

## com.wowza.wms.mediacaster.shoutcast Interface IShoutCastHeaderDecoder

---

public interface **IShoutCastHeaderDecoder**  
extends

---

### Method Summary

void	<a href="#">addHeader</a> (String name, String value)
java.util.Map	<a href="#">decodeHeader</a> (byte[] headerBytes)
void	<a href="#">setAppInstance</a> ( <a href="#">IApplicationInstance</a> appins)

---

### Methods

#### setAppInstance

public void **setAppInstance**([IApplicationInstance](#) appins)

---

#### decodeHeader

public java.util.Map **decodeHeader**(byte[] headerBytes)

---

#### addHeader

public void **addHeader**(String name,  
String value)

---

## com.wowza.wms.mediacaster.shoutcast Interface IShoutCastMetaDataListener

---

public interface **IShoutCastMetaDataListener**  
extends

IShoutCastMetaDataListener: Internal use.

---

### Method Summary

void	<a href="#">addMetaDataListener</a> ( <a href="#">IShoutCastMetaDataNotify</a> listener)
boolean	<a href="#">removeMetaDataListener</a> ( <a href="#">IShoutCastMetaDataNotify</a> listener)

---

### Methods

#### **addMetaDataListener**

public void **addMetaDataListener**([IShoutCastMetaDataNotify](#) listener)

---

#### **removeMetaDataListener**

public boolean **removeMetaDataListener**([IShoutCastMetaDataNotify](#) listener)

## com.wowza.wms.mediacaster.shoutcast Interface IShoutCastMetaDataNotify

public interface **IShoutCastMetaDataNotify**  
extends

IShoutCastMetaDataNotify: Internal use.

### Method Summary

void	<a href="#">onAACEncodeInfo</a> ( <a href="#">IMediaCaster</a> mediaCaster, int frequency, int channels, int samplesPerFrame)
void	<a href="#">onHeaderData</a> ( <a href="#">IMediaCaster</a> mediaCaster, java.util.Map headerMap)
void	<a href="#">onMetaData</a> ( <a href="#">IMediaCaster</a> mediaCaster, java.util.Map metaMap)
void	<a href="#">onMP3EncodeInfo</a> ( <a href="#">IMediaCaster</a> mediaCaster, int frequency, int channels, int samplesPerFrame)

### Methods

#### onHeaderData

```
public void onHeaderData(IMediaCaster mediaCaster,  
    java.util.Map headerMap)
```

#### onMetaData

```
public void onMetaData(IMediaCaster mediaCaster,  
    java.util.Map metaMap)
```

#### onAACEncodeInfo

```
public void onAACEncodeInfo(IMediaCaster mediaCaster,  
    int frequency,  
    int channels,  
    int samplesPerFrame)
```

#### onMP3EncodeInfo

```
public void onMP3EncodeInfo(IMediaCaster mediaCaster,  
    int frequency,  
    int channels,  
    int samplesPerFrame)
```

Package

**com.wowza.wms.module**

## com.wowza.wms.module Interface IModuleCallResult

public interface **IModuleCallResult**  
extends

IModuleCallResult: callback interface used by IClient call.

### Method Summary

void	<code>onResult(<a href="#">IClient</a> client, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params)</code> Triggered on client side result from call to IClient.call
------	--

### Methods

#### onResult

```
public void onResult(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Triggered on client side result from call to IClient.call

#### Parameters:

client - client  
function - function object  
params - result parameters

## com.wowza.wms.module Interface IModuleNotify

public interface **IModuleNotify**  
extends

IModuleNotify: listener interface for listening to module loading and unloading. See  
IApplicationInstance.addModuleListener(IModuleNotify moduleListener)

### Method Summary

void	<a href="#"><u>onModuleLoad</u></a> (ModuleItem item) Called when module loaded
void	<a href="#"><u>onModuleUnload</u></a> (ModuleItem item) Called when module unloaded

### Methods

#### onModuleLoad

public void **onModuleLoad**(ModuleItem item)

Called when module loaded

**Parameters:**

item - module

#### onModuleUnload

public void **onModuleUnload**(ModuleItem item)

Called when module unloaded

**Parameters:**

item - module

## com.wowza.wms.module Interface IModuleOnApp

All Subinterfaces:

[IModuleOnApp2](#)

All Known Implementing Classes:

[ModuleMediaCaster](#)

---

public interface **IModuleOnApp**  
extends

IModuleCallResult: method interface examples for application level methods in a module.

Since module method must be implemented as static method a module cannot directly implements this interface. This interface only serves as an example of the method names and call signature needed to implement these application methods.

---

### Method Summary

void	<a href="#">onAppStart</a> ( <a href="#">IApplicationInstance</a> appInstance) Invoked when an application instance is started.
void	<a href="#">onAppStop</a> ( <a href="#">IApplicationInstance</a> appInstance) Invoked when an application instance is stopped (destroyed).

---

### Methods

#### onAppStart

public void **onAppStart**([IApplicationInstance](#) appInstance)

Invoked when an application instance is started.

**Parameters:**

appInstance - application instance

---

#### onAppStop

public void **onAppStop**([IApplicationInstance](#) appInstance)

Invoked when an application instance is stopped (destroyed).

**Parameters:**

appInstance - application instance

## com.wowza.wms.module Interface IModuleOnApp2

All Superinterfaces:  
[IModuleOnApp](#)

public interface **IModuleOnApp2**  
extends [IModuleOnApp](#)

### Method Summary

void	<a href="#">onAppCreate</a> ( <a href="#">IApplicationInstance</a> appInstance) Invoked when an application instance is created.
void	<a href="#">onAppDestroy</a> ( <a href="#">IApplicationInstance</a> appInstance) Invoked when an application instance is destroyed

Methods inherited from interface [com.wowza.wms.module.IModuleOnApp](#)

[onAppStart](#), [onAppStop](#)

### Methods

#### onAppCreate

public void **onAppCreate**([IApplicationInstance](#) appInstance)

Invoked when an application instance is created.

**Parameters:**

appInstance - application instance

#### onAppDestroy

public void **onAppDestroy**([IApplicationInstance](#) appInstance)

Invoked when an application instance is destroyed

**Parameters:**

appInstance - application instance

## com.wowza.wms.module Interface IModuleOnCall

public interface **IModuleOnCall**  
extends

IModuleOnCall: method interface example for the catch-all method handler onCall.

Since module method must be implemented as static method a module cannot directly implements this interface. This interface only serves as an example of the method name and call signature needed to implement this method. The onCall method, when defined in a module, is invoked for all handlers that are undefined in a given module. The onCall handler can also be used to catch calls to server side component calls.

### Method Summary

void

[onCall](#)(String handlerName, [IClient](#) client,  
com.wowza.wms.request.RequestFunction function, [AMFDataList](#) params)  
Catch-all method handler.

### Methods

#### onCall

```
public void onCall(String handlerName,  
    IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Catch-all method handler. The onCall method, when defined in a module, is invoked for all handlers that are undefined in a given module.

##### Parameters:

handlerName - handler name  
client - client  
function - function object  
params - function parameters

## com.wowza.wms.module Interface IModuleOnConnect

public interface **IModuleOnConnect**  
extends

IModuleOnConnect: method interface examples for client level methods in a module.

Since module method must be implemented as static method a module cannot directly implements this interface. This interface only serves as an example of the method names and call signature needed to implement these client methods.

### Method Summary

void	<a href="#">onConnect</a> ( <a href="#">IClient</a> client, com.wowza.wms.request.RequestFunction function, <a href="#">AMFDataList</a> params) Invoked when a client connection is initiated.
void	<a href="#">onConnectAccept</a> ( <a href="#">IClient</a> client) Invoked when a client connection is accepted.
void	<a href="#">onConnectReject</a> ( <a href="#">IClient</a> client) Invoked when a client connection is rejected.
void	<a href="#">onDisconnect</a> ( <a href="#">IClient</a> client) Invoked when a client disconnects.

### Methods

#### onConnect

```
public void onConnect(IClient client,  
    com.wowza.wms.request.RequestFunction function,  
    AMFDataList params)
```

Invoked when a client connection is initiated. It is within this method that module can call to client.acceptConnection or client.rejectConnection.

**Parameters:**

client - client  
function - function object  
params - function parameters

#### onDisconnect

```
public void onDisconnect(IClient client)
```

Invoked when a client disconnects.

**Parameters:**

client - client

(continued from last page)

## onConnectAccept

```
public void onConnectAccept(IClient client)
```

Invoked when a client connection is accepted.

**Parameters:**

client - client

---

## onConnectReject

```
public void onConnectReject(IClient client)
```

Invoked when a client connection is rejected.

**Parameters:**

client - client

## com.wowza.wms.module Interface IModuleOnHTTPCupertinoEncryption

public interface **IModuleOnHTTPCupertinoEncryption**  
extends

IModuleOnHTTPCupertinoEncryption: listener interface for listening to AES-128 encryption events.

### Field Summary

public static final	<a href="#"><u>KEYDATA_MODE_ENCRYPT</u></a> Value: <b>3</b>
public static final	<a href="#"><u>KEYDATA_MODE_INIT</u></a> Value: <b>1</b>
public static final	<a href="#"><u>KEYDATA_MODE_KEYFRAME_ENCRYPT</u></a> Value: <b>6</b>
public static final	<a href="#"><u>KEYDATA_MODE_KEYFRAME_INIT</u></a> Value: <b>4</b>
public static final	<a href="#"><u>KEYDATA_MODE_KEYFRAME_PLAYLIST</u></a> Value: <b>5</b>
public static final	<a href="#"><u>KEYDATA_MODE_PLAYLIST</u></a> Value: <b>2</b>

### Method Summary

void	<a href="#"><u>onHTTPCupertinoEncryptionKeyCreateLive</u></a> ( <a href="#"><u>IApplicationInstance</u></a> appInstance, <a href="#"><u>String</u></a> streamName, <a href="#"><u>byte[]</u></a> encKey) Called when live stream key is requested (per-published stream)
void	<a href="#"><u>onHTTPCupertinoEncryptionKeyCreateVOD</u></a> ( <a href="#"><u>HTTPStreamerSessionCupertino</u></a> httpSession, <a href="#"><u>byte[]</u></a> encKey) Called when video on demand key is requested (per-session)
void	<a href="#"><u>onHTTPCupertinoEncryptionKeyData</u></a> ( <a href="#"><u>HTTPStreamerSessionCupertino</u></a> httpSession, <a href="#"><u>IHttpRequest</u></a> req, <a href="#"><u>IHttpResponse</u></a> resp, <a href="#"><u>byte[]</u></a> encKeyData) Called when a key data is requested.
void	<a href="#"><u>onHTTPCupertinoEncryptionKeyLiveChunk</u></a> ( <a href="#"><u>ILiveStreamPacketizer</u></a> liveStreamPacketizer, <a href="#"><u>String</u></a> streamName, <a href="#"><u>CupertinoEncInfo</u></a> encInfo, long chunkId, int mode) Called when live stream key is requested (per-published stream, per-chunk - for rotating keys)
void	<a href="#"><u>onHTTPCupertinoEncryptionKeyRequest</u></a> ( <a href="#"><u>HTTPStreamerSessionCupertino</u></a> httpSession, <a href="#"><u>IHttpRequest</u></a> req, <a href="#"><u>IHttpResponse</u></a> resp) Called when a key is requested.

void

[onHTTPCupertinoEncryptionKeyVODChunk](#)([HTTPStreamerSessionCupertino](#) httpSession, [IHTTPStreamerCupertinoIndex](#) index, [CupertinoEncInfo](#) encInfo, long chunkId, int mode)

Called when video on demand key is requested (per-session).

## Fields

### KEYDATA\_MODE\_INIT

```
public static final int KEYDATA_MODE_INIT
```

Constant value: **1**

### KEYDATA\_MODE\_PLAYLIST

```
public static final int KEYDATA_MODE_PLAYLIST
```

Constant value: **2**

### KEYDATA\_MODE\_ENCRYPT

```
public static final int KEYDATA_MODE_ENCRYPT
```

Constant value: **3**

### KEYDATA\_MODE\_KEYFRAME\_INIT

```
public static final int KEYDATA_MODE_KEYFRAME_INIT
```

Constant value: **4**

### KEYDATA\_MODE\_KEYFRAME\_PLAYLIST

```
public static final int KEYDATA_MODE_KEYFRAME_PLAYLIST
```

Constant value: **5**

### KEYDATA\_MODE\_KEYFRAME\_ENCRYPT

```
public static final int KEYDATA_MODE_KEYFRAME_ENCRYPT
```

Constant value: **6**

## Methods

### onHTTPCupertinoEncryptionKeyRequest

```
public void onHTTPCupertinoEncryptionKeyRequest(HTTPStreamerSessionCupertino
httpSession,
IHTTPRequest req,
IHTTPResponse resp)
```

(continued from last page)

Called when a key is requested. Call `httpSession.rejectSession` to reject the streaming session and stop delivery of the encryption key.

**Parameters:**

`httpSession` - HTTP session  
`req` - HTTP request  
`resp` - HTTP response

---

## onHTTPCupertinoEncryptionKeyData

```
public void onHTTPCupertinoEncryptionKeyData(HTTPStreamerSessionCupertino httpSession,
IHTTPRequest req,
IHTTPResponse resp,
byte[] encKeyData)
```

Called when a key data is requested. Set `encKeyData` to the key data to be sent to the client.

**Parameters:**

`httpSession` - HTTP session  
`req` - request  
`resp` - response  
`encKeyData` - key data

---

## onHTTPCupertinoEncryptionKeyCreateVOD

```
public void onHTTPCupertinoEncryptionKeyCreateVOD(HTTPStreamerSessionCupertino
httpSession,
byte[] encKey)
```

Called when video on demand key is requested (per-session)

**Parameters:**

`httpSession` - HTTP session  
`encKey` - encryption key

---

## onHTTPCupertinoEncryptionKeyVODChunk

```
public void onHTTPCupertinoEncryptionKeyVODChunk(HTTPStreamerSessionCupertino
httpSession,
IHTTPStreamerCupertinoIndex index,
CupertinoEncInfo encInfo,
long chunkId,
int mode)
```

Called when video on demand key is requested (per-session). Allows setting of encryption key and URL.

**Parameters:**

`httpSession` - HTTP session  
`index` - file index  
`encInfo` - encryption key  
`mode` - KEYDATA\_MODE\_\*

---

## onHTTPCupertinoEncryptionKeyCreateLive

```
public void onHTTPCupertinoEncryptionKeyCreateLive(IApplicationInstance appInstance,
String streamName,
byte[] encKey)
```

Called when live stream key is requested (per-published stream)

(continued from last page)

**Parameters:**

appInstance - application instance  
streamName - stream name  
encKey - encryption key

---

**onHTTPCupertinoEncryptionKeyLiveChunk**

```
public void onHTTPCupertinoEncryptionKeyLiveChunk(ILiveStreamPacketizer  
liveStreamPacketizer,  
    String streamName,  
    CupertinoEncInfo encInfo,  
    long chunkId,  
    int mode)
```

Called when live stream key is requested (per-published stream, per-chunk - for rotating keys)

**Parameters:**

liveStreamPacketizer - live stream packetizer  
streamName - stream name  
encInfo - encryption info  
chunkId - chunk ID, -1 for stream creation  
mode - KEYDATA\_MODE\_\*

## com.wowza.wms.module Interface IModuleOnHTTPCupertinoStreamingSession

public interface **IModuleOnHTTPCupertinoStreamingSession**  
extends

IModuleOnHTTPSession: method interface for HTTP Cupertino Streaming session create/destroy.

### Method Summary

void	<a href="#">onHTTPCupertinoStreamingSessionCreate</a> ( <a href="#">HTTPStreamerSessionCupertino</a> <a href="#">httpCupertinoStreamingSession</a> ) Invoked when an HTTP Cupertino Streaming session is created.
void	<a href="#">onHTTPCupertinoStreamingSessionDestroy</a> ( <a href="#">HTTPStreamerSessionCupertino</a> <a href="#">httpCupertinoStreamingSession</a> ) Invoked when an HTTP Cupertino Streaming session is destroyed.

### Methods

#### onHTTPCupertinoStreamingSessionCreate

public void **onHTTPCupertinoStreamingSessionCreate**([HTTPStreamerSessionCupertino](#) [httpCupertinoStreamingSession](#))

Invoked when an HTTP Cupertino Streaming session is created.

**Parameters:**

[httpCupertinoStreamingSession](#) - [httpCupertinoStreamingSession](#)

#### onHTTPCupertinoStreamingSessionDestroy

public void **onHTTPCupertinoStreamingSessionDestroy**([HTTPStreamerSessionCupertino](#) [httpCupertinoStreamingSession](#))

Invoked when an HTTP Cupertino Streaming session is destroyed.

**Parameters:**

[httpCupertinoStreamingSession](#) - [httpCupertinoStreamingSession](#)

## com.wowza.wms.module

# Interface IModuleOnHTTPMPEGDashEncryption

public interface **IModuleOnHTTPMPEGDashEncryption**  
extends

IModuleOnHTTPMPEGDashEncryption: listener interface for listening to MPEG-DASH encryption events.

## Method Summary

void	<a href="#">onHTTPMPEGDashEncryptionKeyLiveChunk</a> ( <a href="#">ILiveStreamPacketizer</a> liveStreamPacketizer, String streamName, <a href="#">CencInfo</a> cencInfo, long chunkId) Called when live stream key is requested (per-published stream)
void	<a href="#">onHTTPMPEGDashEncryptionKeyVODChunk</a> ( <a href="#">HTTPStreamerSessionMPEGDash</a> httpSession, <a href="#">IHTTPStreamerMPEGDashIndex</a> index, <a href="#">CencInfo</a> cencInfo, long chunkId) Called when video on demand key is requested (per-session).

## Methods

### onHTTPMPEGDashEncryptionKeyVODChunk

```
public void onHTTPMPEGDashEncryptionKeyVODChunk(HTTPStreamerSessionMPEGDash
httpSession,
IHTTPStreamerMPEGDashIndex index,
CencInfo cencInfo,
long chunkId)
```

Called when video on demand key is requested (per-session). Allows setting of encryption key and URL.

#### Parameters:

httpSession - HTTP session  
index - file index  
cencInfo - Common Encryption information  
chunkId - chunk identifier

### onHTTPMPEGDashEncryptionKeyLiveChunk

```
public void onHTTPMPEGDashEncryptionKeyLiveChunk(ILiveStreamPacketizer
liveStreamPacketizer,
String streamName,
CencInfo cencInfo,
long chunkId)
```

Called when live stream key is requested (per-published stream)

#### Parameters:

liveStreamPacketizer - live stream packetizer  
streamName - stream name  
cencInfo - Common Encryption information  
chunkId - chunk identifier

## com.wowza.wms.module

# Interface IModuleOnHTTPMPEGDashStreamingSession

public interface **IModuleOnHTTPMPEGDashStreamingSession**  
extends

IModuleOnHTTPMPEGDashStreamingSession: method interface for HTTP MPEGDash Streaming session create/destroy.

## Method Summary

void	<a href="#">onHTTPMPEGDashStreamingSessionCreate</a> ( <a href="#">HTTPStreamerSessionMPEGDash</a> <a href="#">httpMPEGDashStreamingSession</a> ) Invoked when an HTTP MPEGDash Streaming session is created.
void	<a href="#">onHTTPMPEGDashStreamingSessionDestroy</a> ( <a href="#">HTTPStreamerSessionMPEGDash</a> <a href="#">httpMPEGDashStreamingSession</a> ) Invoked when an HTTP MPEGDash Streaming session is destroyed.

## Methods

### onHTTPMPEGDashStreamingSessionCreate

public void **onHTTPMPEGDashStreamingSessionCreate**([HTTPStreamerSessionMPEGDash](#)  
[httpMPEGDashStreamingSession](#))

Invoked when an HTTP MPEGDash Streaming session is created.

**Parameters:**

[httpMPEGDashStreamingSession](#) - [httpMPEGDashStreamingSession](#)

### onHTTPMPEGDashStreamingSessionDestroy

public void **onHTTPMPEGDashStreamingSessionDestroy**([HTTPStreamerSessionMPEGDash](#)  
[httpMPEGDashStreamingSession](#))

Invoked when an HTTP MPEGDash Streaming session is destroyed.

**Parameters:**

[httpMPEGDashStreamingSession](#) - [httpMPEGDashStreamingSession](#)

com.wowza.wms.module

# Interface IModuleOnHTTPSanJoseStreamingSession

public interface IModuleOnHTTPSanJoseStreamingSession  
extends

IModuleOnHTTPSanJoseStreamingSession: method interface for HTTP SanJose Streaming session create/destroy.

Method Summary	
void	<a href="#">onHTTPSanJoseStreamingSessionCreate(HTTPStreamerSessionSanJose httpSanJoseStreamingSession)</a> Invoked when an HTTP SanJose Streaming session is created.
void	<a href="#">onHTTPSanJoseStreamingSessionDestroy(HTTPStreamerSessionSanJose httpSanJoseStreamingSession)</a> Invoked when an HTTP SanJose Streaming session is destroyed.

## Methods

### onHTTPSanJoseStreamingSessionCreate

public void **onHTTPSanJoseStreamingSessionCreate**([HTTPStreamerSessionSanJose httpSanJoseStreamingSession](#))

Invoked when an HTTP SanJose Streaming session is created.

**Parameters:**

`httpSanJoseStreamingSession` - httpSanJoseStreamingSession

### onHTTPSanJoseStreamingSessionDestroy

public void **onHTTPSanJoseStreamingSessionDestroy**([HTTPStreamerSessionSanJose httpSanJoseStreamingSession](#))

Invoked when an HTTP SanJose Streaming session is destroyed.

**Parameters:**

`httpSanJoseStreamingSession` - httpSanJoseStreamingSession

## com.wowza.wms.module Interface IModuleOnHTTPSession

public interface **IModuleOnHTTPSession**  
extends

IModuleOnHTTPSession: method interface for HTTP Streaming session create/destroy.

### Method Summary

void	<a href="#">onHTTPSessionCreate</a> ( <a href="#">IHTTPStreamerSession</a> httpSession) Invoked when an HTTP Session is created (both Smooth and Cupertino sessions).
void	<a href="#">onHTTPSessionDestroy</a> ( <a href="#">IHTTPStreamerSession</a> httpSession) Invoked when an HTTP Session is destroyed (both Smooth and Cupertino sessions).

### Methods

#### onHTTPSessionCreate

public void **onHTTPSessionCreate**([IHTTPStreamerSession](#) httpSession)

Invoked when an HTTP Session is created (both Smooth and Cupertino sessions).

**Parameters:**

httpSession - httpSession

#### onHTTPSessionDestroy

public void **onHTTPSessionDestroy**([IHTTPStreamerSession](#) httpSession)

Invoked when an HTTP Session is destroyed (both Smooth and Cupertino sessions).

**Parameters:**

httpSession - httpSession

## com.wowza.wms.module

# Interface IModuleOnHTTPSmoothStreamingPlayReady

public interface **IModuleOnHTTPSmoothStreamingPlayReady**  
extends

IModuleOnHTTPSmoothStreamingPlayReady: Still working on this...

## Method Summary

void	<a href="#">onHTTPSmoothStreamingPlayReadyCreateLive</a> ( <a href="#">IApplicationInstance</a> appInstance, String streamName, com.wowza.wms.drm.playready.PlayReadyKeyInfo playReadyKeyInfo)
void	<a href="#">onHTTPSmoothStreamingPlayReadyCreateVOD</a> ( <a href="#">HTTPStreamerSessionSmoothStream</a> <a href="#">er</a> httpSession, com.wowza.wms.drm.playready.PlayReadyKeyInfo playReadyKeyInfo)

## Methods

### onHTTPSmoothStreamingPlayReadyCreateVOD

```
public void onHTTPSmoothStreamingPlayReadyCreateVOD(HTTPStreamerSessionSmoothStream  
httpSession,  
com.wowza.wms.drm.playready.PlayReadyKeyInfo playReadyKeyInfo)
```

### onHTTPSmoothStreamingPlayReadyCreateLive

```
public void onHTTPSmoothStreamingPlayReadyCreateLive(IApplicationInstance appInstance,  
String streamName,  
com.wowza.wms.drm.playready.PlayReadyKeyInfo playReadyKeyInfo)
```

com.wowza.wms.module

# Interface IModuleOnHTTPSmoothStreamingSession

public interface IModuleOnHTTPSmoothStreamingSession  
extends

IModuleOnHTTPSession: method interface for HTTP Smooth Streaming session create/destroy.

Method Summary	
void	<a href="#">onHTTPSmoothStreamingSessionCreate(HTTPStreamerSessionSmoothStreamer httpSmoothStreamingSession)</a> Invoked when an HTTP Smooth Streaming session is created.
void	<a href="#">onHTTPSmoothStreamingSessionDestroy(HTTPStreamerSessionSmoothStreamer httpSmoothStreamingSession)</a> Invoked when an HTTP Smooth Streaming session is destroyed.

## Methods

### onHTTPSmoothStreamingSessionCreate

public void **onHTTPSmoothStreamingSessionCreate**([HTTPStreamerSessionSmoothStreamer httpSmoothStreamingSession](#))

Invoked when an HTTP Smooth Streaming session is created.

**Parameters:**

httpSmoothStreamingSession - httpSmoothStreamingSession

### onHTTPSmoothStreamingSessionDestroy

public void **onHTTPSmoothStreamingSessionDestroy**([HTTPStreamerSessionSmoothStreamer httpSmoothStreamingSession](#))

Invoked when an HTTP Smooth Streaming session is destroyed.

**Parameters:**

httpSmoothStreamingSession - httpSmoothStreamingSession

## com.wowza.wms.module Interface IModuleOnPushPublish

public interface **IModuleOnPushPublish**  
extends

### Method Summary

void	<a href="#">onPushPublishSessionCreate</a> (String streamName, <a href="#">IMediaStream</a> stream, <a href="#">IPushPublishSession</a> pushPublishSession) Invoked when push publish session is created
void	<a href="#">onPushPublishSessionDestroy</a> (String streamName, <a href="#">IMediaStream</a> stream, <a href="#">IPushPublishSession</a> pushPublishSession) Invoked when push publish session is destroyed

### Methods

#### onPushPublishSessionCreate

```
public void onPushPublishSessionCreate(String streamName,  
    IMediaStream stream,  
    IPushPublishSession pushPublishSession)
```

Invoked when push publish session is created

**Parameters:**

streamName - stream name  
stream - stream  
pushPublishSession - push publish session

#### onPushPublishSessionDestroy

```
public void onPushPublishSessionDestroy(String streamName,  
    IMediaStream stream,  
    IPushPublishSession pushPublishSession)
```

Invoked when push publish session is destroyed

**Parameters:**

streamName - stream name  
stream - stream  
pushPublishSession - push publish session

## com.wowza.wms.module Interface IModuleOnRTPSession

public interface **IModuleOnRTPSession**  
extends

IModuleOnRTPSession: method interface for RTP session create/destroy.

### Method Summary

void	<a href="#">onRTPSessionCreate(RTPSession rtpSession)</a> Invoked when an RTP Session is created.
void	<a href="#">onRTPSessionDestroy(RTPSession rtpSession)</a> Invoked when an RTP Session is destroyed.

### Methods

#### onRTPSessionCreate

public void **onRTPSessionCreate**([RTPSession](#) rtpSession)

Invoked when an RTP Session is created.

**Parameters:**

rtpSession - rtpSession

#### onRTPSessionDestroy

public void **onRTPSessionDestroy**([RTPSession](#) rtpSession)

Invoked when an RTP Session is destroyed.

**Parameters:**

rtpSession - rtpSession

## com.wowza.wms.module Interface IModuleOnStream

public interface **IModuleOnStream**  
extends

IModuleOnStream: method interface examples for stream level methods in a module.

### Method Summary

void	<a href="#">onStreamCreate</a> ( <a href="#">IMediaStream</a> stream) Invoked when a stream is created.
void	<a href="#">onStreamDestroy</a> ( <a href="#">IMediaStream</a> stream) Invoked when a stream is destroyed.

### Methods

#### onStreamCreate

public void **onStreamCreate**([IMediaStream](#) stream)

Invoked when a stream is created.

**Parameters:**

stream - stream object

#### onStreamDestroy

public void **onStreamDestroy**([IMediaStream](#) stream)

Invoked when a stream is destroyed.

**Parameters:**

stream - stream object

## com.wowza.wms.module Interface IModulePingResult

public interface **IModulePingResult**  
extends

IModulePingResult: callback interface used by IClient ping.

### Method Summary

void	<a href="#"><code>onResult(IClient client, long pingTime, int pingId, boolean result)</code></a> Triggered on client side result from call to IClient.ping.
------	--

### Methods

#### onResult

```
public void onResult(IClient client,  
                    long pingTime,  
                    int pingId,  
                    boolean result)
```

Triggered on client side result from call to IClient.ping. This method will be called on a success or failure (ping timeout) of a ping.

#### Parameters:

`client` - client  
`pingTime` - time in server time (milliseconds) when the ping was initiated  
`pingId` - internal server id for the ping request  
`result` - true is ping was successful false if failure (timeout)

## com.wowza.wms.module Class ModuleBase

java.lang.Object

└--com.wowza.wms.module.ModuleBase

Direct Known Subclasses:

[ModuleCore](#), [ModuleClientLogging](#), [ModuleMediaCaster](#)

public abstract class **ModuleBase**  
extends Object

ModuleBase: Base class that all server side modules should extend. Provides basic utility functionality for handling function parameters and return data. Also provides a simplified API for logging.

### Field Summary

public static final	<a href="#">CALLBACK_PARAM1</a> Callback param: param1 Value: <b>1</b>
public static final	<a href="#">CALLBACK_PARAM10</a> Callback param: param10 Value: <b>10</b>
public static final	<a href="#">CALLBACK_PARAM2</a> Callback param: param2 Value: <b>2</b>
public static final	<a href="#">CALLBACK_PARAM3</a> Callback param: param3 Value: <b>3</b>
public static final	<a href="#">CALLBACK_PARAM4</a> Callback param: param4 Value: <b>4</b>
public static final	<a href="#">CALLBACK_PARAM5</a> Callback param: param5 Value: <b>5</b>
public static final	<a href="#">CALLBACK_PARAM6</a> Callback param: param6 Value: <b>6</b>
public static final	<a href="#">CALLBACK_PARAM7</a> Callback param: param7 Value: <b>7</b>
public static final	<a href="#">CALLBACK_PARAM8</a> Callback param: param8 Value: <b>8</b>

public static final	<a href="#">CALLBACK_PARAM9</a> Callback param: param9 Value: <b>9</b>
public static final	<a href="#">PARAM1</a> Method param: param1 Value: <b>3</b>
public static final	<a href="#">PARAM10</a> Method param: param10 Value: <b>12</b>
public static final	<a href="#">PARAM2</a> Method param: param2 Value: <b>4</b>
public static final	<a href="#">PARAM3</a> Method param: param3 Value: <b>5</b>
public static final	<a href="#">PARAM4</a> Method param: param4 Value: <b>6</b>
public static final	<a href="#">PARAM5</a> Method param: param5 Value: <b>7</b>
public static final	<a href="#">PARAM6</a> Method param: param6 Value: <b>8</b>
public static final	<a href="#">PARAM7</a> Method param: param7 Value: <b>9</b>
public static final	<a href="#">PARAM8</a> Method param: param8 Value: <b>10</b>
public static final	<a href="#">PARAM9</a> Method param: param9 Value: <b>11</b>
public static final	<a href="#">PARAMMETHODNAME</a> Method: method name Value: <b>0</b>
public static final	<a href="#">PLAYTRANSITION_APPEND</a> Value: <b>0</b>
public static final	<a href="#">PLAYTRANSITION_APPEND_IMMEDIATE</a> Value: <b>2</b>

public static final	<a href="#">PLAYTRANSITION_RESET</a> Value: <b>1</b>
public static final	<a href="#">PLAYTRANSITION_RESET_IMMEDIATE</a> Value: <b>3</b>
public static final	<a href="#">PLAYTRANSITION_STOP</a> Value: <b>10</b>
public static final	<a href="#">PLAYTRANSITION_SWAP</a> Value: <b>12</b>
public static final	<a href="#">PLAYTRANSITION_SWITCH</a> Value: <b>13</b>
public static final	<a href="#">PLAYTRANSITION_UNKNOWN</a> Value: <b>14</b>
public static final	<a href="#">PLAYTRANSITIONSTR_APPEND</a> Play2 transition: APPEND Value: <b>append</b>
public static final	<a href="#">PLAYTRANSITIONSTR_RESET</a> Play2 transition: RESET Value: <b>reset</b>
public static final	<a href="#">PLAYTRANSITIONSTR_STOP</a> Play2 transition: STOP Value: <b>stop</b>
public static final	<a href="#">PLAYTRANSITIONSTR_SWAP</a> Play2 transition: SWAP Value: <b>swap</b>
public static final	<a href="#">PLAYTRANSITIONSTR_SWITCH</a> Play2 transition: SWITCH Value: <b>switch</b>
public static final	<a href="#">PLAYTRANSITIONSTR_UNKNOWN</a> Play2 transition: UNKNOWN Value: <b>unknown</b>

## Constructor Summary

public	<a href="#">ModuleBase</a> ( )
--------	--------------------------------

## Method Summary

static <a href="#">IApplicationInstance</a>	<a href="#">getAppInstance</a> ( <a href="#">IClient</a> client) Get applicationInstance of a client.
--	--

static <a href="#">IApplication</a>	<a href="#">getApplication</a> ( <a href="#">IClient</a> client) Get application of a client.
static int	<a href="#">getCallbackParamCount</a> ( <a href="#">AMFDataList</a> params) Get the total number of parameters passed to callback.
static <a href="#">WMSLogger</a>	<a href="#">getLogger</a> () Get the logging interface.
static <a href="#">AMFData</a>	<a href="#">getParam</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter by index.
static boolean	<a href="#">getParamBoolean</a> ( <a href="#">AMFDataList</a> params, int index) Get parameter by index, Return as boolean.
static boolean	<a href="#">getParamBoolean</a> ( <a href="#">AMFDataList</a> params, int index, boolean defaultVal) Get parameter by index, Return as boolean.
static int	<a href="#">getParamCount</a> ( <a href="#">AMFDataList</a> params) Get the total number of parameters passed to method.
